Dei, Cap. 4. to count (saies he) the faults of Beasts, and Trees, and other mutable and mortal things, wanting either understanding, or Sense, or Life, to be damnable, is a ridiculous Thing: since those Creatures have by the will of the Creater received that manner of being, that by going and coming they might perfect the lowest Pulchritude of times, agreeable to the parts of this world, according to their kind. *And a little after*: the beauty of which order therefore delights us not, because in this condition of our mortality being interwoven therein we cannot discerne the whole, to which the particles which offend us are decently and aptly fitted. And *Again*: Nature considered in her self and not with reference to our commodity or discommodity Glorifies her Work-Master. For living Things make a nobler degree of Bodies, then things simply mixed. And *Aristotle* himself 1 *de Part. Animal. Cap.* 5. (which place also we cited before) acknowledges the Wisdom of the most good and great God, in such petty Animals, while he thus writeth: *With a Childish scornfulness to despise and be troubled at the disputation and consideration of the meaner sort of Animals, is an unworthy thing: since there is nothing in Nature which hath not some wonder in it. And that which* Heraclitus *is reported to have said to those who coming to speak with him, and because they found him sitting in a Bakers Shop Warming him at the Oven, they stept back and would not go to him; come in boldly quoth he, and be not ashamed, for the Immortal Gods are even in this place also. The same must be done in the searching out of the Nature of Animals. For we ought to attempt every thing, without any shame since the Divinity of Nature is in them all, and her comly and beautiful Artifice. For that is every where chiefly joyned to the works of Nature, where nothing is done rashly and by chance, but all to some end and purpose. Now the end for which any thing is, or was made, hath in it the Notion of goodness and Honesty. But if any man think the contemplation of other Animals to be Base and Vile, he must needs think the same of himself also, for we cannot behold without much loathing those things whereof the Body of man consists, as Blood, Flesh, Bones, Veins, and such like.* So far *Aristotle*. *Fortunius Licetus* indeed, *Lib.* 1. *de Spont. Vivent. Ort. Cap.* 11. opposes their Opinion who hold that such things are Generated for the perfection of the universe, with this reason chiefly, because the universe is before them in Nature, and furnished with its own perfection, which no Generation of Spontaneous things can encrease, and because it many times happens, that some sort of these Spontaneous Creatures is wanting in the world, and yet the world is not therefore imperfect. But although the universe were perfect before some such Spontaneous Animal was bred, and granting (whereas nevertheless if they are not in one place, they are commonly alwaies in another) that some sort of these Creatures is wanting in the world: yet the forms from whence they proced never have been nor never are wanting. And he himself grants, that Souls may lurke in other Bodies, as in a Vessel, so as neither to have the notion of an efficient, nor of a Soul.

The Glory of God shines in the smallest Creatures.

Chap 5. *The Sum of what hath been said concerning the* Spontaneous *Original of Living Things.*

AND that we may contract what hitherto hath been said concerning the Spontaneous Original of live Things, into a smal compass; Spontaneous live things are Generated, when either the Seed, or Seminal principle, and the Soul it self of live things, being somwhere secretly hidden, having obtained a fitting matter, and stirred up by the heat of some Ambient Body, doth put it self forth and begins to exercise vital operations: or when the Form which was necessary to the constitution of the subject of some more Noble living thing, the former Soul departing, becomes its own Master, and being excited by the Ambient heat or the heat of putrefaction, and having obtained a new disposition fit to exercise Vital actions, it rouzes it self, and becomes an actuating and Vivifying Form to the subject matter, and begins to exercise the actions of a living thing.

A brief of the opinion concerning the original of spontaneous live things.

From whence it is apparent, that all matter which is necessary to Spontaneous Generation, and which contains secretly in it self the Form and Cause of a new and Spontaneous Body, proceeds from living Things, and it is either Seed, or somwhat answering to Seed, either the whole Carkass or part of the Carkass of a living Thing,

Spontaneous live things spring only from live things.

Thing, or an excrement, or somwhat that some way proceeds from a live thing, and contains in it self a vital principle. For, as was said before, the Seed and Seminal principle, and that which answers to Seed, may long lie hid in Atomes, divers matters, powders, dry things, and in the Earth. Yea and the more Ignoble sort of Animals some of them, although they somtimes seem deprived of life, and to exercise no Second act of the Soul, as it happens in Flies, Frogs and some other Animals, which lie all Winter long as it were dead: yet the Soul lying hid even in vile matter doth vivifie the same, and being in the Spring cherished and awakened by the Ambient heat, it exercises vital actions by the Second act, and is then said to revive again. Moreover there is no living thing, out of whose Carkass Excrements, Urine, Sweat, Vapors, and steams going out of the Body, and filth gathered in the Skin and Garments sundry kinds of Worms are not produced; so that *Aristotle* said rightly, that all things were after a sort ful of Souls. Now the Soul which lies hid in such things as proceed from perfect Animals, and afterwards proceeds from them, is alwaies of an inferior degree and sort, but never of the same or an higher, unless they be some imperfect Animals, as was newly said of Flies and Frogs. For the same Soul cannot inform Bodies of divers sorts, nor cannot any thing act beyond its strength. And although as was also said before, *Fortunius Licetus, Lib.* 2. *Chap.* 17. teaches that the same Soul, or of the same sort and condition with the Soul of the former live thing, is in Spontaneous live things: yet that may not be allowed, for the cause aforesaid. And the Nature of Degeneration is far different from that of the Spontaneous Original of living Things. For in degeneration, as also in Silk-Worms and Butter-Flies, it may happen, that the same Soul may be in divers bodies, and so be naturally disposed to put on divers external Forms, as when Rye is turned into Wheat, and of the Egg is made a Palmer-worm, then a Silk-Worm, then a Butter-Fly: but in Spontaneous Generation, properly so called and of the second kind, it is impossible, that a more noble Form should remain in the Carkass or Excrements. But these things will be more clearly understood, now we come to particulars.

Chap. 6. *Of the Spontaneous Original of Plants, and first of the Generation of Mushroms.*

Spontaneous live things how manifold they are.

NOw al living things Spontaneously generated whether of the first or second order, do belong either to Vegetables or to Animals. And both of these again are twofold: Vegetables are Mushroms, Puck-Fists, Mos, and perfect Plants; Animals are Plant-Animals, and true Animals.

The Generation of Mushroms and Puck-fists.

In the first place all Puckfists are generated without any tillage or manifest Seed, which as *Scaliger* saies are to themselves Root, Stem and Fruit; also Mushroms, and Toad-stools, which spring up so swiftly that they are generated in one Night, and attain that greatness which belongs to their Nature. For they neither afford any Seed of which to be generated, nor are they procreated and multiplied by setting any part of them into the ground. Since therefore they are bred of their own accord, they must needs have the common way of generation with other Spontaneous Live things of which we spake before. For whereas *Matthiolus* writes, that the Earth by an hidden faculty doth breed Puck-fists, and Mushroms in her self, that must be fitly explained. For the Earth is not in it self and by its own Nature the efficient Cause of Puck-fists and Toad-Stools, but a Soul lying hid in the Earth, or in some Juyce mingled with the Earth. But whence that Soul proceeds is not so manifest.

Whence toad-stools have their Soul.

Fortunius Licetus, Lib. 3. *de Spont. Viv. Ort. Cap.* 4. thus writes thereof: the Spontaneous Original of Puck-fists and all Toad-stools in general, is, when the Soul of a more perfect living thing, Plant or Animal, abiding in the Carkass, as in a Vessel, being much impaired, and having gotten a matter not exactly disposed, and having none of the best instruments for the Organization of the parts, communicates it self for a Form and quickening Soul to the subject matter, first disposed by the moist warmth or heat of the Ambient Air, which works chiefly upon the Earth in the Spring and Autumn, with Thunder and Rain, or rather with the Sun,

after

after Rain. The same *Licetus*, *Lib.* 3. *de Spont. Vivent. Ort. Cap.* 5. conceives that the matter of Toad-stools is an aliment fit to nourish plants, falling upon the ground from the Carkasses either of other Plants or of Animals, which when the neighbouring Plants do not draw to nourish themselves, the Soul of its own accord turns it into Toad-stools and Puck-fists.

The kinds of toad-stools or Mushroms

But in very deed, there is not only one kind of Toad-stools, as hereafter will appear when we speak of their differences. Some grow to Trees, some Spring out of the Earth. The former proceeds from the Soul in the Body of the Tree, mistaking by reason of the unfitness of the matter it works upon, but not from the Soul weakned. And as in Man certain Toad-stools are bred, sundry sorts of Warts, Wens and other Excrescences, by reason of Vitious Aliment, which Nature changes into the best Form it can, and such as the Nature of the place will bear: so also in Trees, especially those that are aged, when either vitious Aliment flows in, or in a weak part it is not well digested, Nature generates such like Toad-stools. The rest have their nourishment in the Earth, but not all that which *Licetus* would have. For if all that which *Licetus* would have were the immediate matter of Toad-stools they would grow every where in Fields and Gardens; since there is such matter in all places: which nevertheless doth not come to pass. Nor hath it ever been observed, that Toad-stools and Puck-fists were bred out of Animals; as for those which are said to breed upon men, they are only so called by way of similitude.

All toad-stools or Mushroms arise from Plants.

And therefore I conceive it is more probable that Puck-fists do arise and grow only upon and out of Plants. And that in the Earth they are generated out of the Roots and Barks of Trees and Shrubs, either Putrified and Corrupted, or sending some Juyce out of themselves, and consequently of such matter which was the proper and immediate subject of the Soul of the Plant, and contains in it a subordinate Form, which being afterwards stirred up by heat, and having got a fitting matter it turns to a Toad-stool to which it is Naturally disposed. For when somwhat is separated and divided from the Tree, and is no longer governed by the Form of a plant, then that concealed Form is stired up by the moist Heat of the Earth about it, and begins to exercise the Function of a Soul, and of its subject matter being disposed thereto it forms the Body of an imperfect or half Plant. Whence it is that after Thunder and Showers great store of Toad-stools are wont to Spring up. And that which Rains especially coming down with Thunder do perform by their Warm moisture, that also Leaven mixt with Blood-warm water can effect. And *Matthiolus* writes, in *Lib.* 1. *Dioscorid. Cap.* 93. that a white Poplar Tree cut off close by the ground to the very Root, and Sprinkled with hot Water wherein Leaven is dissolved, within four daies brings forth store of Mushroms or Toad-stools very pleasant to Eat.

Toadstools from a white poplar tree.

Why toad-stools are so suddenly Generated.

And because Toad stools are speedily Generated and grow up, *Licetus* holds *Lib.* 3. *de Spont. Viv. Ort. Cap.* 10. that there must needs come together at once many such Atomes as are fit to Generate Toad stools, so as to make up a sensible bulk; because the Soul of one Atome is so weak, that it cannot vivifie nor shape the matter of a Toad-stool, nor perform that which the Souls of many Aromes flowing together into one Body and becoming one, can do. But there is some doubt in this point. For wonderful, truely, is the Nature of Forms and Souls, which of it self hath no quantity, and hath the same force in a smal Body which it hath in a great. Nor doth the bulk of a Toad-stool prove that which he saies; since we see of an exceeding smal Seed a great Plant doth arise, matter being drawn out of the Earth for the formation and Augmentation thereof. The most swift encrease of Toad-stools doth rather seem to perswade what *Licetus* thinks; since it is not credible, that in so short a space of time a Soul lurking in so smal a Body can draw to it so great a quantity of matter. Unless any man will peradventure say, that the matter is prepared by little and little by the Soul of the Toad stool, and afterward it suddenly Springs up.

The Differences or Sorts of Mushroms or Toad-stools, and of Puck-fists.

The differences of toadstools.

And although all Toad-stools do arise from plants, and the Roots, Branches, Stocks, and Barks of Trees and shrubs: yet there is great difference amongst them,

in regard of diversity of their matter. For some grow to Trees and Wood, some grow under Trees and in the ground. Nor is it easie to find a Toad-stool where there is not or hath not been some Tree or Wood. And the matter, truly, of such as grow upon Trees and Wood proceeds in the first place from the substance it self of the Trees, or that matter which is the proper subject of the Soul of the Tree. But a Toad-stool is not made thereof, so long as it is under the dominion of the Soul of the Tree, or Shrub, but when it is deserted thereby, and either the whole Plant, or some part thereof comes to die. And therefore we see that Toad-stools for the most part do not grow upon sound and uncorruped Trees, but on such as are old, and in some part decaied. Secondly, The vitious Aliment of the Tree or Shrub. Thirdly, some Excrement shed from the Tree or Bark; whence *Pliny, Lib.* 22. *C.* 23. writes that Toad-stools are bred of the Flegm of Trees. And indeed, it is credible that Toad-stools which grow on living Treees by means of the two last causes and manners are the works of the Soul it self of the Tree. For like as, according to what was formerly said, Toad-stools and Warts are generated on the Body of Man, while Nature, which is never idle, turns and Forms the vitious and superfluous Humor (which breaking through the Membranes and Pores, it cannot change into the substance of the part, by reason of the unfitness of the matter and the weakness of the part) into such a substance; so credible it is, that the same doth happen in trees.

The original of toad stools which grow upon Trees.

The matter of those which Spring out of the Earth is either some part of a Root, or a Bark, or some other part separate from the Tree. And therefore where Toad-stools are bred, there for the most part you shal find the Barks and parts of Trees, which when they are corrupted and Rot, by Rain falling upon them they are covered in the Earth, and being cherished with the Heat thereof are changed into Toad-stools. And that also may be artificially procured. So of the Leaves of Poplar Trees cut in pieces and buried in the ground Toad-stools do arise, as *Scaliger* observes *Exercit.* 104. *Sect.* 17. the same happens of a Fig-Tree buried underground, as *Athenæus, Lib.* 2. *Cites from Nicander*, whose Words are these.

Toadstools Springing out of the Earth.

Out of a poplar tree

Out of a Fig-tree.

Cover a Fig-Tree under store of Dung,
And Water't well, then store of Mushrooms Yong
Will Spring apace.

Hitherto also may be referred the Toad-stools which grow out of Tree branches burnt; of which *Cardan, Lib.* 13. *de Subtil. Page* 509. you shall have Mushroms when you burn dry sticks, and Rain fals upon them, or (in case it Rain not) if you sprinkle Water upon the remainders. And that this is so, not only when the sticks are burnt, but also when they are not burnt, any one may easily try. For when I had used to manure my Garden with Earth that had smal fragments of sticks mingled therewith, the second year there grew up store of smal Mushroms or Toad-stools al about.

Out of tree branches Withered.

Again though no part of the Tree or Shrub be found evidently corrupted in the ground: yet of them Toad-stools are bred, when the Juyces or Excrements of Trees lie hid in the ground. For such is the Nature of these more Ignoble Forms, that even in the smallest Atomes and Juyces they can remain intire, which afterwards gaining a convenient place, and being stirred up by the heat of some Ambient Body, they rouze themselves, and Form and shape the Body of a Toad-stool. For since a Soul can abide in the smallest Seeds of Plants, and when it gets place and matter it can Form a great Plant: why may not these Forms much more Ignoble be preserved entire in the smal Bodies or Atomes of Plants?

Now the chief cause of the variety of Toad-stools is the diversity of Trees and Shrubs from whence they arise; for some sorts grow upon or under some kind of Trees or Shrubs, and some upon or under others. So, those great and very white Toad-stools like a mans Skul, which Chirurgeons use to stop Blood, and are called *Crepitus Lupi*, do hardly grow any where but in Vineyards, and they grow out of Vine Branches dead and corrupted. Also the variety of the Parts themselves of the Trees.

The variety of Toad stools.

Howbeit, I am apt to believe that the variety of Toad-stools doth not only depend upon the diversity of the matter which Trees afford them, but also upon the

the variety of matter which is otherwise found in the Earth. For seeing certain it is that all this great bulk of some Toad-stools doth not come from the Tree, doubtless the form or Soul communicated by the Tree doth in the Earth associate such matter as it meets with, and thereof frames to it self a convenient Body; as also we see that small Seeds do draw matter and aliment out of the Earth, and that thence great Plants grow up. And that the Soul of the Toad-stool doth snatch any Obvious matter, and thereof shape a Toad-stool, appears even hereby, that *Pliny Lib. 19. Chap. 2.* writes: We know what hapned to *Laertius Licinius* a Pretorian, being Judg at *Carthage* in *Spain*, a few years since; who biting a Mushrom had his fore Teeth loosned by a Brass Farthing that was therein.

Of the Harts Toad-stool or Boletus Cervinus *so called.*

And since among other Toad-stools, both in regard of the shape and strong smel, the *Fungus Cervinus* or Harts Toad-stool is remarkable, Now *Matthiolus* writes thereof, as of a thing by himself lately found out, *Lib. 3. Epist. Ult. ad Julium Moderatum* in these words: seeing I know that you are much delighted with novelties, I have sent you with these my Letters a certain Subterranean Puck-fist, which the Bohemians cal Harts Mushrom. For I conceive it is a thing you never heard of before, because no Ancient nor late writers make any mention thereof; and because it is not to be found, save in those Woods where there are many Harts and Hunters, who know these secrets of Nature: but because these things are unheard of in your parts, I will not have you any longer unacquainted with the History and Virtue of this Toad-stool. Now Hunters relate that this Toad-stool after the manner of ordinary puck-fists grows under the ground, where the Earth is infected with the Harts Sperm falling thereupon. Which many times happens when the Male draws his Yard out of the Genitals of the Female containing Seed in the passage, by reason of the Females withdrawing her self from the Violence of the Male. And perhaps no man could ever find this Toad-stool, did not the Harts themselves at a certain season of the year discover the place where they grow. For led by a Natural Instinct they scrape with their fore Feet upon the ground whereunder the said Toad stool grows which they are said to discern by the smel. For the Toad-stool hath a very strong smel, especially when it is first dug up. Hunters and Country-men which are acquainted with the Secret and frequent the Woods diligently observe the places, being drawn by the Harts Feet, and digging the pit they take out the Toad-stools and sel them to the Apothecaries, who cut them in pieces, draw them upon Threds, and dry them afterwards in the shadow, and keep them for Medicinal uses. They are of the same shape (for the most part) which we see in other Puck-fists, yet all are round like Globes and uneven. The outmost thin Rind is swarthy somwhat, but the fleshy *Fungus* substance is white. Some say there is a certain kind of these Puck-fists resembling a mans Yard Erected, with the Nut uncovered, and at the other end certain Knobs resembling Testicles. But that vulgar Opinion of the Hunts-Men touching the Original of these Toad-stools sounds like a Fable, into which perhaps the strong smel, and in the latter sort the shape, might bring them. Whereof *Thomas Jordanus, de Pest. Phæn. Tract. 3. P. 605.* They exceedingly commend the Harts Toad-stool so called, bred of the Sperm of that Beast, and found by the Goates Scraping up of the Earth. They are found truly in such places where in the Memory of Man there was never any Hart seen. At *Trenzine* a Famous town of *Hungary* about the Clifts of *Carpathus* they are very plentiful; in Mountanous places, and dark Woods, where though you may find Harts, yet is there not so great plenty, as to suffice for the Generation of Wain-Loads of these Puck-fists, if that were to be thought true which is related of their Generation. Also I have as touching the latter kind been brought into a suspition by what I observed here at *Wittenberge*, in the year 1626. For the Trench being to be repaired and the City to be fortified, the Captain of the Garrison walking accidentally in the Ditch, drawn by the smel, he found one of these Puck-fists having the form of a Mans Yard, and wondering (for he had from Hunters drunk in the foresaid Opinion concerning the Original thereof) how in a place where no Hart had been this Toad-stool could be Generated, he brought me to the place, and being some spaces distant I also perceived that same exceeding strong smel proper to this kind, and under an

The Harts toad-stool is not bred of Harts-Seed.

Elder Shrub I found ten such Puck-fists. But seeing it is certain, that there never came any Hart into that place, probable it is, that such Puck-fists are not Generated of the Harts Sperm, but of the Juyce or corruption of some Plant, and matter determined to this kind of Toad-stool, arising from some certain Plant.

Toad-stools growing out of Stones.

Toadstools out of Stones.

Moreover this is also worthy of consideration whether Toad-stools or Puck-fists grow out of Stones. Many learned men affirm the same, and hold that there are Mushroms fit to Eat growing out of Stones. *Jul. Cæsar Scal. Exercit.* 173. *Sect.* 2. writes: *The Particular Nature of a certain Stone is to be reckoned amongst the most wonderful. This Stone is highly esteemed by the Romans. I saw one at Naples, in which Kingdom they say they are found. It hath a thick crust. Which being covered with Earth nine inches deep, and sprinkled with warm Water, the fourth day after it sends forth Mushroms.* And *Cardan, Lib.* 13. *de Subtilitate,* saies: *Mushroms grow from certain broad Stones buried underground, after the manner of measures, four inches underground within four daies Water being sprinkled thereupon. They abound in groves and grow speedily: for they require a dry heat, and therefore those stones must have some adustion, for the Generation of Mushroms is speedy, and as it were without a Root, for nothing grows without a Root indeed. For if it draw aliment, if it live, or grow though it live not, it draws out of the Earth; now that which draws must be Joyned to that whereout it draws; and the part whereby it is Joyned is the Root.* And *Matthiolus* upon *Dioscorides, Lib.* 4. *Cap.* 78. hath these Words: *Mushroms are at this day in so great request at the Tables of* Italy, *(where they are most frequently Eaten) that at Naples stones are found, which being Dug up and carried into Wine Cellars, covered a little with Earth, and now and then sprinkled with Blood-Warm Water, within four daies they produce pleasant Mushroms. These Stones I have seen at Rome and Naples; where they are kept with great diligence, because by help of them they can Eat Mushroms when they please.* Which is confirmed by *Johannes Baptista Porta* the Neapolitan *in Sua Villa Lib.* 10. *Cap.* 70. The last kind of Mushroms (quoth he) are Bred out of Stones. They are cropt off to be Eaten, and fresh ones grow up, by a continual fruitfulness, They grow to their perfection in seven daies; sixtimes a year they cut them off; the Stone is covered with nine inches depth of Earth. The Stones are brought to Naples from the Mountain *Vesuvius*; to *Surrentum* from *Fagetus* the highest Mountain of that Tract; to *Abellinum* from the *Parthenian* Mount; in *Apulia*, from *Garganus* and the highest part of the Mountains; for when they once perceive the stones have born Mushroms, they dig them up, and expose them to sale. Sometimes they do not grow in the fashion of Caps, but like Tendrels or in the shape of *Asparagus*, and divided into branches. And *Fortunius Licetus Lib.* 3. *de Spont. Viv. Ort. Cap.* 11. relates, that *Jacobus Antonius Marta* a Neapolitan told him, that the *Parthenian* Mount aforesaid, the highest of all the Mounts in the Territory of Naples, in the top thereof hath store of Stones of a wonderful Nature, which being put under the droppings of the Wine Spiggots, and drinking in the drops of Wine do in the morning afford Mushroms, sprung up the night before, delightful to the taste, and not prejudicial to Health.

what kind of Stones they are out of which Mushroms grow.

But, forasmuch as the said *Licetus*, in the place cited, relates, that he saw at *Padua*, in the Garden of *Benedictus Sylvaticus* a Famous Physitian, three such Mushroms bearing Stones, sent him from the Country of *Naples*, and that he did Eat Mushroms which grew upon them; and adds, that those Stones were very soft, yielding to the touch, so that they seemed rather pieces of Wood then Stones; we may justly conclude, that Mushroms never grow out of true Stones, but that these Neapolitan Stones so accounted are pieces of wood, by a Stone-making Juyce hardned into the Similitude of Stones; or as *Licetus* would have it, that these Stones had their original from Earth, which being ful of the parts and Juyces of Plants was by a stone-making juyce hardned. Which Woods or parts of Plants containing in them the Form of a Mushrom, when by the pouring on of Wine or warm Water they come to be softned, and to be mingled with the juyce of the Earth about them, and by the heat of wine or warm water to be digested, the Form lying hid within breaks into act and Forms the Body of a Mushrom. But those Mushroms which are bred

bred by Wine dropping upon the stone do owe their original chiefly to the Wine. Yet the Clay which is there found, or is Generated by the continual dropping of the Wine upon the Stone may be mingled therewith. *Mushroms growing from Wine dropping upon the Stone.*

Chap. 7. *Of Plants which grow up of themselves.*

NOW several Men are of several minds as concerning the manner how Plants come to grow of their own accord. Some follow the Opinion of *Erastus* propounded *Chap.* 1. and hold, that every Earth is endued with a peculiar faculty of producing Peculiar Plants, or that it hath a Seminal power communicated by the blessing of God at the first Creation, which is brought into act by the Sun and influx of the Stars. And they are induced so to think, because, if Earth digged out of the deepest Pit or Well be placed upon the highest turret, it produces Plants. And *Johannes Baptist. Port.* writes *Lib.* 2. *Phytognom. Cap.* 1. That when he had gotten Earth out of the deepest Cellars of certain Houses, that there might be no suspition of Seed, and had set it in the open Air on the top of his House, left the wind should bring seeds into it from elsewhere, not many daies after out of the several sorts of Earth in so many baskets several kinds of Plants Sprung up, but such as usually grow in the Neapolitan Soil. For clayish ground did bring forth one sort, the *Puteolan* Mould another, gravelly Earth another. And *Porta* adds that in the Island of *Crete*, whithersoever a man carry the Earth, unless somwhat else be sowed therein, it presently brings forth Cypress. And most certain it is, that in Fields and Meadows some Plants are Natural to one Field or Meadow, some to another. Which Opinion if any man will follow, I shall not quarrel with him. Yet these doubts occur in this Opinion: first, that God did once command the Earth, at the Creation, to produce Plants, and it was accordingly done: And he blessed the Plants, and commanded them to produce their Seeds, whereby they might multiply themselves, but he did not bless the Earth. Which doubt whether it can be answered by saying, that it is not to be understood of simple Earth, but of the kinds of Earth, of which Questionless there are many, and they mixt Bodies, and that these mixt Earths have a Seminal faculty put into them by the Creator whereby they produce Plants; I leave to the Judgment of the Reader. St. *Ambrose* seems to incline to this Opinion, who in *Lib.* 4. *Hexamer.* Writes thus concerning this matter: *That first word of God whereby he created all Creatures, is the Law of Nature, which hath continued ever since in the Earth, giving a rule to Future succession.* Another doubt is, that this Earth doth not bring forth Plants before it is moistened with Rain. So that the Seminal Virtue may seem rather to be communicated thereto by Showers of Rain, then to be Naturally implanted therein. *Plants, how they grow up of themselves*

But suppose, indeed, that this is one manner of the Spontaneous Generation of Plants; Yet is it not the only manner: but that oftentimes Seed is communicated from elsewhere to an Earth of it self barren, appears even hereby, in that it hath been observed that after Rains and inundations of Water new Plants have sprung up in certain places. But how this comes to pass, is not very apparent. I conceive that all this Spontaneous Generation of Plants, may be reduced to those two manners, which I formerly propounded in General. For some plants although they are not Generated of Seed manifest to our senses, nor spring from branches set in the Earth, yet they really proceed from another Plant of the same sort, and from the Seed thereof; which although it be not in a visible Body, yet is it in the smallest Particles or Atomes containing the Soul of the same sort, which Particles may lie concealed in Rain or in the ground; whose Soul having afterwards gained a fit place, and being provoked by the heat of the Ambient Air, it displaies it self. *Licetus* indeed, *Lib.* 3. *de Spont. Vivent. Ort. Cap.* 13. doth grant that these Atomes perform the Office of Seed, and answer to Seed by way of proportion, but he denies that they are really seed: but I see no cause why he should do so, unless peradventure inasmuch as this Seed hath no external Figure as other Seeds have; meanwhile it may wel be called a Seminal Principle. For an external Figure and a certain manner of Formation doth not primarily constitute Seed, but the Soul lying hid in the same with that same implanted Spirit which is said to answer to the Element of the *The manner of the Spontaneous generation of Plants.* *Whether Atomes containing the Soul may be called Seed.*

the Stars, and makes the Seeds fruitful: which because they with their subject may be in the smalleſt Atomes, there is no cauſe why they may not be called a peculiar ſort of Seeds, or a Seminal Principle. And although the Soul which lies hid in ſuch ſmal Bodies or Atomes doth not inform the Earth or Water wherein it is contained, but lies therein concealed as in a Veſſel; yet thoſe little Bodies it informs wherein it is as its proper ſubject, and is in them according to its firſt Act, and it then comes to its Second Act when it hath got a convenient place.

But other Plants are more properly ſaid to be Spontaneouſly Generated, when they proceed not from a Seed or Soul of the ſame ſort, but from that Form which in a more noble Plant was inſtead of the next matter, and the ſubject of its ſpecifical Soul, juſt as Toad-ſtools (whereof we treated in the former Chapter) and moſs do grow upon Trees.

The generation of Moſs.

Now Moſs grows upon ſundry Trees, as on the Cedar, Poplar, Oak, and Pitch-Tree, from which in the Mountains of the Valley of *Anania* above Trent, *Matthiolus* ſaies he had frequently gathered very long Hairy moſs, much ſweeter and fairer then that which grows upon the Poplar and Oak, *in* 1 *Dioſcorid. C.* 20. Yea, and there is hardly any Tree but when it is old it bears Moſs, and it is a token of a Trees being Old, when it begins to be covered with Moſs. Alſo *Fab. Columna* hath deſcribed ſundry ſorts of Moſs, *Minus Cognitar. Stirp. Lib.* 10. *Cap.* 158, 159, 160.

To Moſſes belong the kinds of Liver-wort, which although, as *Dioſcorides Lib* 4. *Cap.* 48. writes, it grows familiarly on Stones, as on Rocks, the Stones of Wells, the Tiles of Houſes: yet the ſame *Fabius Columna* tels us they grow alſo upon the ſtumps of Trees, in moiſt and Champian Countries eſpecially, in the foreſaid Book, *Cap.* 154. Yea in our Countries alſo that ſame kind of Moſs which they cal Tree-lung-wort doth grow upon Trees.

The Generation of Plants out of dried Plants.

Nor muſt we here paſs over that ſingular Opinion of *Fortunius Licetus*, which will ſeem a Paradox to ſome, touching the Generation of Plants out of dried Plants, which are commonly thought to be dead and void of all Soul. We have in General, indeed, ſpoken ſomwhat hereof before: yet I think fit more Particularly in this place to repeat the ſaid Queſtion, and more clearly to explain the ſame. Now *Fortunius Licetus* is of this Opinion, that the ſame Soul which did conſtitute the Living Creature doth remain in the dead Carkaſs, but doth not inform the ſame: Yet that it doth again rouze it ſelf, and is able again to perform the Office of a Form; and that two manner of Waies. For ſomtimes the ſame Soul (he ſaies) being decaied and weakned doth procreate imperfect things: and ſomtimes again, as he ſhews *Lib.* 3. *de his qui diu ſine Alimentis Vivunt, Cap* 7. out of the Body which is accounted for dead a new plant is produced. Foraſmuch as Plants pluckt up out of the Earth, or broken off from their Roots or trunks, do not preſently die, only being deſtitute of a fit place out of which they may draw Aliment they cannot grow, and they ceaſe bearing branches, leaves, and Fruits; yet in the mean time the ſelf ſame Soul doth Vegetate that Body: as ſeeds that are kept in the Winter time ſhew no other ſign of a Soul in them, but that their Body is thereby kept alive; whence it is, that the ſaid ſeed is fit to be ſown and to be uſed in Phyſick: but when it is no more animated but corrupted, it becomes both unfit to be ſown, and loſes all its vertue in Phyſick: If the Wood of an Olive (ſaies he) be ſimply dry, it will live no longer; ſince life conſiſts in moiſture, and dryneſs according to *Ariſtotle* is the Death of Plants; but there wil be the Carkaſs of an Olive-Tree, wherein with ſome degree of Heat, and ſome Foot-ſteps of the former temper, (if the Soul be yet contained in it as in a Veſſel; not quickening the Wood) when it is digged up and hath gained a fitting heat for life from the Ambient Air, and like its former temperament, then it becomes fit for the Soul again therein as the conſtituting Form of an Olive Tree to ſhew it ſelf: but if the Olive Wood were not exactly dry, but ſtill had life in it, it would ſprout of it ſelf, and produce an Olive Tree, by a non-Spontaneous Generation. Now this chiefly brought him into that Opinion, in that Woods do laſt many Years and preſerve their ſtrength. Yea, and which is ſtrange, it hath been obſerved that they have ſprouted the Second time and performed the operations of the Soul. Of Which *Virgil*, 2 *Georgic.*

A dry olive ſtock wil ſprout againe.

Some

Some need no Roots; the Pruner Young Slips cuts,
And them into the Earth securely Puts.
And (wondrous to be told) an Olive Tree
Out from a dry cut Trunk oft Springs we see.

Which Verse although some interpret concerning ingrafting: yet they do it contrary to the mind of *Virgil*, who treats of ingrafting in the verse following. And why should that be counted a wonder? But *Servius* hath rightly interpreted this Verse. That (saith he) which is here said is true of the Olive and Myrtle, whose dry stocks are cut to the middle or pith, and so put under ground, and from them Trees do shoot forth, which is strange indeed. *Theophrastus* taught the same thing *Lib.* 5. *de Caus. Plant. Cap.* 4. who writes, that in an ordinary course of Nature the dry wood of an Olive Tree will sprout again. For those Woods also, saith he, which sprout of their own accord, as the Olive-Tree-Wood, and all such like, which they reckon for Miracles and Wonders, have their Reason in Nature. For they are Naturally long lived and apt to sprout, because of their thickness and moisture, and therefore as soon as they are sensible of any Liquor from without, presently they send forth branches. In very deed, for the most part Wood covered with Earth and laid in moist places doth Sprout; besides that, a bough cut off hath been seen to shoot forth Twigs soon after, because it had in it moisture enough, and the Spring was at Hand, the like whereof happens to the Squil or Sea Onion, and such other Plants as Sprout after they are hanged up in the House. And the said *Theophrastus* in *Lib.* 5. *de Hist. Plant. Cap.* 10. writes, that the Wood of the Olive Tree doth above all other Woods Sprout and send forth Twigs, both rude, or rough and when it is wrought into some work, if it be sensible of any moysture and have attained a moist place, so that a part of a folding door hath been said to Sprout, and a wooden Cup which fel into the Dirt. So, credible Authors relate that *Hercules* his Club which was made of Olive-Tree-Wood did Sprout. And *Fortunius Licetus*, in the place fore alleadged *Lib.* 3. *de his qui diu vivunt sine Alimento*, *Cap.* 7. writes that he saw at *Rechum* in the Garden of his Unkle *Bartholomeo Licetus*, the stock of an Olive Tree which had been Planted, and was now near dried up and had been Naked ten years together, and of it self separated from the Trunk, and never after that Planted in the Earth; which being thrust into the ground near a Wel to prop up some other Wood, and Nailed to the Wood which it bore up with Iron Nailes, it budded and branched many Olive branches laden with Leaves and Fruit, and afterwards bare in like manner, many years. *Johannes Ludovicus de la Cerda* confirms the same, who, upon that Verse of *Virgil* aforesaid, commenting, thus writes: the Eyes of many most skilful Husband-men have been witnesses, of whom I made enquiry: the Art it self is a Witness, which is now much in request in *Spain*, where at present I live. The Husbandmen cut the stock of an Olive Tree (whose Root and branches are taken away) into many parcels, and so they bury it in the ground, which forms first a Root and then a Tree, which *Virgil* wonders at; for it is really a wonderful thing.

Hercules his Club did sprout.

Other Trees also besides the Olive have been observed to do as much. Yea *Aristotle* himself grants, 2. *Phys. Cap.* 1. that a Wooden Bed-sted buried in the ground may Sprout. They report as much of the Male wild Ash, of which *Romulus* his spear was made, which *Plutarch in the Life of Romulus* writes that it took Root again, and sprouted. Which *Ovid* confirms *Lib.* 1. *Metamorph.*

The spear of Romulus being made of Ash sprouted.

And as Astonisht Romulus *of Old*
Did on Mount Palatine *his Lance behold*
To flourish with green Leaves: the fixed Foot
Stood not on Steel, but on a living Root.
Which now no weapon, spreading Arms displaid;
And gave Admirers unexpected shade.

And *Julius Cæsar Scaliger*, in *Theophrast. de Caus. Plant. Lib.* 5. *Cap.* 1. Writes, that he hath seen Willow Rods carelesly thrown away, and not so much as stuck into the Earth, to sprout, yea and a great Trunk of a Poplar long after it was cut off.

The

The premises therefore being such, and confirmed by the Testimony of most learned men, Yea, by experience it self, upon which the Judgment of *Licetus* is founded, although his Opinion seem Paradoxical, yet it is not simply to be rejected, but to be dextrously explained and limited. This in the first place is certain; that all Plants pluckt up out of the ground do not presently die, as may be seen in the Squil and the American *Sempervivum*. But that all Plants pluckt up out of the Earth and dried should retain their Souls and live, and that only nutrition in some sort ceases in them, this cannot easily be granted, especially if the Root being cut off, and the bark taken away, they be cut in pieces. Much less can it be granted, that the Carkasses of Animals do retain their former Soul. For every Soul requires its proper subject, *viz.* Innate Heat, consisting of the implanted and influent heat, in Animals; but in Plants, likewise, a temperament so and so disposed, which because in dried Plants it is changed, so they come also to lose their Life.

All Plants do not die as soon as they are pluckt out of the Earth.

But because the former experience cannot be denied, we are now to enqure how it hath and may come to pass, that the Wood of a dry Olive Tree should Sprout again. Which though it be hard to find out, yet because it is not Miraculous but Natural, I will propound my Opinion: let every man follow what Opinion he likes best. And in the first place, this must be remembred, as hath been many times said before, that there is not one manner of the Propagation of Plants. For all Plants are not propagated by Seed formed after a certain fashion, and included in one part, but that same juyce containing in it the Seminal principle is in many diffused through the whole Plant; so that those Plants may be propagated by a slip or branch put off, or by their Roots, and so multiply themselves; and after this manner the Seminal faculty communicated either from Seed properly so called, or from a Root, or any other way from a Plant of the same sort, may many times lie long hidden. *Jul. Cæsar Scaliger* relates, that the Seed of Bears-Foot hath thus lain hid in the Earth eight years together, *Exercitat.* 140. In my little Garden (saith he) which is next my study, I planted Bears-Foot, I kept it a long time diligently. Some Thievish Herb gatherers, from whom nothing can be kept, had to my thinking pluckt it all away by the Roots. For above eight years there was no appearance therof. A Berberry was set near that place. The place it self was digged and rak't, and sowed with patience Seed, which they here falsly count to be *Raved*. The Patience grew and fild the bed and was gathered. I falling sick, that plat lay waste and was not stirred for three years together. This present year I find the remainder of my Bears-Foot, *viz.* two Plants with most beautiful neat leaves, a large stalk and fairly flowred. And therefore as in Wheat, Barley, Oates, and other dead Plants, the Seed may remain in the straw shut up in its Chaffie cases: so also, that same juyce containing the Seminal Principle, diffused through the whole Plant, may in some Plants dead and dried last for a season. And as (nevertheless) he should not say truly who should say that dried Oats or dried Wheat in the barn doth live, although in the dried straw a living Seed is contained: so also it must not be said that the foresaid wood doth live, but only that it containes in it self a Seminal principle. Yet few Plants once dried do recover that same Ancient Seminal disposition which was necessary to the exercise of the Second Act. That it sometimes so happens in the Olive Tree hath been observed, since it above all others abounds with that same Fat Balsamick Juyce. That the same hath hapned in an Ash and Poplar hath been said before. But that Herbs after they are rotten and corrupted may revive again, daily experience shews, while in Fields and Gardens manured with Dung those Plants which have putrified in the Dung are Generated, the Juyce which contains the Seminal principle having remained unhurt. And al Husband-men know, that of Hogs-Dung Sow-Thistle is bred, in Vine-yards, Gardens and Fields. This Thistle is a Familiar food to Swine, and therefore the Germans call it *Sæw-Diestel*, Sow-Thistle. And al these things although they seem wonderful and almost incredible: yet that they are true appears even hereby, in that also of the Tears and Gums of Plants Plants are generated, as shall be said hereafter.

Which way a dry Olive tree may come to sprout again.

Sundry waies of the Propagation of Plants.

Herbs that Rot, revive again

Of Hogs-dung Sow-Thistles are bred.

But although these things are true of Plants: yet the Souls of perfect bruce Animals cannot survive after Death. And whereas out of the Carkasses of Animals such Ignoble petty Animals are bred as aforesaid, that doth not happen because the Soul

The Souls of Brutes Mortal.

Soul of the Animal remaining the same being reduced to a more Ignoble degree does produce worms (for the Soul of a Man, a Lyon, an Ox, doth not go into such Animals) but because the subordinate Form lying hid doth then rowze it self up, as was said before.

Moreover, after both the manners before propounded sundry Plants do Spontaneously arise. For in the first place, out of the Ground although never sowed with any Seed some Plants do spring up of themselves, as *Virgil* said of Trees.

Some Plants without Mans labor freely come.

Now this doth not only happen when (which belongs not to this place) the Seeds themselves intire are carried by force of Winds or overflowings of Waters into some other place; but also when those little Bodies containing seed in them are carried thither either by Winds, Rain, or inundations of Water, or when some Plant of the same kind hath putrified in that place, and yet hath there left its Seminal rudiments. And thus *Pliny* writes concerning the Spontaneous Original of the herb *Laserpitium*, *Lib.* 19. *Cap.* 3. We find, (saith he) in most credible Greek Authors, that this Herb suddenly sprung up after the Earth had been moistened with a Pitchy shower, about the Gardens of the *Hesperides*, and the greater *Syrtis*, seven years before the building of *Cyrena*, which was built 143. years after our City. And the force of the shower reached four thousand *African* furlongs. Doubtless that same shower, so thick, black, and Pitchy as it were, did contain many smal Seminal Atomes of *Laserpitium*, containing in them the rudiments of that Plant, which being forced into the ground produced that Herb all along that tract of Land aforesaid. And after this manner, *viz.* those little particles containing in them the Seed being brought from elswhere by showers, Winds, inundation of Waters, whole Woods have sometimes sprung up of themselves, as *Theophrastus* doth witness, *Lib.* 1. *de Causis Plant. Cap.* 5. Also after this manner, in Earth digged deep out of the ground, and containing no Seeds in it, being exposed to the Air and Rain, Plants do Spring up. Unless any man will follow their Opinion which we mentioned at the beginning of this Chapter, who hold, that the Earth by Virtue of the divine Benediction given at the Creation hath a peculiar faculty to produce certain peculiar Plants.

Laserpitium bred by a shower.

How plants are propagated by Rains.

Moreover, Another manner of the Spontaneous Generation of Plants is, when a plant is generated out of another Plant of a several sort, in the Earth. The Generation of which Plants is the same with that of Mushroms, *viz.* When an inferior form which was formerly under the superior Form in the notion of matter, now the superior Form is lost, is set at liberty, and shapes a convenient House for it self. Thus Mos grows upon Trees. Unless any man will here also hold, that when the Soul through fault of its Organs (which happens in aged Trees) or badness of the Aliment, cannot change it into such parts as it ought to do, that it may not be idle it Generates Mos and such like Things.

Plants bred of Plants of a different sort.

Hither may be referred the degeneration of Plants, of which we spake also before *Cap.* 2 when a Plant springs indeed from Seed, but of a different kind from it self; when Water-Mint turns to mint; Wheat to Darnel; Barley to Oates, Basil into running Betony; a rape into a rediſh; a white Vine into a black; a black into a white; Barley in Wheat; Wheat into Barly, and other Plants degenerate into others, Where of *Scaliger* hath a rare example, *Exercit.* 140. I sowed with mine own Hand the Seed of the Vulgar Smallage, which they commonly but falsly call Persley, by a Wall which would defend it from the Summers heat; that growing up and preserved by the shadow it might serve for the Kitchins use. But it never sprung up according to the usual manner: but another Plant quite different therefrom, to my admiration. It was that which the more learned call *Scorodotis* and hath been hitherto falsly taken to be *Scordium* by many. Its leaves when it is yong (if you look on it at a distance) are like Violet Leaves, it hath a white flower, with the Smel and Taſt of Garlick. [*This should be that we call Jack by the Hedg, or sawce alone, and our Herbals Alliaria.*] In which case nevertheless a man must take heed that he be not deceived, and think that Plant which springs up from some secretly hidden Seed to arise from the degeneration of another. We spake before of Bears-Foot from *Scaliger*, *in the place lately cited*, how that when he thought it

The degeneration of Plants.

was Rooted al up, and had not appeared for about eleven years, at length it sprung up again.

How it comes to pass. Now how this degeneration comes to pass is doubtful: *Fortunius Licetus*, indeed, *Lib.* 4. *de Spont. Viv. Ort. Cap.* 35. and elsewhere, holds that Forms do also degenerate whiles they are weakned, and through weakness come to degenerate into weaker Forms. Now he writes that they are weakned, either by a contrary agent working upon them by it self; or upon the mutation of the subject upon which they depend as to their Essence; or from both causes together. So the Soul of a Calf when it dies degenerates into the Souls of Worms and Bees, which Spontaneously breed out of the Carkass thereof; so the Essence of Wheat is changed into the substance of Darnel and Oates; so heat Fainting away degenerates into Luke-warmness, so that not only the Forms of the substances but of the accidents also are changed, as he writes. But as was said before, this degeneration of forms, so that the form of a calf should degenerate into the form of worms, is not agreeable to Reason. Rather there is a certain kndred of Forms, as *Matthiolus* speaks in his preface upon *Dioscorides*, and some Seeds are Equivocal, that is, common as it were to divers sorts. And as the same internal Form Bears one while the Form of a Palmer Worm, another while of a Butter Fly, another while of another Worm, and then of a Silk Worm: so also in Plants, some Souls are so constituted, that, according to the disposition of the matter they may form now this, now that shape of Body; or they are so subordinate that one is Lady and the other a Servant, and the Lady exercises her Soveraignty so long as the matter of which the Plant is formed and nourished is wel disposed; but when there is any deficiency therein, the Hand-Maid takes the Soveraignty.

The Degeneration of plants where caused. *Theophrastus* disputes whether Plants degenerate in the Seed or in the Root, 4. *de Caus. Plant. Cap.* 6. and denies that it is made in the Root, because the Nature of the stalk, Leaves and Seed, do alwaies follow the Nature of the Root; and he concludes that it is made in the Seed, and that it grows fruitless either through penury or superfluity of nourishment. *Johan. Gallego de la Serna de Princ. Generat. Lib.* 2. *Cap.* 7. conceives that these degenerations of plants may happen two manner of waies, either because the Soul of the Seed weakned by faultiness of the matter could not produce its proper issue, and bred a monster, as happens in Animals; or because the form of Wheat, for example, is quite corrupted, and upon the corruption the matter remains so disposed, that by the universal cause the form of Darnel or Spelt may forthwith be produced in it. But neither of these waies may be simply allowed. For, as to the first, this is true, that through fault of the matter the Soul cannot produce that which it is ordinarily accustomed to do, otherwise. Yet that Body which it produces is not alwaies a monster. And the generation of Monsters is tied to no certain Rules. But the degeneration of Plants is made certain waies, and such Plants degenerate into such and no other, or not into any at least. But the second manner is absolutely false, *viz.* That the Soul is corrupted, and from the disposition of the matter remaining the universal Cause produces another. For the Universal cause doth not produce any specifical effect. And he acknowledges, that the said effect is not indefinite and indeterminate, and that of Wheat Turnep or Cole-wort is never made, but only Darnel or Spelt. As also of the Carkasses of Animals only some sorts of Animals arise, and not any whatsoever. This therefore is more likely, that the Creator hath given to those forms the faculty to shape themselves sundry Bodies; so that when the matter is rightly disposed it makes some kind of Bodies; and so of Wheat grows commonly Wheat, but when the matter is ill disposed, yet that Nature may not be idle it hath the power to produce another Body; for examples sake, when the Soul of Wheat hath matter indisposed, it makes the Body of Darnel or Spelt. And it is here much after the same manner as was said before concerning Palmer Worms and Butter-flies, where the same form at sundry times makes sundry Bodies. And that the Soul doth not perish appears even hereby, in that after Spelt is sprung from Wheat, black Oates from white, if it find again a convenient soil it will return to Wheat and white Oates again.

And although all Spontaneous Generation of Plants may be reduced to these two manners, whether it be properly or improperly so called: yet that the thing may be more Plain, I think fit to explain this business according to the matter and subjects in which these Plants Spontaneously arise.

Secondly

Secondly therefore, what hath been newly said of the Earth is much more true of Dung; since therein lie hid and Jumbled together the Seeds, parts and juyces of sundry Plants, and other things, and al the causes of Spontaneous Generation in the Earth may be found much more in Dung. *Plants arising from dung.*

Thirdly, That many Plants Spring up in the Waters, Duck-weeds, Water-Lillies, Water Caltrops, and many others, is most notoriously known. Now such Plants are not all of them Spontaneously Generated (to speak properly) but the Roots of some are divided out of which new ones spring up, others sheed the Seed which they generate into the Waters, whereof Plants of the same sort are bred, and the Seeds of Plants by the Wind and Inundations of Waters are brought in from other places. But those which are so Spontaneously bred that they spring not from intire Seed, are Generated either from Plants putrefying in the Waters, or from Atomes or smal Bodies having Souls in them, falling into the Water in Rain showers; which may also be caused by the Winds, when they blow into the Water amongst the Dust such petty smal Bodies containing the Souls of Plants in them; or because from the Roots of Trees some Juyce or Excrement containing in it a Seminal principle is shed into the Water. For by all these manner of waies those petty Bodies containing the Souls of Plants, or at least their forms which will turn to Souls when they meet with fit matter in the Water, (which chiefly comes to pass in standing Waters) and are cherished by the ambient heat; they are rouzed up, and generate such a plant as they are Naturally fitted for. *Plants breeding in the waters*

Fourthly, Some hold that Plants are also bred out of the Snow. But more credible it is, they grow under the Snow. For although it may come to pass, though seldom, (for that cannot easily happen in Snow which happens in Rain) that petty Bodies (with the rudiments of Plants in them) may descend with the Snow: yet the heat by which they might be brought into act is wanting therein, and therefore very seldom or never, if by chance the Snow begin to be warmed and Melt with the heat of the Sun, or if that part of the Snow especially being deep which is next the Earth do begin to be warm through hot Exhalations Springing out of the Earth, and the Soul lurking there be rouzed up and brought into act, Plants are bred out of the Snow. *Plants out of Snow.*

Fiftly, 'Tis also found that some Plants grow upon other plants. So, many times, upon Willows great Celandine, Bitter-sweet and sometimes Elder doth grow, yea and Services and other Plants. Which happens, either because whole Seeds are brought thither by the Winds (which yet is not Spontaneous Generation properly so called) or smal Bodies containing in them the Seed of Plants are brought by the Rain or Wind. Now this happens chiefly in those Trees in which part of the Tree begins to Rot, and turn to dust as it were: which often happens in old Willows cut off about the Head as they cal it. For since there is found matter fit to Form and Augment a Plant, the Soul of a Plant can easily display it self therein. And therefore in such Generations the Tree which grows in the Earth affords only a place to the Plant which grows upon it. *Plants growing upon other plants.*

Sixtly, 'Tis also very wel known that Plants do grow upon Rocks and Stones, as a kind of Mos doth every where grow upon Stones, and Coral grows out of Sticks upon Rocks in the Sea, and Sea-Mos grows upon Rocks and upon Shell-Fishes. But I doubt whether Corals do grow of their own accord. For although no Body Plants it in the Sea: yet because it is a certain sort of Natural thing, which is no where else Found save on the Rocks of the Sea, (nor can it be said to grow from the Corruption of any other Plant or Animal;) this doubtless is its Natural place, and it was doubtless created upon these Rocks at the first Creation, on which it is propagated, either by Roots or by some juyce containing in it the principles of this Plant. But as to other plants, they grow upon stones, when showers fal upon them, which contain either petty Bodies with the Forms of plants in them, or smal Bodies separated by the corruption of other plants, yet fit to produce plants. And this happens more easily, if upon the Rains any Clay or Earth stick upon the said Stones. For then those Seeds find a more convenient place to display themselves. The same also may happen by the Excrements of Birds falling upon the Stones; since also in those very Excrements the Forms of plants may remain unchanged. But it oft fals out, that not perfect Plants, but only some Mos grows on Stones. For since by Reason of defect of Aliment that same Soul cannot make what it *Plants growing on Rocks. whether Corals grow spontaneously.*

would, it makes what it can, and rather then be out of employment it frames Moss.

And whereas Plants seem to grow sometimes, not only on the surface of Stones, but also to spring out of the depth of them; the cause (doubtless) is, that those Stones have Clifts not discernable by our Eye-sight, into which those petty Bodies or Atomes, containing in them the form of a Plant do insinuate themselves with the Rain, which Form being wakened by the Heat of the Ambient Aire doth at last rouze it self up and fall to work.

And whereas Plants do somtimes grow out of Brick or Stone Walls Joyned with Mortar, Yea, and Shrubs and Trees; it is no wonder. For their Original is the same with Plants that grow out of the Earth, when as either in the Sand which is mixed in the Mortar the Seed of some Plant is mixed, or is brought thither by Birds, or by the force of Winds, and insinuates it self into the chinks of the Walls (which nevertheless is not Spontaneous Generation properly so called) or when with the Excrements of Birds or Rain petty Bodies containing in them the form of Plants are brought thither, and creep into the Chinks, and so in time Sprout forth.

Plants from the tears of plants.

Also *Theophrastus* teaches, *Lib.* 1. *de Causis Plant. Cap.* 4. that Plants do also grow out of the Tears and Gums of Plants. Which Generation although *Licetus* saies it is Spontaneous, *Lib.* 3. *Spont. Viv. Ort. Cap.* 25. yet I had rather hold that this is no Spontaneous Original; since they are produced in a manner of Seeds, and that of the same sort; and *Theophrastus* himself saies, that the Generation from Tears doth plainly answer to that which proceeds from stalks; which questionless is not Spontaneous. And he teaches that there is a fruitful principle in the Tears, when he writes: But that is a most peculiar way of Generation which proceeds from Tears, as that of Horse-smallage, Lillies and some other Plants. Nor is a Reason wanting, but this plainly answers to Stalks. For the tears have in them a fruitful principle, and that is al the cause. And whereas *Licetus* holds a threefold fruitful principle, *viz.* Seed, a bodily part of the plant, as a Root, or stalk, and the Soul, he is out. For he doth ill to ad the Soul, as a different manner of propagation from the others; since all propagation is made by the Soul, and the soul is never propagated without the Body. And whereas he propounds the subjects or Bodies wherein the Soul is, and by which it is propagated, to be the Seed, and Root, and Stalk, he errs therein also. For the Soul may also be in the Tears themselves, which *Julius Cæsar Scaliger* causelesly opposes, when upon the forecited place of *Theophrastus*, he writes, if of a Gum sowed a plant is bred, the Gum cannot be the excrement but must be a part of the plant, wherein there is a vigorous generative principle. For all know that the word Excrement is taken equivocally when it is attributed to the Dung of the Belly, Urin, and other Excrements properly so called, and afterwards to the Seed. But as *Theophrastus* hints, al plants wil not spring from Tears, but only some certain kinds.

Plants from plants of a several sort.

But those plants which spring from plants of a different sort are properly said to grow of themselves. So sundry sorts of Moss do grow upon trees. So Misselto grows upon the Oake, the Hazel, the Apple-Tree, Pear-Tree, plum-tree, Birch-tree, but grows no where by it self. That other Herbs and Shrubs grow upon trees, as hath been said, is not unknown. But that is not Spontaneous Generation; since they grow not out of the Trees, but only upon the Trees, from their own Seeds, and the Tree which sticks in the Earth doth only afford the place; which chiefly comes to pass when some part thereof is putrified and turnd to Earth as it were, whereof we have already spoken.

The four manners of Licetus.

Now *Licetus* propounds four manner of waies whereby plants of a different sort are bred of other plants, *de Spont. Viv. Ort. Lib.* 3. *Cap.* 27. two Spontaneous and two non-Spontaneous. The first he makes to be, when the Soul of an old plant in a matter some waies within it self procreates a new Soul different from it self, which constitutes a new plant of a different sort, and less perfect then it self. The second is, when the seed of any plant doth any waies fall upon another plant. Of which second manner there is no doubt, but the first can hardly be allowed. Nor is it credible that a Soul should procreate another Soul different from it self. More likely it is that the generation of a new and different plant doth proceed from a

subordinate

subordinate form; as hath been said concerning Worms bred out of plants. But that manner is properly Spontaneous.

The Third manner, and that not Spontaneous, he makes to be; when in the chinks and passages of an old Plant the pouder of Animals and Plants containing in it the Soul, as in a Vessel, are by the heat of the Ambient Air disposed to life. But, since those pouders do contain in them a Seminal principle, we have formerly shewed in what sence this generation caused by them is Spontaneous. For Mos doth not belong to this manner of Generation, as he imagins with *Costæus*. For Mos is not made of the poudery matter of Mos cast upon the Trees from elswhere, but out of the barks themselves of Trees when they now begin to be corrupted, as was said before.

The fourth manner is, when sundry Excrements of an old Plant, (the former Soul that had Animated the same being put off by Death, but yet contained in them as in a Vessel) when they come by the heat of the Ambient Air to be digested they are disposed to a new life, and take to themselves again the weakned Soul, degenerating from its old species or sort, so as to become a new vivifying Form, constituting a new Plant.

The generation of Bird-lime.

Peculiarly, as to what concernes the Generation of Missleto, *Julius Cæs. Scaliger* treats largely thereof *Exercit.* 168. where first he relates the Opinion of the Ancients, imagining, that the Berries of Missleto being Eaten by Thrushes, the pulp thereof is concocted; but the Seed comes away indigested with the dung, and fals on the boughs of those Trees whereon the Thrushes are wont to settle. But he conceives this Opinion is therefore to be rejected, because it is not any where planted or sowed, nor grows upon every sort of Tree, nor is it credible the Seed can enter into the hardest boughs so as to cleave the Bark, and become one with them without any Roots; that it proceeds out of some branches where no dung could ever rest nor no Seed stick; nor could he ever find any grains of Missleto in the Crops or Guts of Thrushes, having nourished them with the berries thereof on purpose, and afterward cut them up. But he holds, that as horns (as it were) grow out of the Bones of Animals, so Missleto grows out of Trees, and that the unshaped principles of Missleto being cherished by the inward heat, assisted by the outward, in a Juyce con-natural thereto, it grows into this Plant. And therefore there is one Wood of both, nor is the Missleto inserted into the bough of the Tree like a Pant thrust into the Earth. Which Opinion is so far true, as it holds that the principle of the Missleto is in the Trees on which which it grows, and doth not come from without, but is Generated within the same, and proceeds from superfluous matter, as horns in Animals. Yet herein is a difference, in that Missleto is not bred on all such Trees, as all Animals of the same sort bear horns, but on some Particular Trees only. There must therefore, doubtless, some peculiar disposition concur in some sorts of Trees, and in some Individual Trees of those sorts, by reason of which this superfluous Humor may be generated, which the Soul of the Tree doth afterwards drive into the outward parts, and thereof Generates Missleto. And whereas it may be objected, that because it grows upon Trees of several sorts it cannot proceed from one and the same principle but if it came from the inward Nature of the Tree the Leaves of the Missleto should differ according to the difference of the Tree: to that *Scaliger* answers, that it is not necessary that the Excrements of different Bodies should differ in outward appearance, but it suffices if they be rationally or respectively different, as we see in the Tears of Plants. And although the external face is one and the same, yet the Nature it self is different, and the Missleto of the Oak hath far other Virtues then that of the Apple-Tree. As also Galls are bred on sundry Plants, as shall be anon declared. And this Juyce hath one peculiar property, that though the leaves of the Tree fal off, yet the Missleto keeps his Leaves all the year. *Theophrastus* indeed, in 2. *de Caus. Plant.* writes that Missleto holds its Leaves all the year, upon such Trees as hold their Leaves, but loses them if it grow on Trees that shed their Leaves. But *Scaliger* rightly accuses this of falsity. For every where in the Woods we see Missleto at all times green, upon the Oak, the Apple-Tree, the Birch-Tree, the Bullas-Tree, when those Trees have lost their Leaves. Yet is not this Humor simply superfluous, but either part of the Alimentary or Seminal Juyce of the Tree, which the tree wantonizing (as it were) doth thrust

out:

out: and therefore those Trees on which Mistletoes do grow do for the most part die.

Galls. After the same manner as Mistleto doth grow on divers Trees, so also Gals do grow upon the Oak, the Holme, the Beech; yea and *Scaliger* writes in the forealleadged place that he saw Galls grow upon Sage, of an Ashy colour; and he relates also that Italian Merchants trading to *Aleppo* and other parts of *Asia* informed him, that there is such Apple-bearing Sage to be seen in many parts of *Asia*.

Whether plants breed of Animals. Whether Plants breed of Animals is doubtful. *Licetus* indeed every where affirms that Plants are bred of corrupted Animals. But I scarce think there are any examples to be found of such a thing, and that of the substance of Animals and their Excrements Plants should be generated, as Worms are; unless peradventure the Seeds of Plants, or a Juyce containing in it the Seminal principle of Plants be contained in the Excrements of Animals. And the examples which are brought of Plants bred out of Animals do hardly prove any thing else, then that the Seeds or rudiments of Plants may stick outwardly to the Bodies of Animals, and grow out of them and be augmented. Now Plants are bred either in living Animals or dead ones. As for live Animals, *Aristotle*, in 9. *de Hist. Animal. Cap.* 5. And *Theophrastus*, 2. *de Causs. Plant. Cap.* 23. do relate, that an Hart was caught, with green Ivy growing in his Horns, which (as *Aristotle* wel adds) being accidentally thrust into the tender horn, as it were into a green Tree, became incorporated therwith. Which both *Pliny* confirms, *Lib.* 5. *Cap.* 32. as also *Julius Cæsar Scaliger*, who in his Comment upon that place of *Theophrastus*, writes, that in the budding of his Horns the Hart rubbing them against some Ivy had broken a branch with a Root at it, which fastned it self into some tender part. *Licetus* indeed adds also two other manners, *Lib.* 3. *de Spont. Vivent. Ort. Cap.* 28. The former whereof is, that a dusty matter being blown into the Roots of the Horns near the Hair, and mixt with a various Humor, either proceeding from the Body of the Hart, (in form of sweat or some other Excrement, or from the Air in form of dew or some other matter) did stick unto the Horns, to which poudery matter the form which had long lain therein as in a Vessel being stirred up by the Heat of the Ambient Body doth now adjoyn it self as a quickning and Ivy-making form. The other is this. He holds, that out of the Body it self of the Hart an Excrementitious substance, bred chiefly by eating of Ivy, by the concoctive and expulsive faculty separated and expelled with other Excrements of the third digestion to the Roots of the Horns, and by reason of its own clammines or some other glutinous matter sticking there fast, it is by the ambient heat digested into a new living Plant. But neither of these waies is probable. For as to the former, if so great a quantity of dusty matter might be collected at the Roots of Horns in the Hairs, that therein as in the Earth Ivy might grow, other plants might also grow there. Nor can any reason be shewed, why that poudery Humor gathered at the Roots of the Harts-Horns should be collected only from Ivy. Again, it cannot easily be shewed, how the Soul of the Ivy through so many digestions can arrive safely to the Horns of the Hart; nor can any reason be shewed, why other Plants also should not grow on the Harts-Horns.

How plants grow in Animals

Mos growing on Shel fish and on the Backs of whales. But on the back of Shell-fish and Whales mossie Herbs grow out of the Mud and Scum of the Sea, sticking to the Backs of these Fishes, which contain in them the Seeds or Seminal rudiments of Mos and other Plants. But that other manner added by *Licetus* of Excrements driven from the inner parts of the Beast into the surface is less probable then the former. For it is not credible, that Whales feed upon Mos and Plants. And if this manner were true, other Fishes which are known to feed upon Gras, Mos and Plants, should have mossie Plants growing upon their Backs.

whether plants grow out of the dead Bodies of Animals. Now it is worthy our consideration to examin, whether Plants do grow also out of the Carkasses of Animals. *Licetus* saith they do, and that it is no news, *Lib.* 3. *de Spont. Vivent. Ort. Cap.* 32. But this must be fitly explained. For I cannot beleeve, that as Worms are bred of the very substance of dead Carkasses, so also Plants are Generated of the same substance; nor doth experience confirm the same. Upon the Skuls and Bones of Men Mos is bred. But since it grows not upon such bones as lie under a roof or covering, but on such only as lie in the open Air

Moss bred on the bones of men.

and

and are wet by the Rain, the original thereof is rather to be attributed to the Rain, like that which grows upon Stones. For since, as was said before, the principles of the Seeds of Plants are mixt with Rain, if they fal upon bones, especially such as are Rotten and begin to turn to dust, the said Seminal principle sticking in them and finding matter to work on, and cherished by the Ambient heat, if it do not make other Plants, it will at least generate Mos.

Coral growing on a mans skul.

Some also relate that Coral hath grown in the Sea upon a dead mans Skul. Yet it is impossible that it should grow out of the substance of the Skul: But, questionless, in the Sea some matter having the Rudiments of Coral in it stuck fast to the Skul, out of which afterward the Coral grew.

whether Asparagus do grow upon the horns of a Ram.

It is an old Story that Asparagus grows on Rams-Horns, but Fabulous without doubt; nor doth experience confirm the same. *Fortunius Licetus* indeed, in the place fore alleadged, endeavors to defend it by four Reasons, but all in Vain. For First he saies Plants grow out of Stones, much more may they grow out of Horns. But as was said before Plants grow not out of the very substance of Stones, but of seed or a Seminal matter which sticks to them.

The other is, because Animals are bred of the Carkas of Plants, Namely worms out of Wood, whereas nevertheless the Carkasses of Plants are more imperfect then the Carkasses of Animal. And seeing that it is much easier for a thing to procreate that which is more imperfect then it self, then to act beyond its forces by breeding that which is more perfect: credible therefore it is, that Asparagus may grow upon the Horns of a Ram. But Carkasses do not as the efficient causes breed any thing of themselves, but we must look to the disposition of the matter, and consult with experience, what may be made out of those subordinate forms. Moreover, although Worms are Animals, yet it is a question whether they are more perfect then perfect Plants. Nor doth any reason enforce, that as out of an Animal another Animal though of a different sort may be generated, so also a Plant may be bred thereby.

His Third Reason is, because it hath been observed that in the Sea Coral hath grown out of a dead-mans Skul. If therefore Coral were bred out of a Skul, Asparagus may also grow out of horns. But how Coral may grow upon a Skull, (which notwithstanding is very rare) hath been lately shewed.

Fourthly, Since Ivy hath been found to grow upon the Horns of an Hart; Asparagus may in like manner grow upon a Rams horns. But the case is different. That Ivy did not grow out of the substance of the horns, but the Root of Ivy stuck thereupon, as was said before. And therefore, warily, *Lib. 1. Cap.* 18. he recites indeed the Ancient Opinion, but he makes it not his own, where he writes; 'tis also reported, that Asparagus hath grown upon the horns of Beasts being bruised, and buried in the ground.

whether plants grow out of Metals.

Much less are Plants generated out of Metals, for there is in them no disposition towards the Generation of Plants. And if plants have grown upon Brazen Statues, as *Pliny* reports *Lib.* 17. *Cap.* 25. And *Lib.* 24. *Cap.* 19. that was not caused by the Metal, but the Seminal principle of some plant was by the Rain, or Winds, or birds, or by some other means cast thereupon.

whether the souls of plants and brutes do perish by Death and come to nothing.

Julius Cæs. Scal. Exercit. 307. *Sect.* 29. doth wel complain of the shallowness of Human understanding, as being unable to comprehend the Essences and Forms of substances. And he concludes at last: that it is a part of Mans Wisdom to be contentedly ignorant of some things. Which difficulty and obscurity hath deterred many from making any further search into the Nature of Forms. Whence it comes to pass, that little is to be found (and that of smal solidity) in the writings of Naturalists concerning the Nature of Forms and Souls. But because beautiful things are alwaies difficult; the hardness ought not to discourage us from searching into so noble a subject. And having spoken somwhat in the former part of this Treatise of the Original and Nature of Souls, I shall here undertake the explication of one question of sufficient difficulty and explained by few: *viz.* whether the Souls of plants and brutes when they die do perish and turn to nothing.

whether they perish.

Some deny it, and hold it for an axiom and principle, that Naturally nothing is made of nothing, and again, that somthing doth not turn simply to nothing. And to beleeve it they are perswaded by these Arguments, propounded also by *Scaliger, Exercit.* 307. *Sect.* 14. If saies he, any substance can be so corrupted as to become

come nothing, then on the other side some substance may naturally be made of
1. nothing; First of all because, whatever is created by God that can no Creature
Annihilate, nor can the Creator be compelled, or hindred from that action where-
2. by it is preserved, the withdrawing of which action is Annihilation. Secondly,
Because God did not repent him of his works, but saw that al was good which he
3. had made. Thirdly, Because those Souls and Forms do pertain to the perfection
4. of the universe. Fourthly, Because *Eccleſiaſt. Cap.* 3. *v.* 14. the Preacher saies, I *know*
5. *that all the works which God hath made do endure for ever.* Fiftly, Because many things
which are said to have perished did not indeed perish, as Serpents and Frogs turned to slime are in the spring time regenerated, and live again.

But since these men acknowledg the difference betwixt the rational Soul and the Souls of Plants and Brutes; and do grant that every form besides the rational Soul cannot subsist of it self and by its own power, out of and without the help of the matter; and that they depend upon the matter in their making, being and operation; I cannot see, how they can so simply deny this. Especially since they themselves cannot tel us where these Souls remain after Death. Some say they turn to somwhat which was before and simpler then themselves. But they cannot make out what that former and simpler thing is, nor prove that those Souls were compounded of any thing existing before them; since they are Naturally most simple essence. For if, as *Jul. Cæſ Scaliger* rightly saies *Exercit.* 307. *Sect.* 20. every Soul is the perfection of the Body, and the Act of the matter, and the matter nothing but the four Elements; the Soul must needs be a fift Essence, and that most simple, having nothing before it whereof it could be compounded.

The opinion of the Chymists. Some of the later Chymists, and amongst them *Severinus*, do hold that they go into the *Chaos*, *Orcus*, or *Abyssus*, or Night, (which *Hippocrates* terms *Hades*, *Orpheus* calls Night; *Hermes Trismegistus*, τὸ ἀφανὲς, the invisible Region; as also *Dionysius* the *Areopagite*, in *Eccl. Iustica Hierarchia*, *Cap.* 2. *Apollonius Thyaneus*, *Ousian*, the substance; *Seneca Cap.* 36. Nature; *Servius* upon the 8. of the *Eneids* the Generality) and to their Fountains, from whence at their appointed times taking new bodies they enter again upon the stage of the World. For which opinion they cite a place of *Hippocrates*, *Lib.* 1. *de Diæta*; Whereof we have spoken *in our Book of the Consent and Dissent of the Chymists with* Galen *and* Aristotle. But the Heathens could not explaine what that same *Orcus*, (or Generality of things) is, or where it is; and al these opinions have arose from the ignorance of the Creation of the World, and of the Conservation thereof.

John Marcus Marci. *Johannes Marcus Marci*, in *Defen. Idearum suarum*, *Prefat. Loco Tractat. Premissa*, teaches, that such Forms divided from the society of matter, because they are impassible do need no place. Yet because a finite Essence is necessarily defined to be in some part of an imaginary place, he holds, that it abides in that part of a place where it is separated from its subject, and is neither by it self nor by accident Locally moved. And in Chap. 4 of the same Treatise, he writes that such Souls, the Corporeal number failing, (into which they had degenerated by the fellowship of matter) being freed from Corporeal Laws, they return to the unity of the simple essence in which they were at first created. Yea, he conceives that they are not to perish at the last day, but that the form of this world being passed, they shal not at all be subject to those vicissitudes, nor reassume any Bodies, but passing the time in eternal silence they shall as well as the Elements distinguish and adorne the world with a wonderful variety of Essences, without sensible Figures, the world being no less absolute and perfect then now it is. But these things are only said and not proved, nor do the Reasons before alleadged for this opinion sufficiently prove the same. To which before we make answer, that is to be noted in the first place which *Scaliger* hath, *Exercitat.* 207. *Sect.* 20. All that is (saies he) is either the first principle or proceeding from the first. There is but one first, therefore the rest depend thereupon. Therefore all things, but one, are in their own Nature corruptible For although beings are free from subject and Term; yet are they not free from cause. They are therefore by another and from another. But every thing dependent may be changed by that on which it depends, if it be voluntary. And therefore the immaterial minds themselves, as they depend upon the first Principle, at the Pleasure of the first they may be deposed from that Essence wherein

they

they are placed by him. For if they could not, they must have in them another principle resisting his infinite power. And then he should not be the first principle. But they are not corrupted, because it is not his pleasure.

And *Johannes Serranus* upon the *Timæus* of *Plato*, writes according to *Platos* opinion: God only truly is, and therefore he only is truly eternal, and the Foundation of all created things, all which have this common adjunct, that they had a beginning; yet the Nature of things created is not one, but various and manifold. For some by the pleasure and power of the Work-master have a more firm and constant essence, and therefore compared with other things they have a kind of eternity, given them by favour of the Creator: yet are they not truely eternal; since they did proceed from a certain beginning, and when the Work-master shall please may have an End. For the glorious God is only independent and simply immutable. But all the parts of the World being created by God, as by a voluntary Principle, do depend upon him in their Essence and conservation; or they have their Essence in God, and are preserved by him. But Angels and the Human Soul, inasmuch as they are immortal, they have not their immortality of themselves and their own Nature, but by the Favor of God, by whose power they are preserved. God only hath immortality and immutability communicated from no other: but the Human Soul and Angels have immortality indeed, but communicated from God, by whose Favor and grace it is that they have in themselves no inclination to non-being, but may also be conserved and subsist without matter. Whereof *Damascenus*, *Orthodox. Fid. Lib. 2. Cap. 3. Angelos Athanatos, ou Phusei, alla Chariti*: *an Angel is immortal not by Nature but by Grace.* Now God hath afforded this Grace and Favor, not to all Creatures, but only to Angels and the Human Soul; but all other forms and Souls are so subject to the will of the Creator, or so immersed into this matter, that out of it they cannot be preserved, but their subject perishing they have a natural inclination to not being, and being destitute of their subject they are annihilated.

Out of which it is easie to answer to the Arguments for their opinion who hold, that the Souls of Brutes and Plants cannot be Annihilated. For First, whereas they say, that what ever is created by God cannot by any creature be Annihilated, nor the Creator be hindred from the action of conservation; all that, truly, we grant, but we say withal, that such was the free pleasure of God, that some forms should be immortal, others corruptible; and therefore he is not by any Creature hindred from the act of Conservation, but by his own most free will withdraws the said act, since he would have such to be liable to perpetual Generation and corruption, and would not have individuals perpetual, but that the kinds of things should be perpetuated by reparation of new Individuals. And if it were not so, what difference would there be betwixt the Soul of a man and the Souls of Beasts? And thus not only the Human Soul, but the Souls of brutes and Plants should be immortal. *The former arguments answered.* 1.

Secondly, Although the Souls of Plants and Brutes do perish as soon as an Individual dies: yet God doth not therefore repent of his works. For as God of his own most free Good will created them of nothing, as an Essential being, so he most freely withdrawing his conservation suffers them to return to nothing. 2.

Thirdly, All sorts indeed of things tend to the perfection of the world, and no sort is abolished; but all Individuals are not necessary for the perfection of the world, but there is in them a various Intercourse of Generations and Corruptions. Now the sorts necessary to the worlds perfection may be as well maintained in a few Individuals as in many. And when after the flood there were but a few individual Animals, the world was not more imperfect then now it is. 3.

Fourthly, That Place therefore of *Ecclesiastes* must be understood of the sorts and not of the Individuals of Animals and Plants. 4.

Fiftly, We grant that the forms of Plants and imperfect Animals do not alwaies perish when they are thought so to do, but those that were thought to be abolished do lie hid for a time, and afterwards return to life again, either in their former or in a new shape. 5.

Now this therefore happens, because those forms do not require for their simple being a matter so noble, variously elaborated, and furnished with so many Organs, but can many times lie hid for a Season in some place. But this is not alwaies,

waies, for they also are at last abolished. But in more perfect Animals, where the Seeds if they must be perserved must of necessity be forthwith received into the Womb, the Soul cannot be perserved out of its Body and out of its Seed. And let them shew us but the least sign or token, whereby it may appear that the Soul of a Lyon, an Ox, an Horse, a Dog, did ever live after the Death of the said Animals.

Chap. 8. *Of the Spontaneous Original of Animals.*

Animals which breed of themselves

NOW of Animals that breed of themselves there are sundry kinds. The Weezel lives upon Corn; the Worm *Midas* feeds upon Beans, Trox a Worm so called Eates Pease; There is a Worm which feeds upon the Vine, which *Pliny* calls *Volvox*, *Columella* cals it *Volucra*; the Worm *Cossus* and *Teredo* Eates Wood, especially that of the Pitch-Tree; the Moath Eates Garments, the Worm cal'd *Termes* breeds in Dogs. And there are almost innumerable more of this kind of Worms, whose differences we shal explain by and by, being drawn from the Bodies wherein they breed. Now touching the Generation of little Animals and insects, I could wish more were extant written by others then there is; and I wonder that *Vlysses Aldrovandus* a most Learned man (in that most laborious work concerning Insects) relates many other petty matters concerning them, but mentions very little about their Generation. For although most insects do couple, and bring forth somwhat resembling Eggs; of which see *Aristotle, de Histor. Animal. Lib.* 5. *Cap.* 8. and 19. yet since it is certain that such insects are also Spontaneously generated; the first question is, which were first, those that are Spontaneously Generated, or those which spring from Copulation and Seed. *Austin* toucht this question *Lib.* 1. *de Genesis*, when he wrote: it is a question, whether any of these petty Animals were made at the first Creation, or whether they were a consequent to Creation, or bred of the corruption of Carkasses, and some of the Corruption of Woods and Herbs, and some of the Corruption of fruites. Now this question *Eucherius* answers, *Lib.* 1. *de Genesis*, where he determines that the forms of al things were extant at the beginning, but some Actually, others Potentially. Touching the smalest sorts of Animals (saith he) we must beleeve that whatever of them are bred out of the Waters and the Earth, were made at the first Creation, but the rest that are bred of the corruption and putrefaction of Bodies, Woods or Carkasses, were not then created in *Specie*, but there was present in their Bodies a Seminary original, that in process of time out of their corruptions several kinds might arise. So far *Eucherius*. Wherein he is in the right and thinks the same with us, so that there is no reason that I should be accounted the first Innovator and Broacher of Paradoxes. For we are indeed to beleeve that all petty Animals how smal soever, which are not bred of the corruption of other things, were created and had actual existency at the beginning of the world; but such as now proceed from the corruption of others, they were not made at the first Creation so as actually to exist, but their form was already present in other bodies, although not actually, nor performing the office of a form, but subordinate to the other more noble forms, and affording to them a matter and fit subject. And thus what was before said of the original of live things in general is true also in the original of Spontaneous Animals; and the most Famous Philosophers and Physitians who have diligently weighed the matter have acknowledged that such Animals can by no means proceed from putrefaction, nor yet from that Heat which is joyned to putrefaction. Amongst the Ancients is *Theophrastus*, who *de Causis Plant. Cap.* 13. writes, as in other things putrefying a certain kind of Animal is generated: so in these also (among the rest he speaks of the wild Fig-Tree) there is a certain Animal-making Nature. Which *Jul. Cæs. Scalig.* in *Comment.* approves, and *Ulysses Aldrovandus Lib.* 3. *de Insect. Cap.* 5. confesses, that he likes wel of this Opinion, which holds that there is in Herbs certain principles tending to the Generation of Animals, and that it is fit to explain the mind of many of the ancients. *Eustachius Rudius* consents also with them, who in *Lib.* 2. *Pract. Cap.* 27. concerning the Generation of Worms thus writes: because, (saith he) simple heat being an accident cannot by its own power make a substance and that a living one (for heat in living Creatures nourishes by Virtue of

Whether Spontaneous Animals were made at the first Creation.

The original of spontaneous live things

the

the Soul and of the Aliment begets a ſubſtance) hence it is that this Heat was to be lively and ſtrong, and endued with a vital faculty. Nor ought we to refer this force to the ſimple Intention of heat, as *Galen* did, 3. *Aphoriſm.* 20. who propounds no faculty above heat. For although heat concurs to the production of living things; yet unleſs a ſuperior vital cauſe doth concur, it cannot of it ſelf produce an Animal. And whereas afterward he makes that Cauſe to be the Cœleſtial Bodies, therin he is out; ſince he doth not propound an univocal and proper Cauſe, as was ſaid before in *Chap.* 1. The Opinion of *Thomas Minadous* long ſince a renowned profeſſor in the Univerſity of *Padua* was more true and accurate, who in his Treatiſe *De humani Corporis Turpitudinibus, Lib.* 2. *Cap.* 9. Treating of the Generation of Lice (and the caſe is the ſame with ſuch like petty Animals) thus writes: Here (ſaith he) the underſtanding of man is dimſighted, and dazled at the knowledg of this and ſuch like things, as the Eyes of an Owl at the Sun-light. And a little after when he had related their Opinion who held heat to be the efficient Cauſe, he adds: but on the other ſide, ſince it ſeems impoſſible, that the introduction of a Form and ſhaping of an whole Animal ſhould be the effect of bare heat, but that it depends upon ſome provident action of a certain Artificer working with diſcourſe and prudence; the mind is forced to ſeek out another agent beſides heat, which can moderate all things in the forming of an Animal with Councel and Choice. For heat alone hath never learnt to ſhape an Arm, a Leg, an Eye, with its own ſhape, nor hath it been accuſtomed to uſe the Diſcipline of ſome Maſter; but acting alwaies after the ſame manner converts it ſelf to ſundry things, ſets it ſelf about ſundry formations, according as the builder and Architect of all the parts directs and moves the ſame. Nor doth *Minadous* attribute the generation of perfect Animals alone to a ſuperior power, but of Lice alſo. For although *Galen* conſidering the Generation of Wig-Lice, Lice, Fleas, and the like petty Animals, durſt not aſcribe their Generation to this divine formative faculty, not being able to underſtand, how ſo excellent and noble an agent is able to abaſe himſelf to ſo mean employment, without diminution of his Majeſty: yet he counts it better to conclude, that the ſame mind moderates the generation of theſe petty Animals and thoſe more perfect; and to hold that it is by a common providence the orderer of the ſmalleſt matters, rather then to ſay it is like a ſtepdame, making difference of her Children, ſo as to contemne ſome and leave them only to Fortune and Chance, but to regard others as her own; when as nevertheleſs none of them can be finiſhed and duly accompliſhed without the Providence and Counſel of the Work-Maſter.

Alſo what hath been ſaid before Chap. 4. concerning the final End or uſe of Spontaneous live things, doth belong to this place.

This alſo is to be obſerved in General, of which we ſpake alſo before in Chap. 2. although theſe petty Animals and inſects are generated of the corruption of Plants and Animals: yet moſt of them do afterwards lay Eggs or things reſembling Eggs, whence more of the kind do afterwards ſpring, as ſhall hereafter be ſhewed particularly. *Spontaneouſly bred Animals degenerate*

Now, I think fit to propound the differences of theſe Animals, according to the variety of things from whence they ſpring. In the firſt place, which is to be admired, in the very fire, in the Iſle of *Cyprus*, in the Copper Furnaces, winged petty Animals are generated, a little bigger then our largeſt flies, which fly and leap through the Fire, and die when they are removed therefrom, as *Ariſtotle* 5. *de Hiſtor. Animal. Cap.* 19. Pliny *B.* 11. *Cap.* 36. Seneca *Lib.* 5. *Quæſt. Nat. cap.* 6. *Jul. Cæſ. Scaliger, Exercit.* 23. and other credible witneſſes, yea and ſuch as have ſeen them with their own Eyes do reſtifie. Yet are they not generated in the Fire nor by the Fire. For a pure and ſimple Element cannot produce an Animal. *Fortunius Licetus, Lib.* 3. *de Spontan. Vivent. Ort. cap.* 38. imagines theſe *Pyrauſtæ* or Fire-flies aforeſaid are bred of the Smoak of Wood, eſpecially green Wood, which aſcends from the burning. But ſeeing Wood is burnt every where, and no ſuch Animals are bred, ſave in the Copper furnaces of *Cyprus*, the cauſe muſt needs be proper and peculiar to thoſe furnaces. Now *Ariſtotle* ſeems to point at it, when he writes, that in Copper Furnaces Fire-flies are bred, where the Stone Chalcitis is thrown in and burnt many daies together. Now Copper is molten in *Cyprus* out of its proper Vein or Oare, which *Ariſtotle* here cals a Stone; *Galen* names it ſometimes a Stone, ſometimes Earth, *viz.* becauſe it is hard as a Stone, but crumbly, and *The difference of Spontaneous Animals.* *Flies that live in the Fire.* *Not generated in the Fire.* *where bred.*

when it is burning it rises into bubbles. And therefore without doubt that same stone contains in it some kind of Earth tempered with moisture, in which moisture doubtless the form is, which is afterward actuated by the force of Heat, and being rouzed ingenders this Animal; as in other furnaces and about Bakers Ovens Crickets are engendred of the Morter. And these Fire-flies have a different matter from all other Spontaneous Animals; *viz.* a most dry sooty vapour raised from adust matter and cleaving to the sides of the Furnaces, wherein the form lies hid, which is by the strongest Heat disposed to formation, but dies with cold.

Animals bred out of the Snow.

That Animals are also bred in the Snow *Aristotle* teaches, 5. *de Hist. Anim. Cap.* 19. Yea also, saith he, in those things which can suffer no corruption, we have known Animals to breed, as reddish hairy Worms in old Snow. But in the Snow of *Media* greater and Whiter are found; they are all sluggish and move very hardly. He relates also the same thing in 2. *de Plantis, Cap.* 1. And *Pliny Lib.* 11. *Cap.* 35. writes. In old white Snow Worms are found; in the middest of the Snows thickness reddish (for the Snow it self looks red with Age) hairy, large, and Lazy. And *Olaus Magnus, Lib.* 2. *de Hist. Septentr. reg. cap.* 8. saith thus: in the most vast desarts of *Iseland*, especially under Juniper Trees, and great heaps of Chaff or Straws, although the Sun be in the Scorching sign of *Leo*, there is snow lying, wherein in the Summer time they keep Wine and Beer who desire to drink Luxuriously; but no Body mingles the Snow with his Wine or Beer, because of its Clamminess and Impurity. For Worms and Moths are found in it, just as in Cloaths ill laid up.

Mercurialis indeed, *Lib.* 3. *Variar. Lect. cap.* 4. doth altogether question the truth hereof, because Heat is required for the Generation of Animals which is not in Snow, and because the Snow is wont to kill such petty Animals in the Earth as are wont to hurt the fruits thereof. And if any Worms are seen in Snow, he conceives they came out of the Earth, and so entred into the Snow. But these Reasons are not sufficient to make us reject the testimonies of so many Learned Men. For there is some heat in Snow. Although Snow of its own Nature is exceeding cold, yet it may receive Warmth from the Sun and from the Earth; especially out of the Earth many hot exhalations do arise, which the Snow retains within it Self. And therefore husband men do in the Winter wish for Snow to cover their sowed Lands; because experience hath taught them, that the Corn is sooner hurt by the coldness of the Winter Air if it be not covered with Snow, then when it is so covered; not that the Snow it self doth warm the Corn, but because it keeps in and retains the exhalations which spring out of the Earth, and hinders the coldness of the Air from piercing to the Corn.

How Worms are bred in the Snow.

Now these Worms are bred in the Snow, not as it is simply Snow or Rain congealed with cold, but inasmuch as Pouders, Juyces, or Excrements of Plants or Animals disposed to the production of such Worms are mixed therewith; and then Worms are bred of Snow after the same manner as of Rain, of which we shall speak hereafter. Again the same Exhalations and Atomes may ascend out of the Earth, being ful of them, when it is covered with Snow, and may so be mingled with the Snow. Yea and dust containing in it the Rudiments of such Animals may by the winds be brought from elswhere, and mixed with the Snow; which chiefly happens in Snow that hath lain long. Now this matter which way soever it comes to be mingled with the Snow, when after it comes to be cherished by the Ambient heat, raised partly by the Sun, partly from hot Vapors exhaling out of the Ground, the concealed form displaies it self and produces Worms. Now, this seldom happens in the upper part of the Snow, since the heat exhaling out of the Earth, necessary to excite the Form, doth hardly rise so high, nor can long continue there, seeing it is easily dissipated by the cold Winds.

From Rain, Dew Mists.

It is also wel known to Husband-men, that out of Rain, Dew, and Mists, sundry petty Animals are bred in those Plants which they fal upon; as they often find to their great dammage. For by the Heat of the Sun Vapors out of all kinds of Sublunary Bodies are carried from the Earth up into the Air: wherein there being Atomes containing in them forms disposed to breed such petty Animals, or an Animal-making Nature, as *Theophrastus* calls it; when they are cherished by the Ambient heat, and gain that disposition of matter which is necessary to the performance of operations sundry sorts of Worms are generated. And these Worms are either

generated

generated in the Plants themſelves, *viz.* Trees and Herbs wherefore ſomtimes after Rains, eſpecially thoſe ſmal ſhowers which fal the Sky being clear, and are termed heat drops, and after Miſts and Dew a great quantity of Palmer Worms Caterpillars and ſuch like Creepers are found: or as ſome think, they are found in the Air it ſelf.

Animals falling down with Rain.

For it hath been alſo obſerved that petty Animals have fallen down with Rain. So *Olaus Magnus, de Hiſtor. Septentr. Lib.* 18. *Cap.* 16. writes: Not only in *Norway*, ſaith he, but alſo in *Heſlingia*, and in many other Provinces of the *Dioceſs* of *Upſal* certain ſmal four-footed Creatures called *Lemnars*, of the bigneſs of Mice, with a party coloured Skin, do fall down with the Rain; and it is yet unknown whence they come, whether brought by the Winds from the neighbouring or other remoter Iſlands, or bred rather in the clouds. Yet this is well known, that ſome of them having been cut open as ſoon as they fell down were found to have raw Herbs in their ſtomach, as yet undigeſted. Theſe falling down like Locuſts in Huge quantities deſtroy all green things, and infect whatever they touch with their mouths, and they live till they taſt the Second ſprouting of the Herbs and go away all together, like ſwallows taking their flight; but at a certain ſet time they die in great multitudes, exceedingly infecting the Earth and Air, which becomes peſtilential; whereby men are taken with dizzineſs in their Heads and with the Yellow Jaundize. So far *Olaus Magnus*. But it is ſcarce credible that Animals can be bred in the Air. For ſuppoſe it, that Animals have fallen out of the Air: Yet, it is doubtful whether they were bred there; ſeeing Winds and whirle Winds carry many things from the Earth into the Air which owe their original not to the Air but to the Earth. And ſince there are ſundry winged Animals in the Summer time flying in the Air, if they ſhould be ſurprized with a ſudden thick ſhower, or beaten down with the weight of great drops of Rain, or ſhould be hindred from flying by the wetneſs of their Wings, they might well fall down with the Rain, though they were not Generated in the Air. Nor is it probable that they could be bred in the Air. For, ſince all Animals are heavy, and riſe not up into the Air, unleſs by Leaping or Flying, or except they are detained therein ſome other way; they do by their weight all tend unto the Earth, and reſt themſelves upon the ſurface thereof, and conſequently cannot be generated in the Air. For the ſhaping of parts which accompanies generation ſince it cannot be done in an inſtant, but in proceſs of time, the Animal not yet perfectly ſhaped ſo as to be able to ſuſtain it ſelf by flight cannot be held in the Air, and therefore muſt needs fal down rude and imperfect. And as to that greater Animal called *Lemmar*, *Fortunius Licetus* indeed conceives *Lib.* 3. *de Spont. Vivent. Ortu, Cap.* 40. that it is generated of putrid Clouds, or rather of the Vapors of putrid Carkaſſes carried aloft, and brought into *Norway* by force of Winds. But that Clouds being rare Bodies ſhould ſo putrifie as for Animals to be bred of them; or that vapors from Carkaſſes, (few being drawn up in thoſe cold Countries) ſhould be carried aloft and putrifie in a cold place, and be turned into Animals, is not probable; but likely it is, that in ſome Iſle, or other neighbouring place unknown (as there are many unknown places in thoſe Regions) thoſe Animals were bred, and by force of Winds like Locuſts were brought into *Norway*. Which may be known hereby, that when the ſaid Animals were cut up preſently upon their falling raw Herbs were found in their Stomachs undigeſted, which doubtleſs they had eaten in ſome other place, and not in the Clouds.

Animals are not bred in the Air.

The Lemmer of Norway.

Animals bred in the water.

Experience teaches that ſundry Animals are bred in the Waters, eſpecially in ſtanding Waters. Concerning the Tipulæ or Water-ſpiders that run upon the top of the Water *Ariſtotle* writes, *Lib.* 5. *Hiſtor. Animal. Cap.* 19. Water-Spiders are commonly bred in Wells and Pits, wherever the Water ſtands, and there is an Earthy Muddineſs ſetled in the bottom. Firſt of all the Mud it ſelf putrifying becomes whitiſh, afterwards blackiſh, then Bloody-colord. Whereupon little reddiſh things come out, which for a time cleaving to their original are moved, then they become perfect and move through the Water, being called *Tipulæ*; then a few daies after they rear themſelves on the top of the Water, being hard and immovable; a while after the Shel being broken, a gnat ariſes and ſits thereon, til being moved by the Sun or Wind it falls a flying. Alſo Spiders, and ſundry other petty Animals are found in the Waters in the Summer time.

Water-ſpiders or Tipulæ.

Now,

Animals bred in the Water sundry waies.

Now, Animals are bred in the Waters sundry waies. For some though they seem to be ingendred Spontaneously: yet properly they are not Spontaneous, but are bred of Seed, and by Animals of the same sort, as Frogs. For as Fishes cast their Eggs into the Water, which afterwards become Fishes of the same sort; so Frogs and other like petty Ignoble Animals do shed their Seeds into the Water, which afterwards by the heat of the Sun are cherished and awakened. Moreover of the Juyces and Excrements of Animals and Plants, being corrupted, sundry sorts of Animals are bred in the Waters; which being not of the same sort with those things out of which they are Generated are rightly said to be of Spontaneous original; and they are generated after the same manner as Animals which breed of dead Bodies corrupted, and of Plants.

Animals bred out of the Earth

Many Animals are also bred out of the Earth. But not out of pure Earth, but that which is slimy, and Muddy. That Frogs are bred of the Dust of the Earth moistned by Summer showers, is very well known. And in some places also Frogs grow out of the Earth it self, whereof *Ovid* hath a verse:

The Earth hath Seeds which Generate green Frogs.

Also certain kinds of Fleas are bred out of the Earth in the Summer time, when there is want of Rain, which Eat yong plants, and the Buds of Hops, which the Germans cal *Erdflœhe*, Earth-Flea. Also that Worms are bred in the Earth, especially under dung, is commonly known. But especially after the overflowings of the River *Nilus* sundry sorts of Animals are bred out of the ground, whereof *Ovid* in the 1. of his *Metamorphosis* thus writes:

So, when seven Channeld Nile *forsakes the Plain,*
When ancient Bounds retiring Streams contain,
And late-left Slime æthereal Fervors burn,
Men Various Creatures with the Gleab up turn:
Of those some in their very time of Birth;
Some Lame, and others half alive, half Earth.

Which passage of Ovid *is rarely imitated by the Prince of English Poets and Glory of* London *his Native City,* Edmund Spenser, *in the* 1. Canto *of his* Faery *Queen and the* 21. Stanza, *where our* Thames-Swan *thus Chaunts it:*

As when old Father Nilus *gins to swel*
With timely pride above th' Egyptian Vale,
His fatty Waves do fertil Slime out well,
And over flowe each Plain and lowly Dale:
But when his later Ebb gins to a Vale,
Huge heapes of Mud he leaves, wherein there breed
Ten thousand kinds of Creatures, partly Male,
And partly Female, of his fruitful Seed;
Such Ugly Monstrous shapes elswhere may no man read.

Earth fishes.

That Fishes are dug out of the Earth, even where no Waters are, *Aristotle* tels us, *de admirand. Auscult. cap.* 69, 70, 71. Strabo *in Lib.* 4. Pliny *Lib.* 9. *cap.* 57. also *Theophrastus* in *Lib. de Piscibus*, where he writes: but besides these, there is another thing of a peculiar Nature, and needs to be examined, *viz.* how they are said in *Paphlagonia* to dig Fishes out of the ground in great quantity and very good; which they dig deep out of the Earth where there is no standing water, nor doth any River run through the place, by which (as we said before) Eggs and principles of generation might be brought and left; so that they must needs breed of themselves, and that frequently, for they cannot couple: and if it be true, we must conclude also that that ground is moist and fruitful and fit to engender such Animals; or else that some moisture is brought thither from elswhere, containing in it the principles of Generation; and that the place is fit to receive and nourish the same. For we can hardly think of any other way besides. Also those Fishes are known which our Country-men cal *Peisker*, and some Earth-Weazels, which *George Agricola* describes in his Book of underground Animals Chap. 16. Which are really Earth-Fishes. For in puddlish and Muddy places, where the Summer hath dried up the Water which had been there collected in the Winter, they are dug up out of the Mud.

Mud. And concerning Eeles it is reported, as we read in *Aristotle, Lib.6. de Histor. Animal. Cap.* 16. that they are neither bred by Copulation, nor do breed any Eggs, nor was there ever any Eele caught having any row, Eggs or Seed, or any passage for Seed to come out at; and that in some Muddy Ponds all the Water being let out, and the mud cast away, Eeles have bred again after Rain had fallen. But I cannot beleeve that Eeles have no Seminal principles; seeing they are caught in Rivers, as wel as in Muddy Ponds, 'tis credible those that are taken do leave some Seminal principle behind them, out of which afterwards others are generated: and some conceive that Eeles do grow of the slime, which the former Eeles cast from their outsides, as the Snake casts his Skin. Of which *Scaliger* also writes *Exercit.* 15. Eeles are thought to generate nothing within themselves, but by their mutual twining and twistings one about another they are thought to make a kind of Slime, of which yong ones are generated without. *The Generation of Eeles.*

Oisters also and all Shel-Fish are bred of Slime, concerning which *Opianus*, in his Poem of Fishes, *Lib.* 1. thus writes:

They couple not nor bring forth any young,
But of themselves they breed the Mud among,
As Oisters do, Glib Oisters that no Male
Nor Female have.

Yet some aver that Snailes do also couple, and that they have seen them Joyn together, and sticking one to another, so as to send forth a slimy froth, which after a day or two was changed into the shape of a Snail. Nor is it absurd, that they may be bred both waies, so that when many have been generated Spontaneously, those may afterwrads generate more by Copulation of Male and Female.

Moreover the *Urticæ*, *Purpuræ*, *Ungues* (Plant Animals so called) and all such as stick fast in the Earth, seem to be of Spontaneous Original, and are so accounted by *Licetus Lib.* 3. *de Spont. Vivent. Ort. Cap.* 35. For since they remain fastned to their places, they exercise no Copulation, nor do they seem like Plants to shed any Seed. But this may be doubted of. For although they have no sex, yet they may have Seed, since they are Plant-Animals, and belong partly to Plants, wherein also there is not properly any Sex; and therefore it is not absurd to think they may send forth Seed, which sticking to the Rocks may be formed into a Body like the Generator; which way soever this emission of Seed is caused, whether by Seed properly so called, or by some other thing Analogical to Seed. *Plant-Animals*

And inasmuch as so many Animals are bred out of the Earth, *Aristotle* said very wel, that all things are after a sort ful of Souls. For every where almost smallest Bodies or Petty Atomes are found, severed from the Bodies of Animals, wherein there is a Soul but Latent, and not exercising the second Act or Functions of a Soul. For those more Ignoble Animals do not send forth seed as the perfect Animals do, but a Seminal principle dispersed through their whole Body, as it is in some Plants. And therefore it is no wonder, that the Bodies of such Animals being turned to Dust should be like Seed, and having afterward attained a fitting place should again produce Animals. *Pliny* knew thus much, who *Lib.* 9. *Cap.* 51. writes thus of Frogs: 'Tis strange (saith he) how after six Months time of Life they are turned into Slime and no man perceives it, and in the Spring they are again regenerated in the Water, after the same secret manner, and this happens every year.

Also sundry Animals are bred of Plants, and some of Plants that are yet living, and others of dead Plants: yet every Worm is not bred of every Plant, but certain Worms of certain Plants; as also the same worms do not breed out of all Carkasses of Animals, but some out of one sort, some out of another, and the forms of such insects seem to be subordinate to the forms of Animals and of Plants. Which *Scaliger* also teaches, *Exercit.* 59. *Sect.* 2. and *Exercit.* 190. But which are generated from which, we shall hereafter shew when we come to speak more particularly. Concerning which *Aristotle* hath many excellent things wel worth the reading in 5. *Hist. Animal.* especially in the 19. Chap. Where he teaches in general, that Worms and Caterpillars are bred of Plants, and of them *Chrysalides* Golden-Worms, and of them butter-flies and other Winged Animals are bred. For not only

only Butter-flies, but other winged Animals also are bred of Plants, as Flies, Beetles and such like. Concerning the Spontaneous Original of Flies *Ulysses Aldrovandus* writes, *Lib.* 3. *de Insectis*, *Cap.* 1. some do suppose, that they spring partly from corrupted fruits, and rotten Carkasses of Animals, and partly from the Corruption of the Air, as *Ovid* shews *Lib.* 5. *Metamorphos.* but that their chief matter is Earth. I, as I will not deny but Flies may be generated out of any putrid matter, and out of the Carkasses of Animals, (and I have shewed before that out of the putrifying flesh of other Animals as wel as of Bulls Bees are generated as from the most fitting matter) yet I conceive they are bred for the most part of Plants, and I have observed an example thereof. For when, some years agone, in the Winter time, when no other green Herbs were to be had, I did beat red Cole-worts, and kept them in a stove til they bred Worms, the Worms generated thereof turnd into Golden Caterpillars, which when I had kept shut in a Box, and afterward came to open the same, a troop of smal Flies made their escape, which were bred of the Caterpillars, and broke out of their Crackt Skins.

The Spontaneous Original of Flies.

But to come to Particular sorts; in the first place, truly, 'tis very well known that of Mushroms which are the lowest sort of Plants, Worms are bred. Of the Generation whereof *Fortunius Licetus* disputes *Lib.* 3. *de Spont. Viv. Ort. cap.* 44. and conceives that they cannot be produced by the Soul of the Toad-stool or Mushrom, because it is in the lowest ranke of vegetables and cannot act beyond its power, so as to procreate a sensible Soul more noble then the vegetable. And that also for the same reason the Soul of a Mushrom cannot be changed into a sensitive Soul. But he himself holds that Worms are bred of Mushroms, because in the substance of a Puck-fist, a Toad-stool or Mushrom, many petty Bodies or Atomes are contained, which came from the Bodies of Animals either living or dead, in which Bodies a Portion of the old sensitive Soul doth remain as in a vessel, which the Toad-stool coming to wither, and it having by the heat of the ambient Air attained dispositions necessary to life, it is Spontaneously animated and turns to little Worms. But this opinion of *Licetus* hath been often propounded and examined. In this place, we shall first observe this doubt therein, whether or no those little Worms which are of the kind of Animals are simply more noble then Plants: of which there seems no necessity. For the Creator did not in the first place intend and create those Worms, but the Plants as we shewed before, *cap.* 4. speaking of the final end of these kind of Creatures. Again it hath been often said, that that Hypothesis of *Licetus* will hardly be granted, that the form of nobler Animals should be changed into the form of Ignoble Worms. Moreover Toad-stools are often bred upon Trees, and under Trees in Woods, where it is scarce credible that there hath been any Carkas of an Animal. Yea and they are bred every year. And although peradventure Animals have discharged their Excrements in those places, yet the Soul of an Animal was not in them.

Animals bred of Mushroms

Moreover worms are bred out of sundry perfect plants, whiles are they living. *Pliny Lib.* 13. *cap.* 6. writes, The Turpentine Tree bears certain Bladderkies, out of which certain gnats or other Animals do spring. And *Jul. Cæs. Scalig. Exercit.* 59. *Sect.* 2. nor are these petty Animals bred only in fruites alone, such as Wivels or Wibbles which breed in Wheat, Maggots in Nuts, and other petty Animals in others, of which see *Theophrastus*; but also of the bladders of a Lentisch Tree, which it bears besides its berries, like Cods: so that they seem contrived on purpose by Nature, to be first the Wombs and soon after the Cottages of these smal winged Animals. As in the Cods of Elmes there are bred much such like. And therefore the Arabians are wont to call the Elme the Tree of Wig-Lice, or lowsie Tree. So out of the pith of the Fullers Thistle when it is ripe a smal Worm grows: which *Dioscorides* truly reports to be good against the Quartan Ague. Such Bladders also the Turpentine Tree bears, wherein are a certain Liquor and Gnats. It is exceeding well known that Worms are bred in Hasel-Nuts, Cherries, Apples, and Plums. Upon the Leaves of Oakes little Apples grow like Galls, in which about the beginning of *Autumne*, either a little Worm, or a Fly, or a Spider is found: each of which are thought to be Prognostications of the year following, and that the Worm signifies Plenty, the Fly scarcity, and the Spider Pestilence. On wild Rose bushes hairy Apples grow, called Spunges of Roses, which have a Worm within them.

Worms out of living Plants.

In

In a word, as *Julius Cæs. Scaliger* upon *Theophraſtus* rightly ſaies, every Worm grows in his own Tree or Plant.

The generation of Caterpillars and Butterflies

But eſpecially of living plants ſundry ſorts of Caterpillars and Palmer Worms, and out of them divers kinds of Butter-flies are bred. And *Ulyſſes Aldrovandus* deſcribes near an hundred ſorts of Caterpillars or Palmer Worms, *Lib.* 2. *de Inſect is Cap.* 4. and more then an hundred ſorts of Butter-flies, in the ſame Book Chap. 1. And that which was ſaid before in general is alſo true of Caterpillars, that every ſort grows out of its own Plant. Which alſo *Fabius Columna* confirms by his own experience, *in obſervat. Lib. Minus Cognit. & Rarior. Stirpium addit. Pag.* 87. where he ſaies, that Caterpillars and other petty Animals do not only breed of certain plants, but that a Caterpillar bred of one Plant doth not feed upon another, but only upon its own out of which it was generated: as for example, if a Caterpillar were bred out of a Plant of Rue, it will feed upon other the like Plants of Rue, but not on all that bear the Name of Rue, as Goates Rue and Dogs Rue, by late Authors ſo called, nor on the Leaves of any other Plant unleſs it be of the ſame Nature, and quality. And thoſe that are bred upon the Radiſh will Eat the Leaves of Radiſh, but of no other plant, unleſs peradventure it be a Plant of the ſame kind, as Cole-worts, Rapes, Navews and ſuch like. From which obſervation of the feeding of Caterpillars I conceive a man may know the qualities of the Plants they feed upon. For Silk-worms we know eat the Leaves of Brambles and Mulberries, our People when the Worms are little lay Bramble Leaves upon them for their food, and when they are greater the Leaves of the black Mulberry Tree, which are queſtionleſs of the ſame Nature with the bramble leaves, for they do doth bind and color, as *Dioſcorides* teſtifies: ſo that from the food of theſe Caterpillars and Butter-flies we may know what Plants are of like Nature. For if Caterpillars or Butter-flies feed upon divers Plants of the ſame kind, 'tis Credible they have like Vertues and qualities. So far *Fabius Columna.*

How Caterpillars and Butterflies are Generated

But touching the Generation of Caterpillars and Butter-Flies Authors agree not. *Ariſtotle, Lib.* 9. *de Hiſtor. Animal. cap.* 19. thus writes thereof: Butter-Flies (ſaith he) are bred of Caterpillars; Caterpillars of living Leaves of Plants, eſpecially of the Cole-wort. Firſt of all a ſmal Seed leſs then Millet lies upon the leaf, ſoon after of that Seed ſmal Worms are bred and grow, then within three daies they become ſmal Caterpillars; which being augmented ceaſe moving, and change their ſhape, and are for a ſmal time called *Chryſalides*, as if you would ſay Golden Worms. They are covered with an hard Shel, ſtirring when you touch them, and full of little pores. They have no mouth, nor other member diſcernable. A long time after the Shel being broken, out Flies a parcel of winged Creatures which we call Butter-Flies. And therefore at firſt whiles they are Caterpillars they are nouriſhed by food, and void Excrements. But when they are turned into thoſe *Aureliæ* or Golden-worms, they neither Eat nor void any thing. And concerning the Generation of the Silk-worm, in the ſame place; It is made of a certain large worm, which thruſts out two horns as it were, and is of a kind by it ſelf, which is firſt wholly changed into a Caterpillar, then it becomes a Fly like a Butter-Fly, and afterward it is called *Necydalus.* Which various ſucceſſion of Forms is accompliſhed in the ſpace of ſix Months.

But *Ulyſſes Aldrovandus* in the place fore alleadged diſſents from *Ariſtotle*, and thus he deſcribes the Generation of theſe Creatures: every Butter-fly is bred of the Worm called *Chryſalis* the *Chryſalis* of a Caterpillar, the Caterpillar of the Eggs of Butter-flies; whoſe end is not to breed Caterpillars or Gold-Worms, but other Butter-flies. But he blames *Ariſtotle* for not having obſerved that the ſeed on the leaf was the ſeed of a Butter-fly; and for not underſtanding, that thoſe little Worms which firſt break out of the Eggs are ſmal Caterpillars. But in good deed, although it cannot be denied, that ſome Caterpillars are bred of the Seed of Butter-flies (which I doubt whether *Ariſtotle* were ignorant of) and that the Seed on the Leaves of Plants, leſs then that of Millet, is the Seed of Butter-flies: yet the queſtion now is, whether Butterflies are only bred of Seed, or whether they are not alſo Spontaneouſly generated: ſince certain it is that many Animals Spontaneouſly generated do ſend forth Seed. And experience ſhews that ſuch Worms and Caterpillars are bred out of Dew and Rains falling down upon Plants. For in the ſpring time for the moſt part Caterpillars are thus bred before

Butterflies are seen; and therefore since these Caterpillars come before Butterflies, it is a sign that they are not bred of the Seed of Butterflies, but of corrupted Plants. Which *Aldrovandus* himself was forced to confess, when he relates afterwards, that those Caterpillars which are turned into Butterflies are not all bred of Butterflies Eggs, but some of them of the corruption of Plants. Which experience also doth Testifie, whence it is manifest, that frequently Caterpillars are bred of the corruption of Plants, and of the Caterpillars Butterflies are bred, which bring forth Eggs, out of which again Caterpillars are bred, and of them again Butterflies. In the same place *Aldrovandus* denies that all Butterflies are bred of Caterpillars, but some, he saies, are generated of Worms; and he writes that if Corn be over moist it breeds Worms, which turn to Gold-Worms, and they to Butterflies. He writes also, that he hath seen Butterflies come out of hollow Trees especially Willows, with their Skins wherein they were bred scarce off. But here it is to be inquired, whether or no those Worms were not Caterpillars, which were afterward changed into Gold-worms, and they into Butterflies. Nor are Caterpillars all of one kind, but some are bred of Living Plants, others of Corn, others out of Wood. And those Caterpillars of which Silk-worms are engendred do not retain the same Figure, but change their Coats four several times. Whereof see *Libavius Lib.* 1. *Bombycior.* who hath written most diligently concerning this matter. This is general, that all those little worms which hide themselves in down, or wrap themselves in the Leaves of Trees, after some changes of their outward shapes are changed into a flying Creature, like to that by which the Eggs were laid.

This I have also observed in Caterpillars bred of Indian Water-cresses, which they frequently feed upon, being kept in a Glass; that out of their Bellies live Creatures did come forth, which died soon after, and would questionless revive again the next Spring, and the Caterpillars themselves also died, no Butterflies being of them generated. Wherein I was confirmed by that which *Aldrovandus* relates *Lib.* 4. *de Insectis, Cap.* 1. how that such as have written of the wonders of the new World do report concerning Pismires, how that out of the Body of the dead Parent innumerable little Worms arise, which live after a wonderful manner, until being winged they fly out of their underground Habitations; although the Parents do somtimes bring forth during their Life.

The generation of Gnats. We conceive that Gnats also are bred of the corruption of living, or withered Plants. For although Gnats are generated out of Water and Vinegar: yet that happens, because they contain in them either the parts or Juyces of Plants. For although, as *Aristotle* relates, *de Histor. Animal. Lib.* 5. *Cap.* 19. they are also bred of Water, especially standing Water: yet there is no question but many things are bred therein by the corruption of Plants. And those which are Generated of a sowre Humor *Aristotle* calls *Conopas*; and of them *Pliny* relates, *Lib.* 9. *Cap.* 51. that they are generated of a tart Humor; and *Lib.* 10. *Cap.* 70. that they fly to and feed on sowr things, but care not for what is sweet. Yet they are not immediately Generated of the acid Humor, but of a Worm which is first bred of the said Humor. So that the Original of all these petty flying Animals is from some peculiar kind of Worm.

Gnats generated of a wild fig-tree. More Particularly, Gnats are bred of the wild Fig-Tree, whereof *Aristotle*, 2. *Histor. Animal. Cap.* 32. The wild Fig-Tree generates certain Fig-Gnats out of its Apples; first there is a Worm, soon after the Skin breaks and out Flies a Gnat, and changing its place it goes to the unripe Figs, whereinto insinuating it self it keeps them from falling. *Theophrastus*, 2 *de Caussis Plantarum*, adds that they are bred of the Seeds, a sign whereof is, that after they are fled away there are scarce any Seeds in the Figs. For they fly away maimed, leaving a Feather or a Foot in the Apple. Which *Pliny* comfirms, *Lib.* 17. *Cap.* 27.

A fourfold original of Animals that breed of living Plants. *Fortunius Licetus* holds a fourfold Original of such as spring from living Plants, *Lib.* 3. *de Spont. Vivent. Ortu, Cap.* 46. The first he saies is of the Excrements of Plants. For seeing Plants are nourished by an Earthy Juyce, with which a great quantity of dung and mixt matter is mingled proceeding from the Bodies of Animals living or dead, he holds that there is therein remaining some portion of the former sensitive Soul, and that the said matter

The First

ter is carried for the more abundant nourishment of the Plant to the flours, or Fruites, leaves, or Barks, or elswhere, which when it is digested by the heat of the Ambient Air, and acquires dispositions necessary to life, presently the Soul which lay hid therein doth display it self, and somtimes a Caterpillar, somtimes a Wivel, otherwhiles a Moth, otherwhiles a Worm, somwhiles a Goose, other whiles a Duck is bred, and somtimes another Animal. But this manner is scarce agreeable to reason; especially that Geese and Ducks should be thus bred. For it is not credible that the Souls of such perfect Animals should be able to remain perfect and intire under so many Mutations. Nor doth the sensitive Soul constitute any Animal in its kind; and every Animal, as for example a Lion, an Ox, a Goose, an Hare, hath not only a sensitive Soul but a specifical Soul of its own, differing from the Souls of all other Animals.

The Second manner he makes to be of Atomes, which have flowed from the Bodies of Animals, flying in the Air, and driven into the substance of Plants and sticking thereto by the clamminess of Dew, and being driven within the Porous matter, or the Downy corpulency; which in fit season being digested by the concoctive faculty of the ambient Air, and prepared for another life, they become living Creatures, *viz.* Caterpillars, Spiders, *Canthorides*, Geese and such like Animals. But neither is this manner probable unless it be limited. For that Geese should be generated of Atomes flying in the Air, and sticking to Plants, as it is a thing unheard of, so any one may easily understand that it is impossible. But this we grant, that with the Rain and Dew a matter fals upon Plants, and cleaves to them, out of which Caterpillars are generated, and other such like Insects. Nor do we deny, that Atomes in which the Seeds of such living Creatures do stick may descend with Rain or Dew upon Plants: Yet we do not think that this is alwaies necessary, since the Excrements of Plants and Animals and their corrupted parts have this power, and the Seminal principles of these Animals are fastned upon Plants by the dew and Rain. *The second.*

The Third manner he makes to be, when Atomes or Juyces of the same kind, being any waies slipt out of the Bodies of Animals, and by the Earth communicated to a Plant, are by the heat of the ambient Air awakened and enlivened. Nor yet is it necessary that this should be done, but the parts of Plants themselves if they be corrupted may turn to such petty Animals. And if after this manner Animals should be bred of living Plants, many more would be generated then are: Howbeit certain Animals are nevertheless bred of certain Plants. *The third.*

The fourth manner he makes to be proper to those which are bred in the Water, *viz.* when of the Juyce, Atomes, or Excrements of Plants mingled with the Water, and cleaving to the substance of Plants which grow in the Water, Animals are bred. *The fourth.*

Two manners therefore are altogether sufficient. The First is, when of the corrupted parts of Plants Animals are bred, as of the Barks of Pine Trees corrupted Pine Caterpillars are bred. The other is, when Atomes containing the Forms of such Animals do with the Dew or Rain fall upon Plants; which happens most frequently when few little drops fall as the Sun shines, which we call heat Drops. For with these not only the Leaves of Plants (as it is wel known) are corrupted, but also Husbandmen know, that by this shower little Animals are bred in them. *Two manners of the generation of Animals out of living Plants.*

Animals are also bred of dead and dry Plants; and that Moths, and Wood-Lice, Cos-worms, and sundry sorts of Worms are bred in rotten Wood, every body knows. *Aristotle, Lib. 5. de Hist. Animal. Cap.* 19. writes that the Beetles called Bulls are bred of the Worms which are generated out of dry Wood; and in the same Book, Chap. 32. he relates, that the smallest creature in the world, called *Acari*, is bred not only in old wax, but also in white Wood. *Animals bred of dead plants.*

Among Animals that breed out of rotten Wood, we must reckon that little worm which is called *Xulophthoros*, and which *Arisotle*, 5. *Histor. Animal. Cap.* 32. describes. Which I take to be no other then that which our Germans cal *Stock-wurm* that this Stick-worm, and we in *England*, if I mistake not, call them *Cad worms*, which is bred in the Water of Rotten sticks and Stocks of Trees, being a River VVorm, and taken in the Spring time with River Gudgions. But *Aristotle* seems to have described this Worm, rather when it puts on the Form of a Gold-worm, then when it lives in the Water. The same *Aristotle* *The Cad-worm.*

writes, that he had not yet experimented what Animal was bred thereof. But experience shewes that it is changed into that commonly known insect which *Ulysses Aldrovandus* (2 *de Insectis Cap.* 10.) calls *Perlas*, the *Silesians* term it *Schneider*, those of *Misnia Boltzen*.

Wall-Lice. Whence the *Cimices* Wig-lice or Wall-lice so called are bred, is doubtful. Most are of Opinion they are bred of the filth proceeding from mankind; and *Aristotle*, 5. *de Hist. Animal. Cap.* 31. saies: they are bred of the Humor which is in the upper parts of the Bodies of Animals. But if this were true, why should they not be bred in the Skin, hairs, or Garments of Men and Women, as Lice and Fleas are? And therefore it is more likely, and experience doth witness the same, that they are bred in Bedsteads [*understand Dutch Beadsteads*] and especially in their chinks, and in the Wood of the Walls next the Bed, which is their proper place. And if they are found elswhere in the Straw, or in Garments, they have crept thither from the Bed-steads. Howbeit, there is assistant to their Generation the filth or rather the Vapors of Men and Women sleeping, which sticking to the Wood corrupt the same and cause it to breed these Vermin. Now they are chiefly bred in Wood of the Fir and Poplar Trees. Whereof *Julius Cæs. Scaliger* doth well write (save that he holds they are bred in straw likewise) in *Lib.* 2. *de Plantis*; That certain Woods, as the Fir, and Straws, have in them Natural Rudiments of these Animals.

Concerning the Scotch Geese call'd Brant-Geese.

Hither some refer the Stotch Geese called Barnacles, which some write are bred of rotten Wood. Because Authors Dissent hereabouts, I think here sitting to speak somwhat Particularly thereof. Most, as hath been said, are of Opinion, that they are not bred of Eggs, but in the Sea, out of rotten Wood; although some say in one place some in another. *Munster* saith in the *Islands* call'd *Orcades*, others in *Ireland*, others in *Scotland*, others in the *Islands* called *Hebrides*; some say they breed in any Sea if the Ships be made of Wood which grew in *Scotland*, and therefore some do not ascribe the place of their breeding to one part, but to all that tract betwixt the *Orcades* and *Scotland*, and betwixt the *Hebridæ* and *Ireland*. Moreover, there is a controversie whereof they are bred. For some suppose, that in the *Orcades* upon the Banks of the Rivers there is a Tree which bears a fruit resembling Ducks, which when it is ripe fals off, and if it light upon the water it presently conceives life, and becomes a bird, but if it fall upon the Land it putrifies. Others write that of the pieces of Ship-Masts floating in the Ocean there is first of all somwhat thrust forth, and that afterward at the Sea-weed (or Sea-grass called Wier or Wear) sticking with the pitch to those pieces of wood, there hang little Shel-fish like Cockles or Muscles, which in process of time receive wings and Fly through the Air, or fal into the water and Swim. Others think that these Geese are bred, neither of rotten wood, nor on Trees, but out of Shels. Others conceive they are bred none of these waies, but that they are hatched of Eggs, as other Animals are.

But I think it will be best to set down the Relations of Authors themselves concerning this matter. *Fortunius Licetus* produceth this follwing Account (in *Lib.* 3. *de Spont. Viv. Ort. Cap.* 47.) out of *Turner*. *The former Goose is termed by our countrymen a Brand Goose and a Barnacle; it is less then a wild Goose, on the breast partly black, on the Rest of the Body of an Ash-color. It Flies and cries like wild Geese, frequents standing Waters, and devours standing Corn. The flesh of this kind is somwhat unpleasant, and not in request amongst the Rich. No man ever saw the Nest or Egg of a Barnacle; which is no wonder: because they are without the help of any parent, Spontaneously bred after this manner. When the mast, or some Fir-boards of a Ship have lain Rotting for a time in the Sea, there grows thereout, at first, certain Mushroms as it were; in which in process of time the manifest Forms of Birds are to be seen, which are afterward cloathed with Feathers, and at last quicken and fly. And I would not have any one think that this is a Fable, for besides the common Testimony of all People living upon the Sea-coasts of* England, Scotland *and* Ireland, *that same Famous Historian* Gyraldus, *who hath wrot the History of* Ireland, *(more happily much then could be expected in the Age wherein he lived) doth testifie that Barnacles are Generated no otherwise then as we have said. But counting it not safe to*

beleeve

beleeve vulgar reports, and not crediting Gyraldus *by reason of the Novelty of the matter, while I was ruminating upon this subject whereof I now write, I made enquiry of a certain Iriſh Divine Named* Octavianus, *whom I knew by experience to be a very honeſt and credible Perſon; whether he conceived a man might beleeve* Gyraldus *in this point: whoſe anſwer was (ſwearing by the Goſpel he did profeſs) that what* Gyraldus *had reported concerning the Generation of this Bird was moſt true; and that he had ſeen with his own Eyes, and handled with his hands ſome of theſe fowl before they were come to perfection: and that if I would tarry a month or two longer at* London, *he would ere long cauſe ſome of the imperfect Birds to be brought to me. I am therefore by the credible report of honeſt and learned men who were Eye witneſſes perſwaded, that it is a real truth, that Brand Geeſe or Barnacles, are bred out of the rotten Maſts of Ships, after the manner of Muſhrooms. In Wales, which is a part of* England, *in* Ireland *and* Scotland, *theſe Birds are found up and down upon the Sea-ſhores imperfect and unfeathered, but having the true and proper ſhapes of Birds.*

Hector Boetius *in his deſcription of the Kingdom of* Scotland, *thus writes concerning this matter: It remains (ſaith he) that we ſhould declare what (after long and diligent ſearch into the matter) we certainly know and underſtand concerning the Scottiſh Geeſe which they call Clack-Geeſ, and which are commonly but falſly thought to grow upon Trees in theſe Iſlands. For I conceive that the Virtue which breeds them is rather in the Seas which flow betwixt theſe Iſlands, then in any other thing. For we have ſeen them Generated ſundry waies, but evermore in the Sea. For if you caſt a piece of timber into that Sea, in proceſs of time, there are firſt of all Worms bred, the Wood being hollowed, which by little and little have Heads ſhaped, and then Leggs and Wings, and at laſt are covered with Feathers: Finally growing as large as Geeſe, when they are come to their full ripeneſs of Age they fly in the Air like other fowl, which was evidently ſeen in* Buchphan *by many ſpectators, in the year of our Lord* 1490. *For when as in that Iſland at the Caſtle of* Pechſlege *a great log of this kind of Wood was brought a ſhore by the Sea Waves, thoſe that firſt eſpied it, being aſtoniſhed at the Novelty of the thing, ran to the Lord of that place and acquainted him with the news. He coming cauſed the Log to be ſawed aſunder, which being done, preſently there appeared an huge Multitude, partly of Worms, of which ſome were yet unſhaped, others had ſome members formed; and partly of Birds perfectly ſhaped, of which ſome had Feathers, others had none. Being therefore aſtoniſhed at the ſtrangeneſs of the thing, at the command of the Lord they carry the Log into the Church of* St. Andrew *at* Tyra *(a Village ſo called) where it remains at this day bored through as it were with Worms. The like Log in the* Iſle Taum *was caſt aſhore by the working of the Sea, at the Caſtle of* Bruthe, *two years after, which was ſhewed to many that came running of purpoſe to ſee it. Nor was that any other which two years after the former was ſeen by all the people in* Lethe *a port of* Edin-burge, *For an huge Ship whoſe name and Badge was* St. Chriſtopher, *when it had Lien at Anchor three years together by one of the Hebrides Iſlands, and was brought hither again and laid in Dock, the Beams being eaten aſunder as far as it had lien in the Water, there were ſeen therein a great number, partly of ſuch rude Worms, not yet having their perfect ſhape, and partly of fowls fully perfected. But ſome may cavil and ſay, that there is ſuch a virtue in the Wood of the Trees which grow in thoſe Iſlands: and that the Ship* Chriſtopher *was made of Timber which had grown in the Iſlands* Hebrides: *Therefore I ſhall not think it tedious to ſet down, what I my ſelf ſaw ſeven years ago.* Alexander Gallowid *the Paſtor of Kilkenny, a man beſides his ſingular honeſty incomparably ſtudious after Rarities, having drawn out ſome Sea-weeds, and ſeeing betwixt the ſtalk and the branches, from the bottom to the top, certain Shell-fiſh growing, he was amazed at the Novelty of the thing; but when preſently for his further ſatisfaction he opened the Shells he ſtood much more aſtoniſhed then before. For he found no Fiſh in the Shells, but (ſtrange to tell) a Bird, and according to the bigneſs thereof, he obſerved the Shells to be bigger or leſſer. Wherefore he ſpeeds him to me forthwith, whom he knew of old to be exceedingly deſirous of the knowledg of ſuch things, and acquaints me with the whole buſineſs, being no leſs aſtoniſhed at the ſtrangeneſs of the thing, then delighted with a Spectacle ſo ſtrange and unheard of. Now I conceive it is ſufficiently apparent, that theſe Seeds of breeding theſe fowles are not in the Trunks or Boughes of Trees, but in the Ocean it ſelf, which* Virgil *and* Homer *do not without cauſe term the Parent of things. But when they ſaw that Apples falling from Trees that grew upon the Sea-ſhore, in proceſs of time, the like Birds came out of them, they were brought to conceive*

that

that the Apples were changed into such Birds; but they were mistaken. For in time by the Seas virtue Worms grew to the Apples, and they encreasing, and the Apples rotting by the moisture and vanishing, they through want of good heed imagined that the Apples were turned into these kinds of Fowles. So far Hector Boetius.

The relation of Jul. Cæs. Scaliger.

Julius Cæsar Scaliger, Exercit. 59. Sect. 2. thus writes concerning this matter: You may rather wonder that in the Britannick Ocean, a Bird unknown in your parts hangs by the Beak in the Timber of rotten Ships, till it grow to perfection, and swim away, being fashion'd like a Duck, and living upon Fish. I have also seen one of these Fowls. The Gascoigns inhabiting by the Sea side call them Crabrans, but the Britanies Bearnacles. And a little after: There was brought to the most excellent and great King Francis, a Shelfish as it seemed, not very large, in which there was a young Bird almost perfected, with the tops of the Wings, the Bill and Feet, sticking to the farthest parts of the Shell.

Of P. Pena and M. Lobel.

Petrus Pena, and Matthias Lobelius, In their Observations of Plants, near the end, write thus concerning these Geese. This example of Natures endeavouring to draw some good even out of corruption makes us now willing to beleeve many things which else we should have laughed at, if we had read them in the Historians of the Northern parts of the World. Although they relate the matter somwhat differently, that this is only found in Scotland, or in the Islands of Orcades, anciently conquered by the Roman Navy. But we have not only from Scotland, but here also, in the River Thames where it runs by the City of London, Shells which have been pluckt from the Bottom of an old Ship, with thick rugged stalks. They are very smal, as round in a manner as Cockles, white without, shining, Smooth, as thin and Brittle as Egg shels, opening with two sides like Limpins, of the size of an Almond-Nut compressed: now these hung on the outside of the Belly of a large Ship, upon which being half rotten with Moss and Mud there grew as it were the stalks of Mushroms, resembling the Navil-strings, the ends whereof after the manner of Fruits were inserted into the broad end or Basis of the Cockles, as if the little Birds were thence to draw their life and nourishment, the rudiments of which Birds were to be seen in the upper sides of the Cockles which gaped. These stalks Historians report to grow first out of Worms, which we could not discern, nor do we yet beleeve it to be so: although we know that such kind of Cockles most neatly shaped do grow on pieces of Wood cast up by the working of the Sea. And such of them as fall upon the dry land dye; but such as remain in the Water do hatch a Duck or a Fowle of that kind. The English and Welsh cal them Barnacles; the Scots cal them Clack-Geese, and there are many of them in Scotland, where they are caught, when the standing Waters are frozen with Ice. When we did eat of them, we conceived that they tasted like a Duck, or wild Goose.

Of Michael Mejer.

Among the Germans, Michael Mejer, in his Treatise de Volucri Arborea Chap. 3. himself being an Eye witness relates, that out of Shels like Cockles such Geese are bred, and that he had seen wellnigh an hundred such Cockles, which being opened, there were smal young birds in them, ready as it were to come out of the Egg, with all members necessary to fly with, some of which Birds he had in his own hands. Thus he describes them: if at any time a piece of a Ship-mast smeared with pitch fall into the Sea which runs betwixt the Orcades and Hebrides Islands, and lies there for some considerable time, it grows not only rotten by reason of Worms bred within it, but it is covered all over with Sea-weeds, store of which grow in those parts, and upon any wood that is in the Water, especially if it sweat forth a Pitchy fatness, as the Masts of Ships made of Fir or Pitch-Tree, and abounding naturally with Rosin, and pitched over for the service of the Ship, that the sailes may be swiftly hoised up and let fall, and not stick any where. Now the Sea bears these weeds on the bottom thereof, whence at a certain season it rises up to the top, being as it were pluckt up or cut off, by the Waves. This weed being bred in the Water doth not easily putrifie, having much saltness in it; and therefore in North-Holand, and many other places, they make Dams thereof very strong against the Violence of the Ocean, so as they fetch a remedy from whence the Disease comes. The foresaid pieces of Wood therefore being covered with this weed, which insinuates it self into the smal holes which remain by reason of the rottenness thereof; in process of time, at the other End of the said weed smal Cockles as it were do grow, which are whitish, or of the colour of a Mans Nail, and in shape much resembling the Nail of ones little Finger, and the two Shels being so joyned together, that they stick close, on the upper and more pointed sides they receive the Sea-weeds end, and are firmly

firmly shut on the broader sides, which are afterwards opened, that the fruit being ripe may go out of its own accord to fly. After this manner thousands of smal Shels more or leß do stick, each Shell at the end of a Weed, the other end of the said Weed (as hath been said) being fastned to the pitched Logs of Wood, and that so many in number that the Wood can scarcely be seen: which pieces of Weeds are hardly above twelve Fingers breadths long, and strong, as if they were thongs of Leather. *Somtimes they are certain feet long.*

Carolus Clusius, in *Auctario Exoticorum*, thus writes concerning them: *The Clack-Geese so called by the Scots, which the English cal Barnacles, the Highlanders Rot geese, is a kind of Fowl seen only in the Autumn and the Winter resembling a Duck. The Original of these Fowls being unknown, it came to pass that the common people imagined their first Rudiment to be certain Shells of whitish colour growing to the Trunks or fragments of Wood, which are wont in these parts to be driven on shore by the flowing in of the Sea, where the Wood doth not otherwise Grow, and resembles in some manner the shape of these Birds. But that he ever saw a living and perfect bird come out of those Shells, no man dares averre. So far* Hoierus. *Moreover, these are not the Birds which are commonly thought to grow upon Trees in the* Orcades Isles, *and are called Barnacles, or Rot-Geese; but Birds commonly not leß then a Duck, which I have somtimes seen, yea and tasted of their flesh. And all is found to be fables which hath been reported of them by the* Hollanders, *who some few years since sailed to* Nova Zembla, *and past beyond the Bay of* Nassou, *commonly called* Weygaz. *For they observed those Birds sitting upon their Eggs in the Rocks, and brought many of their Eggs into the Ship, to satisfie their Hunger.* So far *Clusius.* *Of Carolus Clusius.*

Which is confirmed by *Gerhardus de Vera*, of *Amsterdam*, in the Navigation *to* China: *Then rowing,* (saith he) *to the Island which was middlemost, there we found many Eggs of Barnacles (which the Hollanders call Rot-Ganßen or Rot-Geese) and the Fowls themselves sitting in their nests; which being chased away, did cry Rot, Rot, Rot, (whence they have their name of Rot-Geese) and by the throw of a Stone we killed one of them, which we did boyl and Eat, with about threescore Eggs, which we carried with us to the Ship. These Geese or Barnacles were true Rot-Geese, such as in great Quantity do hant every year and are caught about* Weiringen *in* Holland; *which where they laid their Eggs (this man never read* Albertus Magnus) *and hatched their yong, hath been hitherto unknown. Whence it came to pass, that some Authors have dared to write, that they grow out of Trees in* Scotland, *from the branches whereof hanging over the Water, if the fruit fall into the Water yong Geese are thereout generated; but if they fall on the ground, they perish and come not to perfection: which appears now to be false. Nor is it any wonder that it hath been hitherto unknown where these Birds laid their Eggs, since 'tis most certain, that none was ever heard to have come to the eightieth degree of Latitude before, nor was that part of the Country (which I conceive to be* Groenland) *ever known before, much leß were those Geese ever found sitting upon their Eggs.*

Out of all which Narrations it is manifest, that these Geese are not bred out of rotten Wood, but out of certain Shels, which by means of Sea-weed are fastened to the holes of rotten wood, as the foresaid *Mejer* writes. Those Cockles as it were with black Shels are alwaies found sticking to wood lying in the Water, as to the wooden foundations of Bridges, and to Ships sunk under the water. Now they stick to the wood by certain thrids of Hair or Snevil as it were, or else by Sea-weed. And *Mejerus* adds this also in their description, that if the Cockles open themselves, those smal yong Birds appear, like Chickens in their Eggs, which have a Bill, Eyes, Feet, Wings, also the Hairy Rudiments of Feathers. And as they encrease, so their Shells encrease, as it is with all Shel-fish and Snailes. And credible it is, that these Cockles do draw nourishment out of the fat and clammy substance of rotten wood, by those pieces of Grass or Sea-weed, that goes between them, as by Navil-Vessels. And as to the relation of the Hollanders who found these Geese sitting upon Eggs, it may thus be reconciled with the rest, by saying that some were first bred in *England* and *Scotland*, out of the Shels, which might fly to other places: of the number of which were those Geese, which the Hollanders saw upon the Rocks in their Voyage to *Nova Zembla*. For since the greatest part of Insects being Spontaneously bred do afterwards couple and Generate: why may not these Fowls being Animals much more perfect do the same? *The true Opinion concerning these Scottish Geese.*

Now

The Generation of these Scottish Geese.

Now there is nothing of certainty to be found in Authors concerning the Generation of these Geese. The said *Mejer* Cap. 5. attributes the Generation of these kind of Shels and Birds to the Heaven, and conceits they proceed from I know not what imaginative Virtue in the Heaven. But, as we have said elsewhere, the Heaven is only an universal Cause; whereas here our question is about the next and immediate cause. Nor do I conceive that the Generation of these Fowls is Spontaneous, but I conceive they are bred as other Cockles or Shel-fish are.

And if any one shall wonder that a Bird should spring out of a Cockle or Shelfish, let him think with himself that it was as easie for the Creator to make a Cockle bring forth a Bird as another Cockle; and let him consider how many other wonderful things do happen in Nature. Amongst which is that Relation concerning the Lamb which in *Tartaria* grows out of the ground, which *Sigismund* Baron of *Herberstein* (*in Rerum Muscoviticarum Commentariis*) thus describes: *Not far,* (saith he) *from the Caspian Sea, betwixt the Rivers* Volga *and* Jaik, *there dwelt once the Sawolhensian Kings, of whom I shall speak hereafter. Among these Tartarians,* Demetrius Danielis (*as he was counted among the Barbarians, a grave and credible Man*) *told me a wonderful and scarce credible thing; How that his Father being once sent from the Duke of* Muscovia *to the Zawolhensian King; while he was upon this Embassage, he saw a Seed a little greater and rounder then the Seed of a Musk-Melon, but otherwise not unlike the same: out of which being set in the ground there grew up a thing very like a Lamb five hands high, which they called in their speech* Boramez, *or the little Lamb: For it hath an Head, and Eyes, and Ears, and all other parts like a Lamb newly brought forth, also a delicate fine Skin, which many use in that Country to line their Caps withal. He said moreover, that this Plant, (if it may be called a Plant) hath blood indeed, but no flesh: but instead of flesh a substance very like that of the flesh of Crabs. Moreover it had little hoofs, not horny like those of a Lamb, but Cloathed with hairs resembling horn: the Root thereof was at the Navil or the middle Belly. And it lived so long, til having eaten all the grass round about it, the Root it self for want of nourishment withered away. And this Plant was exceeding sweet, so that Wolves and other Ravenous Beasts did exceedingly delight to Eat thereof.* This Relation is confirmed by others. *Fortunius Licetus, Lib. 3. de Spont. Vivent. Ortu, Cap. 45.* hath this Relation out of the Journey of *Odoricus Utinensis* to the great Cham of *Tartary. I write,* (saith he) *a wonderfull thing, not seen by my self, but which hath been told me by very credible persons, who say that in a certain Kingdom there are Mountains called* Capesci, *where grow very great Pompions, which being ripe do open, and therein is found an Animal like a smal Lamb, which hath flesh and the substance of a Pompion together; and although this may seem incredible, yet as there are Trees in* Ireland *which bring forth Birds, so may there in that place be such Pompions as we speak of.* And in another place he reports the same thing saying. *One day I saw a beast, as big as a Lamb, white as Snow, whose Wooll being like Cotton might easily be pulled off from its Skin; the by-standers being asked told me, that it was given by a certain Baron to the great Cham, as the best flesh in the World for a Man to feed upon: and they said withal, that there was a Mountain called* Capsium, *in which there grew great Pompions, which when they are ripe do gape, and put forth such an Animal. Julius Cæsar Scaliger,* approves the same in *Exercit. 181. Sect. 29. The things aforesaid* (quoth he) *are but toies in comparison of that wonderful Tartarean plant.* Zavolla *is a prime Country of* Tartaria *Famous as the seat of their most ancient nobility. In that Country they plant a Seed, very like the Seed of a Melon, but rounder. From whence arise a plant which they cal* Boramez, *or the Lamb. For it grows in the shape of a Lamb, about three foot above the ground, having Feet, Hoofs, Ears, and the whole head like a Lamb, only it is without horns. Instead of horns it hath hair resembling an horn. It hath a very thin skin whereof the inhabitants make Caps to cover their Heads. They say the inner pulp is like the flesh of a Crab, and of an admirable sweetness. A Root grows out of the ground fastned to its Navil. And which makes the wonder greater; as long as any Herbs grow about it, it lives like a Lamb in a good pasture: But when they are consumed it pines away and dies. Which happens not only by chance, and in tract of time, but also when the grass is taken away, for experiment sake. And to encrease the miracle, it is desired by Wolves, but not by any other Beasts which live upon Flesh.* See concerning this thing, *Andreas Libavius, 2. Part. Singular. Exercit. de Agno Vegetabili Scithiæ.*

The Vegetable Lamb of Muscovia.

But

But how Animals should grow out of dried Plants, is a doubtful question. *Fortunius Licetus, Lib. 3. Cap. 48.* doth blame *Jul. Cæsar Scaliger, Exercit. 59. Sect. 2.* for holding that Plants do generate Animals out of themselves, because a living piece of Wood contains only a vegetative Soul, and therefore cannot produce a sensitive Soul more noble then it self, whereby to constitute an Animal, nor change its own Soul into a sensitive. But he himself holds (which is the first manner according to his reckoning) that a Spontaneous Animal is bred out of the Excrements which yet remain in the rotten Wood, together with the Aliment drawn out of the Earth, made up of the dung and Juyces out of the Bodies of sundry Animals; which afterwards from some external agent receives a disposition at last, to put on the Nature of an Animal; and the Soul being present as in a Vessel presently displaies it self, and gives it self thereto, as an Essential and Quickening form.

Animals springing from dried Plants.

Their manner of Generation according to Licetus. First.

But although I leave every mans Opinion free to himself, yet the Opinion of *Scaliger* is more agreeable to truth. For the vegetable Soul doth not produce the Soul of an Animal nor is changed thereinto, but contains under it another Soul of an Animal, which doth belong to the disposition of the matter, which afterwards being set at liberty displaies it self. And therefore *Scaliger* said not absurdly, that Plants contain in them certain Seeds for the Generation of Animals. Nor is it sufficiently proved, that such insects and imperfect Animals are more noble then the noblest Plants; seeing both the Plants themselves have more noble faculties, and are of longer life then such petty Animals; nor were they produced at the beginning of the World by the first intention of the Creator, as other sorts of Living things; but were only bred out of the Corruption of other things. And if the Opinion of *Licetus* were true, a great many more sorts of Animals would be bred of Woods, seeing the Excrements which Plants draw are various, and therefore of the same Wood sundry Animals should be bred; whereas nevertheless only certain Animals are bred of certain Plants.

Afterwards *Licetus* propounds three other manners, according to which Animals are bred out of the Carkasses of plants. The Second manner he makes to be, when Animals are bred of the Carkasses of Plants in the Waters; and that he saith comes to pass, when the Juyces, Excrements or Particles of Animals contained upon any occasion in the Waters, have in themselves (as in a Vessel) some weakned part of the former sensitive Soul, with a small degree of heat, and so cleave to Plants, and sink into them through some pores or Chinks, and being digested by the ambient heat they are prepared for life again, whereupon the Soul as lying hid in the Form begins to be a substantial and quickning Form, and to constitute an Animal. But though it is not to be denied, that sundry Excrements of Animals with their Juyces and parts are contained in the Water, and may there cleave unto Plants: yet if this manner should be allowed, sundry Animals answering to the several forms of Animals should be bred of woods in the waters, which nevertheless is not so. And therefore after this manner also lately declared, I hold that Animals are bred in the Waters out of dry Plants, and that the Water contributes nothing, save that it disposes the dead Plants to putrifaction, and supplies heat necessary to actuate the hidden form.

The second manner.

He makes the Third manner to be, when as out of the water, in the surface of wood, Atomes or Juyces which have flowed from the Bodies of Animals, living or dead, and fly in the Air, do light upon logs of wood, when they are come to a due quantity, and have from the Ambient Air attained a disposition necessary for Life. For then the sensitive Soul which before lay hid in them as in a Vessel, gives it self to them in the Nature of a quickning Form. And thus he holds that Moths, Flies, Worms, and other such Animals, are bred in the rotten boughes of Trees, which touch neither the Earth nor the water. But those little Animals are Generated, not so much out of the woods, as out of the things which did stick to the said woods: and if they are generated of the substance it self of the rotten woods, they belong unto the first manner.

The Third

Finally, He makes the fourth manner to be, when out of the shavings and juyces of Animals shed from their Bodies upon the Earth, and from the Earth some waies thrust into the Bodies of dead Plants, being digested by the ambient heat, and pre-

The fourth

pared for life, an Animal is bred. But this manner seems not much to differ from the Third.

Animals bred of the juyces of Plants. Animals are also bred of the Juyces of Plants; as is seen by Vinegar and Wine, and other Juyces, and *Aristotle* makes mention of wine gnats 5. *Histor. Animal. Cap.* 19. to which also Honey may be referred. For Animals are also bred thereof, especially if bread be mingled therewith. Now *Licetus* makes a twofold original of these Animals, *Lib.* 3. *de Spont. Vivent. Ortu, Cap.* 49. The First is, when in particles long since fallen from the Body of an Animal, and infected with Dung and Onions, and pressed out with Wine or Juyce of Onions and Basil (for of the Juyce of Onions and Basil he conceives Scorpions are bred) some degree of the former Soul remains, which when by the ambient heat it is cherished and disposed to life; the sensitive Soul lying hid as in a Vessel joyns it self thereto as a quickning form, by which the Worms are first Animated. But *Licetus* hath recourse to the same manner, which he never proved, as if it were impossible that an Animal could be bred of other then an Animal; wheras nevertheless experience teacheth, that such Ignoble petty Animals are bred of the matter which in living Plants was the proper subject of the specifick Form of the Plants. And if Animals were bred of Juyces after this manner, not only Flies and Wine gnats would breed out of Wine, but other Animals also; since it is not credible that the forms of Flies only are contained in the dung wherewith Vines are manured. And whereas many things are every where reported by Authors concerning the breeding of Scorpions out of Basil, (concerning which experience must be consulted) it is not credible that all Basil Plants have drawn with their Aliment the particles of Scorpions; since in many places Basil grows, where there are no Scorpions. It is more credible, that since of certain Juyces not any Animals but only a certain sort is bred; the Creator being rather willing that of the Corruption of Plants an Animal should be made, then a putrid Body, hath given to the Bodies of Plants a power for the production of such determinate Forms.

Some Animals generate without Copulation Moreover it is well known, that most Animals are generated by the Copulation of Male and Femal, or of the Seeds of Male and Female Joyned together. Yet it is also observed that some Animals are Generated without the Congress of Male and Female. Female Mice engender of themselves, and thence it is they are so speedily and plentifully generated. So, *Aristotle* 6. *de Histor. Animalium* relates, *Cap.* 37. that a Mouse with young being shut up in a Barrel of Milet, a while after the Vessel being opened, an hundred and twenty yong Mice were found therein. And a little after he writes, that in a part of *Persia*, a Mouse with yong being cut up, the Female Mice in her Belly were found to have yong ones in them: and that there are some who stand stifly in it, that if Mice lick Salt they breed yong without Copulation. So that a man may (not without Reason) doubt, whether that is true which is reported of Mice being bred of rubbish. For since Mice can be so easily generated, if some Mice do but Leap to seek Food out of an old Ship into a new one, they may easily grow to a great multitude. So *Aristotle* tells us that Eels have no Male nor Female 4. *Histor. Animal. Cap.* 11. and that they have neither Seed nor Eggs, but they are generated of a slimy matter coming from the whole surface of the old Eele, as Snakes Skins come from them. And he tells the same thing in 6. *de Histor. Animal. Cap.* 14. and 16.

Female Mice engender of themselves without the Male

Eeles have no Male nor Female

The Seminal principal of some Animals may lie hid in sundry Bodies. From the premises 'tis easie to answer to the objection of some men, who cannot understand how the Seminal matter may lie hid in rubbish, (*viz.* Such as mice are said to be bred of, if so be they are so bred as hath been said) can be of the same specifick Nature with the Seed of the Male and Female, of which they are otherwise generated. For we must observe that in such more Ignoble Animals Generation is not so strictly tied to the Seed of Male and Female, as in perfect Animals, but that one sex alone may also generate. And as some Seeds of Plants can consist and abide even in a base matter, as in Rain: So also the Seminal matter of these Animals can lie hid in rubbish, or other base matter.

The Generation of Animals without sex is not Spontaneous. *Fortunius Licetus* reckons this kind of Generation, when an Animal is bred of another Animal of the same sort, but without Seed, or without the Seed of the Male, to be a Spontaneous Generation, *Lib.* 3. *de Spont. Viv. Ort. Cap.* 50. But I conceive this to be no Spontaneous Generation properly so called. And as the Generation of

of Plants whichhave no sex by their Seed, or by a branch or Root, is therefore termed non-Spontaneous, because it is made by the same sort, and by Seed, or part containing in it the Seminal principle: so also Mice, if they breed Seed in themselves without the Male, or if Eeles are produced out of the slime containing in it the Seminal principle, they are not properly said to be of Spontaneous Original.

A three-fold Original of Spontaneous Animals

Those Animals are more properly said to be Spontaneous, which are generated out of Animals of a different sort. Now this comes to pass three manner of waies. For sometimes petty Animals are generated in Living Animals; and sometimes Animals proceed from the Excrements of Living Animals, and sometimes out of the Bodies of such as are dead. And of such as are bred in live Animals, some are bred in the very substance of the living parts, and some in the Cavities. And because both these kinds proceed from Excrementitious Humors, we shall treat of them together. Hitherto pertain those little Dragons which are bred in the external habit of the Body of such as dwel in the Easterne parts of the world. Of these *P. Æginet*a doth write, *Lib. 4. cap. 59.* In the *Indies* (saith he) and the upper parts of *Egypt*, little Dragons are Generated, or certain Animals resembling Worms, in the Musculous parts of the Body, as in the Arms, Thighs, Legs; and they creep along the sides of Children, under the Skin, so as they are plainly seen to move. Moreover when some reliques of a Dragon have remained long in a place, the place suppurates, and the Skin being opened, the Head thereof comes forth; when it is drawn it causes pain, especially if it be broken off. *Diodorus Siculus* also mentions the same Disease, *Lib. 4. Cap. 3.* and *Straboin Lib. 6.* who writes that this Disease happens to the Ethiopians who are next to the *Silli* who live upon Locusts; and *Plutarch* 8. *Sympos. Quæst. 9.* in these words: those that inhabit about the red Sea, when they are sick (as *Agacharchides* relates) as they are vexed with other unheard of Symptomes; so also with little Snakes, which breed in their Arms and Thighs and put out their Heads to eat the flesh, and being touched enter into the Flesh again, and creeping through the Musculous parts cause intollerable inflammations; which kind of Disease was never heard of before, or since, in any other people. Also *Amatus Lusitanus* treates of this Disease in *Cent. 6. Curat. 64.* [*I have heard here in* England *strange stories of People that have had Wolves in their flesh which they were fain daily to feed with raw beefe. Which I allwaies reckond for Fables. I knew a Woman in* Amsterdam *that pretended one in her brest, but upon visitation I found it an Imposture, to move pity, and that the Meat which was given her to feed the Wolfe she might Eat her self.*

Dragon-worms.

Fortunius Licetus, Lib. de Spont. Viv. Ort. cap. 51. makes the fiery Serpents which God sent amongst the Israelites, *Numb. 21.* to be these kind of Dragons aforesaid, and reprehends *Vallesius*, for that in his *Philosophia Sacra* where he handles such like subjects, he did not observe and signifie as much; and holds that really out of the Bodies of the living Israelites little Serpents and Worms were generated, of so Malignant a Nature that they did cruelly eat their Members, and exceedingly inflamed the same, raising most sharp and burning pains, whence they were called fiery Serpents. But he reproves *Vallesius* without cause, and his Opinion doth not agree with the text of the Bible, from which it is manifestly apparent, that as by the sight of the Brazen Serpent the stinging of those Serpents were cured, so God for to punish the People of *Israel* had sent amongst them such Serpents as did bite them without, but were not bred in their Bodies.

The Serpents sent by God amongst the Israelites in the wilderness were not these little Dragons.

It hath been observed that Worms grow under the Tongue of an Hart, and *Aristotle* saith as much, *2. de Histor. Animal. Cap. 15.* And Hunts-men relate, that mad Dogs have a great Worm in the loose parts under their Tongues, bred of black blood, whereof that Vein is full, which being shut up in a little bag sends Poisonous vapors into the brain and makes the Dogs mad; which Worm being taken out in time prevents their madness. *Pliny* makes mention thereof, *Lib. 29. Cap. 5.* and writes that the Greeks call this Worm *Lytta*.

Worms under the tongue of Harts and Dogs:

That certain Vermine called *Ricini* and *Cynorrhaistæ* or Tykes are bred in the Skins of Dogs, Sheep, Oxen and Harts, is very well known. That Worms are bred in almost all the parts of a Mans Body, I have shewed, in *Lib. 2. Instit. Medic. Part. 3. Sect. 1. Cap. 11.* which happens also in other Animals. For in them are

Ricini or tykes, worms so called:

bred Fleas and Lice.. *Aristotle* makes mention of the Acari. And *Julius Cæsar Scaliger* speaks of an Animal much lesser, *Exercit.* 194. *Sect.* 7. which the *Piceni* cal *Pedicellus*; the *Taurini*, *Scirus*; the *Gascoignes* a *Brigant.* They are vulgarly called *Sirones* or *Chirones.* And he writes that it is wonderful, that they have no express shape, save of a Globe, and that they are scarce discernable by the Eye-sight, and so little that they seem not to be made of Atomes, but to be themselves the Atomes of *Epicurus*; it quarters so under the Skin, that by making holes it breeds a burning pain.

Animals Breed in Animals after a threefold manner, according to Licetus.

As to their Generation, *Licetus* propounds a threefold way and manner, *Lib.* 3. *de Spont. Vivent. Ortu, Cap.* 51. The First is when the Soul of the old Animal begets another Soul in the Excrements contained within the Body subject thereto, not like it self, but much more imperfect; being hindred by the imperfection of the matter; as the Seed of an Horse coupled with an Asse doth not generate the Soul of an Horse, but one of a far inferior Nature, by Reason of the baseness of the matter.

The Second manner he makes to be out of the Excrements separated from the Aliment, wherein (as in a Vessel) there is a portion of the former living Creature from whence the Aliment came. For such Excrements being digested in the Body of the Animal by the heat of the Ambient Bowels, and by digestion having attained dispositions necessary to Life, they come to receive the Latent Soul, in the notion of a quickning form. And after this manner Worms (he saies) are frequently bred in the Belly of Man, out of the Excrements of the first digestion brought thither.

The Third manner he holds to be of Excrements into which by the action of heat the substance of that living thing is turned, in which such Animals are Spontaneously generated, in which Excrements there is yet remaining some portion of the former Soul, as in a Vessel; which when by the digestive heat of the Ambient Air it hath attained dispositions necessary to Life, it gives it self to its subject matter in the Nature of a quickning Soul, which constitutes divers kinds of Animals; for that the former Soul is so impaired as to degenerate into an Essence much more imperfect then it was before. And that after this manner a Serpent may Spontaneously breed in the Womb of a Woman, a Flea or Louse in the Skin of a man, or a Crab-Louse within the pores of the Skin.

But in very deed, as to his first manner of Generation, it is hardly agreeable to truth. For it is not yet proved that one Soul can beget another of a different sort. The forms indeed by the indisposition of the matter are so hindred that they cannot attain their end, so that somtimes Monsters are bred; and that one Soul may put on different Bodies, was said before: but that it may produce another Soul, is not agreeable to truth. Every Soul indeed can multiply it self, not by generating another out of or in the subject matter, but by multiplying it self, by the divine Benediction, and by communicating some of its Essence, without Diminution of its self. Nor doth a Mule Generate, because the Soul of an Horse acting upon the matter of an Ass doth produce the Soul of a Mule, as baser then it self; but the Horse communicates his Soul, which being mixed with the Seed and Soul of the Ass doth not produce an Ass, but a Mule, equally participating of the Nature of an Horse and an Ass.

Also the Second manner cannot take place. Nor when Worms are bred in the Guts, was there a portion of the Soul divided from the Worm; but such was the disposition of the matter, that thereof a Worm might be bred.

Thirdly, In Excrements indeed into which the substance of some part is turned, Worms are bred, as happens somtimes in Ulcers: but who can beleeve that the Soul of a man (for that there is but one Soul in a Man we proved before) should so degenerate as to turn into the Soul of a Worm? And to let pass that question concerning the Soul of a Man; Worms often breed in the Ulcers of Horses, but who will beleeve that the Soul of an Horse is turned into the Soul of a Worm? I hold to that which I have said in my 12. *Chap. de Consens. & Disen. Chymic. cum* Galen. And I have said before in general, that of the matter which is the subject of the specifick Form such Animals are bred; and therefore as that matter is various, so also various Animals are generated, and determinate Animals of such and such matter;

in

in Ulcers Worms, not Lice or Fleas, of the filth of the Skin Lice and Fleas, not Worms. For just as Plants (as *Scaliger* writes, *Exercitat.* 59.) breed Animals, not by putrefaction, but cherishing certain Seeds within themselves; and in *Exercit.* 100. Animals are not bred in putrid Plants, but are the work of the remaining vigor of the said Plants; so is it in Animals: and as he writes in 1. *de Causs. Plant. Cap.* 5. in Spontaneous living things there are certain most secret Seeds.

Animals bred of the Excrements of Animals.

Moreover Animals are bred of the Excrements of Animals of the same sort. *Pliny Lib.* 9. *Cap.* 51. writes concerning Frogs, that they are dissolved into slime, and in the Spring time breed again in the Waters. That dead Flies and Bees revive again, is most known; and of dead Bodies little Animals of the same sort are generated. Concerning Silk-worms it is a noted Case, of which *Hieronymus Vida* in his 1 Book of his Poem of Silk-Worms, hath these Verses:

Go luckie Souls, and in your labors blest,
That die with courage; when you are at rest
Venus of pitty shall new Bodies give,
And you in open Air again shall Live.

And *Paulus Zacchias* writes concerning this matter, *Quæst. Medico-Legal. Lib.* 4. *Tit.* 1. *Quæst. Ult. Also that Worms and Beetles, and many Bodies of Insects, are oftentimes changed, and do many times live again, and take new shapes, any one that will may easily experiment, and the most industrious Physitian* Petrus Castellus *hath a thousand times experimented.* Which it would also become others to experiment, before they did deny things contrary to manifest experience, yea and traduce them as absurdities. This indeed is strange, but experience manifests it to be true. For the more Ignoble Forms are so ordered by Nature, that they can lie hid under matter of a different sort as to external Form, and their Soul can retain its Essence entire without the operations of Life. Where it is to be noted that such insects sometimes do not really die, but only because they are ill disposed they lie as it were dead, exercising no manifest operations: in which manner, Flies lie in cold Chambers as it were dead in the Winter time, but as soon as the Chambers are heated they begin to Fly again. But sometimes they die really, which comes to pass when Frogs are turned into Mud as it were, or such insects are so broken to pieces that there is no more disposition to Life; where nevertheless the Latent Soul having gotten fit matter it shapes it self a Body like the Former.

Some Animals after they are dead revive again:

Fourthly, 'Tis very well known, that Animals of a different sort are bred out of the Carkasses of Animals. That Bees may be generated out of the Carkass of an Heifer *Columella* relates from *Democritus, Magus,* and *Virgil, de Re Rustic. Lib.* 9. *Cap.* 14. That of the Carkass of an Ass drones are bred, and Hornets of the Carkass of a Mule, and Waspes of the Carkass of an Horse, many Authors relate. *Hieronymus Vida* tels us that Silk-worms are bred of the Body of a yong Heifer fed with Mulberry Leaves, *Bombyc. Lib.* 2. And many like things are related, concerning the truth whereof we must consult with experience. Many report that a Toad wil breed of the Carkass of a Duck. And divers give out, that of the marrow of a Mans Body lying in the Grave Serpents are bred, of which the Poet;

Animals of a different sort out of the Carkasses of Animals:

When a Mans Back-bone in the Grave doth Rot
Some think a Snake is of his Marrow got.

And *Pliny, Lib.* 10. *Cap.* 66. reports from many Authors, that a Snake is bred of the marrow of a Mans Back-bone. But this is doubtless Fabulous, nor doth experience confirm the same. *Ovid* writes that Scorpions are bred of Crabs:

From a Land-Crab taking his Clawes away,
If what remains under the Ground you lay,
Out comes a Scorpion with his hooked Tail
Threatning to sting you, if he can prevail.

Concerning

Concerning these things therefore we must consult with experience. For all such Animals are not bred of every Animal; but some of one only, some of another.

How worms are bred of the Bodies of Animals:

Nor doth it follow from our Opinion, as one man cavils, that the Bodies of Serpents, or Serpents themselves, Frogs, Toads, Lizards, do go to the constitution of our Bodies, and that we are actually made up of such things as are destructive to our Natures. For no man ever saw such Creatures bred of the Body of a Man. And although such things have been bred in Mens Bodies, yet have they not been bred of the Body it self, but of vitious matter brought into the Body from elsewhere. Yet is our Body so disposed that some Worms may breed thereof, which nevertheless were not actually in the Body, but that matter had a disposition that Worms might be made thereof. Where nevertheless this is also to be considered, seeing our Body may be considered as in health, and as being sick, we must mark whether these Worms are bred in the Body being sick or in health. And it is most credible that such Worms are bred in Mans Body being sickly, but not as it is found; but rather of vitious Aliment, and Excrementitious Humors, as in *Arabia* the foresaid little Dragons are reported to be bred of Excrementitious Humors in living Bodies; and little Worms breed in the back of Infants, of which we spake before. *Johannes Marci* in his *Idea Idearum Operatric.* makes the cause thereof to be the eating of Locusts. For since those people Eat Locusts frequently (from whence they are termed *Acridophagi*) in proces of time there grows an itching and putrefaction in their members, and their flesh is changed into a kind of insect not unlike a Locust, whereupon they pine away and die. For he writes, that in the Chile and blood, yea and in the flesh it self, strange forms are contained and may be preserved, because in all those Mutations nothing is generated contrary to them. For the latter Form approaching doth not change the whole substance and abolish the former Forms, but takes away only such as are contrary to its own faculties. So, that same subordination of forms must not be stretched too far, nor must we if any thing be bred of the Body of an Animal presently conclude, that it proceeds from the Natural matter thereof; since it may be bred from the Aliment and Excrementitious Humors therein. So I do not conceive, that the Form which shapes the Body of a Silk-worm in the Carkass of an Heifer is a form subordinate to the form of an Ox, but that it lay concealed in the Mulberry leaves, as appears out of these Verses of *Hieronymus Vida*, in the 2. Book of his Poem of Silk-worms.

But if your stock of Silkworms should decay,
And all your Seed should chance to die away,
By wrath of Jove: *As Bees they say are bred*
From Heifers Body, kil'd and buried;
From the same Body, only with more care,
Your missed Silk-worms Generated are.
For twice ten daies, and twice ten Nights, at first
Keep her from Graß, nor let her quench her thirst
With any Water. But in Stable shut
Mulberry Twigs and Leaves see that you put
Into the Crib: no other Meat or Drink;
Then kill and let her Carkaß Rot and stink:
When lo a Lusty swarme of Silk-worms smal
Out of her Sides and Back you'll see to Crawle.

The manner of Generation is the same, which we have formerly declared concerning Plants.

The difference of Spontaneous Animals.

Now this is also to be noted, that there is some difference betwixt Spontaneous Animals. For some are altogether base, which generate nothing, as the Wine Gnats and such like Worms; other somwhat more perfect do not Generate living yong ones, but produce little Worms, or somwhat like an Egg in Nature, out of which afterwards petty Animals of the same sort are Generated. So Flies engender little Worms, which grow to be Flies; which also *Julius Cæsar Scaliger* observed, as he relates, *Exercit.* 191. *Sect.* 2. Lice breed Nits, which also turn to Lice; although some

some falsly deny the same; as we have shewed in our *Tract de morb. Infant. Part.* 2. *Cap.* 5. *de Phthiriasi.* Others produce Animals of their own sort, as is wel known of Mice; provided it be certain that they are Spontaneously generated. And truly I conceive there are few Animals Spontaneously Generated, which do not afterwards generate such as themselves. *Aristotle* in *Lib.* 5. *de Hist. Animal. Cap.* 19. tels us that Glow-worms are Generated out of a certain kind of hairy Palmer-worms. Yet *Fabius Columna* relates, in *Observ. Lib. min. Cognit. et Rar. Stirp. Addit.* that *Carolus Vintimillias* the *Panormitan* observed in *Sicily*, that Glow-worms are some Male and some Female. For keeping divers naked ones in a Glass for his pleasure, and delighting to see them shine in the night, (for which cause he fed them with moistned bread) as he was at Supper, a winged one came flying about the Candle, which he caused to be caught and put into the Glass unto the rest, which presently (he looking on) one Trod one of them and stuck to her, as the Silk-worm is wont to do, and being Pluckt from her he Trod another and another: and the day following they laid their Eggs, resembling Milet Seed in shape and color. *Glow-worms do couple.*

This only we shall add by way of Conclusion, that we conceive *Aristotle* to have been in the right when he wrote, *that all things in some sort are ful of Souls.* Which though they do not allwaies Animate and inform the things wherein they are, no nor act at all, yet they lie concealed in them; and when they find their time and have gained fit matter they display their forces. And therefore again, *Julius Cæsar Scaliger* did wel write, in 1 *de Plantis*, that there are most secretly hidden Seeds of Spontaneous live things. And therefore, if we list to speak accurately, nothing can properly be said to be Spontaneously generated; but every thing is bred of its own Seed, though hidden and not discernable by our senses, or at least of a principle answering to Seed. And this is all the difference betwixt Spontaneous things and non-Spontaneous, that the latter have a manifest Seed, the former an hidden secret Seed, or somwhat equivalent thereto. For we list not here to contend about words. Only this must be remembred, that those things which are said to be Spontaneously generated do not proceed from an external equivocal agent, but from an internal principle; which if any man will cal Seed, or a Seminal principle, or somwhat answering to Seed, he shall have my Consent. For although *Licetus*, *Lib.* 4. *de Spont. Viv. Ort. Cap.* 2. denies that all things have their Seeds: yet there he grants, that those things which are said to be of Spontaneous original have somwhat answering to Seed. Now the manner of their Generation is this; as an Animal is said to nourish and augment it self, whiles the common principle and first cause of nutrition and augmentation communicates it self to the assimilated Aliment, and insinuates it self thereinto, but doth not make a Soul like it self in the Aliment: so the Spontaneous original of live things is effected, whiles the agent lying hid within the matter, and not yet manifestly performing the operations of a Soul, having gained a matter rightly fitted and disposed, communicates it self therto, and begins to perform therein the operations proper to it self, and to exercise the function of a Soul, but doth not produce another Soul in the matter. *All things ful of souls*

The Conclusion.

And so much shall suffice to have spoken (though but briefly) of a most exceeding hard and obscure subject. It had been easie to have discoursed more largely of more sorts of Spontaneous living things: but my purpose is not in this place to write a natural History, but only to propound the manner of the original of Spontaneous living things, and to declare the same by certain examples. And although I know many things may be objected against that manner of the Generation of these things which seems to me most probable: yet this I know withall, that it is easier to oppose the truth then to declare the same; and that a right line is the measure of it self and a crooked line too; and who ever shall rightly discern the truth may easily answer all objections, of which a thousand may be invented.

Nevertheless

Nevertheless if any thing obscure and doubtful shall occur in an Argument handled by few Authors, it is not fit to reject or condemne the same, before somwhat better shall be substituted in the place thereof. And therefore, friendly Reader,

If ought thou know'st, which is then this more true,
Write it; if not, Use this: and so Adieu.

SUch is the Acuteness and Solidity of this Excellent Philosophical Treatise, wherein our learned Author hath in my Opinion performed his Master piece, that he and the Englisher thereof may well say in the words of *Ovid*:

And now the work is ended, which Joves rage
Nor Fire nor Sword shall raze, nor Eating Age.
Come when it will my deaths uncertain houre,
Which of this Body only hath a power:
Yet shall my better part transcend the Skie
And my immortal name shall never die.
For whereseere the British Peoples spred
Their conquering Arms, I shall of all be Read.

FINIS.

The Art of CHIRURGERY,

Explained in

SIX PARTS.

Part I. *Of Tumors*, in forty six Chapters.

Part II. *Of Ulcers*, in nineteen Chapters.

Part III. *Of the Skin, Hair, and Nails*, in two Sections, and nineteen Chapters.

Part IV. *Of Wounds*, in twenty four Chapters.

Part V. *Of Fractures*, in twenty two Chapters.

Part VI. *Of Luxations*, in thirteen Chapters.

Being the whol

FIFTH BOOK OF Practical Physick.

By *Daniel Sennert?*, Doctor of Physick. And *R. W.*
Nicholas Culpeper, Physitian and Astrologer.
Abdiah Cole, Doctor of Physick, and the Liberal Arts.

Above Eight thousand of the said Books (in Latin and English) have been sold in a few Yeers.

LONDON:

Printed by *Peter Cole* and *Edward Cole*, Printers and Book-sellers, at the Sign of the Printing-press in Cornhil, neer the Royal Exchange. 1661.

The LIFE of
DANIEL SENNERTUS,
Doctor of Physick.

DAniel Sennertus *was born at* Uratislaw *the chief City of* Silesia, *in the Year of Christ*, 1572. *on the* 25. *day of* November, *about the time of Sun-set. His Father was* Nicholas Sennertus, *a* Shoo-maker, *born at* Lehnen *in* Silesia, *and Free-man of the City of* Uratislaw, *a good honest man, and respected amongst his fellow Citizens. His Mother was* Katherine Helman *born in the Town of* Zotten *at the Foot of the Mountain* Zaboth *or* Zoten, *whence the Town hath its well-known name. And it being his Fathers hap to die in the Yeer* 1585. *on the eigth day of* April, *about the Eightieth Yeer of his Age; his Mother was as careful as a Woman could possibly be, to have him trained up in Piety and good Literature. To both which (by the Goodness of God) he had such a Natural Inclination, that he hardly ever stood in need of any body to provoke and incite him thereunto, nor did he ever make use of any private Master, but by the advice of Friends (with whom his careful Mother consulted) he wholly devoted himself to the study thereof. And when he had made so great a progress in the Schools of that City wherein he was born, that he was now fit for the University (as his Masters judged) he went to the University of* VVittenberge, *in the Yeer* 1593. *on the sixt day of the Month of* July. *And because he then entertained no high Hopes nor Ambitions, but his only Aim was to gain a School-Masters Place in the City wherein he was born; therefore in his first Yeers spent in this University, he chiefly busied himself in the studies of Phylosophy, in which by the Blessing of God he so thrived, that in the Yeer* 1598. *on the third day of* April, *he was made Master of Arts, holding the fourth place of Seniority and Dignity amongst fifty eight that Commenced with him. But notwithstanding, coming by divers Circumstances to understand that God had designed him to some other Imployment, he joyned the study of Physick to his study of Philosophy, and afterwards applied himself wholly thereunto, and so handled the same that he gained the Love of his Fellow Students, and the Favors and Good-will of*

his Instructers in that Faculty. And although he well-nigh finished the Course of his Studies at VVittemberge; *yet he visited the Universities of* Lipsia, Jene, *and* Francfort *upon* Odera. *And when at lengh his Age and other considerations did advise him so to order his Affairs that some Fruit might redound from his Studies both to himself and others, he went to* Beroline (*where the Electors of* Brandenburge *keep their Court*) *in the Yeer*, 1601. *that he might there observe the Practice of the most expert Physitians. And from thence he intended to go to the Universty of* Basil *that he might there Commence* Doctor of Physick, *minding afterwards to return into his Country to practice the same. But whiles he was writing his Disputation which he intended to hold at* Basil *for his Degree, a Messenger comes from* VVittemberge, *and brings him a Letter from* Tobias Knoblock, *intimating that he and some others were intended to Commence Doctors there, and desiring to know if he would make one amongst them. Being doubtful therefore what to do, whether he should proceed to* Basil, *or return to* VVittemberge, *he asked Advice of his most intimate Friend, Dr.* George Magnus, *who advised him to return to* Wittemberge, *saying withal,* * Who knows what good may come on't? *Whereupon (taking the Speech of his Friend for the Voyce of God) he returned to* Wittemberge, *and (with these following Competitors, Mr.* Balthazar Schultzius, *Physitian to the Dutchie of* Pomerland, *and the Common-wealth of* Colberge, *Mr.* George Belser *of* Ulme, *then Professor of Natural Philosophy at* Eilenberge, *and afterwards prime Physitian to the Prince Elector of* Saxony, Tobias Knoblochius *of* Bretaigne *in* France, *afterwards Physitian to the Prince and Common-wealth of* Onold) *he Disputed for his Degree on the third of* July, *in the Yeer* 1601. *and upon the tenth of* September *in the same Yeer, he was with them created* Doctor of Physick *by the Colledg of Physitians of that Universty. And although then also he was thinking to return into his Country; yet that same Prediction of his Friend appeared not to be vain. For Doctor* Johannes Jessenius *being then about to leave the Professorship of Physick, not only some of the Professors did put him upon it to seek the gaining of the said* Jessenius *his vacant Place; but Doctor* Jessenius *himself also in his Letter of the sixteenth of* June, 1602 *whereby he resigned his* Place *to the Prince Elector, commends him as a man of an hundred for ability to undergo that Function which was a burden too heavy for ordinary shoulders. Wherefore following their Advice, he wrote a Letter to the Colledg of Physitians presenting his Service unto them, and he did easily obtain, not only to be nominated by the Colledg of Physitians and Universty, but to be confirmed in the place of Professor by the* Prince Elector of Saxony, Christian, *the second of that Name, and upon the fifteenth day of* September, 1602. *he was received into the Colledg of Physitians. In*

* *Wer weiß wozu es gut seyn möchte*

See at the beginning of the Judgments of Learned Men.

which

which Place *by the blessing of God, to whose Name be the Glory, he so carried himself that all his care was faithfully to discharge the Office committed to him: and his Diligence in teaching was rewarded by the Gratitude of the yong Students his Disciples. Nor did he think himself sufficiently discharged of his Duty, if he did not neglect his publick Lectures, but he labored withal to advance the Art of Healing by his Writings. Wherein how he hath acquitted himself appears from the following Testimonies and Judgments of most renowned men. He was the first that brought the Practice of Chymistry into the University of* Wittemberge, *concerning which Art, though the Judgments of men are various, and true it is, that the abuse thereof is now adaies as great as the use well-neer. Yet it is well known that no man can wholly reject the same, save he that is altogether unacquainted therewith. Also in the Practice of Physick he did all his endeavor to help many, and hurt none. Hence it came to pass by Gods blessing, that not only at* Wittemberg, *but from other* Parts *also, his Advice was sought by many sick people, both high and low, rich and poor. To all which he was most ready and willing to afford his Advice and Pains, even with the neglect of his own Health: nor did he ever refuse his helping hand to any one. He never required any price of any one for his pains, but whatever was presented to him he received it with thanks, and he passed by without offence the Ingratitude of many of his Patients, yea, and to poor people he restored what they presented him by way of acknowledgment. What danger he underwent from the Yeer* 1602. *to the day of his death, in which time the Plague was in the City seven times and more, very brief, besides other contagious Diseases which frequently crept up and down, his unexpected and sudden Death did at last declare. In which pestilential and sickly seasons he never stirred out of the Town, although he was at liberty so to do, having no obligation upon him to the contrary. In the Year* 1628. *on the* 28. *day of* March, *attending upon the* Prince Elector *of* Saxony, *being sick of a pestilential Feaver, he was unexpectedly by him made one of his Physitians in Ordinary, he leaving it free for him to continue in his* Place *at* Wittemberge. *He was also most frequently sought unto and advised with by many other Dukes,* Princes, *Earls, and Nobles, especially of lower* Saxony, *and upper* Germany, *who all by the Grace of God found good by his Advice and Help. Nor must it be here omitted, how by the advice of the* Physitians *of* Padua, *the most illustrious Lord* Nicholaus Sapieha, *Earl of* Coden, *chief Ensign-Bearer of the great Dukedom of* Lituania, *being troubled with a desperate kind of Disease, came out of* Poland *to* Wittenberge, *above an Hundred German Miles, and received Help by the Advice of* Sennertus.

* See his Letter among the Judgments of famous Men.

He was many times Dean of the Colledg of Physitians, and six times publickly created Rector of the University, a thing never known before.

He

He had three Wives, but Children only by his first Wife Margaret, *Daughter of the most excellent and renowned* Andreas Schaton, *Doctor and Professor of Physick, and Senior of the same Colledg at* Wittemberg: *By her he had seven Children, whereof three are only yet alive, two Sons and one Daughter, viz.* Andrew *and* Melchior, *the former Doctor of Divinity, and the latter Doctor of* Physick; *and* Margaret *the Wife of Dr.* Laurence Pope, *Physitian to the Prince Elector of* Saxony. *The rest of his Children died in their Infancy, or before they were well come out of Boyes Age, excepting* Daniel *his eldest Son, who being twenty eight yeers of Age, died at* Padua *where he studied Physick. But this his Father (of whom we speak) ended his daies, and rested quietly in Christ the* 21. *of* July, *in the Yeer* 1637. *at which very time the Pestilence was also rife, whereof he died. He was three score and five yeers old when he died. He was buried in the* Tower Church, *or the Church of the* University. *There his Tomb-stone is to be seen with this Inscription graven thereupon.*

The Inscription of the Tomb-stone.

D. O. M. S.

THOU THAT CANST TREAD UPON THIS SACRED EARTH, STOP TILL THOU READEST WHAT THE STONE WILL SAY.

HERE LIES

DANIEL SENNERTUS,
A SILESIAN OF URATISLAW:

WHO IN TEACHING AND PRACTISING THE ART OF HEALING XXXV. YEARS, WAS AS IT WERE THE ORACLE OF HEALTH: AND THEREFORE BEING MADE ONE OF THE CHIEF PHYSITIANS TO THE PRINCE ELECTOR, HE ATCHIEVED THE TOP-CHAIR OF PREFERMENT BY HIS VERTUES.

HE WAS BORN THE XXV. OF NOVEMBER 1572. AND DIED THE XXI. OF JULY 1637. BUT ETERNALLY SURVIVES IN THAT GLORY AND RENOWN, WHICH LIVING, BY THE ILLUSTRIOUS MONUMENTS OF HIS MIND, WIT, AND UNWEARIED INDUSTRY, HE GAINED TO HIMSELF THROUGHOUT EUROPE, AND WHEREWITH HE DID ILLUSTRATE THIS UNIVERSITY.

THE SURVIVING ORPHANS TO THEIR INCOMPARABLE AND INDULGENT FATHER, HAVE IN PIETY REARED THIS MONUMENT.

THE CONTENTS OF THE Art of Chirurgery, Explained in SIX PARTS.

PART I.
Of Tumors.

Page

CHAP. 1. *Of the Nature, Causes, and Differences of Tumors.* 2401
Chap. 2. *Of Tumors arising from Humors in general.* 2407
Chap. 3. *Of Impostumes.* 2411
Chap. 4. *Of extream Corpulency, or over-much fleshing.* 2416
Chap. 5. *Of an Inflammation.* 2420
Chap. 6. *Of the* Sinus *in the Tumor.* 2441
Chap. 7. *Of the Tumor* Erysipelas *or* Rosa. 2445
Chap. 8. *Of a* Bubo. 2446
Chap. 9. *Of the Tumor* Furunculus. 2448
Chap. 10. *Of the Tumor* Phyma. 2449
Chap. 11. *Of the Tumor* Phygethlon. 2450
Chap. 12. *Of the Tumor* Parotis. ibid.
Chap. 13. *Of a Carbuncle.* 2453
Chap. 14. *Of the Tumor* Paronychia. 2459
Chap. 15. *Of Perniones or Kibes.* 2460
Chap. 16. *Of the Tumor* Ecchymoma. 2462
Chap. 17. *Of the Tumor* Herpes 2467
Chap. 18. *Of the Tumor* Oedema 2470
Chap. 19. *Of a* Scirrhus. 2473
Chap. 20. *Of a Cancer* 2476
Chap. 21. *Of a Watry Tumor* 2481
Chap. 22. *Of* Exanchemata, Ecchymata, Papulæ, Pustulæ, Phlyctenæ, *and* Eczesmata. 2482

Page
Chap. 23. *Of* Vari *or Pimples.* 2484
Chap. 24. *Of* Sudamina, *and* Sirones. 2485
Chap. 25. *Of* Epinyctides, *and* Terminthi. 2486
Chap. 26. *Of* Effere. 2487
Chap. 27. *Of* Scabies, *or Scabiness.* 2488
Chap. 28. *Of* Lepra *of the Greeks.* 2495
Chap. 29. *Of* Vitiligo, *or* Leuce, *and* Alphus. 2497
Chap. 30. *Of the Tumors,* Impetigo, *and* Lichen. 2500
Chap. 31. *Of* Gutta Rosacea. 2502
Chap. 32. *Of Crusta Lactea, Achores, Favi, Tinea, Ficus, Helcydrium, Psydracia, and Phthiriasis.* 2504
Chap. 33. *Of* Strumæ, *and* Scrofulæ. 2506
Chap. 34. *Of* Ganglium, *and* Nodi. 2507
Chap. 35. *Of* Meliceris, Atheroma, *and* Steatoma 2510
Chap. 36. *Of* Testudo, Talpa *or* Topinaria, *and* Natta 2513
Chap. 37. *Of* Verrucæ *or Warts.* 2514
Chap. 38. *Of* Cornua 2517
Chap. 39. *Of* Fungi 2518
Chap. 40. *Of Tumors Malignant and Poysonous, and in special of* Elephantiasis. 2520
Chap. 41. *Of a flatulent or windy Tumor.* 2527
Chap. 42. *Of Tumors proceeding from the solid parts falling down into, or resting upon some other parts, in general,* 2528
Chap. 43. *Of* Aneurysma 2529

Chap. 44. *Of the swoln Veins, called* Varices 2533
Chap. 45. *Of the* Elephantiasis *of the Arabians* 2537
Chap. 46. *Of Particular Tumors* 2538

PART II.
Of Ulcers.

Chap. 1. *Of the Nature and Differences of an Ulcer* 2544
Chap. 2. *Of a simple, or single Ulcer.* 2546
Chap. 3. *Of an Ulcer with a Distemper.* 2553
Chap 4. *Of an Ulcer with the afflux of Humors* 2556
Chap. 5. *Of the* Sordid, Putrid, *and* Corroding *Ulcer* 2557
Chap. 6. *Of an Ulcer with Tumors.* 2559
Chap. 7. *Of proud flesh growing forth in Ulcers* 2560
Chap. 8. *Of an Ulcer that is wan, and Callus* ibid.
Chap. 9. *Of Ulcers that are hallowed and furrowed.* 2561
Chap. 10. *Of Fistula's* 2563
Chap. 11. *Of an Ulcer, with Vermine, or Worms breeding therein.* 2568
Chap. 12. *Of a Varicose Ulcer* ibid.
Chap. 13. *Of an Ulcer with the rottenness of a Bone.* 2569
Chap. 14. *Of Ulcers hard to be cured, commonly called* Cacoethe, Telephium, *and* Chironium 2572
Chap. 15 *Of the Ulcer* Phagedæna 2574
Chap. 16 *Of an Ulcer with pain* 2576
Chap. 17 *Of the Ulcers of the Legs, and other particular Ulcers* ibid.
Chap. 18 *Of Burnings* 2577
Chap. 19 *Of a Gangrene and* Sphacelus 2584

PART III.
Of the Vices of the Skin, Hair, and Nails.

SECT. I.
Of the Vices of the Skin.

Chap. 1. *Of the color of the Skin changed, (in general) and in special touching that blackness that is contracted from the Sun* 2598
Chap. 2 *Of the* Ephelides *in Women with Child* 2600
Chap. 3 *Of* Lentigines, *Pimples, or specks in the Face* ibid.
Chap. 4 *Of Cosmetical, or Beautifying Medicaments* 2601
Chap. 5 *Of those they cal Mother Spots, or Blemishes* 2604
Chap. 6 *Of the Volatick, or flitting spots of Infants* 2605
Chap. 7 *Of the spots and blemishes that the Germans cal Hepatick, or Liver-spots* ibid.
Chap. 8 *Of the Itch* 2606
Chap. 9. *Of the ill and offensive Smel* 2608

PART III.

SECT. II.
Of things amiss in the Hair and Nails.

Chap. 1. *Of the Nature of the Hairs* 2611
Chap. 2 *Of things amiss in the Hair; and first, of Baldness and want of a Beard.* 2613
Chap. 3 *Of the shedding of the Hair* 2616
Chap. 4 *Of* Alopecia *and* Ophiasis 2618
Chap. 5 *Of* Tinea *or Worms eating off the roots of the Hair* 2621
Chap. 6 *Of the Cleaving of the Hair* 2622
Chap. 7 *Of hoariness in the Head and Beard* ibid
Chap. 8 *Of the Scurfiness and Dandrif of the Head* 2626
Chap. 9. *Of* Plica Polonica 2627
Chap. 10 *Of the Vices of the Nails* 2643

PART IV.
Of Wounds.

Chap. 1 *Of the Nature, Causes, and Differences of a Wound* 2593
Chap. 2 *Of the Diagnostick Signs* 2595
Chap. 3 *Of the Prognosticks, and the foretelling of the Event of Wounds* ibid.
Chap. 4 *Of the Cure of Wounds, and first of all, touching the Indications* 2614
Chap. 5 *Of things extraneous, and from without, that are to be taken forth of a Wound.* 2616
Chap. 6 *Of the Provision that is necessarily to be made for the binding up of Wounds.* 2619
Chap. 8 *Of the Swathing of wounded parts.* 2622
Chap. 8 *Of those Medicaments that are necessary for the Curing of Wounds* 2628
Chap. 9 *My Judgment touching the Method of* Cæsar Magatus, *and* Ludovicus Septalius, *in their*

their Curing of Wounds 2639
Chap. 10 Of the Weapon Salve 2654
Chap. 11 Of altering Medicaments, and Vulnerary Potions 2663
Chap. 12 Of the Diet of Wounded Persons. 2667
Chap. 13 Of keeping the flux of humors from the Wounded part 2669
Chap. 14 Of the Wounds of the Veins and Arteries; and of the stopping the Hæmorrhage in Wounds 2671
Chap. 15 Of the Wounds of the Nerves, and Tendons, in general, and of the pricking of the Nerves 2674
Chap. 16 Of the downright Wounds of the Nerves, as also of the Ligaments, by Cutting. 2683
Chap. 17 Of the Wounds of the Joynts. 2685
Chap. 18 Of a Wound with a Contusion. 2687
Chap. 19 Of Wounds caused by the biting of Living Creatures 2689
Chap 20 Of Wounds by Gun-shot 2691
Chap. 21 Of Poysoned Wounds 2704
Chap 22 Of Particular Wounds 2710
Chap. 23 Of the Diseases, and Symptoms that happen unto Wounds ibid.
Chap. 24 Whether it be Lawful for a Christian by Amulets (the Greeks cal them Periapta, we Preservatives) or else by hanging Seals about their bodies, or by the like means to defend and preserve themselves from all danger by Weapons. 2716

PART V.

Of *Fractures.*

Chap. 1. Of Fractures, and the Cure of them in General 2727
Chap. 2 Of a Fracture with a Wound 2739
Chap. 3 Of a Fracture with a Wound in which there is no bone made bare, and yet nevertheless a Cause to fear the falling forth of some fragments of the broken bone 2742
Chap. 4 Of the preternatural Affects that happen unto Fractures 2744
Chap. 5 Of Distorted and ill set Bones. 2745
Chap. 6 Of Correcting the Callus that is greater or less then what it ought justly to be. 2746
Chap. 7 Of the Slenderness and Weakness of the Member 2747
Chap. 8 Of the Fracture of the Arm. 2748
Chap. 9 Of the Fracture of the Shoulder. 2749
Chap. 10. Of the Fracture of the Leg 2750
Chap. 11 Of the Fracture of the Thigh. 2751
Chap. 12 Of the Fracture of the Nose 2753
Chap. 13 Of the Fracture of the Jaw bone 2754
Chap. 14 Of the Fracture of the Channel bone, or the Bone of the Throat 2755
Chap. 15 Of the Fracture of the Shoulder-blade 2756
Chap. 16 Of the Fracture of the Sternum, or Breast-bone. 2757
Chap. 17 Of the Fracture of the Ribbs. 2758
Chap. 18 Of the Fracture of the Spina Dorsi, or Back bone 2760
Chap. 19 Of the Fracture of the bones of the Hand 2761
Chap. 20 Of the Fracture of the Hip-bone. ibid.
Chap. 21 Of the Fracture of the Whirlbone in the Knee ibid.
Chap. 22. Of the Fracture of the Bones of the Foot 2762

PART VI.

Of *Luxations.*

Chap. 1 Of Luxations in general 2669
Chap. 2 Of a Luxation with Pain, Inflammation, Wound, Fractures 2672
Chap. 3 Of a Luxation of the Mandible. 2674
Chap. 4 Of a Luxation of the Channel Bone. 2675
Chap. 5 Of a Luxation of the Back bone and Ribs 2676
Chap. 6 Of a Luxation of the Shoulder. 2677
Chap. 7 Of a Luxation of the Elbow and Radius 2681
Chap. 8 Of a Luxation of the Hand and its Fingers 2682
Chap. 9 Of a Luxation of the Thigh. ibid.
Chap. 10 Of a Luxation of the Patel Bone. 2685
Chap. 11. Of the Knee Luxated ibid.
Chap. 12 Of the Distraction of the Bracer. 2686
Chap. 13 Of a Luxation of the Foot and its Bones, and of the Toes ibid

Books Printed by Peter Cole, *Printer and Book-seller of* LONDON, *at the Exchange.*

Several Physick Books of Nich. Culpeper *and* A. Cole, &c.

1 Idea of Practical Physick in twelve Books.
2 *Sennertus* thirteen Books of Natural Phylosophy.
3 *Sennertus* two Treatises. 1 Of the Pox. 2 Of the Gout.
4 Twenty four Books of the Practice of Physick, being the Works of that Learned and Renowned Doctor, *Lazarus Riverius.*
5 *Riolanus* Anatomy.
6 *Veslingus* Anatomy of the Body of Man.
7 A Translation of the New Dispensatory, made by the Colledg of Physitians of *London.* Whereunto is added, The Key to *Galens* Method of Physick.
8 The English Physitian Enlarged.
9 A Directory for Midwives, or a Guide for Women.
10 *Galens* Art of Physick.
11 New Method both of studying and Practising Physick.
12 A Treatise of the Rickets.
13 Medicaments for the Poor, Or Physick for the Common People.
14 Health for the Rich and Poor, by Dyet without Physick.

The *London Dispensatory* in Folio, of a large Character in Latine.
The *London Dispensatory* in twelves, a smal Pocket Book in Latin,

Mr. *Burroughs* WORKS.
viz. on *Matth.* 11.

1 Christs call to all those that are Weary and Heavy Laden to come to him for Rest.
2 Christ the Great Teacher of Souls that come to him.
3 Christ the Humble Teacher of those that come to him.
4 The only Easie way to Heaven.
5 The excellency of holy Courage.
6 Gospel Reconciliation.
7 The Rare Jewel of Christian Contentment.
8 Gospel-Worship.
9 Gospel-Conversation.
10 A Treatise of *Earthly-Mindedness.*
11 Exposition of the Prophesie of *Hosea.*
12 The Evil of Evils, or the exceeding sinfulness of Sin.
13 Precious Faith.
14 Of Hope.
15 Of Walking by Faith.

Twenty one several Books of Mr. William Bridge, *Collected into two Volumns.* Viz.

1 Scripture Light the most sure Light.
2 Christ in Travel.
3 A Lifting up for the Cast-down.

Marks of Salvation.

Mr. *Stephen Marshals* New WORKS *VIZ.*

1 Of Christs Intercession, or of sins of Infirmity.
2 The high Priviledg of beleevers, They are the Sons of God.
3 Faith the Means to feed on Christ
4 Self-Denial.
5 The Saints Duty to keep their Hearts, *&c.*
6 The Mystery of Spiritual Life.

THE FIFTH BOOK OF Practical Physick.

OF THE EXTERNAL DISEASES.

THE FIRST PART.

Of Tumors.

Chap. 1. *Of the Nature, Causes, and Differences of Tumors.*

The names of a Tumor.

THAT External Affect which by the Latines is termed a *Tumor*, *Tuber & Tuberculum*, *i. e.* a greater or a lesse Swelling; the same do the Grecians call *Onchus*; it is likewise by *Hippocrates* and the ancient Greek Physitians named *Oedema*. For although in the account of latter Physitians, yea, and in *Galen*'s time also, such tumors as were soft, and though roughly handled were yet altogether void of pain, these only were said to be *Oedemata*, which the Ancients with an addition called *Oedemata Malthaca*, and *Anodyna*, that is, soft and painless Swellings: Yet this word *Oedema* with *Hippocrates* and the more ancient Physitians signifieth in general all, and every particular preternatural Tumor; as is observed by *Galen* in the 1. Prognost. text 29. in his Comment upon B. 4. of the Aphorisms, Aph. 34. on the fift of the Aphorisms, Aphor. 65, 66. and elsewhere very frequently. Somtimes also by a general name they cal it *Phyma*, and then generally it signifies every Tumor that of its own accord, and without any external cause breaks forth, especially into some one or other outward part of the body; even as a Plant shoots out of the Earth: the truth of this will soon appear, if we consult *Galen* in the sixth of his Epidemicks, Comment. 1. text. 23. In the Books of the more modern Latines, theirs especially whom they usually stile barbarous, or illiterate, al sorts of whatsoever Tumors are comprized under the name of an Apostem; nay more, among these latter Physitians there want not some, who haply ignorant enough of the Greek Tongue, make bold to write that all those are very much mistaken who assign any difference between the name of a *Tumor* and an *Apostem*: which Magisterial Censure of theirs notwithstanding clashes both with the Authority of all the more ancient Physitians, and the propriety of the Greek Tongue. for the Greek Physitians wil have only that Tumor or Swelling which is come to a suppuration, to be called an *Apostem*, as after in the third Chapter shal be shewn; and by the Latines this Tumor is termed *Abscessus* and *Vomica*; but by the more Modern and ignorant Authors it is rendered *Exitura*, from a word taken out of the Interpreter of *Avicen.* But now, all Swellings (or Tumors) come not to a suppuration; as for instance, that which we commonly call *Erysipelas* or St. Anthonies fire, *Herpes*, and oftentimes *Phlegmone*, which is an unnatural Swelling hot and red, and of such like Tumors divers others.

Oedema

Phyma.

Tumors whether rightly called Apostems

Apostem, what it is

Neither is this confusion and promiscuous use of names to be charged upon the Arabians, but

upon the illiterate Interpreters of them, who have unskilfully rendered the Arabian words by such as are very unfit and improper. For the Arabians altogether as exactly as the Grecians have made a distinction in name betwixt Tumors and Apostems; calling Tumors by a general name *Bothor*, but an Apostem they termed *Dubellet* and *Dubellatum*. And therefore for the due and proper signification of each word, the Authors that have written in the same, and not in a differing Language, are to be consulted; that is to say, as *Galen* in his smal Tract to *Thrasybulus* (whether or no the art of preserving the health relate to Physick) in the thirty second Chapter tels us; if it be a word of the Assyrian Tongue, we must for the right understanding of it have recourse to those who were the Authors thereof; or if it be a word in the Persian, Indian, Arabian, or Æthiopian Language, or any other Tongue, we must accordingly apply our selves to such as are skilful therein.

A Tumor

Now then, what a Tumor may properly be said to be, we wil here make an exact inquiry, with this proviso, of which the Reader is desired to take notice, that our chief and main drift is here to treat of such Tumors as are besides Natures intention, and may therefore be justly ranked among the several kinds of Maladies, or Diseases. Now therefore every swelling or augmentation of a part beyond its natural habit may not be reputed a preternatural Tumor. For although some men that are fat and grois grow to breadth and thickness beyond their Natural habit; yet notwithstanding, whenas hereby there is not the least hurt or detriment of any one action caused in them (in which case only something is said to be preternaturally affected) these may not be said to have in them any thing that is beside the intent of Nature, or preternatural, but only something that is not Natural, and above that which is according to Nature, as *Galen* saith. For there is this middle constitution betwixt those bodies that are in al points according to Nature, and those that have in them somwhat that is preternatural, or besides Natures intention, as the same *Galen* gives us to understand in his Book of this sort of Tumors, in the first Chapter thereof. So then, albeit haply the growth of some one part may be extended beyond its natural habit, yet so that this notwithstanding its operations may not be impeded, and that there be not the least sense of pain accompanying it; in this case we say, that such like Tumor or Swelling is not besides Nature, neither as yet is it to be termed a Disease, but rather a symptom. And hence it is also that *Galen* in his Book of Tumors, entitles it, not of Tumors simply so called, but of Tumors preternatural. And much less reason is there that the Breasts of Nurses when they are distended with the abundance of milk, and hereupon are wont to appear far greater than in those that give not suck; and likewise in child-bearing Women that the lower belly though exceedingly dilated in such especially who are neer their time of Delivery, should be said to be affected with a Disease; in regard that these things happen according to the course and Laws of Nature.

Every Tumor is not a Disease

But what a Tumor is, and unto what kind of Disease it belongs, is not altogether so manifest. For many and differing definitions hereof we find given by several Authors, which here particularly to recite is not requisite, nor worth the while; and *Galen* himself seems now and then to thwart himself, and not alwaies to be of one and the same judgment in giving us the definitions of this Tumor we are now treating of. For in his thirteenth Book, and first Chapter, of the Method of Physick, he tels us that a Tumor is a Disease wherein the parts have receded from their natural habit and quantity. And in his first Book of the causes of Symptoms, and the second Chapter, he refers Tumors unto organical Diseases; for there he writes, that *Phlegmones* or Inflammations, *Scirrhos* or hard Swellings in the Skin, *Abscessus*, i. e. Impostumes or Ulcers, and other affects of this nature are to be accounted Diseases of the parts instrumental. But in his Book of the difference of Diseases, Chap. 13. and of the Causes of Diseases, Chap. 6. he reckons up Tumors among the distempers arising from the first qualities, and the diseases of the similary parts. The Physitians likewise that have written since his time differ in their Opinions. *Fallopius* adheres to *Galen*'s Opinion in his 13. Book, Chap. 1. of the Method of Physick, before mentioned, and refers Tumors unto those Diseases we cal instrumental, to wit, when there is a preternatural magnitude or augmentation. *Hieronymus Capivaccius* (in the Chapter where he writes concerning a Phrensie) tels us, that every tumor must needs be a disease in the *intemperies*, or distemper proceeding from the first qualities; and that there is no necessity why it should be accounted an Affect arising from an ill constitution: which Opinion of *Capivaccius* is assented unto by *Hieronymus Fabricius ab aquapendente*. But others there are, among whom *Eustachius Rudius* is one, who assert that a Tumor is an evil compounded of magnitude augmented, and a distemper alwaies accompanying it as its concomitant; and that the augmentation of magnitude with this *intemperies*, or distemper proceeding (as before said) from the first qualities, is the formal cause of every tumor; and *Rudius* determines that those tumors only which are caused in the parts by reason of a preternatural afflux of matter, are Tumors properly so called; but that the Tumors happening in disjoyntings or dislocations, in the falling down of the Intestines into the Cods, and in the Tumor *Aneurisma*, are not properly so to be accounted.

A Tumor what it is

But if we exactly weigh this Controversie, and withal accurately sift out the signification of the word *Tumor*, and *Onchus*; and likewise if we wil heedfully inquire into the essence of a Swelling, as it may be considered in it self, we must then with *Galen* rightly define a Tumor under the notion of a swelling; that it is an affect or disease in the which the parts of our body recede from their natural state by an augmentation of their magnitude. For the word *Onchus* with the Grecians sounds as much as the distance of the parts, to wit, by reason of their being extended in magnitude, breadth, and profundity; as is observed by *Galen* in the first Chapter of his Book of Humors: so that it may justly be reputed a grand absurdity in the definition of a Tumor, to assert that it is this or that, and in the mean time to omit the augmentation of magnitude; this being all one as to affirm that a Tumor may be without a Tumor, that is to say, a Swelling. For although it be a truth (which erewhile we hinted, and that which *Galen* likewise observes in his Book of the differences of Diseases, the twelfth Chapter) that a Tumor if it be not such, and so great that thereby any hurt and detriment shal accrue to the Member affected in any one of its operations, is not properly a disease, but a symptom; and that that preternatural Affect ought to be defined rather by the *intemperies* or distemper that accompanies it, and very much annoyes the actions, then by the swelling, which in no wise impedes or offends them: Yet notwithstanding it wil not therefore follow, that a Tumor also which is a disease, and which doth indeed so greatly hurt and hinder the operations, is to be defined rather by the *dyscrasie* and *intemperies*, than by the augmentation of magnitude. And the truth is, that very frequently Tumors when they have their original either from a fleshy, or from a boney and hard substance, or lastly from a flatulent Spirit, which is not internally either hot or cold, are altogether free from an *intemperies*, or, as we commonly term it, distemper. In the mean time notwithstanding we deny not but that other diseases that are no way essential to a Tumor may yet be joyned with and accompany this augmented magnitude which doth altogether constitute and make up the essence thereof. For if the matter causing the Tumors exceed in heat, cold, driness, or moisture, it forthwith derives this distemper unto the part affected; insomuch that hence it comes to pass that the disease also then concurs, and is concomitant with the *intemperies* or distemper. Moreover, if the same matter shal either by corroding or distending any part disunite what before was close and compact, then there immediately happens that which we call the solution of Unity. Sometimes also it comes to pass that the figure and shape of some part is altogether marr'd, or at least very much vitiated; and sometimes likewise the Cavities, Pipes, and Passages are either compress'd, or at least wise very much obstructed through the abundant afflux of matter: the which accidents very frequently (if not for the most part) concurring with a Tumor, hence it is also that in the difference and cure of Tumors, we handle not only the augmented quantity, but likewise even al those other concomitant Diseases. Mean while it stands good for an undeniable truth, That a Tumor as such, that is, a Swelling, is an affect or disease in the magnitude augmented beyond Natures intention, and hath its production from somwhat that is preternatural, and comes to be adjoyned to some one or other part. Nor is it of any validity what *Rudius* here objects, That in Tumors which have their original from the humors, and those likewise which have for their causes the strutting forth and falling down of parts, and such like, that there the difference is to be taken from the efficient, next, and containing cause, and that from this cause we may gain excellent, artificial, and profitable Indications; but not so from the consideration of magnitude augmented. For albeit they differ in the containing special cause, that this is now and then an humor, sometimes above, and sometimes also an Intestine or Gut fallen down; yet in the general cause they agree, which is some one thing or other preternatural added unto the part, and swelling it up into a Tumor. And in every Tumor (as it is likewise in al other diseases depending upon the cause containing) no profitable Indication can be gained, or may be expected from this cause, no not in those Tumors which have their dependance upon the influx of humors. For the general Indication (though it be altogether useless) is this, that the humor which lifteth up the part into a tumor is to be removed; but how and by what means this may be effected, is wholly left unto the skil of the knowing Artist. In the mean time I wil not deny but that those tumors which have their original from the humors may fitly enough be ranked among the diseases that are compounded of augmented magnitude, distemper arising from the afflux of matter, and a vitiated figure; yet however this is not to be granted in al Tumors. And hence it is (without doubt) that *Galen* hath placed the Tumors one while amidst the Affects of the similary parts, as in the twelfth Chapter of the difference of Diseases; and assoon again among those Diseases we call organical, and this he doth in the thirteenth of his Method, and first Chapter.

The definition of a Tumor

Neither is it to be denied, That now and then Authors whilst they make mention of preternatural Tumors do not intend al Tumors in general, such as are also those that are produced by the falling down of the bowels, or by some boney substance sticking out; but those in special which are caused by the afflux of humors; and these are evermore diseases that may properly be said to be compounded of magnitude augmented, *intempe-*

ries, an unmeet figure, and most usually also the solution of Unity.

The Cause The containing Cause of a Tumor, as we take it in the general, is something beyond Natures intent added unto a part, which elevates, distends, and swels it up to a more than ordinary greatness.

The Difference Now the matter which we say is added being threefold, to wit, a Humor, a Wind, and a solid Substance; the primary Difference then of Tumors ought to be taken from that which we commonly term the Containing Cause. Tumors then are sometimes thus differenced, that some are great, others not so; some external, some internal; some new, others that are of longer standing. But these differences are meerly accidental, denoting a certain mutation or change, and an alteration of the condition, but the *species* or kinds they vary not in the least. But the differences specifical, and which constitute the several kinds, are taken from the matter and the containing Cause, which is threefold, as hath been said. First of al therefore Tumors derive their very being from the humors; but these as yet have not obtained any peculiar appellations to be called by, but at leastwise are al of them comprehended under the general name of a Swelling; yea, as some say, they are only called *Tumors*. Secondly, Winds if shut up in any part distend the same, and lift it up into a Swelling or Tumor; and this sort of Tumors the Grecians cal *Emphysemata*, the Latines *Inflationes*, by reason of their windy original. In the third place, now and then somwhat resembling flesh, or skin, or that is hard and solid as a bone, and other such like matter is super-added unto some one part, and there causeth a Tumor or Swelling: But in regard that these very substances have their original from the humors, we will thereupon adjoyn this sort of Tumors unto the first kind. And lastly, even the very solid parts of the body themselves cause Tumors whenas they change their place, together with their scituation, and slip down upon some other part, which they both distend and elevate: neither have these any peculiar names to be known by. There are yet some other differences behind. From the quality of the concomitant matter, some are said to be hot, others cold; some moist, others dry; some soft and loose, others hard. From their magnitude, the greater of them are by a general name simply called Tumors, the less *Tubercula*. From their scituation, that some are internal, others external; and these again either more deep and profound, or else superficial. From their figure, some of them are said to be broad, others again sharp-pointed. But now to comprehend al those differences of Tumors under names, and to give you the number of them, is not very easie to do. *Galen* in the close of his Book of Tumors writes, That there was not any one kind of these preternatural Tumors which there he had omitted, but that he had spoken of them all, and had not left any one unmentioned. And out of that Book *Johannes Philippus Ingrassias* (in his Book of tumors, first Tract, first Chapter, and second Commentary, pag. 77.) hath collected Sixty one Tumors, which he reckons up in this order: 1. *Corpulentia*. 2. *Phlegmone*. 3. *Abscessus calidus*. 4. *Sinus*. 5. *Fistula*. 6. *Abscessus ex solidis humidisve corporibus*, that is to say, an impostumated matter issuing from solid and moist bodies. 7. *Atheroma*. 8. *Steatoma*. 9. *Meliceris*. 10. *Anthrax*. 11. *Cancer*. 12. *Gangræna*. 13. *Sphacelus*. 14. *Erysipelas*. 15. *Herpes similiter*. 16. *Herpes Esthiamenos*. 17. *Herpes miliaris*. 18. *Scirrhus*. 19. *Ecchymosis*. 20. *Aneurisma*. 21. *Oedema*. 22. *Phagedæna*. 23. *Ulcus Chironium, seu Telepium*. 24. *Scabies*. 25. *Lepra*. 26. *Elephantiasis*. 27. *Exostosis*. 28. *Satyriasmus seu Priapismus*. 29. *Achor*. 30. *Cerion*. 31. *Myrmecia*. 32. *Acrochordon*. 33. *Psydracion*. 34. *Epinyctis*. 35. *Dothien*. 36. *Phyma*. 37. *Bubon*. 38. *Phygethlon*. 39. *Struma*. 40 *Sarcocele*. 41. *Hydrocele*. 42. *Epiplocele*. 43. *Enterocele*. 44. *Entero epiplocele*. 45. *Cirsocele*. 46. *Varices*. 47. *Bubonocele*. 48. *Exomphalos*. 49. *Ascites*. 50. *Tympanites*. 51. *Anasarca*. 52. *Epulis*. 53. *Parulis*. 54. *Thymus*. 55. *Uva*. 56. *Paristmia*. 57. *Antiades*. 58. *Polypus*. 59. *Encanthis*. 60. *Unguis*. 61. *Staphyloma*. But *Ingrassias* himself not content with this number, adds unto these one hundred sixty five more; to wit, of such properly belonging unto the head, twenty seven, the which in page 301. he enumerates after this manner: 1. *Eczesma*. 2. *Elcydrion, sive Papilla*. 3. *Sycon*, that is, a Fig, or pushes in the head resembling it. 4. *Exanthema*. that is, an Ulcerous blowing out like a flower. 5. *Ganglion*. 6. *Hydrocephalus*. 7. *Syriasis*. 8. *Phrenitis*. 9. *Lethargus*. 10. *Typhomania, seu agrypnon coma*. 11. *Catochus Pauli*. 12. *Catalepsis, seu Catoche*. 13. *Carus*. 14. *Apoplexia*. 15. *Rhia alsabian*. 16. *Sibare*. 17 *Fatera*. 18. *Sekakilos*. 19 *Testudo*. 20. *Talpa*. 21. *Topinaria*. 22. *Lattumen*. 23. *Cornu*. 24. *Alopecia*. 25. *Ophiasis*. 26. *Pityriasis*. 27. *Phthiriasis*. Those properly belonging to the Eyes and the parts thereof, sixty three, which in page 351. he reckons up in this order following. 28. *Proptosis* Galeni, *sive ecpiesmos Pauli*. 29. *Taraxis*. 30. *Ophthalmia*. 31. *Epiphora introductorii*. 32. *Chemosis*. 33. *Xerophthalmia*. 34. *Sclerophthalmia*. 35. *Scirrhophthalmia*. 36. *Phlyctæna*. 37. *Bothrion*. 38. *Cæloma*. 39. *Argemon*. 40. *Epicauma*. 41. *Encauma*. 42. *Myocephalos*. 43. *Melon*. 44. *Clavus Pauli et Aetii*. 45. *Clavus introductorii & Celsi*. 46. *Hypopyon*. 47. *Onyx*. that

Tumors, their number and names according to Galen.

Tumors of the Head are twenty seven.

Tumors of the Eyes, and their parts, 63.

that is, *Unguis*, a Nail. 48. *Hypospbagma.* 49. *Achlys Aetii.* 50. *Nephelion Aetii.* 51. *Ula*, or *Nephelion.* 52. *Leucoma.* 53. *Sebel.* 54. *Bothor Avicennæ.* 55. *Hymene panastasis.* 56. *Nyctalopia.* 57. *Anthracosis.* 58. *Carcinoma.* 59. *Synchysis.* 60. *Mydriasis.* 61. *Proptosis Pauli.* 62. *Ptylosis.* 63. *Madarosis*, or *Milphosis.* 64. *Pladarotes.* 65. *Emphysema.* 66. *Symphysis*, or *Ancylosis.* 67. *Entropion.* 68. *Lagophthalmos.* 69. *Trachoma.* 70. *Sycosis.* 71. *Tylosis.* 72. *Dasyma.* 73. *Pachytes.* 74. *Barytes.* 75. *Hydatis.* 76. *Psocophthalmia.* 77. *Trithe.* 78. *Thalazion.* 79. *Porosis.* 80. *Lithiasis.* 81. *Alantiac.* 82. *Sude Avicennæ.* 83. *Sarcosis.* 84. *Lupia.* 85. *Mydesis.* 86. *Pustula Abenzoaris.* 87. *Scleriasis.* 88. *Anchilops.* 89. *Ægylops.* 90. *Epinyctis Plinii.*

Tumors in all other parts of the Body, 97.

And after these he mentions many more in other parts, to the number of ninety seven; and in this following order he sets them down. 91. *Auritus.* 92. *Parotis.* 93. *Therea.* 94. *Ozæna.* 95. *Sarcoma.* 96. *Thelui Albuc.* 97. *Alharbian Avicennæ.* 98. *Chaisum Arabum.* 99. *Hæmorrhoides Arabum.* 100. *Batrachos.* 101. *Glossomegethos.* 102. *Ancyloglosson.* 103. *Aphtha.* 104. *Cynanche.* 105. *Paracynanche.* 106. *Synanche.* 107 *Paresynanche.* 108. *Gongrona.* 109 *Folium.* 110 *Bronchocele.* 111 *Albadal.* 112 *Dionysisci.* 113. *Hypopion.* 114. *Jonthi*, or *Vari.* 115 *Montagra.* 116 *Ephelis.* 117 *Ignis sylvaticus.* 118. *Noli me tangere.* 119 *Buttizaga.* 120 *Gutta rosacea.* 121 *Sparganosis.* 122. *Chondriosis.* 123 *Trichiasis.* 124 *Gynæcomaston.* 125 *Pleuritis.* 126 *Peripneumonia.* 127 *Phtoe.* 128 *Althabalop.* 129 *Napta.* 130 *Cyphosis*, or *Cyrtosis & byposis.* 131 *Lordosis.* 132 *Scoliasis.* 133 *Cœliacus.* 134 *Aurys Rasis.* 135 *Colica.* 136 *Heos.* 137 *Condylomata.* 138 *Hæmorrhoides.* 139 *Marisca.* 140 *Hepaticus.* 141 *Cachexia.* 142 *Altherel, Bellunensis.* 143 *Thelegi.* 144 *Altherbel Bellunensis.* 145 *Splenicus, Aureliani.* 146 *Nephritis.* 147 *Lithiasis.* 148 *Satyriasmus Pauli.* 149 *Cercosis.* 150 *Mola.* 151 *Nymphomegethos.* 152 *Kion Hippocratis.* 153 *Seliroma Pauli.* 154 *Arthritis.* 155 *Podagra.* 156 *Cheiragra.* 157 *Ischias.* 158 *Lupia, Guidonis.* 159 *Tophi.* 160 *Cornua Avicen.* 161 *Ancylosis*, or *Ancyla.* 162 *Paronychia.* 163 *Pterigion, Celsi.* 164 *Condyli.* 165 *Pernionès.* 166 *Gemursa, Plinii.* 167 *Dentes muris, Bellunensis.* 168 *Alliathan.* 169 *Lupus.* 170 *Dactilia, Habab.* 171 *Malum mortuum.* 172 *Terminthos.* 173 *Emphysema.* 174 *Phlyctæna.* 175 *Turmusios Avicen.* 176 *Impetigo.* 177 *Essere.* 178 *Palmos.* 179 *Clavus.* 180 *Calli.* 181 *Ægritudo bovina, Abenz & Albuc.* 181 *Draconium.* 183 *Syrenes*, or *Pedicelli, Guidon & Argelatæ.* 184 *Variolæ.* 185 *Morbilli.* 186 *Rubeola.* 187 *Crystalli.* 188 *Exanthemata.* 189 *Ecthymata*, Fernel. 190 *Hidroa*, or *Sudamina.* 191 *Epinyctis*, Romanorum. 192 *Bothonenes.* 193 *Ganglia.* 194 *Seps* Hippocr. 195 *Spina ventosa.* 196 *Bubasticon Ulcus.* 197 *Hypersarcon.* 198 *Cacoethes.* 199 *Sepedon.* 200 *Nomæ.* 201 *Therioma.* 202 *Herpes Esthiomenos Celsi.* 203 *Herpes ecthiomenos*, Avicen. 204 *Thymion*, Celsi. 205 *Ignis sacer*, Celsi. 206 *Cerion*, Pauli. 207 *Paratrimmata.* 208 *Apostrmata.* 209 *Zerma.* 210 *Rancula.* 211. *Spina.* 212 *Morsus Diaboli.* 213 *Paturia*, that is, *Morbus Gallicus.* 214 *Scopuli.* 215 *Tincosati.* 216 *Pinitæ.* 217 *Spili.* 218 *Tusius*, Avicen. 219 *Eparma*, Hippoc. 220 *Rosbotb.* 221 *Cunus, Rasis.* 222 *Albothir*, Albucasis. 223 *Nakir*, Albuc. 224 *Aichalan*, Abenz. 225. *Arcella*, Abenz. 226 *Rosulæ sataritiæ.* So that the number of all the Tumors recited by *Johannes Philippus Ingrassias* amounts unto two hundred twenty six.

But that Entities should be multiplied in this manner without any cause is altogether unfitting. For, as al the affects which are here reckoned up under the name of Tumors are not properly to be accounted Tumors; besides that one and the same Tumor is sometimes repeated under different names: So again, *Ingrassias* having not at this time compleated the remaining Sections of his Works concerning Tumors, it is not sufficiently apparent what Tumors he would have us to understand under some of these names. Now for the truth of this, that I may give you an instance or two of what hath been said; he reckons up among Tumors, *Sinus* and *Fistula*, *Ulcus Chironium*, and divers other Ulcers. But before or since *Ingrassias*, who hath there ever been that hath taken the liberty, or made so bold to enumerate among the Tumors that are properly so called, such as are these following; viz. *Lethargus, Typhomania, Catochus, Catalepsis, Carus, Apoplexia, Lordosis, Cœliaca affectio, Colica, Affectus hepaticus, Splenicus*, and other such like Affects, which relate either to Symptoms, or the kinds of other Diseases, rather than unto Tumors. And in very truth many of the Tumors wherewith this Catalogue is stuft, are not peculiar kinds of Tumors, but only differences of their species according to the parts affected.

Tumors, their Differences.

Now therefore we conceive that there are two main Differences especially to be heeded in Tumors; one whereof ariseth from the variety of Causes, and the other is by reason of the parts affected. We have said before, that the conteining cause of a tumor is threefold, a Humor, a Wind, and a solid Substance. Again, the humors are various & much different, to wit, Blood, Phlegm, Melancholy, a black humor, a waterish and wheyish humor, and divers other thin excrements; as also mixt humors, and matter into which other humors degenerate, and likewise malignant humors.

Their Cause containing:

From the Blood there is caused an extraordinary Corpulency (which the Greeks call *Polysarcia*) and an Inflammation. There are likewise that re-

fer

fer a Gangrene & a *Sphacelus* unto an Inflammation, in regard that an Inflammation sometimes degenerates into them. But because that a Gangrene and *Sphacelus* do very often proceed from other causes without an Inflammation, and have not alwaies a Tumor to accompany them, and are of neerer alliance unto Ulcers, very usually degenerating into them; we wil therefore treat further of them anon when we come to speak of Ulcers. But with more right it is that unto an Inflammation we refer an *Erysipelas*, or *Rosa* (as it is commonly termed) *Bubo*, *Furunculus*, *Phyma*, *Phygethlon*, *Parotis*, *Carbunculus*, *Paronychia*, *Perniones*, *Ecchymosis*; as afterward from the special Explication of these Affects wil further appear.

From Choler is produced *Herpes*, and its differences.

From the Pituitous or Phlegmy humor proceeds *Oedema*.

From the Melancholly humor, *Scirrhus*.

From black Choler, *Cancer*.

From the watry humor, *Hydrocephalus*, *Hernia aquosa*.

But of the wheyie humor, and the thin excrementitious matter called *Ichores*, from which various lesse swellings by the Latines called *Tubercula* do arise, there is a very vast difference: and oftentimes these serous and wheyie humors, as likewise the salt and cholerick humors are mingled with other, and from hence originally proceed divers Wheals or Pushes in the skin, as to instance, *Psydracia*, *Vari*, *Sudamina*, *Spinyctides*, and *Terminthi*, *Essere Arabum*, *Eloydria*, *Scabies*, *Lepra Græcorum*, *Vitiligo*, *Impetigo*, and *Lichen*, *Crusta Lactea*, *Achores*, *Favi*, *Tinea*, with many other of the like Nature.

Moreover from the humors there is derived also a certain peculiar kind of tumors, yet nevertheless differing from those we have hitherto made mention, of in a twofold respect. The former difference lies in this, that it proceeds not from one single humor, but from more, to wit, Phlegm, I mean such as hath other humors, Melancholly or Choler mixt therewith; yet notwithstanding so, that the cause conjunct may not any longer be said to be an humor, but some other matter generated from out of those humors. The later difference consists in this, that the aforesaid matter is included in some one peculiar Membrane. Tumors of this sort are, *Strumæ*, and *Scrofulæ*, *Bronchocele*, *Ganglia*, *Nodi*, *Melicerides*, *Atheromata*, *Steatomata*, *Testudo*, *Talpa*, and *Natta*.

Out of the humors likewise (where you are to understand such humors that degenerate into another matter) take their rise and original those tumors which the intelligent Artist cals, *Polypus*, *Ranula sub lingua*, *hernia carnosa*, *Verrucæ*, *Fungi*, and others the like. There are moreover tumors that have their very being from malignant humors; and these are *Variolæ*, *Morbili*, *Lepra*, as the Arabians, or *Elephantiasis*, as the Greeks name it, Tumors Venereal of different kinds, *Bubones*, and pestilential Carbuncles.

From flatulency or windinesse are derived *Emphysemata* as the Grecian Authors, or *Inflationes*, as the Latines call them, and all other flatulent tumors whatsoever.

From the solid parts lying out of their proper places arise *Hernia* in the Cods and Navel, when the Intestines fal down thither; *Epiplocele*. And hitherto also is to be reduced *Aneurisma*, a tumor that hath its original from an Arterie dilated, as in like manner *Varix*, being a tumor from a dilated Vein.

From the Bones proceeds that which we term *Exostosis*; and from the Vertebræ or turning Joynts of the Back, when they stick out, is caused *Gibbositas*; like as in other parts also tumors arise, when disjoynted or broken Bones slipping out of their own place happen to fal down thither.

But now those tumors receive various appellations by reason of the part affected, of which enough hath been written already in its due place.

And moreover, as concerning divers of these Tumors this is to be taken notice of; that very many and that in most Countries, have indeed been not a little infested by them; and that they have been likewise as ordinarily cured of them: but yet notwithstanding, what the German, Italian, French, Spanish and other names of several Nations are; and unto what names of the Grecians, Latines, and Arabians they may fitly answer, is not alwaies manifest: which very thing hath exceedingly perplexed and puzled the studious Physician in his perusal of Authors. And of this also *Johannes Philippus Ingrassias* who took a world of pains in comparing together and explaining the Greek, Latine, and Arabian names, extreamly complains, as wil appear by what he writes in his Book of tumors, Tract. 1. Chap. 1. page 220 after this manner. I cannot but exceedingly admire, and withall greatly lament the so great unhappinesse of our Age, in the which we are evermore infested with divers and almost innumerable kinds of Diseases, and day after day are sadly afflicted especially more with this kind of Tumor (he here speaks of *Dothien* or *Furunculus*) by reason of an unwholsome and corrupt kind of Dyet; insomuch that questionless the Affect is most perfectly known; but as for name it hath none, other than what is as obscure (and as ambiguous unto most men) as that of *Epinyctis*, and *Psydracion*; so that hence we find it a business of the highest difficulty to discover the proper head of the Disease, and the Method of curing it, either in the Latines, or the Greeks, and Arabians themselves writing in the Latine Tongue.

Of the signs Diagnostick, Prognostick, and of the indications and Cure of Tumors in generall, some

some there be that are wont to assert many things. But in truth there is but very little that can be said as concerning Tumors in this manner, that is, generally considered, but what for the most part is agreeable to certain species of them; of all which we wil now speak in order, and particularly, in the Chapters following.

Chap. 2. *Of Tumors arising from Humors in general.*

THat kind of Tumors which is caused by the Humors is found to be most frequent and usual; and therefore we wil treat of it in the first place. The primary and nigheft cause hereof is a humor elevating and raising up a part beyond Natures intention unto a greatness more than is ordinary. Which said humor having for the most part a certain excess of qualities adjoyned with it (and thereupon becomes either hot, or cold, or moist, or dry) derives that quality unto the part affected; the which quality since it differeth from the temper of the grieved Member, must therefore necessarily excite in the same an unequal temper; and hence it is that an intemperies or distemper is concomitant with a Tumor.

The Causes.

Now of the humors that cause these Tumors there is great diversity. For both the Natural and preterna tural humors, whose differences we have already spoken to in their proper place, excite Tumors; & hereunto belongs the matter that is wheyey and watereih, filth and corrupt matter, and all things else into which the humors degenerate, and which are to be found in Tumors, and yet are not in the number of the parts of the Body; of which there is great variety. *Galen* in his second Book to *Glauco*, and seventh Chapter, writes, that in Apostems there have been found to be substances contained like unto Stones, Sand, Shels, Wood, Mud or Slime, the filth of Baths, the dregs and lees of Oyl, together with many other such like resemblances. And in his fourteenth Book of the Method of Physick, and twelfth Chapter, he further informs us that in Tumors have been discovered substances resembling Nails, Hairs, Bones, Shels, and Stones. And that Worms also may be found in Tumors frequent experience testifieth; *Fallopius* with others have seen such Tumors; and I my self have more than once beheld the like. *Nicolaus Remigius* in his third Book of the worship of Devils, and first Chapter writes, that with his own Eyes he beheld while they took out of an Impostume ful of filth, and opened in the Calf of a Mands Leg, a certain round substance or Globe, such as is to be seen in Weavers Shops. And *Wierus* in his Book of the Devils impostures Chap. 13. relates that in the incision of an Impostume on the left side of a certain Girl, above the Spleen, there was taken forth an Iron Knife, and after it there issued out abundance of filth and corruption. The like whereunto *Langius* also hath observed, in his first Book, and thirty eighth Epistle. Now if any such strange thing chance to happen, the Vulgar People are wont to ascribe it presently unto the Sorceries, Spels, and Charms of their Devilish Neighbors. But there is no necessity, why for all things that are evacuated out of Impostumes besides purulent matter, we should by and by have recourse to such Causes as these, or rank them among the supernatural Causes of humors, seeing that many of these contingents may be generated out of the humors erewhile rehearsed. For whenas Experience makes it manifest, that in most parts of mans Body smal Stones, Sand and Gravel, Hairs, or such like, and also divers kinds of Worms may be produced out of the excrementitious humors; and that likewise (not only in the Body of man) strange and wonderful kinds of Worms and other little Animals, may be bred out of the Corruption of others, it should not seem any great wonder, that the matter in Tumors (especially if it be naught, and hath been long there shut up and detained) doth admit of those various and strange mutations, happening by means of its rottenness and putrefaction. But yet notwithstanding, if such things be found in Impostumes that are come to a suppuration, and likewise in Tumors, which cannot be generated in mans Body by nature, or at leastwise by Natures strength alone without the concurrence of Art, (such as are all things formed of Metals, Bodkins, Knives, Iron Nayls, and the like) then indeed they cannot be referred unto natural causes; but may upon more than probable Grounds be imputed unto the Impostures, subtilty, and power of the Devil. But as for the manner how such things may be either generated in the Body, or covertly conveyed into it, is not my purpose here to determine. I therefore proceed to dispatch what I have further to deliver touching the rest of the causes of Tumors that take their rise and original from the humors.

The variety of such things as are often found in Apostems.

So then, as for what concerns the causes remote; be they what they will for their kind, they may easily be known, if we do but enquire into the manner how Tumors come to have their first being; and withal take notice from whence, and after what sort, or by what means that humor which hath rightly gained to be stiled the containing Cause, comes into the part affected. Now therefore that humor which is the nigheft and containing Cause of a Tumor is either insensibly and by degrees heaped up in the part, or else altogether as in a heap (which the Grecians express by the word *Athroos*) flow into it. The matter is gradually, and by little and little

Tumors, how caused by congestion or the heaping together of humors.

little gathered together in the part affected, primarily and most especially, by reason of somwhat amiss in the member, to wit, when either the concoctive power is grown weak, and therefore cannot as it should digest the nutriment, but generates more excrements than it ought to do; or else when the expulsive faculty doth not cast out all the excrements as it ought to do; and this may come to pass either through its own weakness, or otherwise because the way by which those excrements should be ejected is not sufficiently open. And again, a humor is likewise then heaped together in the parts, whenas the food it self is naught and unwholsom; for hence it happens that either so great abundance of excrements are caused that the expulsive faculty cannot cast them al forth, or else that they are so thick that Nature cannot easily expel them. But upon what causes these causes do depend hath been already declared in its proper place; nor is it requisite that we should at large repeat what hath been spoken. Only in a few words take this; That the weakness of the faculties wholly depends upon the *intemperies* or distemper of the parts, and the decay of their native heat. The passages are obstructed by overmuch and thick matter, which happens to be condensed by the vehemency of cold. Meats of an ill juyce produce store of excrements: Now what these meats are, *Galen* gives us to understand, in his Book touching meats of a good and evil juyce.

tumors, how caused by an afflux.

How by attraction.

A Humor then flows to some part (this being in truth the more usual cause of Tumors) when either it is drawn by that same part, or transmitted unto it from some other place. Attraction primarily proceeds from heat caused either by overmuch motion, or from the heat of the Sun and Sun-beams, from the fire; or lastly from any sharp Medicine taken in. For the parts so soon as they are heated by these causes draw unto themselves humors from the rest of the body, although there be not therein any excessive store of humors; and yet I deny not but that the more the body abounds with humors, the greater is the store of them that is attracted.

Moreover, Pain likewise frequently enough excites Tumors, by attracting the humors unto the part aggrieved. Yet we say not that pain of it self draws the humors, but that this is done by some other means; and commonly it is said to draw, for these three causes. First, because Nature while she attempts to relieve the suffering part sends in an extraordinary supply of blood and spirits to the part in pain, and this she doth with an endeavor more than usual; so that by this means she over fills, and hurts the parts she intended to succour. Secondly, the grieved part by this time grows hot from that abundance of blood and spirits transmitted thither by Nature; and hereupon fals to drawing more than before, by reason of this adventitious heat. And lastly, pain weakens the Members. Now the Members once weakned, if they attract not, yet they readily receive, and in the least resist not the matter flowing in upon them from several parts.

Secondly, A Tumor is caused by a defluxion, when as the humors are transmitted unto some part, although they be not drawn by that part. For whereas there is in every part a faculty not only of attracting al things familiar and agreeable unto it, but also of expelling and casting out whatever is superfluous and burdensom; hence it is that being stir'd up and provoked by the excess or offensive quality of the excrements and humors it expels and thrusts forth unto some other part whatever is useless, or at least burdensom unto it. Where if it be not digested or evacuated by transpiration, it is thence again forced unto some other parts until at length it come unto the weakest, which is not able to expel these transmitted humors; so that being here left they cause a Tumor. For it cannot be that a Tumor should be caused by the matter transmitted and sent from divers places, unless we grant (as needs we must) that there is a part which sends them, a part receiving them, and the passages by which the humors flow. The parts do then transmit when the vigorous faculty by the quality or store of matter is incited to expulsion. For unless the faculty were provoked, it would never attemp this expulsion; and unless it were strong and vigorous, it could never effect it. And this is likewise much furthered by the external causes exciting the fluxion, to wit, Heat, which attenuates and dissolves the humors; and cold, that by constriction presseth the parts together, and thereby causeth the greater afflux of the said humors.

Notwithstanding, unto these two may be added also a third cause of the defluxion, and that is a certain (ῥόῳ, or) violent issuing forth of the humor it self, as usually it doth appear in persons that have the Dropsie, where we find a water through its own weightiness descending into the Feet and Cods; which motion notwithstanding is wont to cease in the night time; but this would not be if the humor were expelled by Nature; and not rather (as in truth it is) forced down by its own gravity.

the parts receiving

Now as for the humors flowing together from elsewhere, they are received by such parts as are feeble, and through their weakness altogether disposed for the reception of a fluxion. For evermore the more vigorous Members send away that which is superfluous unto the weaker. The weaker Members we account such as either have contracted a certain debility in their very first formation, or being afterward hurt do contract unto themselves a kind of preternatural constitution; or else they are such

as

as Nature her self makes and intends for weak, and so framed and constituted that they may the more easily receive the excrements of other parts: such are the skin, and the parts loose and porous. For Nature (that she might the better preserve the principal and more noble parts from Diseases) hath purposely ordained in mans body some certain parts weak and feeble, that so the principal parts oppressed and burdened with Humors might into them empty whatever is superfluous and burdensom; and these (as we have said) are the skin and glandulous or kernelly parts. And hence it is that the Heart transmits the peccant humors unto the Arm-pits, the Brain sends them behind the Ears, and the Liver thrusts them forth to the Groyns. The parts ready to receive are al those that have any connexion with the part that transmits the humors, and which have the passages through which the humors are conveyed alwaies patent and open; but as for waies whereby to expel and drive them forth, they are either none at al, or otherwise such as are exceeding narrow and over streight; or else lastly, these passages are so scituated that they lie directly under the parts transmitting, so that the conveyance of Humors unto them from the abovesaid parts is render'd the more facile and easie.

the passages by which the tumors flow.

As for the waies and passages through which the humors run, they are either such as lie hid, or else such as are open and very manifest. For whereas the whol body is confluxile, that is to say, apt and ready to flow together; hence it is that the humors have their fluxion out of one part into another by these occult or hidden passages. So the Whey (as we may term it) being gotten in great abundance into the *Abdomen*, or Cavity of the Belly (commonly called the Paunch) by these privy Passages descends into the Cods and the Thighs, and lifts up the said parts even unto a Tumor or swelling; the same which likewise very often happens in other parts. Somtimes the humors assembled together betwixt the Skul and skin of the Head descend thence along under the skin into the inferior parts; but very seldom and rare it is that from hence any tumors are produced. But most an end those humors which excite and raise tumors flow through passages that are patent enough, the Veins and Arteries.

the differences of tumors whence they are taken.

But that we may briefly come to speak of the differences of Tumors arising from Humors, although very many of these differences are accidental, yet notwithstanding those by which the tumors proceeding from humors are truly and properly distinguished among themselves, are taken from the variety of the containing Cause, or the Humor as an efficient cause producing the Tumor. Now the Humors are divers, Blood, Choler, Flegm, Melancholy, black Choler, Choler adust, and Whey. From which likewise various sorts of Tumors are excited and caused. And then again, one while the humor exciting the tumor is (as we use to say) simple and sincere, from whence also the tumor proceeding therefrom is said to be a pure tumor; or anoon again divers humors concur to the making up of one Tumor; and from hence the Tumors which we term spurious, (that is, such as are improperly so called) take their Original.

The Signs Diagnostick.

It is easily known whether the Tumor proceed from the falling down of any part: and if this be not the Cause, we may then lately conclude that the rise of it is from the afflux of humors unto the part affected.

But now whether or no the Tumor takes its beginning from congestion, or rather from fluxion, may by this be discerned; to wit, that those Tumors which are caused by congestion or the storeing up of humors, are a longer while and by degrees arriving at their perfection; neither take they up so much room in the part; nor (lastly) was there any the least preceding cause or sign of a defluxion. But now if the tumor be generated from a fluxion, it wil be discerned by the presence of the contrary signs. And certainly if so be there were not in the grieved part any foregoing pain or heat, it manifestly shews that the said fluxion is caused by a transmission, and not by means of an attraction: like as on the other hand, a preceding pain or heat of the affected part argues the Tumor to proceed from the attraction of humors.

For the Signs whereby to discern and understand the times, take this advertisement; viz. That the beginning of it is then when the part first of al is perceived to be distended and stretch'd forth. The increment or growth, when as the part appears now to be elevated into an indifferent big swelling, and when the Symptoms that accompany al sorts of Tumors are evidently augmented. The state or heighth of it is, when the swelling and (with it together) al the symptoms are at their highest pitch. The declination is then, when both the bulk of the swelling, and all the symptoms are sensibly diminished.

The Signs Prognostick.

1. As for the Prognosticks of Tumors in general, take this for an observation; That in reference to the place aggrieved, inward Tumors are alwaies accounted to be more dangerous than those which are external; and as considered of themselves, they have in them more or less danger of death according to the excellency and use of the part affected.

2. By how much the greater the Tumor, as likewise by how much the greater the *intemperies*

or the distemper accompanying it, is; and by how much also the humor exciting the Tumor is more malignant and vitious; with so much the greater danger and difficulty is the Cure thereof to be expected. And on the other side, look by how much the humor generating the Tumor is more mild and benign, so much the less of danger is there in it, and likewise so much the less of difficulty in the curing thereof. But of all the sorts of Tumors, those arising from a windiness are with the greatest facility remedied, as being in a manner discussed and dissipated of its own accord.

Tumors arising from the humors how many waies terminated:

3. All Tumors deriving their Pedigree from the humors, unless they make a retreat, and then vanish, either of their own accord, or forced thereunto by Medicaments taken in for Natures assistance, are usually terminated these four waies (as *Galen* in his B. of an unequal temper informs us) to wit, either by dispersion, which you may likewise cal discussion, wrought by insensible transpiration; or else secondly, By suppuration, when as the humor which causeth the swelling is converted into a purulent matter; or else thirdly, By corruption, when as the constitution and the radical heat of the part affected is destroyed and wholly corrupted by the pravity and malignancy of the matter; or else lastly, By induration, when the matter that gives being to the Tumor hath acquired an accidental and adventitious hardness.

The signs of a tumors resolution.

Of Resolution an infallible sign is, a lightness in the Member (contrary to its former weight and heavyness) and a cessation of the troublesome beating with which it was formerly disquieted.

The signs of the suppuration of a tumor.

The Signs of a neer approaching suppuration are these, *viz.* a pain and palpitation in the part, together with a Feaver, either now invading it, or at least the increase of a Feaver already and formerly present; according to that of *Hippocrates* in his second Book, and forty seventh Aphorism, While the peccant and crude matter is under concoction, and until it arrive at a ripeness, and maturation (as we usually term it) Feavers are alwaies present. But so soon as the concoction of the crude or raw matter is compleated, so that the filth and impostumated matter appear, then the part becomes in a manner lighter than it was, the heat abated, diminished, the pain assuaged, and a part of the Tumor is eminently elevated, and begins to grow sharp or sword-pointed; and this sharp point forthwith becomes of a white colour; and the part if touched with the Finger seems softer; and the purulent matter sensibly appears to fluctuate and yeild unto the touch of the Hand. Yet notwithstanding it oftentimes chanceth, that the filth and corruption lies altogether hid and obscured, so that it may not easily be discerned, either by reason of the depth of the place, or the thickness of the part; as *Hippocrates* in his sixth Book, Aphorism 41. doth rightly advertise us.

Signs of corruption and induration.

Signs of maturation (which is nothing else but a ripening of crude or raw matter) now nigh at hand, are, a blackness, or a Leaden colour of the part affected. A sign of Induration is, a diminution of the Tumor, but an augmentation of its hardness. A sign of the Tumors retreating and decreasing, is a sudden and unexpected lessening of the swelling; which said diminution if it proceed from an internall cause, is evermore evill; unless the matter retiring be evacuated by a fit and convenient way. Upon the going back of the matter immediately there follows a Feaver, if there were none before; or if there were any before, it is now much augmented; and other evil symptoms arise from the retention of the matter in the Body.

Now the best way of freeing the part of any Tumor that grieves and afflicts it, is that which is performed by resolution; and next unto this, that which is wrought by suppuration; but it is very il, that Tumors or swellings should be hardened; and it is far worse, nay worst of all, that the part it self should be corrupted.

The Cure.

The nature of a Tumor or swelling in it self simply considered (*i. e.* as it is magnitude augmented) affords no useful indication at all; but it is taken from the Cause conteining; for upon the removal of this, forthwith the swelling vanisheth. If there be a distemper accompanying it, then for the better effecting the Cure, it is expedient in Tumors that are hot, that we use means to cool them; if they be cold, that we heat them; if moist, that by the help of Art we exsiccate and dry them; and lastly, if they be dry, it is requisite that we should moisten them. But then, in this alteration of the parts, their Nature, Temper, Action, Use, Figure, Scituation, and Sense (al which prescribe the measure of alteration) are carefully to be considered; of which I have already treated at large elswhere, in my Institutions, the fifth Book, second part, second Section, and first Chapter.

the Causes of a tumor how to be taken away

In the removal of the Cause, we must heedfully look whether the Tumor be already compleated, and not like to receive any further increase or addition; or otherwise whether it may not be further augmented. For if the Tumor be already arrived at its perfection, then there is no more required but that we look back unto the conteining Cause, and then that we take the best course to remove it. But if the Tumor be not already at the heigth, but only in a tendency thereunto;

unto; we must then also look back a little further unto the Antecedent Cause, as likewise the Causes more remote, and those al of them we ought speedily to remove. And this is especially to be done whenas the Tumor is generated from an afflux of humors. For in this kind of Tumor the fluxion it self is to be opposed, and if possible, all its Causes to be taken away. Now the Fluxion may be totally removed, if the flowing humor be either evacuated by drawing of Blood, or by Purgation; or if the course of the flowing humor be turned another way; which is effected either by drawing it back unto the contrary parts, or by intercepting the motion of the humors in their passages or by repulsing of them from the part affected; or lastly, by deriving of them unto the parts adjacent.

A Fluxion, how it may be taken away.

Now the Causes of a Fluxion are taken away, if we take away all such things as conduce unto either the transmission, or the attraction of humors; for in one of these two waies a Fluxion is both begun and carried on. The aforesaid transmission is caused, or at least much furthered, when either the whole, or some part stirred up and provoked either by the over great abundance, or by the quality of the humors, or by both together, drives forth what is burdensome unto it unto some other part that is weaker, and thereupon the more proclive and apt to receive. And therefore whatsoever is oppressive either of the whole, or of any particular part, it behoves us to discharge and remove it, by opening a Vein, or by purging, or both waies; and then to corroborate both the part which breeds, and the part likewise that collects and receives these vitious humors; that so we may hereby free them of all their Obstructions. Attraction is caused by reason of Pain, or Heat; and therefore it is mainly requisite that the pain be removed, and the heat qualified by refrigerating Medicaments. But if the matter of the Tumor or swelling be gradually and by little & little heaped up, then the Cause of this congestion (whether it be a distemper, or any other fault in the part) is to be removed. All which shal hereafter in the peculiar Tract of Tumors be made more manifest.

A Humor how to be taken away out of a tumor.

As for so much of the Tumor as is already caused, it is to be annihilated by freeing the part affected from that very humor which excites the Tumor. Now the humor is taken away out of the affected part, either by translating of it unto some other part, or by the evacuating of it out of the Body. It is transferred into some other part, either by astringents and Medicines that drive back, or else by Medicaments constringent, that is, such as by compression bring the part close together; or otherwise by drawing of it unto other parts, which is effected by the sense of pain, by heat, and by reason of a vacuity or emptiness. Such things as repell and drive back (as elsewhere hath been said) take place only where the matter is not as yet impacted and stuffed into the substance of the part, but only flows to and again in the greater or less Vessels of the same, or else without these Vessels in the vacant spaces of the part; and which is neither so thick, nor yet so thin, that it can resist the repelling Medicines. But if the matter be already farc'd into the part, that it is now neither possible not safe to repel and drive it back from thence (of which we have spoken in the fifth Book of our Institutions, Part 1. Section 1. Chap. 8.) then in this case, repulsion hath no place, neither is it to be attempted. The peccant matter is evacuated out of the Body, either sensibly, to wit, when it is even sensibly poured forth of the parts, or else insensibly, when the matter is dissipated by the Pores.

A Humor, how to be driven back.

Discussion of Humors.

If there be no great store of matter, and the part scituated above it be less compact, and the matter it self not so extraordinarily thick, then it is to be expel'd by insensible discussion. But then notwithstanding if the matter to be scattered be any thing hard, it is first of all to be softened, that so it may the more easily be discussed by the pores of the Skin. But then again on the other side, if the matter conteined in the Tumor be in greater abundance, and withal thick; and if the part lying above it be close and compact, the matter is then rather to be sensibly evacuated by opening the Tumor.

But since that all these things are most conspicuous in inflammations, therefore whatever may here seem fit and requisite to be spoken in general touching the original of Tumors proceeding from the afflux of humors, we wil hereafter treat of in the Cure of an Inflammation: and at present we wil here (as in the fittest place) speak something in general of Impostumes.

Chap. 3. *Of Impostumes.*

FOr oft-times it comes to pass, that the matter which is cause of the Tumor cannot be insensibly dispersed, but that it wil rather admit of a change into some other kind of matter, and so be heaped up in a peculiar place. The which although it most an end happen in Inflammations, yet notwithstanding other Tumors also (and those not a few) in process of time are turned into Apostems, or Impostumes as we term them. For albeit corrupt matter proceed only from Blood, as we shal further shew in the fifth Chapter, when we come to speak of an Inflammation; yet notwithstanding, if in like manner also (in other Tumors) the matter which causeth the Inflammation may not insensibly be dissipated, Nature that is never idle (especially when assisted by the warmth of Medicaments, and most of al if any portion of Blood be therewith mingled) in process of time converts it (and that very variously according to the nature of the humor) into something like

like unto matter; which when it is altogether severed from the parts conteining, and gotten together into the Cavity of the part affected, is properly called an Apostem; as hath already been said in the beginning of the first Chapter. And in truth the name of an Apostem and Impostume is commonly made use of for every kind of Tumor; but unfitly as is aboveſaid, Chapter first. For an Apostem and *Abscessus* or impostumation hath its denomination from parting asunder, in regard that the conteining parts which before touched one the other are now mutually departed asunder, and form a certain Cavity, into which the corruption betakes it self; and likewise an *Abscessus* or Impostume is the collection of the filth and purulent matter in the hollowness of any part whatsoever. *Pliny* gives to Apostems the term of suppurations, in his twentieth Book, and third Chapter; *Avicen* cals them *Dubellet* or *Aldubellet*.

An Apostem:
An Impostume:
An Impostume what it is:
Suppuration:
Dubellet:

Impostumes their Differences:

Tumors some of them more speedily, others again more slowly attain unto their maturation or ripeness. Those that proceed from good Blood, and especially in a fleshy part, are easily and soon maturated: but those Tumors which are bred out of other humors, and have their residence neer unto the Joynts, and in the sinewy parts, those especially that are weak and have in them but very little native heat, are with far more difficulty brought unto a maturation. Now of the matter which is gathered together in an Apostem, there is great variety according to that of the humors. Out of good Blood is generated a filth that is less offensive; but out of the other humors is bred somthing that resembles matter, Green, Yellow, or some other color, Pricking, and Stinking. For as for this preternatural matter, if it may not be driven forth, Nature then separates it from the parts conteining; and thus being severed from the other parts, Nature collects it into one place, and there digests it so far forth as the nature of the subject matter doth admit.

And indeed of the matter that is discovered in Impostumes there is evermore great variety. For there is not only that which we cal *Pus*, *i. e.* a stinking Corrupt matter found therein, but likewise now and then a substance resembling Gruell, Honey, Suet, the Lees of Wine, the Dregs of Oyl; and somtimes also never a whit unlike unto Honey and Snivel blended together; and that oftimes of so ill a savor, that no one is able to abide the Stench: and as soon again also we may therein discern substances like unto Hairs, Nails, Bones, Stones, Worms, Wood, Coals, Cockleshels, as before also (in the beginning of the second Chapter) we have acquainted you. Yea moreover also in Impostumes not unusually there are found Worms alive, and other such like little Creatures that have life; and *Philoxenius* writes (as *Aetius* reports, *Tetrab.* 4. *Serm.* 3. Chapter 7.) that on a time he discovered in a Tumor opened living Creatures like unto Gnats, or smal Flies. And it is a wel-known truth, that the humors in the Body may be wholly changed and converted into Worms, and such like substances in great variety. But then if Coals, Woods, Shels, or any thing else of a like nature (into which the humors cannot possibly be conceived to pass) and more especially when they resemble any thing that is feasible by Art) shal chance to be found in Tumors, then without doubt we ought to ascribe it unto Sorcery and Witchcraft. And this likewise (as touching the difference of Impostumes) is to be taken notice of (the same that *Galen* tels us in his fourteenth Book of the Method of Physick, and twelfth Chapter) viz. that the matter into which the humor causing the Tumor is converted, one while flows to and again in the Cavity of the Tumor, and is gotten together into the nook thereof; and as soon again it is shut up in its own peculiar Membrane, as it shal further be made to appear when we come to treat of the Tumors we cal *Meliceries*, *Atheroma*, and *Steatoma*. Albeit there have not been wanting some (as we may read in *Paulus Ægineta* in his sixth Book, and Chap. 36.) who were of Opinion, that those Tumors alone were to be properly termed Impostumes, that did participate of an Inflammation and Pain, and had within them a sharp and corroding humor; and were not at all conteined in their own peculiar little Skin or Tunicle.

The Signs Diagnostick.

Now then in an Inflammation it may easily be discerned when the humor that causeth the Tumor is turn'd into a purulent matter. In other Tumors notwithstanding there are Signs given which may demonstrate whether or no they be changed into an Impostume. As to instance, Until that the Tumor be turned into an Impostume, it is never a whit lessened, but there is perceived a more intense beating in the part, the Heat, Pain, and the other symptoms are heightned; hence it is that *Hippocrates* in the second of his Aphorisms, Aphor 47. writes, that til the time of maturation the Pains and Feavers are intense. And besides some one part or other of the Tumor begins to be sharp-pointed, the matter then seeking its passage forth and thereby lifting up the part into a Tumor.

Signs of suppuration.

But so soon as the humor is converted into Snot or that kind of matter which much resembleth it, then, and not til then, there is an abatement of the Feaver and pain, and then the swelling round about is somthing diminished, the extension

tension and hardness a little remitted, and the Patient is sensible of ease and a kind of light somnes; for then in Tumors that are hot the heat is abated and becomes remiss whenas the matter is al gotten together into some one part: and hereupon the tumor it self in that part where the matter is thus collected is raised up into a sharp point. And at length, if the place be pressed down with the finger, there is a softness and a certain kind of floting of the matter underneath sensibly perceived in the part. Yet notwithstanding that we be not mistaken in this point, a Caution is very requisite. For now and then there is no fluctuation at all to be perceived, to wit, when either the matter is over thick, or otherwise, when it is scituated in a part very deep. Concerning which *Hippocrates* thus instructs us, in the sixth Book of his Aphorisms, Aphor. 41. when he saith, That for those which have a suppuration in the body really existent and in being, which yet notwithstanding appears not unto them, the reason why it lieth undiscovered unto them is in regard of the thickness either of the matter, or of the place where it hath its residence. But sometimes there is perceived to be somwhat like unto this fluctuation or floting, albeit there be no filth or corrupt matter underneath; which happeneth about the Knees, and other joynts, where there is no flesh underneath the skin.

The Indications and Cure.

Whilst that the purulent matter (by the late Latine Authors termed *Pus*, from the resemblance it hath unto Snot, or Snivel) is in the way of maturation, and until it hath perfectly attained thereunto, the heat of the part that concocts the aforesaid *Pus* or purulent matter must be augmented by Medicaments that cherish and encreate the heat of the part; or else by such Physical Remedies as are proper, to wit, those that tend unto suppuration; and by this means the production of purulency is to be holpen forward and hastened, and the present intense pain appeased. But so soon as this *Pus* or somwhat like thereunto is perfectly generated in the part, in regard that it is in its whol kind universally preternatural, and so cannot possibly be assimilated by the part, it must thereupon be cast out of the body; which may most aptly be accomplished by opening the Impostume, whether it break of its own accord, or otherwise it be opened by art. But seldom or never is the matter contained in the Impostume to be discussed and dissipated; and then it ought to be only when the matter is very thin and fluid.

Matter vulgarly termed Pus, how to be furthered.

Those Remedies that not only mitigate, but wholly also take away from the part al sense of pain, are such as we call *Anodyna*, and *Chalastica*, viz. Milk, Butter, Oyl, Swines Fat, Capons Grease, the Unguent *Dialthea*, and the Emplaster *Diachylon simplex*.

What the Nature of those Medicaments which both cause and hasten maturation, or the ripening of this *Pus*, is, we have declared in the fifth Book of our Institutions, Part 1. Sect. 1. Chap. 9. Such as are these, Oyl mingled with Water, Oyl temperate, without mixture, Wheaten flower, and Bread of the same, the Fat of a Calf, Swines Fat, Hens Grease, the Fat of a Goose, Pitch, Rozin, Wax kneaded and mingled with Oyl, the Unguent named *Tetrapharmacum*, that is, made up of four Remedies, viz. Wax, Rozin, Pitch, and Fat. In Bodies that are soft and loose, the fat of Swine; but in bodies more compact Bulls fat is most approved for use. For this is carefully to be heeded in Maturatives, i. e. Ripening Medicaments, that they ought to have in them the neerest resemblance that possibly may be unto the nature of that body whereunto they are applied. And therefore in Children, Women, and generally in al bodies that are softer than ordinary, the moister kind of Remedies take place; and on the other hand, in bodies more hard and close, Remedies of the moister sort are required. And this in like manner is to be understood touching the Nature of a tumor or swelling. As to instance, in Inflammations such Remedies as moderately heat and moisten (provided alwaies, as I said, that they be temperate) are used with the best success. And yet notwithstanding, because that in some other Tumors naturally more cold there is a maturation, though more slow; and the matter of them being thicker than ordinary, if it be not converted into a laudable *Pus* or Quittier, yet it is turned into a matter neer of kin thereunto; and the heat of the part although it be greatly furthered and carried on by temperate Maturatives, yet can it not ripen the cold matter; upon these aboveseid considerations, Medicaments that are experienced to be somthing hotter are to be added unto the former. The same is likewise to be observed in parts naturally cold, as also in old age. And hence it is that of such Remedies which ripen the crude matter in Tumors, we constitute two kinds. Of the former sort are all those that are moderately hot and clammy, which are of use in hot Tumors; and these are properly such as are said to further and hasten Maturation; of which sort are those before recited, *Hydrelæum*, sweet Oyl, Wheaten Meal and Flour, Milk, the Pith of white Bread, the Fat of Swine, fresh Butter, Wax mingled with a double quantity of Oyl, Mallows, and Marsh-mallows decocted with Oyl, the Mucilage of Linseed, of Fenugreek, of Mallows, and of Marsh-mallows. If any desire a Composition, let him make such an one as this that followeth:

The Differences of Maturatives.

Take *of the pouder of the Root of Marsh-mallows, the Leaves of Mallows, of each one ounce; of Wheat flour an ounce and half; of the seed of Fenu-*

Fenugreek, and Linseed, of each half an ounce; of Saffron half a dram; boyl them in the Decoction of dried Figs, or in Milk; add hereunto of the Fat of Swine, and the Unguent Dialthea, *of each one ounce; and make herewith a Cataplasm.*

Of the second sort are such as are somwhat hotter; which are to be used in cold Tumors, and in colder Natures, because there the parts likewise are colder; and such are, Turpentine, the Gum of the Fir-tree, the Larix-tree, and the Pine-tree, dried Figs, Raisons, Fenugreek seed, Linseed, Onions roasted under embers, Leaven, Oyl of Chamomil, and Oyl of white Lillies, the Fat of an old Hen, old Butter, *Bdellium*, *Galbanum*, and *Ammoniacum*.

Out of which such a like Cataplasm as this may be made:

Take *of the pouder of the Roots of Marsh-mallows, Wheat flour, Linseed, Fenugreek seed, dry figs pounded to a Mash, of each two ounces; of Leaven half an ounce; of the pouder of Chamomile flowers two drams; let them boyl in a sufficient quantity of Water; then add thereunto of the Fat of an old Hen, and Oyl of Camomile, of each an ounce and half, and so make up a Cataplasm.* Or,

Take *the Leaves of Marsh-mallows, the roots of white Lillies, Holy-hock Roots, of each an ounce and an half; Onions one ounce; boyl them to a softness, then mash them and pass them through a hair sieve. Add hereto of Wheaten flour, Linseed, Leaven, of each one ounce; Turpentine half an ounce; of Saffron half a dram; Oyl of Camomile, and Hens fat, of each a sufficient quantity; and so make a Cataplasm.*

The most usual are, the Emplaster of Melilot; and *Diachylon magnum*, with Gums.

The Evacuation of stinking and corrupt matter.

When as the corrupt stinking matter is arrived at its full ripeness, or the matter of the Tumor is changed into an humor resembling this *Pus* so often mentioned, it is then to be evacuated, and cast out of the Body; the which since it may be effected in a twofold manner, either sensibly, or by an insensible digestion; the best course were (more especially in the face, lest that a Cicatrix or scar should ensue and remain upon the opening of the Tumor impostumated) to discuss and scatter abroad the matter by an insensible transpiration; for which very purpose certain Medicaments are described by *Galen* in his sixth Book of the composition of Medicines of the second rank, the 14, 15, and 16. chapters; and there you may see them. But it is not often that this happens; and when it doth, there is cause to fear, lest that if there be great store of corrupt matter, some part thereof should be left remaining and hardened; or that if the filth aforesaid be acrimonious and corroding, that then it may be rendered more sharp by delay, and the application of Remedies that are hot; and so by this means the part affected, as also the parts neer adjoyning should be greatly hurt and injured; and therefore for the most part the safest way is to open the Apostem, if it chance not in a convenient time to be opened of its own accord.

The opening of Apostems.

Now then an Impostume is to be opened in the highest and most eminent place, where the skin usually is at the thinnest; but then notwithstanding the incision must be in that place of the part affected which is most sloping, that so the passage forth of the corruption may be rendered the more facile and easie. Now the opening thereof is effected either by some Caustick Medicament, or else by the help of an Iron incision knife. But most an end the safest way is to open the impostume with an Iron Instrument rather than by a Caustick Medicament. For Medicines most commonly protract and delay the Cure, excite and cause both heat and pain in the part; whereupon it happeneth that the temper and constitution of the part, which was before much weakened by the Disease, becomes now wholly subverted; and from hence dangerous symptoms do frequently shew themselves. Now and then notwithstanding, as for instance, in the watery Tumor of the Testicles, when with the Iron we cannot easily penetrate unto the bottom of the place wherein the vitious matter is contained, we ought to use a potential Cautery. For the way being once opened by a potential Cautery may afterward be dilated as much as we see cause for; that so the Instrument may the better pierce the part, and reach even unto the deepest place, and bottom thereof.

How many waies a tumor may be opened.

The said operation with an Iron is effected whenas the opening is made by an Iron Instrument made red hot, or else with an Iron Incision knife that hath not been heated in the fire. We very seldom make use of the hot Iron, and then never but in cold tumors; and that also only whilst the impostume is in those parts that have in them either many, or else large Veins and Arteries; that so the flux of Blood (which we cal the Hemorrhage) may the better be pre-cautioned and prevented. But as for the Incision Iron that hath not been heated, we use it most frequently, and that with very good success. But if it shall so happen, that upon the opening of the Impostume, sometimes pain, and sometimes an efflux of blood shal ensue; and likewise that by reason of the abundant evacuation of the matter; or else that by pain and fear, a sinking away or swooning should follow; in this case we must endeavor that the Section may be performed with the greatest speed, and the least pain that possibly may be. If an Hemorrhage be feared, we must have in a readiness those Medicaments that stop the flux of

Blood,

Blood, as Frankincense, Aloes, the white of an Egg, Bole Armenick, Pomegranate flowers, Dragons blood, and the like. To prevent fainting and swooning, especially in Children, Women, and other fearful persons, we ought to have at hand such Medicaments as are in use against this faintness of mind. As also that there may be a right and orderly proceeding in the Section or opening, the condition of the part, the scituation of the Veins, Arteries, and Nerves, as likewise the Nature of the Muscles, all these ought to be exactly known and learned by the Chirurgeon from what is written by Anatomists; lest otherwise Veins and Arteries should be cut, and an Hemorrhage thereby caused; or that pain should arise from this hurting and cutting of the Nerves; or that hereby the Member should be altogether deprived of sense; or lastly, that by the hurting of the Muscles the part should be wholly deprived of its motion. Moreover also, a special regard must be had unto the fibres in the Muscles, so that the Section ought to be performed according to the conduct of these fibres, that is to say, not oblickly or overthwartly; for this kind of Section wil greatly annoy the action of the part. We must again heedfully weigh and consider, in what measure, and how great the Section ought to be. For if it be over little, the *Pus* or corrupt matter, especially if it be thick and cloddy, wil have no passage forth without compression of the part, which wil both assuredly excite pain, and beget a kind of brawny hardness in the part, which may be the cause of a Fistula. And on the other side, if the section be made overgreat and wide, there wil then be left remaining a great and unsightly scar; and which is worse, the ambient Air getting in wil alter the part: and therefore the Section ought to be made in such a manner and measure, as shal be most requisite for the evacuation of the Corruption and filth. And although the section be somwhat with the least, it may notwithstanding very easily be dilated by thrusting a tent into the hole thereof. To make the Incision we admit of either the Razor, or the Knife of Myrtle wood edged on both sides, with which the Italians and French open Veins; or else that Knife which we cal *Phlebotomus*, which the Germans use; or lastly, that which we cal *Syringotomos*, an Instrument crooked, and of use only in the incision of an internal, or a concavous body.

The opening of a Tumor in what manner to be performed.

The evacuation of the Pus, *or corrupt matter*

The incision being made, if there be but little filth, the part is with the finger to be prested down, to the end that it may the more readily flow forth: but if there be great store of this filth and matter, it is then to be drawn forth leisurely, and by little at a time, lest haply (if it should be evacuated al together, suddenly, and on an heap as it were) much of the spirits should therewithal exhale, and thereupon a fainting and swooning should ensue.

After Incision, and the emptying forth of the corruption, it will be convenient the first day to strow thereon the dust of Frankincense; on the second day to lay thereon some kind of Digestive or other, that so if any thing yet remain undigested, the compleat digestion thereof may hereby be accomplished. And if there be present any filth, or any kind of uncleanness which may hinder the growth of flesh shal chance to occur, they are forthwith to be wiped and cleansed away. As for example:

Take *Turpentine one ounce; Honey of Roses half an ounce; and of Barley Meal as much as is requisite, and so make a mixture, and use it for the purpose aforesaid.*

If the Ulcer require yet a more forcible cleansing by reason of its extraordinary nastiness, then we ought to use the stronger Abstersives, as *Unguentum Apostolorum, &c.* And at length Sarcoticks, that is, such Medicaments as cause flesh to breed and grow, are wisely to be applied; and the orifice of the Ulcer to be shut up with a scar.

Of Impostumes lying hid, two histories.

Here we are to take notice, That sometimes Impostumes may for a long space lie hid not only underneath the external Muscles, but likewise under the more profound, yea, and the more internal Muscles also. Concerning the Impostumes of the Muscles of the lower belly or Paunch, we have already spoken in the third Book, Part 10. Chap. 7. As touching the Impostumes in the great Muscle *Psoa*, *Gulielmus Fabricius* in his first Century, and sixty third Observation, relates two Histories: And first he tels us, that a certain Matron took her bed, complaining of acute and extream pains about her Loyns, which was accompanied with a Feaver, swooning fits, and difficulty of making water. And when it was sufficiently understood by the kind of the pain, and other signs and tokens, to be an inward Impostume (for outwardly there appeared not any thing, neither could there any thing be discerned by the touch) and that this Apostem could be no where but under the *Psoa* Muscle; and when that the sick party was foretold the extream danger and hazard of her life, unless the Impostume were opened, and the humor caused to flow forth; both her self and her friends gave their consent, that on one side of the *Spina dorsi*, or back-bone, the skin and the exterior Muscles even unto the *Psoa* Muscle should be opened by an Incision with a Razor: which was done accordingly, and out there flows a purulent and stinking humor, and so, after that some certain cleansing and abstersive Medicaments had been for some few months applied, she became perfectly recovered. The other History which he relates, is this: In the Year One thousand five hun-

hundred eighty five, a certain yong man, aged twenty seven years, or thereabouts, as he was descending from the highest pitch of the Mountain *Cinecius* unto the lowest part thereof, not well minding his footsteps in a very steep path, he or ever he was aware fel or rather tumbled down backwards; and that which added unto the mischief of the fall, was this, the hilt of his Sword lighting under the short Ribs and the left Kidney exceedingly crushed and bruised his Loyns. After this his fall, for a few daies at the first, the pains he felt were not many; not long after he grew sensible of pains in the left part of his Loyns, but they were as yet very gentle and remiss: now from hence forward these never left him, until at length by an insensible and gradual growth they arrived at the heighth of their increment, insomuch that at length they became extreamly sharp and intollerable. Upon this immediately follows the loss of sleep and appetite; whenas notwithstanding at that very instant the sick party was not afflicted with any great thirst, or very violent Feaver. Neither was the part affected ever a whit discolored, or as we say, black and blue: nor did there at al any outward swelling appear, nor was there the least imaginable external blemish any where to be seen; but al the parts seemed to be, and indeed were what they seemed, plain and even, and in no point at al altered from their natural scituation or color. But as afterward the event it self plainly evidenced, abundance of humors from all parts of the body had met together in the Muscle *Psoa*. In the first place he was by a certain Physitian tampered withal as a Nephritick Person, that is, one troubled with the pains of his Reins; but the Doctor was much mistaken. For at length whenas no one sign of the aforesaid Nephritical effect appeared; and the sick party had not received the least benefit by what had been prescribed; he was in the next place sent unto *Johannes Griffonius*; who instantly discovered the whol grief, and the mischief that it threatened; all which he very wel knew; and likewise the danger impending from the shutting up of the noysom purulent matter in the inwards, he foretold the yong man; and that his Opinion was, it ought to be evacuated. Unto whose will the yong man giving his consent, commits himself unto the Cure. What doth this expert *Griffonius* hereupon? In the first place he takes care, that the matter which had now seized upon, and did possess the whol Region of the Loyns, should all of it be drawn together into some one place thereof (by the applications of those Medicaments which had a vertue in them powerfully to attract from on high) to wit, such a place, where the principal Vessels were but few, and where the Instruments of motion might least be harmed amidst their operation. Which his design when (ever and anon attempting the part with a Silver Probe) he wel perceived by the sense of pain attending it, that he had successfully accomplished, without any more ado he lanceth on the left side the flesh nigh unto the fourth Vertebra of the Loyns, with a fire-hot Razor, making a Wound as deep and long as is the fore finger from the end thereof unto the hollow of the hand; as afterward it was easie for him to conjecture by that long sharp tent which he put thereinto. And moreover, when he had conveyed down two of his fingers into that same Wound (to the end he might widen the passage forth) out there issueth great store of matter and stinking stuff. And then having prescribed the manner of evacuation according to the rules of Art, the Chirurgeon ordains for the Patient a sharp tent made of Silver, the which being first dipt in cleansing and abstersive Unguents, he enjoyned him to use for some months. So that by this means the lips of the Wound came close together of their own accord; and the yong man recovered his former perfect health.

The humor that flows out of an Impostume sometimes translated into other parts.

And this is likewise as a thing remarkable to be taken notice of, That Impostumes lying concealed in some places, if they be not opened, then they sometimes seek out another passage, and thereby flow forth unto some other place. And so the afore mentioned *Gulielmus Fabricius*, in his first Century, and 81. Observat. relates of a child three months old, that was sorely afflicted with an Impostume neer unto his right shoulder. But the Parents would by no perswasions be wrought upon to admit of an Incision; so that by degrees the Tumor seemed much lessened and abated. But at length it being opened, some smal and inconsiderable quantity of matter issued forth, and the Tumor by little and little became in a short space wholly extinct, and sunk away; the humor now and then a little at a time gliding downwards into the lower belly, and the genitals; by which the radical Native heat being destroyed, a Gangrene follows thereupon, and after a few daies a *Sphacelus*, and in a very short time death demands his due.

And this may suffice to have been spoken concerning Tumors in general arising from the humors. Now we wil take a view of them particularly and in their several species or kinds. Now in the first place, those Tumors that take their rise and original from the Blood present themselves unto our consideration; and among them, we shal first speak to that kind of Tumor which we call *Corpulentia nimia*, or extream corpulency.

Chap. 4. *Of extream Corpulency, or overmuch fleshiness.*

TRuth it is, that *Galen* in his Book of Tumors, Chap. 1. affirms, that Fat and Corpulent

lent men are said to be such as have a Bulk and vastness, not such as is altogether preternatural, that is, beside, above, or beyond Natures intention (much less contrary unto it) but such as may be said to be not Natural, and above that which is according to Nature. Yet notwithstanding in the very same place he immediately adds, that the excesses of dispositions which are not by Nature are therefore besides Nature; and that (in very truth) the hurting of the actions doth terminate the excesses of such as are corpulent. And therefore, since that the Bulk of the Body doth now and then attain unto so extraordinary a vastness, that Natures operations are thereby much impeded and hurt, he doth upon very good grounds (in his Book of the differences of Diseases, the ninth Chapter) reduce extream corpulency, or overmuch Fleshiness, unto the Diseases of magnitude augmented. For the same *Galen* in the place alleadged, *viz.* Chap. 9. of his Book of the differences of Diseases, reports of a certain man, one *Nicomachus* of *Smyrna*; that his Body grew to so huge and extraordinary a bulk, that he could not stir from one place unto another. And within our remembrance also, by the Pictures brought hither and here exposed unto publick view, a certain Rope-makers Wife of *Strasburg* (a City of *Alsatia*) became very wel known; who in the yeer 1613. and of her own age the 36th weighed four hundred and eighty pounds. And I my self of late daies saw here a man who weighed more than four hundred pound; yet notwithstanding this man appeared in publick: and to tel you the whol truth, in this Person Nature began to assay some certain kind of evacuation of the serous or wheyie humor by the Navel. And the very same hath been found to happen unto others also, in whom the Body hath attained unto so immense a bigness, that they could neither move, nor yet so much as breathe freely. But now in such like Persons as these, there is not an equal augmentation of all the parts of the Body (as it is in them who grow, and are naturally enlarged) but only of their Flesh, and of their Fat there is an excessive and over-great encrease.

The Causes.

The conjunct Cause therefore of this Tumor of the whole Body is the Flesh and the Fat. And here truly one while the Flesh, and otherwhile the Fat is augmented: and sometimes they are both alike encreased. But the Antecedent Cause is the over-great abundance of Fat and good Blood. And for this cause it is, that this Tumor is referred unto Tumors proceeding from the Blood. And yet notwithstanding the Reason of these is far differing from that of other Tumors arising from the Blood. For the conteining Cause of bloody Tumors is the Blood, but the conteining Cause of this Tumor is the Fat, and Flesh; and the antecedent Cause is the Blood. The rest of the bloody Tumors that are properly so called spring from the Blood issuing out of the Veins or Vessels into some othe. places; which never happeneth in this extream and extraordinary corpulency, in the which Blood is never known to fall or issue forth into other places, but it is evermore put unto the Body.

But now what the Causes may be that much Flesh and Fat should be generated, will easily and soon be discovered, if we wel consider the Causes of breeding Flesh and Fat. Now then Flesh is abundantly bred in those whom we call *Eusarcoi*; that is, Persons of a pure, untainted, and sound Flesh; yet alwaies provided, that the material cause of Flesh, to wit, nourishing Food, be not wanting; and likewise that the native virtue generating Flesh be as it ought to be, vigorous and active. That which administers matter towards the breeding of flesh is great abundance of good blood; the which to produce and generate, meats of a good and plentiful juyce, and also a due and right temper of the Liver, to wit, hot and moist, are evermore requisite. But now again that much Flesh may be bred from much Blood, it is required that there be a sound and healthful habit of Body, and a good temperament of the musculous parts in the Body; which said temperament is likewise hot and moist. Hereunto also (as we are to understand) very much conduceth an easie or idle kind of life, in the which there is not much Blood wasted; as also the suppression of their accustomed bleedings, and evacuations of Blood, especially in Women. As touching the original and increment of Fat, many and various are the Opinions and controversies among the Physicians at this very day; the which for me in this place to examin were altogether impertinent. And therefore in a word we say, that Fat is generated from the Oyly and fatrish part of the Blood, falling from out of the Veins and Arteries into the membranous parts, and there digested by the innate virtue and temperate heat of the Membranes. That great store of Fat should be bred, in the first place, the Liver is a principal cause thereof. For if by reason of its excellent and perfect temperament it doth not generate either much earthy and cold, nor much cholerick and hot juyce, but produce a sweet fat, and oyly Blood, and fil the Veins and Arteries therewith; and if this Blood be not consumed or wasted in the habit of the Body, but that it stil continue to be more cool and moist, then this Blood is there converted into Fat. Ease likewise, and the intermission of Exercise, the retention of accustomed evacuations, aliment temperately hot and moist; and generally all things which either outwardly or inwardly any waies conduce to the making up of a plentifull and temperate mass of Blood; or that have in them an efficacy in qualifying and allaying the over-intense heat of the Blood of the Entrails, and of the habit of the Body. Hence it is that *Galen*

hath left it upon record; that all Bodies tending towards a cold and moist temperament become Fat. And with this of *Galen* agreeth what *Prosper Alpinus* in his Book of the Egyptian Physitians, Chap. 9. hath written; his words are these, The Bodies of the Egyptians (saith he) are hot and dry, in regard that they live under the hottest (and withall dry) position of the Heavens: but because they moderate and lessen this heat and driness by their dayly drinking of water, by their continual use of meats that have in them a cooling virtue, and likewise by their frequent use of Baths which they make for themselves with sweet Water; their bodies hereupon become extraordinarily fat, so fat, that he never beheld in any part of the world in so great a number and generally such extream fat and gross Persons as he saw at *Grand Cayre* in *Egypt*. For he reports that very many of them are so exceeding gross and corpulent, and generally so fat in their Breasts, that they have Paps of a far larger size, and thicker than the greatest that ever he had observed in any Woman. Other things there are which demonstrate unto us the truth of this assertion, to wit, that a hot temperament of the Liver makes very much for the breeding and augmenting of fat. For I my self knew a Person of Honor, who after he had been sick, and was recovered of a malignant Feaver, grew to be so extreamly fat and gross, that he could very hardly move, or stir himself in any place where he sat; and as for the bulk of his body, he came never a whit behind him whom we have formerly mentioned.

Signs Diagnostick.

As concerning Corpulency therefore, it is sufficiently obvious to every mans Eye. But then, whether or no it only produce some kind of deformity and be no more then a Symptom; or else whether it be not to be accounted a Disease or preternatural affect, the hurt and offended actions wil evidence unto us; of which we wil now speak.

Prognosticks.

1. What the inconveniencies and discommodities are that this over-great fleshiness or (as we term it) extream Corpulency carries along with it, I shal give you an account thereof in the words of *Avicen* that expert Arabian Physitian. For thus he, in his fourth Book, Part 7. Tract. 4. Chap. 5. Superfluous fat (saith he) is that which hinders the body from and in its motion, walking and operation; and streightning the Veins with an undue and dangerous constriction: whereupon it oppilates and stops up the passages of the Spirit, so that hereby it is many times extinguished; and for the same reason likewise it is that such Persons have no refreshment from the breathings in the ambient Air, which finding the passages obstructed, proceeds not so far as the *Præcordia* (or Entrails) to moderate and qualifie their excessive heat: and they are in continual fear, left that their Blood should again be driven forth unto the streightned place. Whereupon haply they wil give way that a Vein be suddenly opened, which may prove very pernicious unto them. And truly in this kind of disposition there happeneth unto them an extream & dangerous constriction or streightning of their breathing, & a beating of the Heart. Hereupon they are evermore exposed to a sudden death; and especially those of them that are fatned in their younger daies; for these have alwaies their Veins very smal, and much streightned. And they are likewise exposed unto the Apoplexy, and Palsie, and throbbing of the Heart, and the Flux *Diarrhœa*, by reason of their humidity; they are also subject to fainting and swooning fits, and the worst sorts of Feavers; neither can they away with fasting or thirst, by reason of the constriction of the passages of breath, the vehemency of the cold of their complexion, their smal store of Blood, and the abundance of their Phlegm. And to this moreover may be added, that they are (whether they be Men or Women) issueless and barren; the Male being not able to Generate, nor the Female to produce the *Embryo* in the Womb. As also their Seed is little or none at all (to wit) because it is concocted, through the imbecility of the heat; although there may be store of Seed in regard of their humidity or moisture; yet notwithstanding such as is watrish, and (in *Galens* judgment) thin, and unmeet for Generation; or if it be generative, it is of Females only. And the like may be said of Women, that those of them which are fat, do not conceive, or if they do now and then conceive, they forthwith miscarry; and lastly, their appetite (to wit that which is natural) is exceeding weak. Thus far *Avicen*.

2. The truth is, that the Cure of this affect may be hoped for; but it is wont to proceed but very slowly; neither is it to be compleated in a short time, and it is mainly requisite hereunto that the Patient be, as we say, morigerous, and in all points ready and willing to submit.

The Cure.

The Cure of this Tumor consists in the removal of the Cause which is an over-great store of Flesh and Fat. Now this abundant flesh and fat is taken away, by wasting and annihilating what is already generated, and then by taking a course that it may not again be multiplied: and this may be done, if we take care that too great an abundance of Blood be not bred; or that which is already in the Body, that it be by degrees wasted and lessened. Both these intentions are accomplished by those things that heat, and exsiccate, or dry much. For whereas the Liver, if it hath a gentle, remiss, and temperate heat, generates great plenty

plenty of sweet and Oyly blood, and so continually foments matter for the breeding of much fat and store of flesh; if now this temperate constitution of the Liver shal be altered, and the Liver rendered more hot & dry than formerly; then instead of good and laudable, I mean, fat and oyly blood, it generates that which is hot and cholerick, or that which is serous, wheyish, & watterish. And thus it is that Medicaments hot and dry do both retard the propagation of an abundant and oleaginous blood, and also they waste, and by degrees consume the fat that is there already bred throughout the body. But then for the wasting or lessening of the flesh already bred, those Medicaments are the most prevalent in which siccity (or drineſs) is predominant, and the heat in a mediocrity. By what hath been said you cannot but understand, how that in curing this affect we ought heedfully to observe, whether it be the flesh, or whether or no it be the fat that offends in the excess; and so accordingly fit and proper Medicaments are to be made choyce of: and as for such as are undoubtedly exceeding ful of flesh (and such generally are al those that have the constitutions and habits of Wrastlers) we are not to prescribe unto them such Medicaments as either cause or encrease heat, but only such as meerly dry and attenuate; and such are, Venesection, *i. e.* Blood-letting, Purgation, abstinence from food, and frictions, or rubbings. In fat persons we may notwithstanding properly enough make use of Remedies that are of a heating Nature; but yet so as that in the administring of them we be very circumspect, lest that by the overmuch heating we procure some other Disease.

And therefore when as the blood administers matter for the raising of an abundant store of flesh and fat, it is to be forthwith evacuated and diminished. And for such as are ful of flesh we may safely enough exact a more liberal and copious evacuation of the blood, yet alwaies provided, that the evacuation be not prosecuted unto the extream, as *Hippocrates* cautions us, in the first Book of his Aphorisms, Aphor. 3. But in those that abound with fat, this letting out of the blood ought to be more sparing, since that fat persons are more propense unto cold distempers. Cupping-glasses also either with or without scarification are very useful and proper for both the one and the other. Frequent, rough, and hard frictions of the whol body are likewise chiefly convenient. *Pliny* in B. 11. Chap. 37. writes, That the Son of *L. Apronius* (who had been *Consul*) was contented to have his fatness drawn away from him, thereby to alleviate and lighten his body (til then immovable) of some part of his burden. But no man wil easily admit of so desperate and barbarous a Remedy; and therefore I forbear to speak any thing more concerning it. Exsiccating or drying Baths, whether taken by drinking, or made use of for the bathing of the body, are in this case of singular benefit. Frequent purgations with Aloes (unto which may be added Mirrh and Nitre) are here likewise very convenient; and consequently the Pills *de Tribus* must needs be a proper Remedy. Such are also al bitter and hot Medicaments administred, as namely, Wormwood, Myrrh, Frankincense, Rue, *Oxymel simplex*, and *Oxymel compositum*, *Oxymel of Squils*, the Syrup *de duabus* and *de quinque radicibus*; and generally al things that provoke and expel Urine. Wherefore the roots of Asparagus and Fennel, and of Parsley, and such like, ought very frequently to be used. This Pouder likewise is much approved of, and commended; viz.

Fat drawn out of the body of one extreamly fat.

Take *Salt of Nitre one dram*; *Allum two scruples*; *Myrrh, Frankincense, the Rind of the Wood Guajacum, the Root of Sarsaparilla, of each of these two drams*; *and so make a Pouder*: Of the which let half a dram be administred in the morning for two months together. Also the Salt of Vipers is very effectual for the purpose aforesaid.

The Diet.

As concerning the Diet in this case, take this for a brief Directory. Let all the Meats and Drinks be such as render the lower belly loose and slippery, or as we use to express it in one only word, Soluble; and in the next place, let them be such as are easily concocted, but withal such as afford but little nourishment. Let their Wine be thin, and wel diluted, *i. e.* made smal with Water. Much fasting, and a more than ordinary frequent abstinence from food; and in a word, a continual spare diet exceedingly furthereth the diminution of Corpulency. Let them likewise accustom themselves to much and often exercise of the body, by al means carefully avoiding a sedentary life. And *Galen* tels us, in his 14. Book of the Method of Curing, and Chap. 15. (where he professedly treats of the Cure of extream fatness and Corpulency) that he on a time perfectly cured a man aged about fourty yeers, who was exceeding fat and gross, even to the admiration of al that beheld him; and this he did, partly by an Antidote compounded and prepared of *Sal-theriack*, against the affects and diseases of the Joynts; and partly likewise by the administring of the right *Theriaca* or Treacle made of Vipers; as also by an extenuating Diet after it; and for his exercise, swift running was enjoyned him. He saith moreover that he fitted and prepared this person for this exercise of running, by a gentle and easie chafing and rubbing of him with hard and rough rubbing-cloaths made of new linnen cloth, until the skin became red; and then immediately upon the rubbing he anointed him with an Oyl that had in it some digestive Medicament; and

this Oyl the party was also to use (as abovesaid) after his running, and more than usual exercise.

Chap. 5. *Of an Inflammation.*

BUt now that we may come to treat of Tumors properly so called (arising from the blood) those Tumors are indeed wondrous frequent, and they appear very commonly, in regard that they proceed not only of and from themselves, but they likewise happen and follow upon divers other affects, as Wounds, Fractures, disjoyntings, and the like. And this Tumor from the Blood is by the Grecians named *Phlegmone*, by the Latines an Inflammation. But now the word *Phlegmone* hath been very variously and in a far differing sence made use of by the ancient Physitians, and those of later standing. For with *Hippocrates*, and generally al the Physitians before *Erasistratus*, the word *Phlegmone* was used to signifie al sorts of *Phlogosies*, that is, every kind of extraordinary heat exceeding the bounds and transcending the limits of Nature, although it be without any afflux of matter, or any kind of swelling whatsoever. But after *Erasistratus* his daies, the word *Phlegmone* was accustomarily used to denote those Tumors alone in which there was not only a vehement and fiery inflamed heat, but likewise also therewithal a certain kind of renitency or resistance, and a beating in the part, with a more than ordinary redness of color; all which last mentioned Species of Tumors *Hippocrates* was wont to call *Oedemata sclera* and *epodyna*, that is to say, hard, callous, and painful swellings; as *Galen* hath observed in his second Book of the difference of Respiration or breathing, Chap. 7. and in his Book 3. Chap. 5. upon the fift Book of *Hippocrates* his Aphorisms, Aphor. 65. and in his fourth Book of the Course of Diet in acute Diseases, Tome 21. Comment. 3. upon *Hippocrates* his Book of Fractures, text 5. and elsewhere.

The subject of an Inflammation.

But now that we may make it apparent and manifest what an Inflammation is, and how to be defined, we wil in the first place exactly weigh and consider the subject and cause thereof; for as for the form thereof, it is of it self sufficiently evident and perspicuous. *Galen* in his Book of Tumors, Chap. 2. expresseth the subject by these terms, *Maria sarcode, partes carnosas*, that is to say, fleshy parts. For he there tels us that the word *Phlegmone* ought to be used concerning those parts which are affected with a greater swelling than ordinary, and which are ful of flesh, stretched forth, resisting, grieved with a beating pain, and therewithal somwhat reddish.

whether the flesh alone may be inflamed.

Which Assertion of his notwithstanding seems to have in it somthing that is very doubtful, and that may wel be questioned. For a *Phlegmone* happeneth likewise unto the Membranous parts; as to instance, in a Pleurisie, the Membrane that girts about and encompasseth the Ribs is inflamed; in the Phrensie, the Membranes of the Brain; and so in like manner, the smal Vessels and Membranes of the eyes suffer an Inflammation in the affect which we cal *Ophthalmia*, or an Inflammation in the uppermost skin of the eye. Neither are (besides the flesh) only the Membranous parts subject unto Inflammation; but also the glandulous or kernelly parts are often inflamed and swollen up by reason of the blood flowing into them. And last of al, not only the muscley flesh, but likewise also the substances of all the other bowels (which have their flesh much differing from that of the Muscles) are oftentimes afflicted with Inflammations; as it is most apparently manifest in the Inflammations of the Liver, Spleen, Brain, and all the rest of the Entrails. And this very Truth *Galen* himself waves not, neither doth he pass it over in silence, whenas (neer about the close of the Chapter alleadged) he thus writes; But likewise also in process of time, the skin it self (saith he) takes unto it self somthing of a fluid and fluxile Nature, as also do the Tunicles of the greater Vessels, and so likewise even the Membranes themselves, in the part inflamed: and moreover also, even the Nerves and Tendons themselves in process of time are made to partake of this very same Inflammation: Thus much *Galen* himself acknowledgeth.

But now that we may the better acquit our selves in this present Controversie, we must know that by the abovesaid *Moria sarcode* or fleshy parts, we are not only to understand the flesh of the Muscles, which indeed is flesh in the most proper acceptation of the word; but we are likewise thereby to understand the several fleshes of the bowels, which we evermore term *Parenchymata*. Moreover also under the notion of a fleshy part are comprehended all the parts that are glandulous or kernelly; yea likewise even the parts that are Membranous. For these also may be said to have a flesh peculiar and proper to themselves: as *Galen* writes upon this very subject, in the 10. Book of his Method of Physick, Chap. 11. In each one of the Primary and simple parts there is, saith he, one part or portion of the substance thereof which is as it were fibrous, another that is Membranous, and a third that is fleshy. As for example, whenas a Vein hath but one only Tunicle, and that likewise very thin, we may even then and there discover many of the fibres in this one thin Tunicle, which are interserted, as I may so say, by their certain Spider-like interweavings; and unto the which the very proper substance of the Vein doth adhere, as growing thereunto. But in other parts of the Body this flesh is of a far differing nature, neither hath it as yet gotten any

common

common name. But that you may the better understand us now that we are treating of this subject, I know nothing to the contrary, but that you may term it a fleshy substance; or truly at leastwise we may call it a certain flesh peculiar and proper unto this little part; and of a differing Nature from that of the stomach, from that of the Liver, and likewise from that of the Arteries and Muscles; in al which the flesh is not one and the same, but (as I said) much differing. Thus far *Galen*. Wherefore that we may determine what the subject of an Inflammation is, we affirm it to be any kind of fleshy substance which hath Veins & Arteries which contain within them, and convey blood, the Cause of an Inflammation; and are therefore even upon this account opposite to the bones, which neither have, nor are so much as capable of receiving Veins. For in good truth, flesh is the chief and principal subject of Inflammation: yet notwithstanding the blood, if it both diffuse it self into the adjacent parts, and likewise draw those parts into a consent and agreement with it self, they may then al of them (both it & they) be truly said to be together inflamed: of which *Galen* treats at large, in his Book of Tumors, Chap. 2. where he thus writes: That al that flesh whose affection is now mainly, and in the highest degree become an Inflammation, should seem to be repleniished with a flowing of the blood, both the color and the Tumor it self demonstrate; whereupon it appears all over humid and extreamly moistened, like as is wool and a spunge. That filth and putrid matter which flows forth whenas the Inflammation hath gotten a little door or gate (as we may so term it) to cast it out by, gives a sufficient testimony unto the truth of what hath been said; and I am rightly of Opinion, that the skin it self is elevated, and extended round about, at once and together with the Tumors and swellings of those things that lie underneath it. And in tract of time even the skin it self participates somwhat of the aforementioned flux; insomuch that the Tunicles of the greater Vessels, and also the very Membranes themselves may suffer together with the part inflamed: and moreover also even the very Nerves and Tendons in process of time come to partake of this same Inflammation. Notwithstanding now and then it chanceth that the parts abovesaid (all or some of them) if they happen to be wounded, or any other way disaffected, then the hurtful distemper, I mean the Inflammation, hath its original from out of those very parts. But universally and generally there is not any thing that according to the bent of Nature perseveres to carry it self in al things exactly conformable unto the inflamed part, if there be but any the least stop put thereunto; but al things together with the flesh participate of the said flux; so that oftentimes it reacheth even the very bones, like as many times also it is by them (when they first of al are affected) much promoted and furthered. And in his sixth Book of the Method of Physick, Chap. 5. he thus writes: Neither do I greatly wonder (saith he) if somthing resembling a *Phlegmone* shal in a smal proportion chance to accrue even to the bones themselves when broken. The which likewise *Avicen* hath taught us in the 2. of his first Book, Doct. 1. Chap. 5. where he acquaints us that Tumors happen unto the Members that are soft; and yet notwithstanding that there is a time also when somthing happens unto the bones themselves, which is assimilated into the matter of a Tumor or Swelling, by the which said matter the Tumors magnitude is exceedingly heightned, and its humidity greatly augmented. And he adds the reason. Neither is it (saith he) at al to be wondered at, or ever a whit extraordinary, that that which receives an encrease or addition with nutriment should likewise receive it, that is to say, an addition with superfluity, when either it penetrates into it, or shal otherwise befal it, as generated therein. And in the species of Teeth, *Galen* in his 5. Book of the Composition of Medicaments according to the parts affected, Chap. 8. informs us, That in the Teeth those things that are redundant and superfluous may excite and stir up in them a like resembling affection, or rather passion, such as is the Inflammation that appears in and neer about the fleshy parts. Yea, possible it is, not only that the bones should get a thickness from the superfluous nourishment, but likewise that another bone should be super-added unto them, and grow up together with them. Concerning the which, *Abenzoar* in his 2. Theisir. Tract. 6. Chap. 1. hath these words: And now and then (saith he) the bones are ingrossed and greatly augmented in their superficies, either by the depraved corroding humors that are infused into the very bones, or otherwise by the thick quittor and mattery filth which passeth over upon them; from whence it is that they are hollowed, corroded, and augmented. And again afterwards he writes more at large upon this subject in these words: The bones (saith he) are somtimes greatned or (to use his own word) ingrossed beyond Natures intention, by reason of an overplentiful and gross course of Diet, it being likewise inordinate, suddenly and rashly fallen upon, and not (as rather it should have been) successively, and by degrees, advisedly entered into. And long it is not since I heard my Father say, that he on a time saw a certain man that had a bone super-added and bred in his back like unto the Harts Horn; and that it was not altogether so hard as the natural bones: and my Father himself (saith he) purged this man, and emptied forth the gross humors that were in him; and after he had so done, he then puts upon the bone certain exiccating or extream drying Medicaments; insomuch that the said bone fel forth of the body; like as the Hart casts his Horns, and

as

as other Beasts shed theirs in the Spring time. And I my self also have had a Bone growing upon my Back, which bred me extraordinary great pain: and I thereupon by Purging freed my self of gross humors, and laid upon the Bone Resolutives, or Remedies of a dissolving faculty.

The Causes.

As for the Cause of this preternatural affect, *Galen* writes that as it is altogether unknown unto the ignorant multitude of men, so it is not very wel understood by all that profess themselves Physitians. For although, as I conceive, it is agreed upon by al Physitians, that Blood is the Cause of an Inflammation, yet notwithstanding lest that (as the same *Galen* writes in the place before alleadged) we should seem only to declare our own single Opinion, without any further enquiry thereinto; we wil therefore make the more accurate search after (thereby to find out) the Cause of an Inflammation, in this manner following. There would be no Tumor at any time generated in any part of the Body, were it not that either its substance as it were boyling over with heat is poured out, or that from without some new substance makes its approach. For there are but two only causes to be assigned of the augmentation of the bulk and quantity in any thing whatsoever. For either the radical moisture through an internal or external heat is resolved into an aery substance, which (as it is wel known) requires a far greater space & room for dilatation then formerly it had; or else, as we said before, some new substance is extrinsecally from some other place superadded thereunto. Now therefore of necessity it is that one of these two causes must be present, when as in that hot and burning Tumor which we commonly call a *Phlegmone*, the part is lifted up into a greater bulk than is ordinary, or agreeable to the intention of Nature. But now, that the fervency and boyling up of the natural moisture, or the effusion thereof, is not the Cause, appears by this, because that every thing that is poured forth and converted, as it were, into spirits, when it is cooled it assumes again its pristine quantity, and (as we may so express it) puts off and laies aside the Tumor; as by common experience it is most apparent. But as for the parts inflamed, let them be never so vehemently cooled, yet wil they never return into the former state and condition, nor ever cast off the Tumor or Swelling. Furthermore, if by reason of the effusion of the part, and its conversion into spirits, a Tumor should be caused in the part inflamed, then necessarily upon the incision of the part the spirit should appear; which yet (as we see) is nothing so: but that rather there follows an effusion of Blood; and the whole place by its colour and the looks thereof seems altogether full of Blood. It remains therefore, that the accession of some new substance is the cause of a *Phlegmone*. But now that this new substance is the Blood, appears from hence, to wit, that the *Phlegmone* is exceeding red both within and without. Now this red colour is only proper unto, and inseparable from the Blood; for there is nothing that waxeth red in the Body, beside the Blood and the Flesh; which later, notwithstanding, *viz.* the Flesh, cannot by any means be the cause of a *Phlegmone*. For if the increment of the flesh were the cause of an Inflammation, there would be indeed a Tumor or Swelling in the part; yet so as notwithstanding the internal heat should remain sound, and in an healthful plight, without the least distemper; and that also it should not in the least vary its pristine nature, when as in no one thing that is augmented according to its substance the heat may properly be said to be heightned and encreased, so far forth that the increment of the substance and quantity should any way differ from the change or alteration of the qualities. But now the case is otherwise in a *Phlegmone*, wherein the colour is changed, and the heat grown to be more intense, the said colour evidently demonstrating not only the quantity, but likewise the quality of the substance. Moreover, that the Blood is cause of a *Phlegmone*, may be manifestly evidenced by this, that the place (in the greatest Inflammations especially, which now and then happen in Ulcers) appears and seems all bloody round about; which certainly would never be, if blood were not the cause of the Inflammation. Furthermore, that Blood is Cause of the Inflammation that generating of the Inflammation which happeneth in Wounds doth evidently demonstrate. For in new and fresh Wounds, the Blood (its true) at the first flows forth; but then afterward being compressed and kept in either by the hand, or else with Ligatures, or Medicaments that stop the issuing forth of blood, or else lastly being suppressed and staid of its own accord, it is then retained either in the Orifice or Cavities of the dissected Vessels, and there it is compacted, and so wrought that it grows together (like as clotted blood useth to do) and there by a continued heaping up of the blood abundantly flowing thereunto it lifts up the part into a Tumor or Swelling, and causeth an Inflammation.

Blood the nigbest cause of an Inflammation.

An Inflammation what it is.

Since therefore the Conjunct Cause of an Inflammation is proved to be the Blood preternaturally flowing thereunto, it is no hard matter thence to collect, that an Inflammation is a preternatural Tumor of the fleshy parts (as *Galen* in the place alleadged takes and understands the name of Flesh) arising from the preternatural afflux of the blood; and that therupon it must necessarily be hot, red, extended; and accompanied with a kind of renitency, or resisting property, pain, and pulsation or beating.

But

The manner how an Inflammation is bred.

But now, that there may not be left to remain any the least obscurity about the nature of an Inflammation; we will here add the manner also how a *Phlegmone* is generated; and this we wil do out of *Galen*, who in his Book touching the unequal *Intemperies*, Chap. 3. hath in these words described it: it is (saith he) a hot fluxion or flowing, the wch when it hath seized upon and seated it self in some muscelly part, at first the greater Veins and Arteries are fil'd up and distended; and next after them the lesser, and so it is carried on untill that at length it arrives even at the least of them. In these when the matter of the fluxion is forcibly impacted, and cannot therein be any longer conteined, it is then transmitted unto the outward parts, partly through their own Orifices, and partly by a percolation, as it were, and straining or sweating out of it through the Tunicles: and then the void spaces which are betwixt the most principal parts are filled full with the fluxion. And so all those parts or places are on all sides very much heated and overspread. Those parts or Bodies are the Nerves, Ligaments, Membranes, the Flesh it self, and before al these the Veins and Arteries. For whereas the Veins and Arteries run along unto each particular part (by the which is received both nourishment and vital Spirit) so long as the blood flows in a due measure, and just proportion, and is conteined within those its receptacles, the part is not wont to suffer any Inflammation at all; but then only, when at the length the blood is overcopiously and all on a huddle emptied and poured forth into the substance of the part by the Veins and Arteries. By which very thing also a *Phlegmone* is distinguished from other fluxions, in which the matter is diffused without the Veins into the whole substance of the part, and there doth distend and dilate it. For in a *Phlegmone*, although all the parts are (as I may so say) embrued with blood, yet notwithstanding there is a certain order observed, to wit, that some of the parts should sooner receive the fluxion, and others of them not til afterward; until that at length all of them come to be replenished and distended by the humor. Now this kind of order wholly depends upon the natural distribution of the greater Vessels conteining the blood. For whereas the Veins and Arteries when they first of all make their entrance into the aforesaid Vessels are evermore the larger, and by how much the deeper they are distributed therein to, so much the less they are; all this while there ariseth no Inflammation, unless it so chance that the blood be emptied forth into those smallest Veins, and again happen to fall out of them. And this that hath been said manifestly appears unto those that by an exact and accurate inspection take a right view of those very little and almost imperceptible Veins that are branched forth and extended unto that Tunicle of the Eye which Oculists usually call *Adnate* or *Conjunctive*. For these indeed do evermore convey blood unto the Eye for its nourishment, and yet notwithstanding whilest that the Eye is free from distemper they are to exceeding smal, that they can hardly be discern'd by the sharpest sighted Eye. But then so soon as the Eye is inflamed, & those slender Veins are preternaturally replenished with blood, then they shew themselves, and become very conspicuous. And it is most agreeable to truth that thus it should be also in al other Inflammations, whatsoever they be. But as yet there is no Inflammation present, albeit the lesser Veins are even filled up with blood, until that at length by and thorow them the blood be derived into the remaining substance of the parts; which may be done two waies. For in the first place, the blood is emptied forth by those very smal and most inconsiderable orifices of the Veins, by which the Veins do (as it were) gape & open themselves into the surrounding substance of the part, that so thereby the blood may through them the more easily drop forth, for nutrition or nourishment. Moreover likewise it strains and swears through by the Tunicles of the Veins: for even the Tunicles of the Veins are in like manner so framed by nature, that they are not without their pores; through which, if not the blood it self, yet certainly the serosity or wheyinesse thereof, and its thinner part is exsudated or sweated forth by a kind of percolation.

From what hath been hitherunto spoken, the distinction of the conjunct cause from the cause meerly antecedent in an Inflammation is sufficiently apparent. For the blood (which we have asserted to be the cause of a *Phlegmone*) doth in a double respect take upon it self the virtue and Nature of a cause. For either it is the next conteining and conjunct cause, of which we have hitherto discoursed; to wit, as it hath already flown into the part, and is irremovably impacted therein, so far forth that it actually elevates that same part into a Tumor: or else it is the antecedent foregoing cause, to wit, as by reason of its abounding in the body it hath a power of flowing into, and by its influx of lifting up the part into a Tumor or Swelling. The which antecedent Cause in an Inflammation, like as also in other Tumors, fals again under a twofold consideration: to wit, either in regard of the Affect simply considered as it is to follow upon this cause which it hath a power to excite, although as yet it hath no being in the body. And so a Plethory (which is an extream and overgreat fulnes of good and laudable blood) is very frequently present in the body, albeit an Inflammation doth not instantly ensue thereupon. Or else secondly, it is considerable, as preceding and foregoing the affect that already hath a being, and is already actually existent in the Body; to wit, when as the Blood now floweth to the exciting and augmenting

The antecedent cause of an Inflammation.

menting of the Tumor. Which (to speak truth) is more rightly stiled the antecedent cause, then was the former; since that this latter hath respect unto an effect already present; but the former relates only unto an affect which hapneth in the future time. But this antecedent cause, that it may flow together unto the place affected, it is thereunto moved and stirred up by other means; whilst that it is either transmitted from some where else; or else attracted by the part it self, for those very causes we have hitherto been treating of and explaining.

The remote Causes.

But now for those Causes which we commonly term Procatarctick, more remote, and primitive, they are such as either conduce to the breeding of a copious and a plentiful blood (as do al meats of good and much juyce) an easie and idle kind of life, and other such like requisites: Or else they are such as render the blood more acrimonious and sharp, as do all things that cause heat, al acid and tart aliments, wrath, watchings, stirrings, and exercises in the extreme, or else such as excite and stir up the blood to move unto the part affected, as doth the overgreat heat of the part, pain proceeding from a wound, from a fall, from contusion or beating, from a fracture, from disjoyntures, and the like causes; or else the weakness and imbecillity of the part affected receiving, compared and considered in reference to the vigour and strength of those other parts which transmit the abundant store of hot blood unto the aggrieved part. Notwithstanding, an Inflammation never happeneth to be generated by a leisurely and gradual storing up of blood; but it is evermore bred by a sudden and thronging affluence and influx of the said blood. For although it may so chance, that some kind of Humor may sensibly and by degrees be collected in some one part, which being heaped up, as aforesaid, may afterward begin to excite a certain kind of pain in the part; yet notwithstanding al this, an Inflammation is never produced until such time as the pain gives cause sufficient that a more plenteous store of blood should forthwith and very easily make its approach.

Notwithstanding we are to take notice, That although the Blood be the containing and antecedent Cause of an Inflammation, yet notwithstanding we say, that a Cacochymy, or a depraved ill digestion, and more especially sharp and cholerick humors, are the prime and principal cause that the blood be moved unto the part affected, in those Inflammations which are excited without any apparent cause, as Wounds, Contusions, and such like. For so it is, That when Nature is twinged and pulled by such like Humors, and yet notwithstanding is unable altogether to expel them out of the body, to the end that she may free the principal parts from the danger impending by reason of them, she assays to thrust them forth unto the external and less principal parts: the which when it is not able to accomplish, unless it make use of the blood for a vehicle or (as we say) a Conduit-pipe of conveyance; and that the acrimonious humor it self excites a pain in that part into which it is thrust and shut up; hereupon it is that there follows a conflux of blood unto that part, and from it proceeds an Inflammation. And much after this manner, the Pleurisie, the *Peripneumonia* or the Inflammation and Impostume of the Lungs, the Quinsie, the Phrensie, the Inflammation of the Ears and Gums, the hot Tumors or Swellings in the groins called *Bubones*, Carbuncles, and such like are generated and excited.

The Differences.

The principal Differences of an Inflammation are taken from the variety of the containing cause, and from the great difference of the blood that stirs up and begets the Inflammation. For a *Phlegmone* is said to be (for distinctions sake) either that which is a true and legitimate one, or otherwise that that is not a true *Phlegmone*, but rather a bastard and spurious one. The true and legitimate *Phlegmone* is that which proceeds from good blood, and such as is in a due natural temper, or at leastwise such as whereof there is more than ordinary store: and this is absolutely and simply termed a *Phlegmone*. But the spurious and counterfeit *Phlegmone* is that which hath its rise and original from corrupt and vitiated blood, and such as swerves from its natural temperament; and this may be occasioned two manner of waies: for if the blood doth neither lose its nature, nor change its substance; but only hath mingled together with it some other Humors, then there are three bastard spurious sorts of an Inflammation that thence arise. To wit, if Choler be mingled with the blood producing an Inflammation, it is then called *Phlegmone erysipelatodes*; if Phlegm, *Phlegmone oidematodes*; if Melancholy, *Phlegmone scirrhodes*. But if the blood change its substance, it then excites not any kind of blood-Tumor: for the blood (as *Galen* writes upon this very subject, in his 2*d* Book of the Differences of Feavers, Chap. 9.) if it be overmuch heated, and (as it may be so expressed) boyled to an extream intense heighth, then its more subtile and fat part is converted into yellow Choler; but the more thick part into black Choler, or, as we usually call it, the Melancholy humor.

The Signs Diagnostick.

The Signs of Inflammation (as may be gathered out of its definition) are, heat, pain, a swelling and stretching out of the part, a renitency or Resistance, a redness of color, and a pulsation or beating.

1. And in the first place, in this kind of Tumor there

there is present so intense a heat, that from it the Tumor hath its very name and denomination; and many indeed are the causes wherefore this heat is necessarily raised and stirred up. For first of all, the blood that through its overgreat abundance excites the *Phlegmone*, is hot, which heat it also communicates to the part affected. Moreover, whenas by the plenty of blood, and oftentimes likewise by a certain kind of thickness al the pores are so filled up and obstructed that the hot exhalations cannot sufficiently be sent forth and evaporated, neither the heat eventilated or cooled as is ought to be, the heat by retention of these exhalations and fuliginous vapors is much encreased. Unto which also a third cause may be added, to wit, putrefaction: for the blood contained in the inflamed part assumes at length a putredinous quality, by which (as is to be seen likewise in other things) the heat is excited, and communicated unto the part inflamed. And this heat is sometimes greater, sometimes less, according to the greatness and growth of those causes.

The second sign is Pain: for whereas there are two remarkable causes of pain, an *Intemperies* or distemper, and the solution of continuity, they both of them take place in Inflammations. For in truth this extraordinary heat by its distemper first of all excites pain: and then the abundance of blood by filling ful and distending the part dissolveth continuity, and thus doing is the cause of this pain. Again, the pain that is thus caused is various & much different, viz. distending or stretching out, pulling or twinging, pressing and burdening, according to the variety of the parts affected: but more especially there is present a beating pain, which likewise for this very reason is peculiarly reckoned up amongst the proper signs of a *Phlegmone*, and of which more hereafter.

In the third place, a Distension. For when the plentiful store of blood doth not only fill the Veins and Arteries, but even the whol substance of the part, all things are now distended and stretched out, but chiefly the skin; the which as it lieth round about al the other parts, and hath a Membranous substance, must necessarily partake of the distension, and the extensive pain.

4. Fourthly, Renitency or resistance, or (as the Grecians cal it) *Antitupia*, in like manner follows upon this repletion and distension. For albeit the inflamed part be not hard in its own nature, yet it is so stuffed out, and distended with store of blood, that now it wil no longer answer the touch, neither yield thereunto, but resist and withstand it; and withal it appears hard unto the touch.

5. Fifthly, the parts inflamed wax red, the blood imparting this color unto them. For there is nothing in mans body that assumes this redness of color, besides the blood and flesh.

6. And lastly, In the sixth place, there is perceived in the inflamed parts a Pulse and beating pain, to wit, when with grief and extream irksomness there is perceived a beating of the Artery in the inflamed part, which while the part was sound was not to be perceived. From whence we are instructed (as *Galen* writes in his sixt Book of the parts affected, Chap. 7.) that this beating pain doth not happen unto al the parts, but only to such of them as have in them certain notable and remarkable Arteries, and that have a part endued with an exquisite sense; and when the Inflammation is raised up unto a magnitude worthy of observation. Now this Pulsatory or beating pain chanceth from hence, that when they are lifted up and distended, the parts inflamed by reason of their store of blood do not allow nor afford a due, free, and sufficient room unto the Artery now distending it self, but that themselves are rather stretched out by the Artery lifting it self up; which said distension excites the pain. And this pulsatory pain is then most of al perceived, whenas the Inflammation tendeth toward a suppuration. For then the blood boyls as it were, and grows exceeding hot; from whence it also comes to pass, that it assumes and makes use of a larger space of room, and so much the more distends the part; by the which part the Artery is henceforth much pressed & kept down in its motion, which we cal *Diastole*; and then afterward hereupon the Artery likewise compresseth and bears down the adjacent and neer neighboring parts that lie round about it.

The beating pain how it is caused.

The Prognosticks.

In an Inflammation there are two things that it mainly and principally behoves us to presage, to wit, its event or termination, and then the exact and punctual time of the said termination. Now the Event is said to be good, when Nature overcometh the matter that breeds the Inflammation, which hapneth when either the Tumor is resolved, and the matter insensibly exhaled (which is the best kind of solution of an Inflammation) or else when the matter is suppurated and turned into that which we term *Pus*, being a thick and purulent matter. Or otherwise, secondly, The event may be said to be evil, or if ye wil, worst of all, when Nature doth not overcome and master the peccant matter; which hapneth when the Inflammation (if it be external) suddenly vanisheth and retires back to the internal parts; or when the natural heat being overcome and extinguished, the Member thereupon becomes putrified and seized upon by a Gangrene, insomuch that if it be not forthwith cut off, ruine and death it self threaten the whol body. Or else in the third place, there follows a Neutral Event (as some cal it) which is absolutely evil; when the Tumor is hardened, and when upon the resolution and discussion of

The termination of an Inflammation. which is threefold.

the thinner parts (the more thick and grosse parts remaining behind) the Inflammation degenerates into a *Scirrhus*. But now, which of these events is to be hoped for or expected, may probably be guessed at by comparing together the vigour and strength of Nature with the matter that causeth the Disease. For if the matter be not overmuch, not thick, not over deeply scituated, not shut up under a hard and thick skin; if the body be not greatly impure, and Nature be strong, then a resolution, and an evacuation by an insensible transpiration may be hoped for. But if the matter more abound, be more than ordinary thick, be contained in a deeper place than usually, and be pent up under a thicker skin, then a suppuration is to be expected. That the matter is retreated unto the inward parts may be conjectured by this token, to wit, When we perceive the Tumor to be diminished, albeit there were no repulsive remedies administred and applied, to drive back the matter. That the extinction and overthrow of the heat is neer approaching may be presaged by this, whenas the heat, redness of color, pain, and the pulse or beating is lessened, the Tumor notwithstanding still remaining; touching which more hereafter, when we shal come to treat of a Gangrene. But then lastly, an Inflammation for the most part then degenerates into a *Scirrhus*, when the matter is over viscous and clammy, and hard therewithal; and when the Natural heat being strong and vigorous, forthwith even in the very beginning of the distemper remedies that discuss and dissipate over forcibly are thereunto applied; which said remedies disperse and scatter the thinner parts thereof, and leave the thicker still remaining.

The times of an Inflammation.

That the time of the Event may be known, it is requisite that the times of the Inflammation be first of all known; and they are likewise heedfully to be observed by us (upon our knowledg of them) in relation unto the Cure. For unless the times of an Inflammation be well known and considered, we may soon run our selves into an Error, whilst we administer and apply Remedies that are any waies improper or incongruous unto any one particular of those several times. Now then, Inflammations (like as all other Tumors and Diseases) have four times or periods; its beginning, encrease, state or perfection, and its decay or declination. It commenceth or begins when the parts are repleniished with blood, and when the swelling, pain, and stretching out are encreased, this we cal the augmentation.

The state or perfection is then, when the Tumor, Distension, Pain, and all the other symptomes are most vehement, and in the heighth of their extremity. And lastly, the declination is then said to be, when the matter generating the Tumor is diminished, and the pain, heat, together with the other symptoms are become more remiss and gentle; or otherwise the matter is converted into *Pus* or purulent matter.

But the truth is, these times are some while shorter, somtimes longer; and the Inflammations are somtimes sooner, and somtimes more slowly terminated. For (as *Galen* tels us in the sixth Book of the Aphorisms, Aphor. 49.) that which is of a thinner substance is in a shorter space digested; and that which is thick or tough requires a longer time for its digestion; but that which is thick and viscous requires a far longer time. And that Inflammation which hath seated it self in the fleshy parts is terminated according to the period of acute Diseases, to wit, fourteen daies: for the substance of the flesh is more soft and permeable, by reason of its thinness. But the substance of the Ligaments, Tendons, and Nerves, being more thick and hard, and thereupon with greater difficulty receiving the fluxion, for the same cause also doth with more difficulty discharge it self thereof; and hereupon the Inflammation in those parts is the longer time ere it attain unto its state and perfection, and is not so soon curable: but yet notwithstanding the Cure is in this case seldom or never prorogued beyond the term of fourty daies; if both the Physitian rightly in al points discharge his part; and likewise the patient be in al things willing to submit.

The Indications and Cure.

Whereas the containing cause of an Inflammation is the blood, which hath preternaturally (*i. e.* beyond or besides Natures intention) flown in unto the part, the Cure is effected if that blood be removed out of the diseased part; and then great caution be had that it thenceforth flow no more unto the part affected; that so by this means, as wel the containing as the antecedent cause may be wholly taken away. For whenas the affect cannot possibly be removed, without a first removal of that which causeth it; and the case so standing, that the causes ought to be taken away in the very same order that they follow one the other in; therefore we say that the Fluxion must first of all be extirpated. Now this intention may be accomplished, if care be taken to prevent the bloods abounding in the body, and that that which is there in great plenty flow not unto the part affected; and this with most safety and speed is to be effected by opening a Vein. For by this Venesection or blood-letting the great store of abounding blood is diminished, and the same is likewise drawn back from the aggrieved place: hence it is, that there is an exceeding great benefit arising from, and following upon this opening of a vein, in an Inflammation; so that it is seldom or never to be omitted, if the strength of the patient wil permit it to be done. And indeed hardly can any other Remedies with safety in this case be applied, unless

The Cure of a fluxion or flowing of the blood.

The benefit of blood-letting in an Inflammation.

unless opening a Vein have the precedence, and the abundance of blood be thereby diminished. For if we administer remedies to drive back, the body stil continuing full of blood, it is greatly to be feared lest that the matter should not be received by the other parts, and thereupon that it should altogether attempt a flowing unto some one or other certain particular part. And as for digestives, hot as they are, if they should be made use of in a body that is full, there might be just cause to doubt lest that there should be more matter attracted then discussed and dissipated.

A Purgation. Moreover also, albeit a *Cacochymy* or ill digestion and bad nutriment be not the cause of an Inflammation; yet notwithstanding, since it is a very rare thing to find a Body that is altogether free from this said *Cacochymie*, it wil be very requisite to ordain a Purgation; which compleated, other Medicaments also are afterward to be administred, with an expectation of more success and greater benefit. And as we hinted to you before, although Inflammations take their Original principally from the blood, yet notwithstanding vitious humors very frequently give an occasion of their being, as also doth the aforesaid *Cacochymie*; and indeed herein the hot humors challenge the first place. For if by these Nature be at any time stir'd up and provoked, and it be so that she cannot of her self expel them, then she endeavors to thrust them forth by some and some unto the other parts: but when she fals short in the effecting of this also (unless she should withall transmit the blood thither) and that by an acrimonious humor sent unto the part a pain is excited; hereupon a conflux of the blood unto that same part into which Nature assaies to empty forth the vitious humor, is caused; and so consequently an Inflammation is generated. And from hence it is also, that from a *Cacochymie* there is very frequently produced a Pleurisie, an Inflammation or Impostume of the Lungs, the Squinancy or (as we use to term it) the Quinsie, and that kind of madness which we commonly call the Phrensie.

Moreover also the blood is abated, and no excessive store thereof bred in the body, if that meat be not taken in which either by its overgreat proportion, or else by reason of its substance, afford too much nourishment, and exceedingly conduceth to the generating a more plentiful store of blood than is requisite. Wherefore let the sick Person abstain from Wine, and let him use a sparing and slender Diet, which both hindreth the breeding of much blood; and if it be already over-much, doth by little and little lessen it.

But that the blood may not flow to the part affected, it may be prevented, if we deprive it of that which necessity requires that it should have to help forward and facilitate its motion; and if we likewise correct the thinness thereof, together with its overmuch aptness to motion; if we obstruct and streighten the passages through which it ought to be moved; and if we recall and draw it back from the part affected. The blood therefore, that it may be withheld from flowing unto the part affected, is to be altered, driven back, intercepted, and derived unto some other place.

Alteration of the blood. The Alteration of the blood is altogether necessary, that so, if it be overhot, thin, and fluxile or movable, it may be cooled, thickned, and rendred more unapt and less prone to motion: and this Alteration for the most part we ought the rather to procure in regard of the Feaver, which almost ever accompanieth the Phlegmone, or heat of the Liver. For it is a rare thing, that they which are infested with an Inflammation of any part should yet not be sensible of a Feaver. Wherefore we must use Medicaments made of *Succory*, *Endive*, *Violets*, *Lettice*, *Sorrel*, *Barley*, the greater cold Seeds, the juyce of Citron, of Pomegranates, and such like. And if the blood be more than ordinarily hot and thin, we ought also then to add those things that have in them an astringent quality; and such are Roses, Purslane, Plantane, and the like. But here notwithstanding we ought carefully to look to it, lest that the Veins being narrow and overstreightned, or there being obstructions in the Bowels, by the use of these or such like astringents more obstructions should be bred or increased.

And then again, we ought not only to administer contrary Medicaments for the altering of the blood; but likewise to remove from the Patient, and cause him to omit and forbear the use of such things as either introduce or augment those qualities whose absence we now require, as being better than their company. For instance, a hot Air is to be shun'd, surfeits with over-eating and drinking must be avoided, and Wine forborn; or if any be drank, it must be that which is weak and wel diluted; all kind of violent motion is to be omitted, and rest rather to be indulged; Wrath and venereal Embracements ought likewise here carefully to be avoided and abstained from.

Revulsion or drawing back. Revulsion or drawing back ought moreover to be ordained, and the humor is to be turn'd away unto a contrary place, that is, we must so order it, that a contrary motion may be procured unto the humor, and that it may move unto that part unto which it naturally tends; so that it may not flow unto the part affected. For, that the turning away and drawing of an humor flowing into some part unto that which is contrary may be termed Revulsion, we rightly take it for granted, and by *Hippocrates* at the first appointed and ordained. For (as *Galen* informs us in his fifth Book of the method of Physick, Chap. 3.) this was the invention of *Hippocrates*, that a Revulsion should be made un-

The controversie in Revulsion.

to the contrary or opposite places. Now although it be much controverted by Physitians, what is here to be understood by this word Contrary; yet notwithstanding we judg the Opinion of *Galen* to be very plain and perspicuous, if we well examine together what he hath here and there oftentimes written upon this subject; and if we take a right view of the conditions that are requisite in a Revulsion. But that *Galen* by the word [Contrary] understood nothing else but the parts contrary, that is, far distant and remote from the part affected, is every where manifested in his own writings: for thus he argueth in his fourth of the meth. of Physick Chap. 6. If it be a perpetual standing rule (as we have learn'd from him, viz. from *Hippocrates*) that a fluxion if but beginning is to be drawn to the contraries, but if already fixed in the aggrieved particle, it is then to be evacuated, either from the particle it self which is afflicted, or else from that which is next neighboring unto it; we may now hence readily conclude, as to the point of this blood-letting, that at first (*i.e.* in the beginning of the distemper) it ought to be attempted from a far off, but afterwards from the affected parts themselves. Now what kind of remoteness, and what sort of longitude he understands, is explained in his fifth of the Method of Physick, Chap. 3. A Revulsion (saith he) ought alwaies to be carried downward in those affects which are upward; and upward evermore in those that are below: and moreover also the Revulsion ought to be made from the right side unto those on the left; and again in like manner, from those unto these: and semblably, from those places that are internal unto such as are outwardly scituate; and on the contrary, from these unto those. For when as the main scope of Revulsion is, not to evacuate those humors which are already conteined in the part affected, but those rather that are flowing thereunto; and seeing it respects rather the part sending the blood, than that which receives it: from these premises it necessarily follows, that questionless this is required in every revulsion, to wit, that it should by all means procure a motion contrary unto that which flows, that so it may not any longer be moved unto the part affected; and for this cause, the revulsion must not be ordain'd either from the grieved part, or from that next unto it; but rather from the opposite, yea (and so far forth as possible it may be) from the places most remote from the affected part. And hence also it is that every opposition doth not constitute a contrariety, neither hath every kind of opposition any place in a Revulsion; but those oppositions alone which *Galen* (in the before alleadged third Chapter of the fifth Book of his Method of Physick) recites; to wit, upward and downward, from the right side parts unto the left, from the places that are within unto those that are external, and so on the contrary. Yet if there be only but a very smal inconsiderable distance, we cannot safely not conveniently draw back from the parts more inward to those more externally scituate, but then only when the distance is greater. But that opposition which is from before and behind, or according to the fore parts and hinder parts, hath no place in this kind of Revulsion, which is so called singly and absolutely. For neither if any affect shal chance to be in the backward part of the Head, are the Forehead Veins forthwith to be opened, by way of revulsion, since that may not be done (without manifest danger) during the continuance of the Plethory, and flowing of the humors. But enough hath been said of Revulsion in the fifth Book of Institutions, Part 2. Sect. 1. Chap. 18.

Revulsion twofold:

But that we may in few words contract whatsoever hath there more at large been spoken, and whatever else may be said upon this subject; it is in the first place to be taken notice of, that Revulsion is twofold, one, which is accomplished together with the evacuation of the humor, such as is that which is effected by Blood-letting, and Cupping-Glasses with Scarification; the other which is wrought without the evacuation of the humor, such as is that which is performed by Fractions or Rubbings, Ligatures, and Cupping-Glasses without Scarification. This latter is never to be practised, but when the Revulsion is to be made unto the parts most remote, since that if it be instituted in the neer adjacent parts, then the humor which is only stirred, and not totally evacuated, may without any difficulty or resistance rush upon the affected part. And it is very rare, and scarcely ever known, that this kind of revulsion hath place or any thing to do in an Inflammation, which requires a manifest, sensible, and suddain evacuation of the blood.

Revulsion by opening of a Vein:

Furthermore, as for what concerns Revulsion which is effected by opening a Vein, this one thing at least is to be observed (which if it be well heeded, many intricate controversies touching the thing now in question may be determined) to wit, that the utmost endeavor must be used that a contrary motion may be procured unto the blood, and that (as much as possibly may be) drawn back unto that Fountain from whence it flows. And since that the Liver is the Fountain and Sourse of the blood, and that the greatest store of the blood is conteined in the *Vena Cava* or great hollow Vein nigh about the Liver, we must do our utmost, that the blood which flows into the inflamed part may be drawn back towards its Spring-head; yea also if it be possible, unto the opposite part, yet notwithstanding so, that the blood which flows may be retracted and drawn back. And therfore in every Revulsion this at least is to be wrought, that the blood may obtain such a motion, as that by it the part affected may not be injured

injured by its immoderate conflux, but that it may rather be again recalled from the diseased part. But how this may be effected in every part, here to declare unto you would be a business too tedious; besides, we have already elsewhere spoken to this very point, in our treating of particular affects.

Revulsion when to be ordained, & after what manner.

And by what hath been said (as I conjecture) it is sufficiently apparent, how and in what manner a revulsion is to be ordained in case of an Inflammation; so that there wil not be any great need, that we should add much as touching the right and due administration thereof. For whereas revulsion is then only suitable and proper unto the Humors when they flow, and unto them alone, and not unto those which have done flowing, and have seated themselves in the part affected; it is hence manifest, that it ought to be instituted and appointed in the very first rise of the distemper. Notwithstanding this is not so to be understood, as if in the first appearing of an Inflammation we were instantly to put revulsion in practice; for if either there be no great store of blood, or if its rushing in upon the part be not over violent and impetuous, Medicaments that drive back and derive will be sufficient. But then only is Revulsion to be put in practice, when there is great plenty of blood, and a more than usual violent and forcible rushing thereof unto the part affected: and according to the greater or less proportion of this abundant blood, and the more or less vehemency of its motion, so answerably ought the Remedies and Medicaments that are prescribed for Revulsories or drawers back, to be ordained so much the more or less strong and forcible. But now that Revulsion which is made with an effusion or emptying forth of the matter must needs be greater than that which is made without it. But amongst all the Remedies which we term Revulsories or drawers back, the most prevalent and efficacious, is, the opening of a Vein; which said Venesection doth more effectually, or less strongly draw back, accordingly as the Veins that are opened be greater or less. The greater Veins are to be opened whiles the blood flows with greater violence, and (as we may say) with a more impetuous motion; and the lesser, when the Fluxion of the blood is less forcible and impetuous. For it is behoveful that the Remedies should be such as may by their celerity or swiftness contend with the over hasty motion of the matter. And therefore we acknowledg *Fernelius* to be in the right, in his second Book of the Method of Physick, Chap. 7. where he writes, That the opening of the Shoulder Vein in the Elbow doth very conveniently draw back al the affects of the Head, as wel internal as external, arising from fulness; if they be on the right side, the right Vein; but if on the left side, the left Shoulder Vein is in the Elbow to be opened. But if this be to be done more deliberately and slowly, as to instance, when the intention and main drift is only to anticipate and prevent future Diseases, then that Vein in the Hand which runs directly unto the Thumb and fore Finger is to be opened, unless haply it take its original from elsewhere, and not from the Shoulder Vein. But for those distempers which are seated betwixt the Channel bone and the Kidneys, the more inward Vein in the Elbow being opened doth more speedily and with greater force draw back from them; but more slowly and dully that Vein in the branch of the Hand, which is extended and stretched forth between the Ring-finger, and the little finger.

Repulsion or driving back.

Repulsion or driving back is used to follow revulsion. For Repulsion and Revulsion as it were mutually assist each other; and hence it is that both these Remedies are to be administred in great Inflammations; yet notwithstanding Revulsion ought alwaies to have the precedence. For Repelling Remedies that drive back may not safely be administred while the body continues full, since that the Vessels yet remaining ful wil hardly give way unto the Humor that is driven back; but if Revulsion be first made use of, where there is occasion for it, afterwards those things that drive back may with more safety be administred. For Repellers both drive back the flowing humor unto some other part, and so permit not the passage thereof into the distempered part; and they also likewise repress the humor which is newly flown into it, and which sticks in the Capillary Vessels; and so by this means they free the part affected from that overgreat abundance of blood. But albeit the benefit arising from these Repelling Remedies be very great and evident, as that whereby the fluxions even in their beginning (by the alone use of these Repellers) are stopped, and the part which began to be lift up into a Tumor again fals down from its Swelling; yet notwithstanding these ought not evermore in al cases to be administred. For (that we may not again repeat what we said before, to wit, that driving back benefits nothing in a full and foul body, but that likewise it cannot then be so much as attempted without danger) it is altogether improper and unfit to administer those things that drive back, when a far greater discommodity and inconvenience may be feared from the repulsion or driving back of the blood, than from the Inflammation it self; which may very wel be, first, if the humor be malignant, venemous, and pestilent; the which if Nature shal thrust forth from the inward parts unto the outward, we ought not to drive it back again unto the internal parts, lest that it should (peradventure) make its retreat back unto those inward parts, and thereby encrease the disease, and indanger the

When Remedies that drive back are not to be made use of.

choaking

choaking of the man. Which very Caution is likewise to be observed in every other humor (be it what it wil) that Nature (rightly acting in a critical way) rejects and casts forth into any some one part. For Nature while it is rightly imployed and busied is by no means to be impeded in her operation. Secondly, Those things that drive back are not safely to be administred in the parts which we term ignoble, or less considerable, being such as Nature hath ordained to receive the superfluities of the more noble Parts; unto which she is oftentimes wont to thrust out the Humors with which the more noble parts are burdened and even loaded; and such are the *Glandules* or Kernels in the Groins, Arm-pits, and behind the Ears. For if repelling Medicaments be applied unto these parts, there will be great cause to fear, lest the matter should again retire to the more noble and principal parts. Furthermore, thirdly, There are other places, and other parts likewise, unto the which Repellers may not commodiously be applied; and such are al those that in their scituation too neerly neighbor upon the noble parts: For the very same thing (as before said) is to be feared, lest that the matter being driven back should invade some of the nobler parts, and create a greater mischief. In the fourth and last place, Repelling Remedies are not then to be tampered with, when the parts are scituated in a place too profound, or over deep. For neither doth the vertue (as we cal it) and strength of the Repelling Medicaments reach unto such parts; neither can it wel be prevented, but that those parts are hereby rather made more ful, than any waies emptied. For while by Repelling Remedies the exterior parts are contracted, and from out of them the Humors are driven inwards, they are (after a sort) thrust and obtruded upon the affected part, the which by this means becomes more repleniſhed.

The time when Remedies that drive back are to be administred.

But then again, For the time and season when these Repellers are to be administred, it is easily discernable. To wit, seeing that the main end and scope of driving back is this, That the flowing humor should be prohibited its passage, and rejected, therefore they are to be prescribed in the very beginning, and that most rightly and properly whilest the matter is yet flowing. But this notwithstanding ought evermore carefully to be observed, as we said before, that the body be not ful. For if the body yet remain ful, drivers back are not safely administred, whenas the blood hath not any free passage for its retreat, and so by this means becomes either more impacted into the part, or else rusheth into some more noble part, and so create a greater danger. But when indeed (even whilest it is in its augmentation) there is yet some of the blood in flowing, even then repelling Medicaments may be administred, yet not alone; whereupon we judg it not amiss, that unto these we add and mingle therewithal some kind of Digestives, to the end that by the heat somwhat may together also be attenuated, and converted into exhalations.

How Medicaments that drive back are to be mingled with those that digest.

Now after what manner Repellers are to be mingled with Digestives, *Galen* instructs us in his sixth Book of the composition of Topical Medicaments, that is, Medicaments that are made suitable unto the part affected, Chap. 1. Like as (saith he) in the beginning those Medicaments that drive back that which flows in are useful and commodious; so, after the beginning, even unto the very end, those Remedies that consist of both together wil be requisite, to wit, such as have in them both a repelling faculty to drive back, and likewise a digestive faculty to discuss and scatter: and as for the time, the astringent Remedy that drives back ought to have the precedence, and in the end that which digests and dissipates; and in the time intervening betwixt the beginning and the end, the Remedies ought to consist of equal parts of both the sorts before specified. But whereas *Galen* elswhere seems to be of a somwhat differing judgment, so that it may be doubted whether Digestives also are to be mingled in the very beginning, or that we are only to make use of Repellers; and whether or not in the state or perfection only digestives are to be applied, or otherwise whether that Repellers may not likewise be added and mingled therewith, these things thus controverted ought rightly to be understood; and thus indeed it may be done. For whereas each part of the times of an Inflammation may again also be divided as it were into three times or spaces, the end of the preceding participates the nature of the beginning that followeth, and almost agreeth with it: hereupon even almost in the first beginning of an Inflammation, or that part of the beginning which is yet further distant from the augmentation, Repellers only ought to be put in practice. But the beginning tending toward the augmentation, or in that very part of the beginning which having already made a good progress is now nigh unto the augmentation, it will be requisite and convenient therewith to mingle Digestives. In the augmentation, and the beginning of the state or perfection Digestives and Repellers are almost equally to be mingled together. For although the blood doth now no longer flow; yet notwithstanding, since it is not so altogether impacted, some part thereof may as yet be driven back. But then afterward in the midst of the state Digestives ought to take place, as most prevalent; and in the end of the state or perfection of the distemper the remedies alone are to be administred; and the same is also to be observed and accordingly practised when the Inflammation is now at length in its declining condition.

Furthermore,

The quality of Medicaments that repell or drive back.

Furthermore, that in our Discourse we may make our approach, and come closely to speak of the subject Medicamental matter it self, all repelling Remedies are cold; as *Galen* asserts in his fifth Book touching the making of simple Medicaments, Chap. 17. For like as heat attracts and draws, so that (whatever it be) that is cold repels or drives back from it self. But then, look as whatever is hot is not in or of it self the principle of the local motion, or attraction, but only as we use to say, *per accidens*, or accidentally; to wit, as it resolves into vapors the matter that is moist, in the room and place whereof (lest a vacuity should happen and follow thereupon, which Nature evermore abhors, and wil by no means admit of) those things that are neer neighboring do afterward succeed: so in like manner, that which is cold doth not of it self drive back, but accidentally, to wit, as it causeth a constriction; by which motion of constriction the thicker parts do coalesce and seat themselves close together, but the thinner are pressed forth. But then that coldness hath adjoyned with it sometimes humidity or moistness, and sometimes its contrary, siccity or drineſs. And hence it is,

Repellers twofold

that of such Remedies as drive back there are two sorts or kinds: one moist and cold, or wateriſh; the other cold and dry, or earthy; and as *Galen* tels us in the Book next before alleadged, it hath conjoyned with it a thickness of the parts. Such as are of the latter sort, since that besides their coldness they have likewise an astringent power, they therefore with a double force, as by their coldness, so also by their astringent faculty, do the more strongly and vigorously repel and drive back. But then those cold and moist Repellers are more mild and gentle, which therefore have power only to drive back the thin humors that are seated in the superficies, and then also when there is no great store of them; and they are commodiously administred when heat and pain afflicts the part. For they do not only oppose and resist the influx of the humors, but they also allay the heat, and by relaxation do something mitigate and asswage the pain. But Repellers with astriction are proper in other cases; and chiefly if the fluxion proceed from the debility of the parts, and that the pain be not over urgent. For they strengthen the part receiving, that so it may not receive the humor flowing into it, and they drive back that which hath already flown in. And they profit likewise, if the Vessels through which the blood floweth be wide and large, like as when the Vessels are smal and streight the gentler sort of Repellers are sufficient. Of the former kind are, Housleek, Wall-Penywort, Lettice, Purslane, Endive, Nightshade, the juyce of Gourds, Water Lentils, Fleawort, Water-lilly, Arrach, Violets, and al other Medicaments that are cold, and which are indued with a Watry humor. Notwithstanding even among these themselves there are also certain degrees; and some of them have a greater, some a less efficacy. Wall-Pennywort and Fleawort drive back less forcibly than Lettice, Housleek, Purslane, and Nightshade.

Repellers with astriction are, the flowers and heads of Roses, the Leaves of the Bramble bush, Vine Leaves, Saunders, Medlers, the fruit of the Service Tree, Wild Pears, Quinces, the Leaves and Fruit of the Myrtle Tree, Pomegranate flowers, Frankincense, the Rinds of Pomegranates, Acacia, Bole Armenick, Earth of Lemnos (called *Terra sigillata* or sealed Earth) Dragons blood, the Leaves and Nuts of the Cypress Tree, Oak Leaves, unripe Galls, Cerus, Litharge, Corals.

Out of these there are compounded divers Medicaments (which you shal anon find expressed) according to the diversity of the disease it self, and its circumstances. For of the Plants, either the crude raw Leaves themselves are imposed upon the grieved part; or otherwise if by reason of their roughness this shal not be deemed convenient then let them be boyled in water, in the which let linen cloaths be dipt, or else spunges throughly soaked, and so let them be laid upon the part affected. Or else the juyce is pressed forth, and applied in the same manner. But others of them are bruised, and then mingled with Liquors are applied in a different manner. *Galen* was wont to dip a spunge and wet it wel in an Oxycrate, that is, a compound of Vinegar mingled with some other Liquor, and then to apply it unto the part. To the same end and purpose are convenient the Oyl of Roses and Myrtles, the Unguent of Roses, the cooling Santaline Cerecloath prescribed by *Galen*. And this likewise that followeth is an excellent Remedy, and in frequent use with Chirurgeons, viz.

Take *the Whites of Eggs, and Rose water, of each alike; let these be well shaken, and throughly mingled together; then let Linen Clouts be wel wet and soaked therein, and so laid upon the part.*

Or, Take *Barley Meal, which boyl in Vinegar and the juyce of Plantane, and lay it upon the grieved part.* *Galen* in his second Book to *Glauco*, Chap. 2. commends a Cataplasm of Housleek, Pomegranate Rinds boyled with Wine, and so made up with Sumach and Barley Meal. For this Cataplasm (as saith *Galen*) is absolutely the best in such like affects; and also very effectual to al those purposes we intend it for. For it drives back that which flows in, dries up what is therein contained, and fortifies the Members scituate round about. Or it may be thus compounded:

Take *Housleek three ounces; Barley Meal two ounces; Pomegranate Rinds one ounce; Sumach ten drams: bruise what is to be bruised, and then boyl them all together in Wine for a Cataplasm.* *Galen* likewise made use of the Plaister

fter *Diachalciteos*, diſſolved with the Oyl of Roſes, or Myrtle. This likewiſe is profitable.

Take *Plantane, Roſes, Lettice, Purſlane, of each alike, one good handful; boyl them in Water, unto which put a little Vinegar to mingle therewith, and then add Barley meal.* Or,

Take *the juyce of Houſleek, Plantane, and Roſes, of each one ounce and half, Barley meal one ounce, Vinegar, half an ounce, Oyl of Roſes as much as will ſuffice; boyl them into the form of a Pultiſe.* Or,

Take *Pomegranate rinds, red Saunders, of each half an ounce, Bolearmoniack two ounces, Barley meal one ounce, Houſleek one ounce and half, Oyl of Roſes and Myrtle of each as much as is ſufficient; and make a Cataplaſm.*

Where there is need of a ſtronger Repulſion, and if the part wil admit of it, thoſe Remedies that are ſomewhat more forcible are to be uſed. As,

Take *Bolearmoniack, Dragonsblood, of each one dram; the Root of the greater Comfrey half an ounce, Barley meal two ounces, make a powder; which as occaſion ſhall require is with Roſewater and the white of an Eg made into the form of a Cataplaſm, and ſo laid on.*

Intercepters and Defenſives:

Thoſe things that Intercept (which are alſo commonly called Defenſives) are the ſame with Repellers, and only differ in reſpect of the place whereunto they are applied. For drivers back are applied unto the very place inflamed, but Intercepters and Defenſives unto the parts and waies by which the humor flows unto the affected part, that ſo it may be intercepted in its paſſage, and that the way may be ſhut up againſt it, that ſo it reach not unto the aggrieved part. And indeed theſe are moſt commodiouſly applied to thoſe parts that have little or no Fleſh, and unto thoſe in which the Veſſels do more appear and are conſpicuous, as in the joynts, and above the joynts. As for inſtance, if the inflammation be in the Hand, they are then applied unto the Wriſt; if betwixt the Wriſt and the Elbow, they are then to be applied above the Elbow; if in the Shoulder, to the higheſt part thereof; if in the Foot, above the Ankle-bone; if in the Leg, above the Knee.

Their Quality:

Now all Intercepters are cold, dry, &of an aſtringent or binding faculty: among which notwithſtanding ſince there is no ſmal difference, as erewhile was ſaid of Repellers, we ought to uſe the gentler ſort of them in the more tender bodies, where the fluxion is not great, the Veins ſmaller, and in the Winter time. But thoſe of them that are more forcible are to be made uſe of in ſtronger Bodies, where the fluxion is greater, the Veſſels wider, and in the Summer time. But Medicaments that intercept are to be adminiſtred after a different manner. For either the juyces, as of Quinces, Pomegranates, Plantane, Houſleek, the Bramble or Blackberry buſh; or elſe the decoction of Saunders, Pomegranate Flowers, Myrtles, Sumach, Roſes, or Roſewater, Plantane, Houſleek, or Vinegar and Oxycrates are uſed, and linen Cloaths are wel moiſtened in them, and then applied to the Joynts and the parts betwixt; or elſe, laſtly, aſtringents being pulverized and mingled with proper liquid Remedies are to be adminiſtred.

The Vulgar or common Defenſive is made after this manner, *viz.*

Take *Bolearmoniack, Dragons Blood, Lemnian or ſealed Earth, all the Saunders, of each one ounce; Oyl of Roſes and Myrtle, of each a ſufficient quantity, of Wax a ſmal quantity, Vinegar of Roſes one ounce, mingle them, and boyl them till the Vinegar be all conſumed.* Yet notwithſtandig the Oyls and Wax are deſervedly and not without cauſe to be ſuſpected in theſe preſcriptions. For by their fat unctuous or oyly ſubſtance they molliſie the parts, and they likewiſe overheat them if they long ſtick upon them. And therefore it wil be more ſafe to apply the aforeſaid or ſuch like powders mingled only with Roſe water or Oxycrate; and if we would have them to be ſomwhat more forcibly aſtringent, mingled with the white of an Egg well beaten and ſhaken together. For by this means they ſtick and cleave the more tenaciouſly unto the part, and cauſe a conſtriction thereof. As,

Take *Bolearmoniack, Dragons Blood, of each an ounce, Flowers of red Roſes, Pomegranate flowers, Myrtles, red Saunders, Pomegranate rindes, of each an ounce; make a Powder hereof, which afterward mingle with the white of an Egg and Roſe water, or Vinegar, as much as wil ſuffice.*

Derivation.

And laſt of all, we may alſo in this place make uſe of derivation, which hath reſpect unto the blood that hath indeed already flown in, yet notwithſtanding as yet is only poured forth without the Veins into the void ſpaces of the part, but as yet fluctuats or flows to and again in the Veins. Neither indeed can the blood poſſibly be derived which is already impacted in the part, or that already begins to be concocted, or to be turned into *Pus*, or quittery matter; ſince that it is now become more thick than formerly, and conſiſts (as having taken up its abode) in that place out of which it cannot eaſily flow back, and thereupon is rendred the unfitter for motion, and the more earneſtly and greedily retained by Nature until it be there digeſted and concocted. From whence wil eaſily appear, at what time the derivation ought to be ordained and adminiſtred, to wit, indeed in the very beginning of the Inflammation; and yet notwithſtanding not inſtanly upon the very

first

firſt onſet of the Diſeaſe, but toward the augmentation thereof, when its beginning is now at hand, to wit, when by means of Revulſion and Evacuation already both preſcribed and adminiſtred the blood is rendered not over abundant, and that which is doth not as yet pertinaciouſly and fixedly adhere unto, or ſtick in the parts, but as yet continues to be fluxile and apt to flow. Wherefore, that we may rightly underſtand that which is on all hands taken from granted, to wit, that during the conſiſtency or continuance of the Inflammation derivation ought to be adminiſtred, this is not to be taken as meant either of the ſtate or (as we cal it) the perfection of the diſtemper, or of its declination, but rather of the latter part of its beginning.

In derivation what to be obſerved.

Now in Derivation, that community and correſpondence that is between the Veins and the part affected (of which we have formerly made mention) is eſpecially to be obſerved. For if the blood that is in the Veins of the affected part ought to be drawn thence unto the neighboring parts by derivation, then in this caſe we muſt evermore make choyce of ſuch a Vein to effect it by as hath the neereſt commerce and vicinity with the part affected; the which if it be opened, brings along with it an apparent and admirable benefit. But now for the meaſure and proportion that we ought ſo heedfully to take notice of & obſerve in letting blood by way of Derivation, *Hippocrates* informs us, in Book 7. of the Courſe of Diet in acute Diſeaſes, chap. 10. The blood (ſaith he) muſt be drawn away ſo far forth, and ſo long, until it flow forth more red, and much yellower, or that inſtead of a ruddy color it appear to be of a livid, or leaden-like color. For (as *Galen* there tels us) whatſoever blood is contained in a *Phlegmone*, that ſame will be changed in its color through the abundance of heat, but the reſt will all of it continue alike in all parts of the body. And for this cauſe, that blood which is contained in that ſide that is afflicted and inflamed with a *Phlegmone* muſt needs be much more red and ruddy than that which is diſperſed and diffuſed throughout the whol body; eſpecially if the body be pituitous or Phlegmy. Now if the blood that is diffuſed into the whol body appear to be al of it of a more ruddy color than ordinary, without doubt then that which accompanieth the *Phlegmone*, boyled and burnt as it is, muſt needs be changed into a black hiew. And from hence it is, that a change in the color denotes and ſignifies a tranſlation of the blood from out of the part affected; which ſaid change notwithſtanding is not evermore to be expected, if ſtrength be wanting in the Patient.

And after ſuch like waies as theſe may the Humors that flowing forth together unto a part generate there a Phlegmone be removed from the aggrieved part. Among the which before mentioned notwithſtanding, thoſe Medicaments that drive back and derive very much, conduce (like as the other) for the removal of the humor that flows amain into the part affected. For Repellers, although their principal ſcope be to repreſs the humor that flows in and is as yet contained within the Veins of the part; yet notwithſtanding they have a power alſo to drive, and thruſt back again into the Veins, & to caſt out of the part thoſe humors likewiſe that are newly fallen forth without thoſe Veins, and as yet not irremovably fixed in the place whither they are fallen. For neither is it a thing impoſſible that the Humors that are fallen out of the Veins ſhould again retire back into them; even as many ſorts of Tumors in the skin evidence unto us the truth hereof, which now and then in a cold ſeaſon ſuddenly vaniſh away, and diſappear. And ſo likewiſe derivation, albeit it hardly cal back thoſe Humors that are fallen forth without the Veins; yet notwithſtanding, as for the blood which fluctuates in the Veins of the inflamed part, it hath a power ſufficient to draw it unto the neighboring parts, and by them to evacuate it.

Evacuation.

Notwithſtanding, ſince that by the alone uſe of Repellers and Derivers al the whol matter is ſeldom evacuated out of the part inflamed, but that after the uſe of them for the moſt part ſomwhat is left remaining behind, this ought in another manner and by other means to be evacuated. Now this evacuation is accompliſhed after a twofold manner; either inſenſibly and by an imperciptible tranſpiration (which the Grecians cal *adelos diapnoe*) or elſe ſenſibly and manifeſtly: The matter is evacuated inſenſibly by Diaphoreticks or Sweaters, as likewiſe by thoſe that we term Digeſtive, Diſcuſſive, and reſolving Medicaments. The ſenſible evacuation is performed by ſcarification, and the opening of the part, after ſuppuration, or (as we commonly term it) maturation of the peccant humor. We will therefore in the firſt place treat of the former manner of evacuation, and declare our opinion touching diſcuſſive Remedies.

Diſcuſſion

But now, ſince that reſolution or diſcuſſion is nothing elſe but an evacuation of the humor by an inſenſible tranſpiration, it wil from hence eaſily be made to appear, that what is to be diſcuſſed ought to be thin or fluxile, and not over clammy and thick; neither the ſkin it ſelf too much ſhut up and condenſed. For if the matter be over thick, it cannot then be eaſily reſolved into vapors: but if the skin be too thick and compact; like as alſo if the matter ſtick in a place over deep; when all or any of theſe happen, then the matter cauſing the diſtemper finds not eaſily any way for its paſſage forth, neither can any Remedies but what are very forcible penetrate unto the place affected.

Discussives, what they are for their quality

Moreover, since that al digestive Medicaments ate hot in their operation (as by and by we shal further shew you) they are therefore to be administred not over haftily in the very beginning of the Inflammation; but then we ought rather to make use of Repellers, for the reasons before mentioned. But the Inflammation approaching now nigh unto (or if ye will, while it is yet in its passage towards) its augmentation, some kind of digesting Medicaments ought to be mingled with the Repellers: and so al along the quantity of the Discussives ought evermore to be encreased, until at length in the declination they alone come to be administred. Now the truth is, al Digestives or Diaphoreticks are hot; for the Humor cannot be resolved, attenuated, and converted into vapors, but only by heat. But of such things as are hot there is a very great difference: for some of them do only rarefie, or open the orifices of the Vessels; other of them cut the Humors; and a third sort there is that attracts and draws them; and last of all, there are others that are of a burning quality. Now the Diaphoretick Medicaments differ from them all; and have in them this proper and peculiar faculty, to resolve the Humors, and to convert them into vapors. Which said quality of theirs may not so easily be described by their Causes; but it is rather discovered by the experience that we have of their effects: so that what cannot be defined by reason, that same is supplied by experience, and use. But now although al Diaphoretick Medicaments are in their own Nature hot, and that they acquire this faculty from a certain due proportion observed in their mixture; yet notwithstanding, among them, some are stronger, some weaker. Those of the milder sort are, Chamomel, Melilot, the Roots of Marsh-mallows, the Roots of white Lillies, and of Fenugreek, the flour or meal of Lupines, of Orobus or bitter Vetch, and of Cicers or Chiches; leavened Bread, Goose fat, old Oyl. The stronger of them are, Dill, Organy, Thyme, Pennyroyal, Hyssop, Calamint, Horehound, Orace roots, Rue, Sage, Annis seed, Fennel seed, Caraway seed, flowers of the Elder Tree, Ammoniack, Bdellium, Galbanum, Buls fat, Bears grease, Oyl of Rue and Laurel. And those most of al forcible, are, Nitre, and the froth thereof, Sulphur or Brimstone, Lime, and the like.

We make use of the milder sort, when the matter is in a place not very deep; when the part affected and the body it self is more soft and relaxed, and the Inflammation but smal and inconsiderable. But if the Inflammation be greater, and the matter scituate more deep than ordinary, the body it self more hard and condensed, in this case the stronger Medicaments are to be administred. Notwithstanding we ought to use the stronger Discussives with due caution, lest that by them the thinner parts of the Humors being discussed and resolved, and the thicker parts left remaining behind, the Tumor should be hardened, and the Malady rendered incurable; which wil most commodiously be prevented, if together with such things as forcibly discuss we likewise mingle those things that moisten and mollifie. We ought in like manner to be very cautious, that the Discussives be not over tart and biting, lest that by their biting property they the more excite pain, and augment the fluxion.

Now out of that before recited Medicamental matter, there are divers kinds and forms. In the end of the beginning of the Inflammation, and likewise in the augmentation, such like Remedies as these that follow are of singular use.

what is to be done in the encrease or augmentation of an inflammation

Take *Barley Meal two ounces; Linsed one ounce; the Pouder of Camomile flowers half an ounce; boyl them in Vinegar; then add of Oyl of Roses and Camomile, and the fat of an Hen, of each alike as much as will suffice, and make a Cataplasm.* Or otherwise:

Take *Pellitory of the wall, Mallows, Plantane, of each one good handful: boyl them in Water: with the which let there be a very smal quantity of Vinegar wel mingled together, and so let them be bruised into smal pieces: after they are thus brayed, add of Barley meal two ounces, Fenugreek seed an ounce and half: Oyl of Roses and Camomile, of each as much as will suffice, and make a Cataplasm.*

A most excellent and useful Cataplasm to prevent Inflammations in Wounds, and in other cases. Viz.

Take *the pouder of Camomile flowers, of red Roses, of Wormwood, and Barley meal, a like quantity of them al: boyl them in pure clear Water, and make a Cataplasm.* Or,

Take *the pouder of Camomile flowers, red Roses, Wormwood, Barley Meal, of each three ounces; Decoct them in common Water; then add Oyl of Roses one ounce and half, and make a Cataplasm.*

What in the state or perfection of it.

In the state or perfection, such like as these that follow may be administred.

Take *Camomile Flowers, and Melilot Flowers, the Leaves of Mallows, of each half a handful; red Roses two large handfuls, boyl them in austere or sharp Wine, and then add of Fenugreek meal one ounce; Oyl of Camomile a sufficient quantity, and make thereof a Cataplasm.* Or,

Take *the Roots of white Lillies one ounce; the flowers of Camomile and Melilot, of each one good handful: red Roses and the tops of Dill, of each half a handful: boyl them in simple common Water, and let them be bruised very smal: then*

then let there be added, of the Meal of Millet seed, Fenugreek Meal, and Barley Meal, of each an ounce; Saffron half a dram; Oyl of Camomil as much as will suffice, and make a Cataplasm. Or,

Take *the Pith of wheaten Bread six ounces; boyl it in common Water, and after this let it be strewed with the Pouder of Camomile flowers and Melilot flowers, of each half an ounce, red Roses two drams, Saffron half a dram, and so make a Cataplasm.*

And what in its declination.

Lastly, In the declination, such like Remedies are to be put in practice, Viz.

Take *Marsh-mallow Root one ounce: the leaves of Mallows, Organy, the flowers of Camomil and Melilot, of each half an handful: Lin-seed, Fenugreek seed, and Dill seed, of each alike two drams: Decoct them in a sufficient quantity of Water, and make a fomentation to be applied warm with a Spunge.* Or,

Take *the Pouder of Camomil Flowers, of Elder and Melilot flowers, of each of these half an ounce; Dill seed two drams, the Meal of Lin-seed, Fenugreek, and Beans, of each one ounce; Oyl of Dill and Camomile, of each alike as much as will suffice; and make a Cataplasm.*

This (moreover) as touching Digestives is to be taken notice of; to wit, That if the matter be grosser and thicker than ordinary, insomuch that Digestives cannot satisfie the expectation by doing their office, we must then do our endeavor that the matter may be rendered fit for Discussion and transpiration by sweat; and this may conveniently and securely be done by mollifying Remedies. And therefore in such a case (as before we likewise hinted unto you) we ought not only to abstain from those Medicaments that over-heat and dry; since that they discuss, waste, and consume the humidity that is in the Tumor, and harden the matter, and so cause the Malady to become altogether incurable: but we ought likewise to administer mollifying and loosening Remedies, such as do moderately heat, and withal do not excessively dry, but rather moisten; which kind of Medicaments you may before find enumerated and reckoned up among the Digestives themselves; such as is Hens fat, Goose fat, the Roots of Marsh-mallows and white Lillies, Mallows, Lin-seed, Fenugreek, Bdellium, Ammoniacum, and such like; al which are most fitly and conveniently administred when the matter is thicker than usual, as we shal further shew you in its proper place, when we come to speak of Emollients or Mollifiers. And in this manner the matter contained in an Inflammation is to be removed by insensible transpiration.

But we have acquainted you that this matter is sensibly and perspicuously poured forth either by scarification, or by opening of the part, after that the *Pus* or purulent matter is generated. As for what concerneth Scarification, that it ought to be administred, *Galen* gives us his judgment clearly for it, whilst that in his ninety fifth Chapter of the Method of Physick he thus writes: But thou shalt more especially evacuate (saith he) both by the useful assistance of scarification, and by the help of Medicaments that have in them a power and faculty to dissolve, in case thou observe any thing to be contained in the intervening middle spaces. And in his second Chapter of a Tumor he thus writes: It is (saith he) by Physicians found to be expedient, in the case aforesaid, not only to discuss by the means of heaters, but likewise sensibly to evacuate at least some part or portion of the blood it self, by making scarifications in the Skin. But here then we are to know, that great heed and circumspection ought to be taken and had, whether or no the matter may be turned into *Pus*, as we term it, being the snotty fetid matter ensuing upon maturation. For if we may probably hope for the said suppuration, then the above mentioned scarifications have not any the least place. But then on the other hand, if the matter may not be changed into the said *Pus* or matter, and that notwithstanding likewise there be little or no hope that possibly it may be wholly discussed or scattered by the application of Medicaments, then in this case both Scarifications and Cupping-glasses may, nay ought to be administred. For these two are a very effectual and prevalent Remedy for the evacuation of the matter (whatever it be) that sticks and is deeply scituated, and which seemeth forthwith to be in the ready way of conversion into a *Scirrhus*. And therfore they are by no means to be administred in the beginning or first appearance of the Inflammation, but at length after that the body is sufficiently emptied, and that the *Phlegmone* is at a stay; that so there may be further cause to feat that a new fluxion should be excited by that pain which originally proceeds from scarification; and then only when we have a purpose to extract that which remains over and above after the use of other convenient Remedies. Yet notwithstanding Scarification hath place only in those parts which in other cases likewise are fit to undergo and suffer the said Scarification. For if an Inflammation happen unto any part unto the which in any other case scarification ought not to be administred, I conceive that there wil be found no man so rash and unadvised, as that he dare be so adventurous as after a *Phlegmone* (for the evacuation of the residue of the matter) to apply Cupping-glasses and administer scarifications unto the part affected. But very rare it is that scarifications are admitted and allowed of for the use and purpose aforesaid.

But the safest and most usual way of curing an Inflammation, is, that the matter which hath flown in unto the part be discussed by the Medicaments before propounded. But if thereby it may

Suppuration

not be effected, we must then have recourse unto some other means for the curing of the *Phlegmone*, and that is by Suppuration.

Now all this that hath been said must be understood as spoken of a pure and simple *Phlegmone*. But if the Inflammation be not pure, but that it rather decline unto the nature of an *Erysipelas*, or an *Oedema*, or a *Scirrhus*, then those Medicaments that are proper and convenient for these and such like Tumors are to be intermingled with the other; yet evermore with this Proviso, that such of them as relate unto the *Phlegmone* be alwaies predominant.

The Cure of an Inflammation degenerating into an Impostume.

The generation of an Impostume.

If therefore there be no hope that the Inflammation may be compleatly cured by the helps and means hitherto propounded (which will appear from the more intense signs of the Inflammation, to wit, grievous pain that encreases day after day, a manifest Pulsation or beating, and an evident discernable extension or stretching out of the part) then we ought instantly to use our utmost endeavor, that the matter that is the cause of the Inflammation may with all possible speed be concocted and brought unto suppuration, that is, converted into *Pus*. For neither can the matter yet unconcocted, and as yet not turn'd into matter, be in a due manner evacuated; and then again, if any one open the inflamed part before the said *Pus* be compleated, he shal thence draw forth nothing; and shal encrease and add unto the Malady rather than relieve and cure it. But if that same part shal be opened, the purulent matter being already elaborated and thereby brought to a due perfection, then all whatever is superfluous in the inflamed part may most commodiously be evacuated. And therefore we conclude, that the matter is first of al to be concocted, and so far forth as possible may be digested by the native radical heat. For although that matter which is conteined in a *Phlegmone* can never be so far forth concocted and elaborated that it may be rendred any waies useful and profitable to Nature, and in any sort fit to nourish the parts; Yet notwithstanding, since that there are therein certain qualities which are to Nature very offensive and burdensome, those may be taken away; and a certain kind of equality, and moderation of the qualities may be instituted; and a separation of the corrupt humors from those that are good and such as are meet to nourish the Body may be wrought; which said elaboration of the humor is here termed concoction and suppuration. And when that that is superfluous and corrupt in the part inflamed is separated from what is useful, good, and serviceable, and that the vitious qualities are now hereby coorrected and amended; and the very proper substance of the blood it self shal be changed into an equal whitish and smooth matter, and gathered together into its proper and peculiar place, so that now without any difficulty at all it may upon the opening of the part be evacuated; then and not til then the *Pus* is said to be now already perfectly concocted; and that same collection or gathering together of the snotty filth, termed *Pus* or matter, into some one particular place, is by the Grecians called *Apostema*, and by the Latines *Abscessus*; with us (in English) it is named an Apostem or Impostume, as hath been said before in the first Chapter. Now that concoction in mans Body is Natures work alone, the which by the help and assistance of the native heat digests the humors, takes pains with them, and as it were leads them along until it hath brought them unto that perfection which they ought to receive: which said heat if it be strong and vigorous, then we use to say, that the *Pus* or matter thereby bred is good and laudable; and it is (as we may find in the first Prognostick, Tom. 42.) white, equal, smooth, and not very stinking and noysom. But if the innate heat be weak, then it wil be quite and clean contrary unto what was in the former case. And therefore the Physitians office is, and his main care must be to cherish or preserve, and encrease the native or natural heat in the inflamed parts, that so by means of it the generating and breeding of the said *Pus* may the better succeed, and the more easily attain unto its perfection. The innate heat is conserved and augmented, if in the first place we take course to hinder the issuing forth of it, and then that in the next place we use all possible caution, that whatsoever of it is more debile or weak in the more external parts may not be dissipated by the ambient Air: and moreover, if Medicaments agreeable and suitable unto the Native heat be applied to the part affected; and hence it is that the Medicaments prescribed to facilitate the said suppuration or production of *Pus*, ought to be such as bear a resemblance unto the native heat in the parts to which they are applied. And thereupon since that our Nature is moist and hot, the Medicaments ought in like manner to be answerable, to wit, hot and moist. Furthermore, let them be such as we term *Emplastick*, that is, such as have in them a certain clammines, that so they may fil up the Pores of the Skin, and that they may prohibit and prevent the flowing forth of that heat that is so apt to evaporate. For all those remedies that are of a cleansing property, or else those Medicaments that forcibly heat (such as Cataplasms of Bean meal, Fenugreek, Chiches, Lupines, &c.) seeing that they permit the vapors to exhale and vent themselves outwardly, they may indeed in this respect be said to dry, but they little or nothing at all further Suppuration.

Take *Marshmallow roots three ounces, the*

Leaves

Leaves of common Mallows, and Bears-breech, of each one large handful; and then having boyled and maſh'd them, add thereto of Swines greaſe as much as will ſuffice; mingle and uſe them. Or,

Take *Marſhmallow roots, white Lillies, of each two ounces; Mallow Leaves, two large handfuls; ſul and fat dryed Figs, in number ten; boyl and bruiſe them ſmal, then add of Wheaten meal two ounces, Linſeed half an ounce; mingle and paſs them through a fine Hair-ſieve, and after add of Swines fat, Butter, or Oyl of white Lillies as much as is ſufficient, and make a Cataplaſm.* Or,

Take *Marſhmallow roots, Onions, white Lillies, alike of each two ounces, Wheaten meal one ounce, Linſeed ſix drams, Turpentine half an ounce, Saffron one ſcruple, Hens fat, and Oyl of Camomile, of each as much as will ſuffice, and ſo make a Cataplaſm.*

The Signs of Pus or ripe matter.

When the *Pus*, that is, the purulent matter, hath once arrived at its perfection, we muſt then do our endeavor that with all ſpeed poſſible it may be evacuated. But then firſt of all it muſt manifeſtly appear unto us, whether or no the *Pus* be already made and brought to perfection. For although in general we have already before (in Chap. 3. concerning Impoſtumes) ſpoken of this ſame ſubject; yet notwithſtanding thoſe things which are moſt proper to an Inflammation ſeem needfull here again to be repeated. Now therefore the beſt and ſureſt ſign is taken from the Touch. And firſt, if the part be perceived to be ſoft whiles that it is preſſed, and that there is therein felt (as it were) a certain kind of fluctuation; to wit, if two fingers of both hands, or the fore-finger and middle finger of one hand be applied to the Tumor, but yet ſo that they touch not one the other, but be ſome little diſtance aſunder, and that one of the fingers preſs down the Tumor, & the other not: for then a certain fluctuation and motion of the matter which is driven forth from place to place is perceived under the other finger that lies quiet. But here notwithſtanding it will not be amiſs to take this caution, leſt that we be miſtaken, and either (the maturation being compleated) deem that there is no *Pus* or matter lying underneath, or elſe, that we open the part, albeit there (indeed) be no filth, which we uſually call *Pus* or matter. For why, there appears a Fluctuation in ſome certain parts, even whiles they are ſound; ſuch as are the places about the Knees. And on the contrary, now and then the ſaid *Pus* or filthy ſnot-like matter, although (as to its maturation or ripening) it be compleated, yet it doth not evermore of it ſelf evidence the ſigns and tokens thereof. Touching which *Hippocrates* likewiſe makes mention in his ſixth Book, Aphor. 41. where he thus writes: Unto whom purulent matter exiſting and abiding in the Body doth notwithſtanding diſappear, and not diſcover it ſelf by any kind of token or ſignification, there we are to underſtand that it doth not diſcloſe it ſelf either by reaſon of its own thickneſs, or the condenſedneſs of the place. To wit, the ſaid *Pus* ever and anon lieth hid and conceal'd and doth not diſcover it ſelf, either by the reaſon of the denſity, that is, the thickneſs, and withal the hardneſs of the place affected; or elſe becauſe of the profundity, or if you will, the depth of the place where it reſides; as for inſtance, when an Impoſtume hath its reſidence, and lies hid between the Muſcles of the Belly, or of the Thigh, or of the great Joynts: like as it comes to paſs alſo in the Heel, and the ſole of the Foot, by means of the Skins extraordinary thickneſs. Or elſe it happeneth, in regard that the ſaid *Pus* it ſelf is overgroſs and thick; upon which account it neither can be driven forth unto the ſuperficies, neither doth it yeild unto the compreſſion of the fingers, and ſo conſequently fluctuate.

There are moreover other ſigns of *Pus* (when perfectly bred) diſappearing and lying hid. To wit, ſecondly, the place (in reference to its color) declineth unto a certain kind of whiteiſhneſs, when the maturation is already terminated; whereas before and until ſuch time as the filthy corrupt matter was ripened, it was of a more ruddy or reddiſh color. Thirdly, it is a ſign, and it argueth that the *Pus* of the quittor is compleatly ripened, if that both the heat and pain be remitted, and the extenſion and pulſation of the part be diminiſhed; touching which likewiſe *Hippocrates* thus writes, in his ſixth Book, Aphor. 47. The pains and Feavers happen and are alwaies more intenſe whileſt that *Pus* is in breeding, and untill it be perfectly bred, then after ſuch time as it is fully ripened, and the maturation compleated. For the concoction being once made & paſt, there is ſome certain portion of the matter and of the vapors reſolved; and the matter being converted into *Pus* is gathered together into one place: from whence it likewiſe proceeds, that the ſenſe and feeling of pain is not now any longer ſo great and intollerable as before, and alſo all the other ſymptoms ſlacken and grow remiſs. The fourth ſign is, that the Tumor ſtruts forth (as it were) into an eminent heighth and ſharp-pointedneſs. For Nature thruſteth forth the elaborated and ripened *Pus*, and confines it unto ſome one place, and according to her power expels it unto the more external parts, and that place more eſpecially by the which it may with leaſt difficulty and danger be emptied and caſt forth.

If therefore by theſe ſigns we get aſſurance that the *Pus* (as we term it) is already made, we muſt then (as hath been ſaid) do our utmoſt endeavor, that without the leaſt delay it may be evacuated. For if the ſaid *Pus* be overlong deteined it overthrows the temper of the member, corrupts the adjoyning & neer neighboring parts and ſo the Ulcer proves to be intricrae and full of

turnings

turnings, or else degenerates into a Fistula; which is then wont more especially to happen, when the matter is sharp and malignant; or otherwise when the Inflammation is seated in the joynts, in the Arse-hole (as we cal it) and such like parts.

The evacuation of Pus *or corrupt matter out of an Impostume.*

Now as for the manner of Evacuation, it is (as hath likewise been shewn before, in the third Chapter, touching an Impostume in general) twofold; either by the opening of the part, or else by insensible transpiration. And very commonly indeed, if not for the most part, that kind of Impostume which we cal *Vomica* (which is an Impostume ful of snot-like filth or matter) is forthwith opened; and that also very conveniently, and usually with good success. Yet notwithstanding *Galen* in his third Book of the Method of Physick, Chap. 15. doth not instantly proceed to opening, but first of al assayes what may be done by exhalation and insensible discussion. And this is especially practised in that affect which we term the Kings Evil, and generally in al Swellings in the Neck, Arm-holes, and al the glandulous kernelly parts. For if such like parts should be opened and altered by the ambient Air, it is possible (and indeed very frequently seen) that from thence the Ulcers are rendered either altogether incurable, or at least more difficultly curable, and of longer duration. But here we cannot be over cautious. For whenas this said resolution and discussion of the purulent corrupt matter happeneth but seldom, and never but after a longer tract of time, so that thereupon there is great cause to fear, lest that it should in the mean while corrupt the neer neighboring parts, and cause windings to and fro in the part affected; then in this case, al the circumstances ought heedfully to be weighed, and duly considered. For if that the *Pus* be good and laudable, thin, not much of it, not scituate in a deep place, but rather seated in the superficies; and if the Skin be softer and thinner, then perhaps we may have some ground to hope and expect a discussion. But if the case stand quite contrary, and it be so that the said *Pus* be not good and commendable, but that it be thick, fixed in a deeper place than ordinary, and likewise if the Skin be thicker than is convenient; then to attempt resolution, and to defer opening, wil be a course altogether safe, and void of danger. But where there is any hope given of resolution, we must then make use of the stronger sort of Digestives to accomplish this discussion. Of this kind is that Medicament which *Paulus Ægineta* (in his fourth Book, Chap. 18.) hath prescribed; which drives forth those Impostumes that are already throughly concocted, and quite and clean discusseth and scattereth such as are not concocted.

Take *of the stone* Pyrita, *Ammoniack, of each one ounce and half: of Bean Meal six drams: let them be incorporated with liquid Rozin, and let the liquid Medicament be spread upon a Skin, and not taken away until it fall off of its own accord.*

This likewise is singularly useful;

Take *Ammoniack two ounces: Galbanum half an ounce: Lithargyrie three ounces: old Oyl as much as wil suffice: make a Liniment.*

But if (which but seldom happens) the *Pus* cannot insensibly be discussed, then it is sensibly to be emptied forth and evacuated by opening the Impostume. Now either the Impostume is broken of it self, or else it is opened by art. The Impostume is opened of it self, whilst that we expect and wait until the *Pus* corrode and fret away the skin it self; which we are allowed to do, in case the Tumor or Swelling be not so very great; but especially if it be in the outwardmost part of the Skin and flesh, and under the Skin that is not over thick. But it is not evermore safe to expect a Spontaneous and voluntary opening. For (as *Galen* writes upon this very subject, in his second Book to *Glauco*, and sixth Chapter) when Tumors which arrive at Impostumes shal be long neglected ere they be launced and cut (either by reason of the unskilfulness of those that undertake the Cure, or the fearfulness of the Patient that is under cure, who wil not suffer themselves to be cut, but wil rather wait and expect until that in process of time the Skin be corroded and eaten through) it then very often comes to pass that the whol Skin is exceedingly extenuated by reason of the purulent matter heaped up together neer unto the Impostume, not unlike unto that which the Greeks cal *Racos*, that is, a rent Garment; from whence it is that Physitians have imposed upon it this appellation or name, *Racodes*, that is to say, rent and torn. And if this chance, the Skin in this manner and by this means extenuated wil very hardly ever after be brought to cement and unite with the part that is subjected and lieth underneath it. But now, in the first place, the said opening is not to be delayed, and a voluntary eruption of the corrupt matter to be expected, if so be that the flesh and skin be thicker than ordinarily; and if there be in that part Nerves, Veins, and Tendons. For then the Impostume is to be opened as soon as possibly it may be, lest that if the opening be deferred, the malignancy of the purulent matter corrupt and eat asunder the Nerves and Tendons; especially if the Impostume be ever a whit nigh unto the Joynts. Yea, in some certain places, as for instance, neer about the Arse, and the Sutures, we are scarcely allowed to expect the highest and utmost perfection of the said *Pus*, lest that the more profound and deep parts putrefie, and thence a long lasting, or Fistula-like Ulcer be generated.

The opening of an Impostume.

when it is to be put in practice.

And

And therefore if the corrosion or gnawing asunder of the Skin, and consequently that spontaneous eruption of the filth and corruption be not to be expected, the Impostume is then forthwith to be opened; and this ought to be performed in that place of it that is the highest and most eminent; for there the Skin is at the thinnest: and withal it is likewise to be opened at the same time, in some more sloping and inferior place thereof, that so the said *Pus* may the more easily pass forth. It is to be opened either with an Iron Instrument, or else by Medicaments. The Iron that openeth it must either be such as is heated in the fire, or else such an Instrument as is prepared to cut. We most rarely make use of the Iron heated in the fire, and never unless in case of urgent and extream necessity; as for instance, if it should so chance, that there be a Tumor in those parts that are ful of Veins and Arteries, and such other like cases. For there the dangerous flowing forth of the Blood is checked and suppressed by the fire-heated Iron. But most frequently it is opened with an Instrument that is fitted expeditely to cut; and this knife ought to be sharpened to the utmost, that so the Section may be performed without putting the Patient unto any extream and intollerable pain; and (if possibly it may be done) so that the sick party may take no notice thereof. But in the accomplishing of this work we must evermore look wel unto it, that the Sections (or cuttings) be no larger than needs must; and yet (on the other hand) not so smal, but that they relieve the present necessity; I mean, that by the Orifice of the incision the *Pus* may find an open and free passage forth. For if the Wound be less than that the corruption may rightly pass out thereat, then it wil be requisite that the part be pressed down; by which compression pain is evermore excited, and the Ulcer is rendered callous and brawny; from whence a Fistula may possibly arise. But on the other side, if the Incision be wider than it needed to have been; then both the Cicatrix or Scar will be greater (and more unsightly) than if it had been artificially made; and then likewise the parts subjected wil be altered by the ambient air; and now & then the part is thereby made the weaker. *Celsus* (in his seventh Book, and second Chapter) gives in charge, that the Incision be made after the resemblance of the Myrtle Leaf, that is, that a simple downright Section be made, and that it be so long, that when the lips thereof are dilated the Wound may bear a resemblance to the Myrtle Leaf. And sometimes one only Section doth not suffice; but (as *Celsus* there instructs us) greater turnings and nooks are by incision to be made in two or more lines. And this also is carefully to be observed, That the Section be made according to the fibres, that is, answerable to the smal strings or hairs of the Muscles. Now the Fibres proceed straight forth, and for the most part according to the length of the body, unless it be in some certain places, as in the forehead. Now this is therefore to be heeded, that so we may not hurt or hinder the motion and action of the member; which yet we need not to observe, if the Tumor be in the Superficies, and close under the Skin; but then only, when the *Pus* sticks in the very substance of the Muscle. In the first place therefore we must take due heed that we keep at a good distance from the Nerves, as also the Veins and Arteries, and that we come not nigh them. The Instruments we make use of for the opening of Impostumes are very many. The first is the Razor; then next the Myrtle Knife, which they commonly cal the Lancet; thirdly, a Knife or Instrument resembling the Olive Tree; fourthly, our Country-men likewise open Impostumes with the Pen-knife, or that with which they let blood when they open a Vein. But of necessity these Instruments must variously be used, according to the great variety and difference of circumstances. For if the Impostume be deeply seated, and the Skin be thicker than usually, then it wil be needful proportionably to make the Section so much the more profound and deep. But if it be (as we use to say) *subcutaneous*, that is, lying close under the Skin, there will then be no necessity for this so deep an Incision.

But in regard there are many that wil not admit of Section or Incision, we therefore prescribe and administer unto such persons Medicaments whereby the impostume may be opened. But those Medicaments are not al of them of one and the same sort, neither of a like efficacy; for some of them are weaker, and other stronger. The stronger sort of them are not over rashly to be administred. For they both prolong the Disease, and introduce an evil distemper into the part; and possibly they may likewise produce divers other ill symptoms. And therefore the gentler sort of them are first of al to be administred, which do rather ripen the matter and draw it to the highest part of the Tumor, and withal do there render the Skin more subtile, and cause it to become more tender, than truly and properly corrode, eat asunder, and break the Skin. And such are these that follow:

Take *Marsh-mallow roots, and white Lillies, of each alike one once: Garlick, Onions rosted under embers, the flour of Fenugreek seed, dried Figs fat and ful, of each two drams: the dough of Bread well leavened one dram and an half: Oyl of white Lillies, Butter, Swines fat, of each alike as much as wil suffice, and make a Cataplasm.* Or,

Take *Onions, Garlick, Marsh-mallow roots, equal parts of them al: boyl them to a softness, and when they be wel bruised add the flour of Fenugreek as much as any one part of them: the fat of an old Hog as much as will suffice, and mingle*

them

them wel. This following is more forcible.

Take *of sharp and sowr Leaven half an ounce, Onions rosted under live coals one ounce, Doves Dung one dram; black Soap, Swines Fat, of each alike as much as is sufficient; and mingle them.*

The Emplaster *Diachylon* mingled with Mustard Seed, Figs, and Salt, performs the same with the former.

But such like Medicaments are more especially applied unto that part in the which the Impostume is sharp-pointed; and round about it there is put to somwhat that is maturative or ripening (understand it here of simple maturatives) as *Diachylon*, which to this end is wont to have a hole made through the mid'st. The strongest sort of them are those that we call potential Cauteries; the which kind of Remedies we have described in our Institutions; among which that is the most efficacious, and withall the most safe, which is prepared and made out of Lee, out of which there is a certain sope prepared; touching which we have likewise spoken in our Institutions. Now of such a Cautery we are to take a certain smal proportion, to the quantity of half a Cicer or Pease, and then apply it unto the part after this manner. Take the Cloth that is spread over with the Emplaster, and cause it to stick close to the Skin; then in the mid'st thereof cut a smal hole, somwhat narrower and streighter than you intend the Cautery shall be. After this take the Cautery, and being somwhat moistened with Spittle apply it unto the Skin that appears and lies open to view through the aforesaid hole, and afterward lay on another Emplaster upon the former. After two or three hours remove the Cautery with the Plaister; upon the removal of which the part appears black, soft, and without any sense or feeling. And that this burnt part may be wholly taken away, let it be all over throughly besmeared with unsalted or fresh Butter, or with the fat of an Hog, or with some other fit Digestive. But if the hole be not wide and large enough, it may very easily be dilated, to wit, if either a little piece of Spunge or Gentian root, or Rape root dry be put thereinto. For these things aforesaid when they are filled full with humidity they are then dilated, and so consequently widen and enlarge the hole. The Spunge is thus to be prepared: the Spunge is to be wel soaked in the white of an Egg twice or thrice throughly shaken together; then afterwards let it be close squeezed together on all sides, and then let it be leisurely dried in the shade: a smal portion of this (when it is dried) is to be taken and put upon the Ulcer. But in regard that the crustiness thereof wil not fall off in a few daies time, and that all this while the *Pus* or filthy corruption (unless it stick immediately under the Skin) is detained and imprisoned in the Impostume, for this very cause, if there were no other, it is by far the safer way to open the Impostume with an Iron.

The Impostume being now opened (whatever the way of opening it hath been) the *Pus* or matter is to be evacuated, but yet this needs not evermore to be wholly all at once or altogether. For if the Impostume be great, and contain much *Pus* within it, neer unto the Arteries and Veins, the whole matter and filth ought by no means to be evacuated all at once, lest that together therewith much of the Spirits be likewise evacuated and dissipated, and so by this means the sick Person should be caused to faint and swoon, or be debilitated and weakned: but rather the corruption is to be emptied forth by some and some, especially if the Patient be weak, or a Woman with Child; or in case the Patient be a Child, or lastly, if the sick party be very aged. When the *Pus* is evacuated, if either pain manifest it self, or else any reliques of the matter not suppurated appear in the circumference, and it be so that the *Pus* it self be not wel and perfectly ripened; then the pain is to be mitigated, and more especially the remainder of the matter is speedily to be converted into the said *Pus* by some concocting Medicament, which they commonly call a Digestive. And such is that which is made of the Oyl of Roses, and the Yelks of Eggs: for it greatly mitigates the pain, and helps forward the generating and breeding of the *Pus* so often mentioned. Or,

Take *Turpentine one ounce, one Yelk of an Egg, the Pouder or Dust of Frankincense one dram, Oyl of Roses three drams; mingle them wel together.*

Likewise the Emplaster *Diachylon simplex* is very profitable in this case.

When this is once accomplished, even while the concoction doth yet appear, we must come to those things that throughly cleanse and purge it: for neither can there flesh be bred, nor any conglutination (by drawing together the Lips of the Impostumated part) be made, unless the part be first cleansed. Which to effect,

Take *Clear Turpentine one ounce, Honey of Roses six drams, the Yelk of one Egg; let them boyl together a little, and afterward add of Saffron one scruple, and a little quantity of Barley meal.*

If there be need of a greater cleansing, you may then add the juyce of Smallage. As,

Take *of crude Honey, Barley meal, of each alike, one ounce; of the Juyce of Smallage half an ounce, Saffron half a scruple; and mingle them.*

If yet there be occasion for a more forcible cleanser, there may be added of the *Unguent Egyptiack* as much as wil suffice.

Centaury the less, and round Birthwort is here likewise very useful. As,

Take *the juyce of the lesser Centaury two ounces, Smallage one ounce, Honey three ounces; let them boyl together, and after add of Barley meal,*

and

and the Vetch Orobus, *of each six drams: when they are taken from the fire, add of Turpentine one ounce, of the Pouder of the Flower-de-luce root one dram; mingle them.*

The Impostume being throughly cleansed, such Medicaments as breed & cause flesh are to be administred. Now of what sort these are, *Galen* in his third Book of the Method of Physick, the second, third, and fourth Chapters teacheth us at large; and we have likewise declared them in our Book of Institutions. As for example,

Take *Frankincense, Mastick, of each half an ounce, Colophony two ounces, Oyl of Roses and Honey, of each as much as is sufficient; let them be mingled.* Or,

Take *The greater Comfrey one handful, Betony, Saint Johns-wort, Horse-tail Grass, of each half a handful; boyl them in Wine, and bruise them wel: out of the mash of them squeez forth a Juyce, and add of Frankincense and Mastick, of each one ounce & half; Dragons blood an ounce, Honey and Turpentine, of each a sufficient quantity; boyl them until the juyce be consumed, and make an Unguent.* Or,

Take *Myrrh, Aloes, Sarcocol, of each an ounce; Honey six drams, White Wine as much as wil suffice; boyl them to an indifferent thickness.*

When the Ulcer is filled up with Flesh, then those Medicaments which we cal *Epulotick*, that is, such as bring to a Scar, are to be administred; of which we have in like manner spoken in our Institutions; such as are, the Emplaster *Diapalma* or *Diachalciteos*, *de minio* of *Vigo*, and others, which are every where known.

Chap. 6. *Of the* Sinus *in the Tumor.*

But it oftentimes so happeneth, that although the said *Pus* or snotty filth be emptied forth of the Impostume, yet notwithstanding it becomes again replenished; from whence it comes to pass that the adjacent Skin doth not close, fasten and grow together with the Flesh that is underneath it; but there is a certain cavity or hollowness left to remain; and at length there ariseth a certain difficulty, if not impossibilily, of cementing and conjoyning the skin with the Bodies lying underneath; which affect the Greeks cal *Colpos*, and the Latines term it *Sinus*; to wit, when the enterance into the Impostume and Ulcer appears narrow enough: but the deeper and more profound part thereof diffuseth it self into a breadth.

The Causes.

Now for the most part, the Causes of this *Sinus* are Impostumes or Suppurated Tumors, overslowly opened, or not wel cleansed. For the corruption if it be longer detained in the deep place than it ought to be acquireth a certain kind of sharp corroding quality, and there causeth divers winding passages and turnings, such like as we find in Coney-borrows; and so unto the part in this manner affected there flow together from the neighboring parts, yea from all the whole body, such excrements and such humors as superabound; from whence afterwards it chanceth, that this kind of *Sinus* or windings to and fro can very hardly be conglutinated and filled up with Flesh.

The Differences.

But now of these *Sinus* there is an exceeding great diversity: for they differ not only in the dimension of quantity (that one should be less and shorter, and another more deep or broad) or in their figure (that one should be straight, and another full of turnings, of this or that figure) but most especially they differ in the manner of their scituation and position; because that kind of difference doth not a little vary the Cure. For that which tends upwards affords us a better hope and surer expectation of cure, seeing that by its orifice the *Pus* may the more readily flow forth and be evacuated. But that which tendeth downwards doth longer retein the said *Pus*; which being kept in doth further corrupt and corrode the parts. Wherefore such a *Sinus* is not to be cured, unless you open it on the adverse or opposite part, that so the *Pus* may freely come forth out of it. Now that the Physitian may not be ignorant of these Differences, but that he may know and well understand whither the *Sinus* reacheth, and how great it is, an exact and strict search must be made thereinto by Tents, or otherwise with those Silver Instruments (we cal them Probes) wherewith Chirurgeons are wont to search unto the bottom of deep Wounds; as likewise by Wax Candles (or the like) gently conveyed down into the very deepest part of the *Sinus*. And withall we must do our utmost endeavor, that the *Sinus* may be speedily cured; for unless it be spedily cured it contracts to it self a certain callous or brawny superficies; and in process of time it becomes exceeding hard; neither will it afterward be cured without much difficulty and danger.

Notwithstanding, what hopes there may be, the qualities of the part it self that is affected do evidently demonstrate, and chiefly the matter which flows forth out of the *Sinus*. For if it be much, not digested; if there be pain sensibly felt in the *Sinus*, or if a Tumor or Swelling appear, as yet there is but small hopes of its Cure: but then if the *Pus* be but little in quantity, if it be good, white; if there be present no pain, and all the whole place be equal; it is a great and strong Argument that the *Sinus* is already filled with Flesh.

The Cure.

As for what concerns the Cure; since that hollowness & solution of Unity are the Causes of the

Sinus, the solution of Unity points us out to the procurement of an uniting; but the Cavity instructs us, that repletion ought to be endeavored. But now those things that stand at a distance cannot be united, unless first that which is hollow be filled up; whereupon the Cavity must in the first place be repleniſhed. But the Cavity can by no means be filled with fleſh, unleſs the temper of the part be right as it ought; and that the ſaid *Sinus* be free and clean from al its impurities. And therefore we muſt primarily provide by a ſedulous endeavor, that if there be any diſtemper preſent it may be removed, and that the *Sinus* may be wel and throughly purged. And moreover, unleſs that either the Orifice of the ſaid *Sinus* look downward, or that the Member may be ſo placed that the matter may freely flow out of it, before any thing elſe be done a way muſt be opened, and a paſſage forth made for the *Pus* or filthy corruption. If the Orifice of the Impoſtume lie open toward the inferior parts, the filth hath then a free paſſage forth, and ſuch a like *Sinus* by the application of Cleanſers is eaſily cured. But then if the Orifice be in the ſuperior place, there is a neceſſity that we forthwith aſſay to open a free vent and paſſage forth for the corruption.

And this may be done in a twofold manner; either by diſſecting the whol Cavity, or at leaſt by opening the Orifice in the inferior part. Now of a truth it is the more convenient of the two that we open al the whol *Sinus*; ſince that by ſo doing the Ulcer may the more eaſily be purged and healed. But becauſe we are not evermore allowed to put this in practice, to wit, when the *Sinus* is great, and that the whol part may not be diſſected without danger; therefore ſometimes we only open the *Sinus* in the bottom thereof. Which being done, and the *Sinus* opened, it is carefully and throughly to be cleanſed and dried, leſt that there be any of the *Pus* left remaining. For if there be any of it left behind, from thence Fiſtula's and recidivations or Relapſes are wont to take their Original. And although the parts may ſeem to be conglutinated, yet notwithſtanding they do not rightly cohere or ſtick together, but afterwards they do again part aſunder. But now, to the furthering of the evacuation of the ſaid *Pus* the uſe of Swathbands & Pillows doth very much conduce; if with them we ſtreightly compreſs and ſtrictly keep down the part affected from the higher part of the *Sinus* towards its Orifice. Now the Medicaments fitted for this uſe and purpoſe are, the Water of the Decoction of Barley, *Melicrate* (that is, Water and Honey ſodden together) which is of it ſelf ſufficiently purgative, ſo that alone it is able to render that *Sinus* whoſe orifice is in the inferior place apt and fit for glutination or cementing together; *Mulſum*, that is, Wine and Honey ſodden together, which both corroborate, and together withal purgeth; Rozin, Turpentine, Honey of Roſes, Barley meal, Bean meal, the flour of *Orobus* or bitter Vetch, of Lupines, Lee, Spirit of Wine, Bath-Water, Allum Water, Oxymel, Unguent Ægyptiack; which are the ſtronger ſort of them, and to be adminiſtred only (or at leaſt chiefly) in the moſt impure and naſty Ulcers.

Out of thoſe before mentioned divers others may be made and compounded: As for example:

Take *Honey of Roſes ſtrained ſix drams: Barley meal a ſufficient quantity, to give it a thick Body.* Or,

Take *Honey of Roſes ſtrained ſix drams: cleer Turpentine one ounce: the juyce of Smallage and Wormwood, of each half an ounce: let them boyl together: and afterward add of Bean, Barley, and Lupine Meal, of each alike, as much as will ſuffice, and then mingle them throughly.*

But when (as now and then it happens) the *Sinus* are manifold, or otherwiſe when they are of an extraordinary depth, ſo that to open them is altogether impoſſible; neither alſo can the Unguents poſſibly penetrate throughout their whol Cavity; then (in this caſe eſpecially) liquid abſterſives are chiefly approved of, as ſuch which can inſinuate and convey themſelves into al parts of the *Sinus*. And ſuch kind of Medicaments ought to be injected by a Tunnel, or by a pipe; and ſo ſoon as the Medicament is caſt in, the Orifice ought ſometimes to be ſtopt up with a Linnen cloth or Napkin; or elſe with a piece of Silk, to prevent the immediate flowing back again of the Medicament. As,

Take *of whol Barley three pugils or ſmal handfuls: Centaury the leſſer, and Wormwood, of each alike two pugils: boyl them in Melicrate, and make an injection.* Or,

Take *of the Water of decocted Barley, Melicrate, of each two ounces: Unguent Ægyptiack, half an ounce; mingle and inject them.*

And thereupon, if by theſe kind of Medicaments the Ulcer be ſufficiently cleanſed and purged, then thoſe Medicaments that produce and breed fleſh are to be adminiſtred. For albeit Nature her ſelf generate and breed fleſh; yet notwithſtanding Art doth by Medicaments ſo far forth aſſiſt Nature, as it removeth and carrieth away the excrements which much hinder her in her operation. For it is generally wel known that any part whatſoever (although it be ſound) doth generate a twofold excrement, and drive it forth without the body; one whereof is more thin, which for the moſt part breathes forth by inſenſible tranſpiration, and is alſo not unuſually evacuated by ſweat; the other more groſs and thick, which outwardly adheres unto the body, and by a general name is termed Scurf, filth, or naſtineſs. Theſe excrements whenas they are reſident in the aggrieved part, being weak and infirm, and cannot by the ſtrength of Nature be expelled and driven forth

forth of the Ulcer, they ſtil perſiſt to ſtick there in the Ulcer, and the thick excrement renders the Ulcer filthy and foul; but the thin excrement makes the Ulcer to become moiſt. Which ſaid excrements ſince that they are an impediment to Nature in the breeding of fleſh, they are therefore altogether to be removed and taken away; and to ſpeak more perſpicuouſly and plainly, the filth and impurities thereof are to be throughly cleanſed and wiped away from off the Ulcer, and the moiſture is to be dried up.

Now thoſe Medicaments which accompliſh the aboveſaid intentions are called *Sarcoticks*, i.e. Breeders of fleſh; not that they themſelves can indeed really generate fleſh (which is the peculiar work of Nature alone) but becauſe (as we have ſaid) they take away the impediments, and ſuffice Nature with ſo good a blood, that from it good fleſh may eaſily and ſoon be ingendred. Now ſuch like as theſe are dry, yet are they not of an over dry quality, but of ſuch a faculty as very little (and that likewiſe moderately) exceeds the temperament of the affected or grieved part. But ſince that there is not the ſame kind or meaſure of drineſs in al Bodies and Members, thereupon the ſame matter is not uſeful for the engendering and breeding of fleſh in al bodies and members; but thoſe bodies and members which are drier require and need the dryer Medicaments; but thoſe that are more humid and moiſt cal for Medicaments that are leſs drying. The more mild and gentle of them are, Frankincenſe, Barley meal, Bean meal; the ſtronger are, the meal or flour of *Orobus* or bitter Vetch, Flower-de-luce root, Root of *Ariſtolochia*, Myrrh, Tutia, Pomphorlyx, and the like. From which we may very fitly and commodiouſly prepare Compoſitions for the preſent occaſion. As,

Take *Turpentine two ounces: Frankincenſe, Maſtick, Colophony, of each half an ounce: Wax, Oyl of Roſes, of each ſufficient; make an Unguent.*

But this following is ſomwhat ſtronger and more forcible. Viz.

Take *Round Ariſtolochia, Flowerdeluce, the greater Comfrey, of each two drams: Maſtick, Frankincenſe, Myrrh, Aloes, of each one dram: Honey and Turpentine, of each ſufficient, and throughly mingle them.*

If the body be more than ordinary dry, and if that hard fleſh be to be generated, and that the Ulcer it ſelf lie open, we may alſo then adminiſter Medicaments in a dry form, and make up Sarcotick Pouders, to ſtrew thereupon. As,

Take *Frankincenſe, Maſtick, Colophony, of each alike: make a Pouder.* Or,

Take *Aloes, Frankincenſe, Sarcocol, Dragons blood, of each as much as ye will, and make a Pouder.*

But if the *Sinus* be not open, then liquid Sarcoticks are by a Funnel to be injected after the ſame manner as the cleanſers were; and the orifice being cloſe ſhut up, they are for a while to be left in the *Sinus*. For which end and purpoſe there may be injected auſtere or ſharp Wine in which Frankincenſe hath been boyled; or the Decoction of Ariſtolochia, the great Comfry which ſome cal Wall-wort, Horſetail, Roſes, and the like, with Wine; unto which may be added, Frankincenſe, Myrrh, Aloes.

But now whether or no by means of theſe Medicaments the deeper parts of the *Sinus* are wel cemented and exactly conjoyned, that which floweth forth wil evidently demonſtrate: which if it be but little in quantity, and wel digeſted; and moreover if there be no pain perceived in the *Sinus* it ſelf, it is an argument that there is a perfect conglutination effected. But if the fourth, or (at the utmoſt) the ſeventh day ſhal be paſt, and yet notwithſtanding a crude raw humor ſhal iſſue forth of the Ulcer, it is a ſign that as yet the *Sinus* is not exactly united and conjoyned, and that fleſh is not as yet therein bred; whereupon thoſe Medicaments that more forcibly dry (yet notwithſtanding without any kind of mordication or biting) are then to be adminiſtred. Whenas now the *Sinus* is in a manner filled up, ſome one or other of the agglutinating Remedies ought to be applied, which may gently and without any the leaſt acrimony cloſe together the tender fleſh that is generated and bred (of which ſort are thoſe which by the Greeks are called *Enaima*;) that ſo they may as it were conjoyn the divided parts, and may likewiſe cure the new made Wounds: of which ſort *Galen* (in his ſecond Book of the compoſition of Medicaments according to their ſeveral kinds, Chap. 21. and 32.) hath given us a deſcription of good ſtore of them.

After that the agglutinating Medicament hath been applied and laid to, *Galen* directs us to caſt round about it a new Spunge made as fair as poſſibly may be with ſweet Wine; or with *Mulſum*, i.e. Wine and Honey ſodden together; which ſaid Spunge others alſo uſe to throughly ſoak, and thereby fil it ful with the Decoction of Pomegranate Rinds, Roſes, and the like; to wit, that it may dry it, and receive in the filthy corruption iſſuing forth of the *Sinus*, which might otherwiſe eaſily corrode the part, or excite and cauſe therein an intollerable itching: and this ſaid binding round about he would have to begin from the bottom of the *Sinus*, and from thence that it tend toward the orifice. And likewiſe about the bottom thereof let Swathbands be rolled as hard and ſtreightly as may be (provided ſtil notwithſtanding that it cauſe not pain) and then let them be looſened by degrees, and by little and little, until you come to the very mouth of the *Sinus*; in the which ſaid mouth let the Medicament be tied unto it after a looſe manner; neither let it too cloſely ſtop up the orifice, but leave a

passage forth for the *Pus* or snotty matter; unto which end, and for which purpose also let the Emplaster which is laid thereon have a hole cut (with a pair of Shears) in that same very place.

And this was the way and method used by the Ancients for the curing of a *Sinus*, and generally al sorts of hollow winding Ulcers; and to speak truth, it was sufficiently useful and commodious. Yet notwithstanding, *Franciscus Arcæus* in his second Book of the Curing of Wounds, the seventh Chapter, tels us of another far more easie and compendious course that he himself had found out and discovered in curing Apostems newly opened; whereby on the third, or on the fourth day at the furthest, all the aforesaid Cavity of Apostems might be remedied, and perfectly cured, by drawing together what was divided; (which operation we cal commission and conglutination of the Impostume) so that nothing should be left gaping, beside the opening or incision place, which was made by Art to the end that thereby the *Pus* might flow out, and be pressed forth; and that al this should be effected without any the least danger to the sick party, without much (if any) pains and labor, or any other difficulty. Now his way and method of Curing was as followeth. If the Tumor or Apostem be great, then (saith he) in the first place let it be opened in the best manner that may be; so that the little finger may be put into the orifice, and that thereby al the *Pus* that is contained within the Impostume may be permitted to flow forth; and may likewise be thence expelled by a gentle compression of the place it self. The *Pus* being once expelled and evacuated, let the mouth of the *Sinus* be stopt with a Tent; and then an artificial Pillow or Cushion being laid and fastened down thereon, let it so remain (without removal) until the next day following. The day following, the Ligature being loosened, let the Ulcer be purified and carefully cleansed from al the *Pus*, if haply there be any left remaining underneath. After this is done, let a Pipe or smal Cane of Lead be put into the orifice; the which let it be as big and large as is the Orifice it self; and let it reach even unto the Cavity or hollow place; but let it not by any means be forced any further. Upon this let the Basilick Emplaster spread upon a Linen Cloth be imposed; in the which also the pipe may be contained, that it fal not forth; yet nevertheless leave a hole at the very Orifice of the Leaden Pipe or Cane. Afterwards, on either side of the Cavity let there be put triangular Pillows or Cushions (of which before) on either side one, so that al the hollow space may be filled up with either Pillow, &c. But let the Orifice of the *Sinus*, in which is the Leaden Pipe be left free and open; neither let it be stopt up by the aforesaid Pillow, nor any waies obstructed by the Ligature or binding; that so al the *Pus* that lieth underneath may be throughly purged out: afterward let the place covered by the Pillows be rolled about with a Swathband, so that it may be without the least pain; and let it be so ordered, that the Ligature may begin at or from the bottom, and tend toward the orifice; that so by this means al the *Pus* or filth that is within may be forced toward the Orifice, and through it may be pressed forth. The *Sinus* thus bound about is to be left in this manner until the day following; on which, the Ligature being loosened, we ought by making strict enquiry to find out how much of the Cavity remains; that so we may be throughly certified, Whether or no the aforesaid Pillows or Cushions did touch upon the places. For al those places which were subjected by the Pillows, &c. wil al of them be found conglutinated and fast closed together. The which when we have discovered, the Pillows are again to be tied and fastened after the same fashion as they lay before; and so they are to continue until the next day. But now if so be that any of the Humor, or of the *Pus* seems to be left in any place, this (as before) is to be pressed forth with the Pillows fastened by the Swathband; together with which the gaping place doth coalesce and joyn close together. In this manner so soon as the parts are closed together, let the Pillows be removed; and then let there be imposed upon the Ulcer a Linen cloth spread over with the Authors *Leonine* Emplaster, or such other like Plaister, as suppose the Emplaster *Diapalma*; and you may not forget to wipe and cleanse it six or eight times every day.

But yet notwithstanding, as touching this way and manner of curing the *Sinus* and Cavities, it is first to be taken notice of, that this same doth succeed most happily in Apozems newly opened, and in them only: for as for an old *Sinus* (where all is not wel within, and which almost declines unto callous Ulcers and Fistula's) the former way and manner of curing it is far better and safer. Moreover, this is likewise to be observed, that we ought wel to look, whether or no there remain any relicks of the indigested matter, spread thorow-out the part; which easily comes to be known by some apparent Tumor or Swelling; as also by its redness of colour. For otherwise, and as long as any thing preternatural sticks in the part, agglutination (as we term it) or closing up of the Orifice is not to be expected; neither is it to be so much as hoped for. And therefore be sure that the *Pus* it self be likewise cleanted and purged in the best manner that possibly you can.

Thirdly, This also is to be heeded, to wit, whether or no the place may conveniently enough be rolled about with Swath-bands, and likewise whether the aforementioned Pillows or Cushions be streightly fastened, and tied down close enough, that so they may both compress and keep

keep down the ſevered and diſunited parts, and alſo preſs forth the *Pus* or filthy ſnot-like matter. For if ſo be that the Swath-bands gape, and that the Pillows preſs not down the part as they ought, then neither is there any *Pus* preſſed forth, nor doth the part coaleſce and meet together.

Chap. 7. *Of the Tumor* Eryſipelas *or* Roſa.

THat Tumor which the Greeks cal *Eryſipelas*, but we here of this Country (commonly) *Roſa* (from its roſie color) is altogether to be referred unto, and ſo to be accounted in the number of the Tumors that take their original from the Blood. All the Latines (*Celſus* only excepted, who retains the name *Eryſipelas*) term it *Ignis Sacer*; we in Engliſh call it St. *Anthonies* fire; of this *Ignis Sacer* the Poet *Lucretius* makes mention in his ſixth Book.

The Body all at once with Ulcers brand
grows red,
As 'tis, when Ignis Sacer *hath the whol ore-ſpread.*

This Tumor is moſt an end by Phyſitians ranked among the Cholerick. But yet there is ground and cauſe enough of doubting, from what humor it derives its beginning and Pedigree. For *Galen* himſelf ſeems now and then to ſtagger, and not alwaies to ſtand to what he had ſpoken concerning it. For in his ſecond Book to *Glauco*, and firſt Chapter, he expreſly writes, that the moſt thin and hot Blood, or Choler together with Blood (to wit, when both of them are hotter than is behooful) is the Cauſe of an exquiſite *Eryſipelas*; and there he determines that meer & pure Choler is not the original efficient cauſe of this ſaid Tumor, but rather of that which we uſually call *Herpes*. And in his Chap. 9. concerning Tumors he aſſerts, that *Herpes* is bred or cauſed, when a cholerick fluxion (being indeed purely and exactly ſuch) happens to be excited, and to exulcerate the Skin; but that when this ſaid cholerick flux is mingled with a wateriſh matter and with blood, & ſo is leſs ſharp, and when it rather ſwels up the part into a Tumor then exulcerates it, that then an *Eryſipelas* is excited. But contrariwiſe, in his Book of black Choler, Chap. 5. in his fourteenth Book of the Method of Phyſick Chap. 1, 2, 3. and B. 17. Chap. 2. in his Book of the Differences of Feavers, Chap. 5. and in his Book of the way of curing by Blood-letting, Chap. 8. and in divers other places, aſſerts that Choler is the cauſe of this Tumor: which latter opinion of *Galen* moſt of our Phyſitians follow.

But truly, if we lay aſide the Authorities and Opinions of the Ancients, and look wel into the thing it ſelf, and if we confer the name of an *Eryſipelas* upon that Tumor that is ſo well and commonly known unto our Country-men; and laſtly, if we take good notice of thoſe things that dayly befall the ſick Perſons in a Diſeaſe ſo well known; we ſhall then (without any ſcruple) judg the Opinion of *Galen* (which he propounds unto *Glauco*, in his ſecond Book and Chap. 1. and in his Book of Tumors, Chap. 9.) to be by far the more true and probable.

For the very colour it ſelf of the part affected (being altogether roſie) inſtructs us, that Blood rather than Choler is the cauſe of this Tumor. And although this kind of Tumor doth now and then from red or ruddy become yellowiſh, yet notwithſtanding this is not altogether true of every *Eryſipelas*, but only of ſome one certain ſpecies and difference thereof. Moreover, the humor that excites and cauſeth this Tumor is not altogether ſo ſharp and tart as is Choler; and for this cauſe doth neither exulcerate, nor produce extream heat, or over vehement pain. Notwithſtanding the Blood that excites this Tumor is the thinneſt and moſt intenſely hot, and it is vulgarly ſaid to be bilious or cholerick; the ſame that *Galen* alſo tels us in his ſecond Book to *Glauco*, Chap. 1. where he writes, that Choler alone (when it lieth hid and ſecret, and conſiſts in ſome one member) doth excite and cauſe the Tumor *Herpes*. But then if ſo be that the fluxion ſhall be mingled, and conſiſt of blood and yellow choler, (being both of them hotter than is meet) or elſe from the blood in this manner waxing hot, and being according to its ſubſtance moſt thin, we then call it an *Eryſipelas*. For albeit that *Galen* in very many other places aſſerts an *Eryſipelas* to proceed from Choler; yet notwithſtanding, what he means and intends by Choler, he hath ſufficiently declared in the place before alleadged. And if we conſult experience, and thoſe accidents that betide the ſick Parties, we ſhall then find that he could not intend any thing but that Choler which they term natural and alimentary or nouriſhing, that is to ſay, the hotteſt and thinneſt part of the blood, but ſuch as is now grown extreamly hot, & therefore the neereſt that may be to Choler. But now, whatſoever kind of Choler we aſſign to be the cauſe of this Tumor, whether yellow, or pale, or like the ruſt of Braſs, or Leek-coloured, they wil not any of them agree with thoſe things that happen in this Tumor. Furthermore this humor hath conjoyned with it a depraved quality, and a peculiar ſort of corruption; and before ſuch time as it breaks forth it exciteth and cauſeth exceeding great ſtreights, not much unlike to thoſe that the Plague (upon the firſt invaſion) is wont to produce; and therefore the ſame kind of *Alexipharmaca* or counterpoyſons that we make uſe of in the Peſtilence are here likewiſe to be adminiſtred, for the expulſion thereof.

Notwithſtanding, the words of *Galen*, and of other Authors (that affirm the original of this Tumor to ſpring from yellow Choler) may be drawn to a better ſence; I mean, that they may be more rightly

rightly interpreted, if we say, that by Choler is to be understood the natural part of the blood, which is more thin and hot, and which is very commonly called Choler; but it were more fitly and properly named a bilious or cholerick blood; the which so soon as it begins to wax intensly hot, and to boyl, it then excites this kind of Tumor. And very frequently there is also herewithal mingled a certain portion of a most subtile thin and intensly hot whey (the which if thou hast a mind, and art pleased to cal it a bilious & cholerick whey I wil not gainsay or oppose thee) and then there is bred an exulcerated *Erysipelas*, yet only superficially; like as oftentimes it is wont to happen in the Face, when there arise and appear little bladders ful of a waterish humor; and then the Skarf-skin alone is affected, and parts asunder. But if (together with it) the Skin it self shal be exulcerated (which ever and anon chanceth in the Thighs) then we may conclude that adust humors are therewith mingled; and this kind of *Erysipelas* is said to be, not pure, or if you will impure.

But of this Tumor enough hath been spoken in the second Book of Feavers, Chap. 16. which here we judg it not fit to repeat, in regard that there the Reader may by perusal be fully acquainted with what hath been written. I wil only repeat this, that the first rise of this affect is from a Feaver, or more plainly, that the affect is primarily and originally a Feaver. For neither doth an *Erysipelas* (or Rosa) invade the part but with a Feaver; which oftentimes a day or two before it breaks forth is wont exceedingly to afflict and excruciate the sick Person. But this Feaver is critically determined (as we wont to express it) and the Patient freed therefrom by means of this Tumor: and thereupon it is, that oftentimes a pain or some kind of swelling is perceived in the Glandules under the Arm-pits, or else in the Groyns; until that at length Nature shall have driven forth the matter unto some extream part of the Body: for then the Feaver is wont to cease, albeit the Tumor is wont to stick and continue in the part affected, for a certain space after.

Touching the Cure, this likewise is to be observed (like as it hath been more at large declared in the place before alleadged) that it ought to be altogether perfected and compleated; and we must use the utmost of our endeavor, that the humor (the conteining cause thereof) may be called forth and not retained therein; since that by the deteining thereof greater evils are wont to be introduced and made way for: which may sufficiently appear even by the example of that Country-man (or Peasant) mentioned by *Gulielmus Fabricius*, in his first Century, Observ. 82. who having an *Erysipelas* in his left Hand (and by the advice of a Barber-Chirurgeon for some daies anoynting his Hand and Arm with Oyl of Roses) a Pain, an Inflammation, and other symptoms were from day to day more and more augmented; insomuch that at length the whol Hand was corrupted (and altogether rendred incurable) by a Gangrene.

Chap. 8. *Of a* Bubo:

A *Bubo* likewise appertains unto Inflammations. For a *Bubo* (as *Galen* defines it, in his Book of the Difference of Feavers, Chap. 5. and in his second to *Glauco*, Chap. 1.) is an Inflammation of the Glandules in the Groyns. For the Glandules being by Nature ordained and appointed, that unto them the superfluous Humors should be expelled from the principal parts; if they (and together with them the blood) shal chance to be thrust forth altogether (and as it were by heaps) unto the Glandulous parts, then an Inflammation is excited; and this happens most and ofd, and especially in the Groins; and sometimes also under the Arm-pits, and behind the Ears; which latter Inflammations behind the Ears are commonly termed *Parotides*.

But now, The Humors that stir up and provoke Nature unto the aforesaid expulsion being very various, hence it is that the differences arising from *Bubo* are likewise exceeding various and different. For one while the Humors are said to be simply vitious or vitiated, so that they have no malignity conjoyned with them; and from these originally proceed those *Bubo's* that are not malignant: but then again (otherwhiles) the matter is malignant, and thence the malignant *Bubo* is produced; and this again according to the variety of the malignant matter, is either pestilent, or else that which we call venereal. But in regard that we have already treated of the Pestilent *Bubo* in our Book of Feavers, and that the other which we call Venereal belongs unto the Tract touching the French Pox, therefore we wil discourse of the *Bubo* at large only, and handle it as it is in the general.

The Causes.

Now every *Bubo* whatsoever hath its original from a preternatural effusion of the blood into the Glandules in the Groyns, or the Arm-holes; the which notwithstanding hath evermore conjoyned with it some certain vitious and corrupt humor, of what sort soever it be, that excites and stirs up Nature unto the aforesaid excretion, or as we usually term it, expulsion. From whence also the antecedent, yea and the external causes likewise which make for the generation of that humor are very various. Notwithstanding the strength of the principall parts is for the most part evermore conjoyned therewith; which expel forth whatsoever is offensive and burdensom unto themselves unto these ignoble parts, and to the Emunctories.

Hieronymus

Hieronymus Fabricius ab Aquapendente determines, that some kind of *Bubo's* have their beginning and original only from the store of Blood, and that certain of them by the way of expulsion are bred from the vitious blood; and that the other Diseases follow, and are excited at the time and Instant of the *Crisis*.

But in very truth I cannot think that a *Bubo* may be excited from the abundance of blood only, but that it hath evermore conjoyned vitious humors which provoke Nature to the expulsion. This notwithstanding is most true and certain, that one while a *Bubo* doth follow upon another Disease, and is excited by the *Crisis* whether perfect or imperfect; and as soon again, without any other Disease preceding it. For although only those Tumors which follow upon other Diseases may properly be said to be caused by the *Crisis*, yet notwithstanding even those likewise that arise without any other Diseases are excited by Nature in her expulsion of the depraved and burdensome humors.

The Signs Diagnostick.

The *Bubo* is known by this, to wit, that in the Groyns, or under the Arm-holes there appears a Swelling or Tumor, with a certain kind of tenitency or resistance, with a redness of color, and likewise with pain; and for the most part also a gentle Feaver accompanieth it. And this is most certain and sure, if the *Bubo* happen to be by the *Crisis*, that then a Feaver or some other Disease went before, which upon the appearing and breaking forth of the *Bubo* is lessened and abated; and then the signs of a good and hopefull *Crisis* preceded; the which if so be they are absent, then the *Bubo* is to be accounted for symptomatical. And then truly if there appear no signs at all of the Pestilence, or of the French Disease, then it is a single and simple *Bubo*, and not malignant and contagious. But if there be conjoyned the signs of the Plague, the *Bubo* is then to be accounted for malignant and contagious; and evermore *Bubo's* are to be suspected, where the Pestilence invades the Patient. In like manner, if the sick Person be infected with the French Pox (commonly termed likewise the Neopolitane Disease) the *Bubo* is then also to be held for and esteemed Venereal, Malignant and Contagious.

Prognosticks.

1. *Bubos* that are not malignant, and those likewise that are not contagious, are not in the least dangerous, since that they are resident in the external parts, and are caused by Nature in her expelling forth the vitious and corrupt blood unto the weak and ignoble parts; and especially if they be forthwith suppurated, and then opened.

2. But if they be long delaied, and that their maturation be not speeded, there may be great danger; in regard that they very easily pass and degenerate into dangerous Fistula's.

3. Those *Bubo's* that are bred or excited under the Arm-holes are sooner maturated, since that they arise from a hotter kind of blood; such as is that which the greater Vessels neer neighboring unto the Heart do extrude and thrust forth; for as much as that part (by reason of the Hearts vicinity) hath more than ordinary heat, which is altogether necessary and requisite for maturation.

4. But *Bubo's* that have their original in the Groyns are longer ere they come to a suppuration; in regard that they are excited by a blood that is less hot and thick; and likewise, because they are scituate in a place more remote from the heart, and which is but meanly hot.

5. The slowest of them all in their maturation are those *Bubo's* that are behind the Ears; upon this account, namely that they proceed from a colder kind of matter, and have their residence in a colder place.

6. What we are to think and judge of Pestilential and Venereal *Bubo's* hath been already shewn in its own proper place.

The Cure.

When a *Bubo* that neither is Pestilent nor Venereal is excited (Nature unburdening her self of that, whatever it be, that is offensive and troublesome unto her and expelling it unto the external ignoble parts) Natures operation and endeavor is by no means to be hindred, nor the matter to be driven back again unto the internal parts. And first of al, we must duly weigh, whether or no Nature hath excited the *Bubo* by the *Crisis* (and that a perfect one) and that thereupon the sick Person be discharged of the Disease, and that there be present and apparent the signs of a good *Crisis* or judgment; for then in this case (according to *Hippocrates* his Precept, Book 1. Aphorism 20.) there ought nothing to be moved; but the whole business is to be committed to Nature; and means must be endeavored, that either the *Bubo* may be discussed, or else that it may most speedily be maturated and brought to a ripeness. But then if in truth the *Bubo* be critical, and that the *Crisis* notwithstanding be an imperfect one, the humor is then yet further to be attracted unto the part affected by the application of Cupping-glasses, or by Medicaments made of Leaven, black Soap, old Hogs grease, the Rosin of the Pine Tree, *Diachylum* with Gums, and such like.

Again, If there be a *Bubo* generated, no other Disease preceding, neither then (as hath been said) is Natures motion in the least to be impeded. But yet notwithstanding the great abundance of blood is to be lessened by the opening of a Vein; which yet is so to be instituted, that Natures motion to the part affected may be holpen forward

forward and furthered, rather than hindered. If also (which very often chanceth) vitious Humors shal happen to be conjoyned together with the blood, they ought to be evacuated.

The remaining part of the Cure in al these *Bubo's* which are not malignant and contagious is to be ordained and ordered like as in other Inflammations. Yet notwithstanding this one thing is wel to be observed in the first place; because that such Digestives as are administred ought to be of the stronger sort, and more forcible than in other Inflammations; in regard that the Glandules are parts that are more cold than ordinary, and more ignoble than the other, and have not any exquisite sense; we advise therefore, that a Cataplasm be made of Barley meal and Lupines mingled with Honey. Or,

Take *the Roots of white Lillies, Marsh-mallows, the wild and spirting Cowcumber, of each one ounce: the Leaves of Pellitory of the Wall, and Parsley Leaves, of each an ounce and half: boyl them in Wine unto a softness, and then bruise them well: being throughly bruised and passed through an hair sieve, add of the meal of Lupines two ounces: Oyl of Camomile and white Lillies, of each a sufficient quantity, and so make a Cataplasm.*

If the Humor be not digested it ought to be converted into *Pus*, and the *Bubo* is to be maturated or ripened; and this for the most part is the safest course. For unless this be done, as I have often observed, after some short interval of time, a new *Bubo* is wont to arise either in the same or some other part. Now the very same Maturatives that are wont to be propounded and prescribed in an Inflammation are here to take place, and to be made use of.

The *Pus* or filthy corrupt matter being bred, the Tumor is then to be launced, that so the *Pus* may most speedily be evacuated; and (the truth is) the section or cutting ought then to be appointed and instituted (in the Groyn) in a transverse or overthwart manner; since that the Tumor being cleansed after this fashion, the skin may the more easily coalesce and come together; because that whilst the Thigh is bending the Skin is united.

The *Pus* being evacuated and emptied forth the Ulcer is to be made clean, flesh to be generated, and at length the Ulcer is to be shut up with a Cicatrice or Scar as we use to cal it.

Touching the Cure of a Pestilential and French *Bubo* we have already spoken in its own proper place.

Chap. 9. *Of the Tumor* Furunculus.

THere is a certain kind of Tumor neer of kin to an Inflammation, which we term *Furunculus*; but by the Greeks it is named *Dothion* or *Dothien*; and by the Germans *Blutschwer*; to wit (as *Celsus* defines it in his fifth Book, and Chap. 28.) a little acuminated or sharp-pointed swelling together with an Inflammation and pain; and especially then when it is now already converted into *Pus*. And it hath its original from a thick and vitious blood (as *Galen* instructs us in his fifth Book of the composition of Medicaments according to the part affected) yet notwithstanding the blood not so burnt and corrupted as in a *Carbuncle*; the which Nature severing from the rest, expels and drives it forth (as offensive and useless) unto the superficies of the body. And thus the *Furunculus* ariseth in the Skin, and in the fleshy parts that are under the Skin. But there seldom breaks forth one alone, but for the most part many of them break forth together.

But now of these *Furunculus* there is a certain difference. For some of them are mild and gentle, which only invade and seize upon the Skin; others of them are malignant, which descend deeper: or otherwise (as *Paulus Ægineta* writes in his fourth Book, Chap. 23.) of *Furunculus*, one sort of them is benign and harmless, another kind of them mischievous and dangerous. And then it is truly said to be gentle and dangerless, when it resides only in the Skin; but mischievous and destructive, and not to be cured without great difficulty, whenas its Roots being deeply fixed it breaks out upon the Skin. These *Furunculus* are sometimes likewise said to be *Sporadick* (that is, such as here and there privately seize upon, and differently afflict the sick person, when they come not after an ordinary manner) and sometimes also they are Epidemick or Universal.

Signs Diagnostick.

The Signs of a *Furunculus* are, a smal and inconsiderable Inflammation in the first beginning thereof, and a Pustule or blister by degrees and by little and little growing forth, and still tending towards an acute and sharp point (not exceeding the bigness of a Pigeons Egg) with a certain kind of pain and redness of color, whenas it hath arrived at its state and perfection; which happeneth much about the eighth, ninth, or (at the furthest) the tenth day; and a *Furunculus* differs from an Inflammation in respect of its smalness in dimension: and then again, the matter which is in a *Phlegmone* or Inflammation is good blood; whereas in a *Furunculus* it is thick and vitious: and from a Carbuncle it differs, in that the matter of a *Carbuncle* is worse and more adust or burnt, and thereupon attains not unto a suppuration; whereas a *Furunculus* may attain unto maturation, and may be suppurated.

If the *Furunculus* be Epidemical and Pestilential, it is then black and green; and there is present to accompany it a malignant Feaver, together with other evil symptoms.

The

The Prognosticks.

1. In a *Furunculus* (as *Celsus* gives us to understand in his fifth Book, and Chap. 28.) there is little or no danger at al, yea, even although there be no means made use of for the cure thereof. For why it waxeth ripe, and attains unto a maturation of its own accord, and so breaks forth. But the pain accompanying it causeth us the rather to put fitting remedies and medicines in practice, that so the Patient may the more speedily be freed therefrom.

2. Among these Tubercles or little Swellings, they of them are the more hopeful, and least to be feared, which bunch forth externally in the outward Skin, and are sharp-pointed, and equally maturate and wax ripe, and are not hard, neither divided and cleft in two parts; or such as have their tendency downwards. For so saith *Hippocrates* in the sixth of his Epidemicks, and first Section.

The Cure.

We must use our utmost Skil and endeavor, that so the matter that is the cause of the *Furunculus* may be most speedily turned into *Pus*; for which end and purpose those Medicaments that have been already described and propounded in an Inflammation are here likewise very requisite and necessary. Now those things that convert the matter into *Pus* or purulent matter, are, Wheat masticated and imposed upon the place, Raisons of the Sun, Figs bruised and laid upon the part, and *Diachylum* simple or without Gums. Or,

Take *of Linseed meal, pouder of Marsh-mallow roots, of each half an ounce; of dried fat Figs in number four; Raisons of the Sun stoned an ounce: boyl them all, and then add of fresh or unsalted Butter two ounces; make therewith a Cataplasm.* Or, if the pain be more vehement and violent,

Take *Roots of white Lillies one ounce; the leaves of Mallows and violets, of each a large handful: boyl them to a softness, and pass them through an hair sieve; then add of Barley meal, Wheaten meal, and flour of Linseed, of each half an ounce; the Yelks of two new laid Eggs, the fat of a Cock, and fresh Butter, of each one ounce; and make a Cataplasm.* Or,

Take *Turpentine, the marrow of an Hart, the fat of a Calf, the fat of a Goose, Wax, fresh Butter, the best Honey, Oyl of Roses, of each half an ounce; and mingle them for a Cataplasm.*

This Tumor when it is maturated (unless it break of its own accord) is to be opened: And so soon as it is opened it ought to be cleansed.

Take *the juyce of Smallage half an ounce: Barley meal two drams: Frankincense a dram and half: Turpentine one ounce: the Yelk of one Egg, Honey of Roses as much as will suffice: mingle and make them into the form of a Liniment.*

After it is cleansed, it is to be filled up with flesh, and shut up with a Cicatrice or scar; like as we are wont to do in other Impostumes.

Chap. 10. *Of the Tumor* Phyma.

UNto an Inflammation these appertains likewise the Tumor *Phyma*, which (as *Galen* acquaints us in his second Book to *Glauco*, Chap. 1. and his third Book of the Method of Physick, Chap. 3.) is a Tumor or Swelling of the Glandules, which forthwith is augmented, and hasteneth unto a suppuration.

The place affected are the Glandules.

The Cause.

The Cause or Humor exciting the *Phyma* is blood; yet not that which is pure, but that which is Phlegmatick; and thereupon the Inflammation is not altogether so great and intense; and this kind of Tumor appertains unto the Inflammation *Oedematodes* (as we usually term it) and appeareth most an end in Children, seldom in Youths, and most rarely in those that are of ful age.

Signs Diagnostick.

It is known by a round Tumor or Swelling, and which is much elevated, little or nothing red, and almost void of pain, and in a glandulous or kernelly part.

Prognosticks.

1. This kind of Tumor is altogether free from danger; it is likewise instantly augmented; and for the most part it is suppurated and healed without the help and assistance of Medicaments.

2. The Cure is more easily accomplished in Children; more difficultly in Youths, and such as are of ful growth, and perfect age.

The Cure.

We must endeavor that it may be suppurated with al possible speed. And to this end, Natures attempt and operation is to be furthered al that may be by maturative Medicaments imposed on the part; (of which we have already spoken enough, where we treated of an Inflammation and a *Furunculus*:) which yet notwithstanding in this case, by reason of the coldness both of the part and cause, ought to be somwhat more strong and forcible: Wheat chewed and laid on is here very useful; as likewise Raisons of the Sun stoned; and also the *Diachylum* Plaister, both the simple, and that likewise with Gums. As,

Take *pouder of the Roots of Marsh-mallows, Wheaten meal, the meal of Lupines, of each one ounce; of dried fat Figs, six in number; Leaven half an ounce: then boyl them, and add thereto*

one Onion roasted in the Embers; Oyl of white Lillies as much as will suffice, and so make a Cataplasm. Or,

Take *Turpentine, the Honey found at the entrance of the Bee-hive, of each one ounce; Ammoniack dissolved in Vinegar half an ounce; Oyl of white Lillies as much as will suffice, and make an Unguent.*

For (to tel you the truth) there are some that conceive that a *Phyma* is not presently to be cut and opened so soon as it is suppurated; but they rather are of opinion that an assay should be made, that it may appear whether or no the matter may possibly be dissipated and scattered by discussives: and therefore *Galen* in his eighth Book of the faculty of simple Medicaments commends Southernwood, Parietary (commonly known by the name of Pellitory of the Wall, and by others likewise called Feverfew) Nettles, Marsh-mallow roots, and Ammoniacum softened with Honey: but this happeneth but very seldom. And therefore the safest course is, unless it break of its own accord, that it be artificially opened; lest that the long detaining of the matter should cause and produce much danger.

Chap. 11. *Of the Tumor* Phygethlon.

IN the self same Glandulous parts of the Body there is likewise another kind of Tumor excited, which the Greeks name *Phygethlon*; but the Latines cal it *Panus*, or rather (as *Celsus* in his fifth Book, and Chap. 28.) *Panis*, from the similitude and resemblance of its figure. But here the cause is more hot; and like as *Phyma* hath its original from pituitous or flegmatick blood; so a *Phygethlon* or *Panis* hath its rise from cholerick blood; as *Galen* instructs us, in his second Book to *Glauco*, Chap. 1. But most an end this kind of Tumor chanceth after Feavers; or else after the pains of some one or other part; and chiefly those torturing pains which invade and afflict the belly.

The Signs Diagnostick.

The Signs of a *Phygethlon* are, a Tumor or Swelling, hardness, heat, distension, and greater pain than might probably be expected in regard and reference unto the magnitude of the dimension of the Tumor. There is likewise sometimes a Feaver to accompany it. But very frequently notwithstanding there is not any one of al the aforesaid perceived outwardly (to wit, when and where the matter lieth deeper rooted, and is there kept concealed) but only at least some certain prickings are inwardly perceived. This sort of Tumor is long ere it come to a maturation; neither is it fitly and properly converted into *Pus*.

Prognosticks.

1. That *Phygethlon* which becomes not more hard than ordinary al on a sudden, and which albeit it waxeth not red is yet notwithstanding (otherwise) of a changed color, this *Phygethlon* (I say) is of the better sort, and there is little of danger in it. Thus *Celsus* in his fifth Book, Chap. 28.

2. That *Panus* which ariseth from an Ulcer, Pain, stroke, or from any external cause, is altogether void of danger. But that which follows upon Feavers (like as it is especially wont to fall out in a Pestilential and contagious season) or else proceeds from Swellings either under the Arm-pits, or in the Neck, is the worst and most dangerous species of this Tumor. And so *Paulus Ægineta* in his fourth Book, Chap. 22.

The Cure.

If a *Phygethlon* shal happen to arise from an Ulcer, pain, contusion, or stripes, or from any other Procatarctick cause, then (like as in other Inflammations) its increment and growth is to be impeded by coolers and Repellers. But if it be in Feavers; or that otherwise it be excited from some internal provision and storing up of Humors, then in this case Repellers have not any place allowed them; neither are they at al to be made use of; but those Medicaments that discuss and resolve are alone to be administred; and if the matter have any thing of hardness in it, then softeners are therewithal to be added; such as are Marsh-mallows, common Mallows, Orach, Chickweed, Parietary, dried Figs, Ammoniack.

But if the matter cannot be discussed, then we ought to use our utmost endeavor that it may be maturated, *i.e.* brought to a ripeness, and turned into *Pus*, by the application of those Medicaments that have hitherunto been propounded. And at length, unless it be opened of its own accord, the Impostume is otherwise to be broken and opened.

Chap. 12. *Of the Tumor* Parotis.

UNto the Inflammations of the Glandules appertaineth likewise *Parotis*, a Tumor so called from the Greek words *Para* and *otos*, because its scituation is nigh unto the Ears. *Hippocrates* in the sixth of his Epidemicks, Comment. fifth, Title first, and elswhere, terms these Tumors *Eparmata*. For a *Parotis* is an Inflammation of the Glandules neer unto the Ears.

The Causes.

Whereas then that a *Parotis* is an Inflammation, it must necessarily follow that the neereft and containing cause thereof is the blood. But this blood notwithstanding is very seldom pure, but most an end Choler, Phlegm, or Melancholy, yea, oftentimes

oftentimes also there are malignant and pestilential humors therewith mingled; from whence it is, that there are malignant and pestilent *Parotides* proceeding therefrom. And it is a most rare thing that blood that is faulty in nothing but that there is too great store thereof should stir up and provoke Nature so far forth that it should attempt such a kind of excretion or separation; but it happeneth from the vitious and depraved Humors, by which Nature being irritated and stirred up is wont to thrust forth unto the external parts such like Humors together with the blood. For like as in critical bleedings (which Physitians usually term *Hæmorrhages*) it is not the blood alone that is principally faulty and peccant, but likewise the vitious humors; the which when that Nature cannot easily expel without the blood, she thereupon assays and instituates this Excretion, or (as we commonly term it) separation of the blood: and this she doth in such a manner (to the end that she may avert and turn away the vitious humors from the principal unto the more ignoble parts) that she makes use of the blood, like as of a Vehicle or Conduit pipe. Now these humors are transmitted and sent either from the whol body, or at least from the Brain. And in good truth we have discovered that these kind of Tumors which we cal *Parotides* may not only happen from vitious Humors bred in the body; but also from poysons that shal by any accident be drunk or taken into the body; as (for instance) I remember the like done here at *Wittenberg*. For a certain Servant Maid (when she was to boyl fish) unwillingly drawing water out of Vessels into which a Bat or Dormouse had accidentally fallen, and was therein suffocated and choaked by the water, and boyling the fish therein; there were (if my memory fail me not) ten Students that together with their Hostess fel sick; and some of them died. And for those of them that recovered (in two of them at least) even these *Parotides* brake forth behind the Ears.

The Differences.

The principal Differences of these *Parotides* are taken from the matter, and from the manner of their Generation. From the matter, because that the blood which exciteth the *Parotis* is either Cholerick, or Phlegmatick, or Melancholick, or in regard also that it hath malignant and pestilent humors mingled together with them. From the manner of their beginning or generation, in regard that some of them have their original without Feavers, or (as *Celsus* speaks in his sixth Book, and Chap. 16.) some of them in good and perfect health, Nature thrusting forth unto those places some certain vitious humors either from out the whol body in general, or else more particularly and principally from the head: but then others of them appear upon Feavers; and those again such as are either long, or acute; and lastly, such as are either benign and inoffensive, or otherwise malignant and pestilential. And this happeneth in the state or declination thereof, Nature by the *Crisis* driving forth the digested humor (the cause of the Feaver) unto these more ignoble places; or else they arise symptomatically in the very beginning or augmentation of Feavers.

Signs Diagnostick.

These *Parotides* are known from the place affected, from the swelling, the pain, and for the most part from the redness that appeareth behind the Ears. But then what kind of Humor it is that is mingled with the blood is known out of the several signs of the Humors that have been elsewhere propounded. If there be present a malignant or pestilential humor, then there is evermore conjoyned therewith a Feaver of the like Nature. If it be only transmitted from the Head, then there are not present any signs of a Cacochymy throughout the whol body; and there went before a pain of the head, the which upon the breaking forth of the *Parotis* either altogether vanisheth, or at least is in great part diminished. Now whether the eruption or breaking forth of it be critical or symptomatical, the time of the Disease, and the signs of the *Crisis* (whether they be present or absent) wil sufficiently instruct us.

Prognosticks.

1. These *Parotides* that have their being without a Feaver are less malignant, and have less of danger in them than those that have a Feaver to accompany them.

2. They also are less dangerous which follow upon Feavers of a long duration, than those that ensue upon acute Feavers; and especially if they be malignant and pestilential.

3. Those of them likewise that break forth critically are more safe and hopeful, more easily cured, and such as free the sick persons from danger. But as for those of them that happen in the end of the disease, after other evacuations, without any remission or abatement of the symptoms, and together with a great debility of the Natural powers and strength of the body, these are very dangerous and pernitious.

4. As for those of them that break forth and shew themselves symptomatically, and have their original from crude and extreamly opposite and (as I may so say) rebellious matter, these evermore prove to be pertinacious, *i.e.* resisting all good means that shal be used; and they alwaies make much work and business both for Nature and the experienced Physitian; and withal they cast the Patient into an extream hazard, and the greatest dangers that may be. For why? they are in a place very nigh unto the Brain, from the which both humors and vapors may easily be

communicated unto the Brain, and to its Membranes; from whence an Inflammation of those parts, and dotage or madness may be excited.

5. Those *Parotides* which being bred at the very instant of the *Crisis* shal not be suppurated, but before ever they are suppurated shal vanish, they wil return, get growth, and so become to be judged of according to the manner, and upon the account of their return; even as are the returns of Feavers into the like circuit. But there may notwithstanding be some kind of hope left, that some Impostumes may arise in the very Joynts themselves. Thus *Hippocrates* in the sixth of his Epidem. Comment. 4. text. 1.

The Cure.

In the Cure of the *Parotides*, we ought in the first place wel to consider, whether they be critical or symptomatical; and what kind of Humor it is that they are bred of, and from which they proceed. If the *Parotis* break forth critically, and so the disease from thenceforth be quite taken away, or at least diminished; then the whol work is to be committed to Nature (according to the Precept of *Hippocrates* in his first Book, and the twentieth Aphorism) and nothing else is then to be done, but only that those things that mitigate pain (as they have been already propounded in the Chapter of an Inflammation) be laid thereupon; the which may likewise at one and the same instant together help forward the suppuration. But then it must not be forgotten that in the *Parotides*, whether they be critical or symptomatical; whether the matter be much or little; and whether it be benign or malignant; that however it be, yet Repellers or drivers back have no place at al (as *Galen* teacheth us in his third Book of the Composition of Medicaments according to the place affected, and second Chapter) lest that the matter be driven back from the more ignoble part unto that which is more noble, and especially the Brain that lieth so neer thereunto. Yea moreover, if the Tumor break not forth sufficiently, and the humor (that by reason of the disease fals and settles it self in the affected part) be not by the vigor of Nature in a sufficient abundance thrust forth; then in this case the gentler sort of Attractives (such as are, the Oyl of Camomile, of Flower-de-luce, of Dill, and of Melilote) are to be made use of. But then the stronger sort of them are not to be administred but with an especial care and caution; lest that the pain should be encreased, and the Natural powers and strength dejected.

After this we are to take notice, whether or no Nature attempt any resolution and discussion; for which purpose she is to be assisted and furthered by discussive Medicaments; or else, whether (which indeed is alwaies far more commodious) it tends toward a suppuration; and in this case likewise Nature her self is to be aided and holpen forward by those Medicaments that promote concoction and digestion of the crude matter. Now the Medicaments of either sort are before propounded (in Chap. 5.) where we treated of an Inflammation, and in the eighth Chapter where we discoursed concerning *Bubo*.

The suppuration being made and past, the Impostume is then to be opened, and (as we have already in its proper place declared) so to be cured.

In the *Parotides* that are Symptomatical Natures endeavor (where it fals short) is to be furthered and promoted; and the overgreat abundance of the antecedent cause (if any such thing be present) is to be lessened and abated. For if that there be present either an abundant store of blood, or else of vitious and naughty humors, we are not to fear that hereby Nature may be averted from, and hindred in her work of expulsion; but rather to expect that being eased of some part of her burden she will afterwards the more easily expel that which remains and ought to be emptied forth.

If yet notwithstanding (an evacuation of the antecedent cause preceding) she be not as yet able as she ought sufficiently to expel; then the expulsion is to be forwarded and holpen on by the application of Cupping-glasses, and other attractives.

And hence it is, that either a discussion of the matter, or (which indeed we usually practise, as most requisite) the conversion thereof into *Pus* or matter is to be procured by those or such like Medicaments as are propounded in the eighth Chapter where we treated of the *Bubo* Tumor. And yet notwithstanding here in this case the condition of the matter is to be heedfully regarded; so that if it be more than ordinarily cold and thick the Discussers that we use are to be proportionably hotter and stronger; and if there be any cause to fear that the matter may be hardened, Emollients are likewise to be made use of.

After the softening of the matter, as aforesaid, (albeit otherwise the matter tend likewise thereunto) a suppuration is by all means to be promoted and furthered, the Impostume to be opened; and as we have already often declared, in this manner the Cure is to be effected.

Neither is it to be expected that this Tumor should be broken of its own accord, nor are we to wait til then, forasmuch as the *Pus* being long reteined is oftentimes wont to produce many sad and dangerous symptoms. And *Gulielmus Fabricius* in his second Century, Observ. 39. relateth that he had observed, that in a certain yong Maiden (while she was afflicted with the *Parotis* we are now speaking of, and yet notwithstanding was not so far amiss and ill as to take her bed, being all the while free from any Feaver) much about the fourteenth day of the Disease an Impostume likewise to the bigness of ones fist appeared forth

forth; the which said Impostume being not timely opened, the Girl thereupon was suddenly surprized with a Feaver, Swooning fits, Vomitings, and Qualms, together with the loss of rest and sleep, and miserably afflicted with a pain in her Back and Reins; and albeit the Impostume was afterward of its own accord broken, yet notwithstanding in regard that very little or no *Pus* at all flowed forth, but rather sought its way and passage downward, it was not long ere it cost her her life.

Chap. 13. *Of a Carbuncle.*

A Carbuncle hath very neer alliance with, and thereupon is by the most reckoned up and in order placed next after an Inflammation; as a Tumor that hath its original from Blood over hot, burnt, and corrupted. But now this same Tumor hath divers Names or Appellations. By the *Grecians* it is termed *Anthrax*; by the Latines, *Carbo* and *Carbunculus*: *Avicen* cals it *Pruna*, and *Ignis Persicus*, or the Persian fire. By which several words & names although some there be who conceive that several and different Tumors are signified, and thereby to be understood; and thereupon have treated of *Pruna* and *Ignis Persicus* in peculiar and distinct Chapters; and likewise have handled the Carbuncle and *Anthrax* as distinct from them, and also as differing each from the other; yet notwithstanding the very Truth is, that by all those aforesaid appellations one only kind of Tumor is signified; for that which with the Greeks is *Anthrax* with the Latines is *Carbunculus*, a Carbuncle, or Fire-coal. Unless any one will make this distinction out of *Avicen*, that what beginneth without pustules and humidity is a Carbuncle or *Pruna*; but that which beginneth with pustules, and bladders, and that likewise hath a moisture flowing out of it, this may be called *Ignis Persicus*.

Now this Swelling is called by this name, in regard that it hath over it a certain Crustiness that is black like a Coal; for which cause it is also termed *Pruna*, because the Flesh is black, and as it were burnt with a Coal; and moreover it is said to be a Fire, in regard that the parts are burnt as by a Fire. But in truth, that which *Celsus* and *Pliny* have left written touching a Carbuncle seems yet scarcely in al things to answer to a Carbuncle in general, but only to some one species thereof; and haply unto a kind therof that is Epidemical, and to a new Disease. For *Celsus* in his fifth Book, Chap. 28 thus writeth: *From those that befall extrinsecally we must now come unto such things as are internally bred, some one part or other of their Bodies being corrupted. Among which there is none worse than a Carbuncle: of this Carbuncle there are these Notes and Marks; there is a certain redness, and upon it there stand and hang out (but not very far) certain Pushes or Pustules, especially such as are black, and somtimes black and blewish or Lead-color'd, or Pale. In these there seems to be a rottenness and filth; beneath the colour is black: the Body it self is dry, and more hard than it ought to be. About the which said Carbuncle there is as it were a Crust, and this is surrounded by an Inflammation, neither can the Skin in that place be possibly lift up, but it is as it were fixed and close fastned unto the Flesh underneath it. The sick Person is extream sleepy; and somtimes there ariseth a certain kind of horror, or else a Feaver, or both. And this Evil creepeth along, there being drawn out as it were certain roots, somtimes more speedily, and somtimes more slowly: and likewise above when it first proceedeth forth it looketh of a whitish colour, and then instantly it becometh Lead-coloured; and about it there arise little Pushes or Pustules. And if it happen to light upon the part neer the Stomack, and the Jaws, it then oftentimes suddenly stoppeth the Breath:* thus far *Celsus*. But now *Pliny* (in his Book 26. Chap. 1. in which he treateth of Diseases that were new and unknown in all former ages) thus writeth: *It is recorded in the Annals that the Carbuncle (the peculiar Malady of the Province of* Narbone) *came first into* Italy, L. Paulus *and* Q. Marcius *being Censors: of which the same yeer two that had been Consuls (*Julius Rufus, *and* Q. Lecanius Basilus) *died; the former of them through the unskilfulnes of the Physitians being cut; & the latter, he himself having put a Needle into the Thumb of his left Hand which being drawn forth the Wound was so smal that it was scarcely to be discerned. It is bred in the most occult and hidden parts of the* Body, *and for the most part under the Tongue; it hath a reddish hardness (like unto the Varix or crooked Vein) but black in the head of it, & elsewhere blewish or Lead-coloured, distending the* Body, *yet not swelling up, without pain, without itching, without any other sign or token (whereby it may be known) then an extraordinary propension to sleep; and those that have been surprized herewith, it hath taken them away in three daies time; and sometimes bringing along with it a certain horror; it hath round about it smal Pustules, but very seldom is there any Feaver attending it; and when it invadeth the Stomack and the Jaws, it soon killeth.* Thus *Pliny*. Now whosoever shall well weigh what he hath written shall easily perceive that he here describeth some other Disease, or at the least a Disease that hath in it some thing peculiar and differing from the ordinary Carbuncle, and ending in a Gangrene and Sphacelus.

Pliny Expressly referreth it unto Diseases new and never known before, and writeth likewise that they arise in the most hidden parts of the Body, and for the most part under the Tongue; that it is without pain, without itching, without any other symptoms then sleep; with which such as are surprized are deprived of life in three daies

time

time, no swelling at all appearing. But now *Celsus* writes, that it sometimes ariseth also without a Feaver, and that it befalleth those parts that are about the Stomack and the Jaws: whereas the ordinary and common Carbuncles arise in the outward parts of the Body, and have a grievous pain joyned therewithall; they likewise invade the Party with a Feaver, and the place affected hath likewise accompanying it a manifest Swelling.

What a Carbuncle is.

But that we may again return unto the Carbuncle that is commonly known among Tumors or Swellings; it is *a Swelling that hath its original from a most fervent and adust blood that corrupteth the part.*

The Causes.

The Conteining Cause of a Carbuncle (according to the assertion even of *Galen* himself, in his Book of Tumors, Chap. 6. and in his second to *Glauco*, Chap. 1. and his 14. of the Method of Physick, Chap. 10.) is a blood fervently hot, and thick, which (in his Book of black Choler, Chap. 4, and 5.) he affirmeth to be black Choler. To wit (as we may gather out of his second Book of the Differences of Feavers, Chap. 19.) a Carbuncle ariseth from a fervent thick Blood, putrifying, and degenerating into the Nature of black Choler, or having black Choler mingled with it, and for the most part a certain malignity conjoyned therewithal. This Swelling although it may be generated in the Body by little and little, and by degrees assume this ill and depraved Nature; yet notwithstanding when it hath gotten any degree of the said pravity and malignity, it is then by Nature instantly and suddenly driven forth from the interior unto the exterior parts, that is to say, from the more noble members unto those that are less noble and worthy. Which likewise happeneth when the Blood is infected and corrupted by reason of some external Corruption; from whence it is, that a Carbuncle is never excited by the Congestion or heaping up of blood; but is evermore generated by a defluxion that is all at once made: and thereupon it is deservedly accounted among Inflammations, and is said to be very neer neighbouring unto a *Phlegmone* or *Inflammation*. Neither is it only generated of black Choler, like as a Cancer, but it is bred by adust and burnt blood, degenerating into black Choler, or else having black Choler mingled therwith.

Now the aforesaid adust blood is generated from an ill and unwholsom course of Diet, and from meats of a depraved and vitious quality affording and supplying the whol matter of all the blood. And this is likewise much more promoted and furthered by the external Constitution of the Air, overheating, burning, and corrupting the humors, and especially its occult and malignant Constitution depraving the humors: and indeed there is hardly any Carbuncle to be found that is altogether void of, and free from malignity.

The Differences.

Yet notwithstanding in regard that this Malignity is sometimes greater, and sometimes less, and that some Carbuncles invade very many in a Pestilent constitution of the Air, and others again here and there seiz upon the sick without any such pestilent constitution of the Air; Carbuncles therefore are to be distinguished into Pestilent, and not Pestilent. Moreover some of them arise with a Pustule, or with such Pushes as are caused and raised by the fire, which if they be broken, there lieth underneath within a Crusty Ulcer (and this happeneth if not alwaies, yet for the most part) and such as these are in special by *Avicen* called *Pruna*, or *Ignis Persicus*: Others of them arise and appear without Pustules.

Signs Diagnostick.

The Carbuncle beginneth (as hath been said) for the most part from a smal Pustule; but sometimes there is not only one of the greater Pustules breaking forth, but likewise many smal ones, like Millet seeds, rising and appearing very thick in the particle; which when they are broken, the Ulcer becometh crusty, such as is excited by a red-hot Iron. But before these Pustules break forth there is a certain itching felt in the part, and thereby there is one or more Pustules arising and appearing: yet notwithstanding the Carbuncle sometimes beginneth without any manner of Pustule, and a crusty Ulcer is excited, the crustiness being one while somwhat blackish, another while having in it the resemblance of the color of Ashes; and then again in a very short space after it groweth forth, and becometh like unto Bubo's, after a round acute figure, with an extraordinary great heat, burning and pain; al which are especially exalperated about the Evening; and then they so vex the sick party that he can hardly withhold his hands, but that he must be rubbing of the part; from which rubbing there afterward arise very many of the aforesaid Pustules. The flesh that lieth round about them waxeth hot, and hath in it at the heighth an extream great and burning heat; it likewise obtaineth a color somwhat blacker than is that in an Erysipelas and a Phlegmone, like as if there were something of black choler mingled together with the red. There happen moreover other Symptoms besides the former, to wit, a Feaver, which (as *Galen* also testifieth in his fourteenth Book of the Method of Physick, Chap. 10.) infesteth those that are surprized with a Carbuncle, more than those that are affected with a Phlegmone or Erysipelas; a nauseousness likewise, a vomiting, a dejection of the Appetite, a trembling with a panting and beating of the heart, frequent

frequent faintings and ſwoundings, dotage; all which ſaid ſymptoms do ſo much the more afflict and grieve the party, by how much the matter is the more malignant.

For there is a certain difference even of thoſe Carbuncles themſelves, not only in regard that with the aforeſaid aduſt blood (which is the conjunct cauſe of the Carbuncle) there is ſometimes this, another while that humor mingled; but more eſpecially, in that one Carbuncle is Peſtilent, and another not Peſtilent. For albeit every Carbuncle be malignant, by reaſon of the hot Matter, being aduſt and putrefying (which hath in it a power and quality to corrupt the fleſh, and cannot wel return into any more benign or better nature; neither may it wel be ſuppurated:) yet notwithſtanding every of them is not Peſtilent; neither hath every of them any adventitious Malignity, but ſometimes only beſides the Native malignity of the Carbuncle there chanceth likewiſe another kind of malignity from the common ſtate, or the contagion of the Air. But now a Peſtilent Carbuncle is diſcerned from that that is not Peſtilent, firſt of al by the preſent Peſtilent conſtitution of the Air. For it is hardly poſſible that a Carbuncle ſhould ariſe at ſuch time as the ſaid Peſtilent Conſtitution is predominant, which in it ſelf ſhould not be Peſtilent. Moreover al the ſymptoms and ſigns that appear in the Carbuncle are both more frequent, and more grievous in a Peſtilent Carbuncle, than in a Carbuncle that is not peſtilent. For even the Feaver alſo which is adjoyned unto the Carbuncle reſembleth and carrieth along with it a Peſtilent nature; and although it ſeem outwardly to be more moderate and gentle than that which appeareth in the Carbuncle that is not Peſtilent (yea, ſometimes ſo that it can hardly be perceived) yet notwithſtanding at that very time it the more burneth the inward parts, and is by far the more dangerous: the freſh color of the face is changed, the tongue becometh black, and is dry; the excrements of the Belly are liquid and cholerick, the appetite is dejected; there is likewiſe preſent a nauſeouſneſs, and a vomiting of the moſt offenſive and the worſt humors; a difficulty of breathing, a ſtinking breath; and there is alſo much ſweat, and this is either ſomwhat hot, or elſe (as we term it) a cold ſwear. The ſleep is ſometimes very ſound, and ſometimes watchings infeſt the ſick party; dotings alſo accompany the ſame, as likewiſe faintings and ſwooning fits. And hereupon it is that there is more danger threatned by one Carbuncle, than there is by another. For although every Carbuncle be not pernicious; yet notwithſtanding (as *Galen* teſtifieth in the 3. of his Epidem. Comment. 3. tit. 2.) the moſt pernicious of al is the Peſtilent, or that which beſides its own proper and particular malignity hath alſo adjoyned with it that which the conſtitution of the Air bringeth along with it, and which is attended with all thoſe pernicious ſymptoms: which if they remit very much of their former intenſneſs and vigor, there is then left remaining ſome hope of ſafety and recovery; but if from day to day they are heightened and become more vehement, there is then no ſafety or hopes of eſcape to be expected.

The Prognoſticks.

1. By how much the blacker the Carbuncle is, by ſo much the worſe is it, as being ſuch as is produced by the moſt corrupt blood. The next unto this is the wan and yellowiſh. Thoſe that are leſs malignant, and conſequently the leſs to be feared, are ſuch as have in them a reddiſh color; to wit, ſuch in which the blood hath not as yet altogether loſt and changed its Nature, but that it hath as yet retained ſomwhat of its native heat and color.

2. Thoſe Carbuncles likewiſe that are ſmal are leſs pernicious than thoſe that are great; and from a very little Puſtule they ſuddenly acquire and get an extraordinary greatneſs.

3. And ſo are likewiſe thoſe that are alone, than ſuch as have other Carbuncles conjoyned with them.

4. Of al other thoſe are moſt deſtructive and deadly, which after they have once begun to wax red do immediatly vaniſh again. For the matter being transferred unto the more inward parts often (if not evermore) proveth deſtructive and deadly.

5. There are ſome alſo who conceive that this is likewiſe throughly to be conſidered, to wit, Whether the Peſtilent Carbuncle ariſe before the Feaver, or elſe whether or no the Peſtilent Feaver going before it at length break forth. For they conceive that the Carbuncle that breaketh forth before a Peſtilent Feaver is more ſafe (provided that no Symptoms follow thereupon) in regard it is an evidence that Nature is ſtrong, and able to expel the Peſtilent Poyſon before the Feaver, ere ever it can ſeize and ſurprize the heart. And (on the other ſide) that to be more dangerous which at length breaketh forth after a Peſtilent Feaver, foraſmuch as (the Heart being ſeized upon) it hath its original from the poyſon and the corrupt humors now diffuſing themſelves into al parts of the body.

6. The place alſo manifeſteth when the danger is more or leſs to be feared. For thoſe are evermore accounted evil and pernicious that ſtick faſt in the Emunctories, and neer unto the Noble and Principal Members. But here moſt eſpecially the ſtrength and natural powers are to be regarded; and we are wel to conſider whether they be ſtrong, or elſe but weak. For that ſtrength that is but weak and languiſhing may be ſoon overpowered and vanquiſhed even by a ſmal Diſeaſe. Whereas (on the contrary) that that is more vigorous oftentimes overcometh and maſtereth even

that

that disease that in it self is strong and powerful.

The Indications.

The Indications in a Pestilent Carbuncle are different from those in a Carbuncle not pestilent. In a Pestilent *Carbo* or Carbuncle the fervent heat of the blood is wholly al the body over to be restrained; and withal, the Heart at the same time is to be fortified against that malignity, which (as we have said) is here very seldom absent. The rest of the Cure is to be directed unto the Carbuncle it self. But now in a Pestilent Carbuncle there is a more poysonous and pestilent quality appearing than in the fervent heat of the blood; yet neither is this to be sleighted or neglected.

The Cure.

And therefore (as to what belongeth unto the Cure of a Carbuncle) there are two things that we are especially to regard and have an eye unto; the Antecedent Cause, or the fervent and corrupt blood that is in the whol body; and the Conjunct Cause, or that same Humor that now exciteth the Carbuncle. A convenient Diet therefore being ordained, and a moderation observed in those things we cal not natural, the extream fervent heat of the blood is by opening a Vein to be taken away. And yet this Venesection is not rashly to be made use of in al manner of Carbuncles; but if it hath any place at al, it is most chiefly in that that is not pestilent; touching which likewise that assertion of *Galen* (in his fourteenth Book of the Method of Physick) and of other Authors (who conceive that the blood is to be drawn forth even until the sick person faint and swoon) is to be understood. But in a pestilent Carbuncle nothing is rashly to be attempted, that may weaken and deject the Natural powers, (of which there ought to be the most special regard had in the plague, and in pestilent Feavers) amongst the which Venesection unto fainting and swounding is not the last (but rather the first) which together with the Spirits evacuateth that humor that is most agreeable and friendly to Nature, and even that most excellent and precious Treasury of the life. Nay indeed moreover, even somtimes when the pestilent Carbuncle is just then breaking forth, we cannot safely enough institute and ordain Phlebotomy. For whereas the Carbuncle somtimes breaketh forth, not instantly upon the very first invasion of the Plague, and pestilential Feavers, but often afterward on the fourth daies (or haply on some other daies) the Natural powers wil not then bear the said Venesection, in regard that they are now dejected by the disease, and have therefore entered the Lists, & are now conflicting with the said disease. But now what Veins are to be opened, sufficiently appeareth from that which we have spoken above, touching the evacuation of the blood, & touching Revulsion, and Derivation, in the Cure of an Inflammation. This only is here to be observed, that we must beware, lest that whilst we evacuate the blood, we do not lead and draw the same either unto any noble Member, or else through any noble Member, lest that the said Member should be affected with its malignity.

And therefore we say that that Vein is to be opened, by means whereof the blood may rather be drawn toward the part affected than drawn back from it. Wherefore if the Carbuncle shal be about the Head, or the Arm-holes, or in the Breast, the neerest Vein in the Arm of the same side is then to be opened. But if it be below the Liver, then the Ankle Vein, or the Ham Vein of the same side. And this Phlebotomy ought to be put in practice instantly, and in the very beginning, before the Feaver get strength, and the Natural vigor be too much dejected.

But now in regard that by this blood-letting the naughty corrupt humors can scarcely be evacuated, therefore some conceive that there is need of purgation, by which the said depraved humors may be evacuated, lest otherwise the Native heat should be suffocated and extinguished by them; and that Nature may afterward the more rightly moderate the expulsion; and that so the part affected may not be corrupted by the great abundance of the Humor flowing thereto.

But then we ought to be extraordinary careful, lest that by the purging Medicament, the Humor that Nature endeavoreth to thrust forth unto the external parts be drawn unto the internal: and this is most of al to be feared in a pestilent Carbuncle. We conceive indeed that it may more safely be ordained and appointed in a Carbuncle that is not malignant. But when a Feaver is therewith joyned (and that an acute one) the crudity of the matter then for the most part forbids it; and to speak truth, there is hardly a Carbuncle to be found in which there is not somthing of malignity; and therefore the malignant matter is with more safety thrust forth unto the superficies of the body by those Medicaments we term *Alexipharmaca*, then drawn to the more inward parts by Medicaments that purge.

That fervent heat also of the adust blood is to be altered; and the malignity to be opposed by convenient Medicaments, as the juyce of Citron, of Pomegranates, Sorrel, Borrage, Bugloss, Water Germander, Succory, and the like; with which (in a pestilent Carbuncle) other Alexipharmaca may also be fitly mingled. As,

Take *Conserve of Sorrel, Borrage, Bugloss, of each one ounce and half; the species of Diamargarit. frigid. Confection of Hyacynth, Elect. de Gem. of each half a dram; of candied Citron rind six drams; the candied roots of Scorzonera (or Vipers Grass) half an ounce; with the juyce of Citron make an Electuary.*

Unto

Unto which (in a Peſtilent Carbuncle) we may add Bole-armenick, *Terra Sigillata* or ſealed Earth, Harts horn, Bezoar ſtone, and the like. Very many there be that in a Carbuncle do much commend *Scabious*, and they conceive that it never ought to be paſſed by; and they write, that either the Juyce, or the Water, or the Decoction thereof, is of ſingular uſe and benefit in a Carbuncle.

It wil not likewiſe be amiſs to fence and guard the Heart with Topicks, by Epithems that are otherwiſe known, applied to the Region of the Heart and the Pulſes; that ſo by all manner of means the Heart may be preſerved ſafe and ſound from all the malignity.

Afterward (as for what concerns the conjunct cauſe, or the Tumor it ſelf) the way and means of curing a Carbuncle is not altogether the ſame as in other Inflammations, unleſs haply there appear to be in it very little of an offenſive quality. Neither muſt we make uſe of Repellers (but the malignant and poyſonous matter is rather to be attracted from the more inward unto the external parts) unleſs perhaps they may be adminiſtred for the mitigating of the vehemency of the pain; touching which more hereafter. And therefore ſo ſoon as Veneſection hath been adminiſtred, the part affected is forthwith to be ſcarified, and that likewiſe with lancings that go deep enough, that ſo the corrupt, malignant, and poyſonous blood (which unleſs it be inſtantly emptied forth of the part affected corrupteth the parts neer adjoyning) may be quite drawn forth. Immediately upon this the part affected is to be cleanſed and throughly waſhed with warm ſalt water, or with ſome other convenient liquor, leſt that the blood ſhould clod, and ſo grow together in the part. Now if the corrupt blood ſeem not as yet to be ſufficiently evacuated, the ſcarifications ought then to be repeated. We are likewſe allowed (when the place is ſcarified) to apply thereto Cupping-glaſſes or Leeches. Yet notwithſtanding if with great violence the humor flow unto the part, then Attractives may not ſafely enough be adminiſtred, ſince there is cauſe to fear, leſt that the matter flowing thereto in great abundance, the pain ſhould be made the more vehement; which may (poſſibly) excite and cauſe watchings, augment the Feaver, and deject the Natural vigor; but rather, if the matter flow thereunto over haſtily, and with too great force, we are then to make uſe of thoſe Medicaments which by moderate repreſſing and driving back may likewiſe digeſt. And ſuch is the following Cataplaſm:

Take *Arnogloſs* (we commonly term it Lambs-tongue, or Way-bread) *Lentiles, Bread that is neither wholly purged from its bran, neither yet ſuch as is altogether branny, of all theſe a like proportion; let them boyl in Water or Wine, and ſo make a Cataplaſm*: which is to be applied twice or thrice every day.

But now this ſaid Medicament that we have mentioned, or ſuch like, is not to be impoſed and laid upon the very Carbuncle it ſelf, but only neer about it, ſome three fingers diſtance from it. For by this means the malignant matter it ſelf is not driven back, but only the extream heat and pain is mitigated, the flux of matter is ſomwhat retarded; and hereby is prevented the retreating back again of the matter unto the more inward parts. But yet neither muſt this be paſſed over in ſilence, that it is not evermore requiſite to fence the Carbuncle with ſuch a guard: but notwithſtanding, this for the moſt part is neceſſary, to wit, That that part which hath a neer relation with a noble Member ſhould be wel guarded; forasmuch as it is no way hurtful (but indeed profitable) that ſome of the matter ſhould be derived and evaporated unto the other ignoble parts.

Moreover, the place being ſcarified, there are not to be applied thoſe Medicaments that otherwiſe are wont to be laid on (in regard that they promote and further the *Pus* or purulent matter, and by this means may encreaſe the putrefaction and rottenneſs; ſince that a Carbuncle in putrefying evermore creepeth and ſpreadeth ſo that very often a Mortification chanceth unto ſuch parts; but rather thoſe Medicaments that are drying, and ſuch as reſiſt putrefaction. For which end and purpoſe we may adminiſter the Paſtils, or Pomanders, of *Andro*, *Muſa*, *Polyidas*, and *Paſio*; which are to be diſſolved firſt of al in Wine, and then alſo afterward in Vinegar; touching which ſee *Galen* in his Compoſition of Medicaments in general, the fifth Book, Chap. 11, and 12. They commonly likewiſe make uſe of the Ægyptiack Unguent. There may alſo be made a Cataplaſm of the Meal of the Pulſe Orobus with Oxymel. *Morſus Diaboli* or Devils-bit is likewiſe very much commended; if while it is yet green and wel bruiſed it be laid on; or elſe boyled in Wine and drunk. There be many likewiſe that here make uſe of thoſe things that are experimentally found to be helpful by the propriety of their ſubſtance; among which *Scabious* is eſpecially commended, as alſo *Morſus Diaboli* or Devils-bit; they take (to wit) the *Scabious* whileſt it is green, and bruiſe it wel, and then they add thereto the Yelk of an Egg, Hogs greaſe that is old, and a little Salt; and herewith they make a Cataplaſm; which is often to be renewed. Some likewiſe take the Herb Comfry for the ſame uſe, and with it they prepare and make ſuch a Medicament as this that followeth:

Take *of the Juyce of the greater Symphytum (or great Comfrey) Scabious, Cranes-bill (or Doves-foot) of each one ounce: of Barley Meal two ounces and an half; and mingle them for a Cataplaſm.*

Others there are who (if there be preſent an extream heat and pain) commend this, Viz.

Take *Plantane Leaves, and Sorrel Leaves,*

of each two handfuls, boyl them to a softneß; then let them be bruiſed; when they are throughly bruiſed, add to them the Yelks of four Eggs, Treacle two drams, Barley meal a ſufficient proportion, and ſo make a Cataplaſm.

Many likewiſe there are that commend thoſe Wallnuts that are old and Oyly, being bruiſed; of the which ſome make ſuch a Cataplaſm as this that followeth.

Take *the Kernels of Walnuts (ſuch as are old, and rancid or mouldy) in number three; dried Figs, and Raiſins, an equal proportion; boyl them in ſtrong white Wine to a ſoftneß, and then bruiſe them; adding thereto a dram of Salt, and two Yelks of Eggs; mingle, and then make a Cataplaſm of them.*

But now if there be any that wil not endure Scarification; or if otherwiſe the Carbuncle wil not yeild unto theſe Medicaments; and it be ſo, that the corruption, the blackneſs, and the ſigns ſeem alwaies to be augmented; we muſt in this caſe have recourſe unto Cauteries; and that inſtantly and with all poſſible ſpeed, for even the leaſt delay may caſt the ſick Perſon into an extream peril, yea into the greateſt danger even of death it ſelf. But here Potential Cauteries may not ſo ſafely be adminiſtred; in regard that the Cruſt which is drawn over them fals off more; and ſo the exhalation of the corrupt and malignant humor is hardened. The actual is therefore by moſt accounted the ſafer. For why, the Actual Cautery, by the heat and drineſs of the Fire, doth eſpecially reſiſt putrefaction, and preſerveth the ſound parts, leſt that they alſo ſhould be infected with putridneſs; and it likewiſe attracteth from the depth and the very bottom all the malignant and corrupt Matter; and for this cauſe it is here by the moſt commended as the moſt effectual Remedy; who conceive that here (in this caſe) this is not ſo grievous a Remedy, ſeeing that the ſick Perſon is hardly ſenſible of it, in regard that the Fleſh is dead; and becauſe that the uſe of it muſt be ſo long continued, even until in all parts thereof there be a ſenſe of pain. Yet notwithſtanding even the Actuall Cautery hath alſo in it this diſcommodity, that it induceth and cauſeth a Cruſt or Eſchar, which it ſelf ſo hindreth that the malignant and poyſonous matter cannot exhale. If therefore any will uſe this Remedy, he muſt be altogether careful, that the Cruſt drawn over it hinder not the exhalation of the corrupt and malignant humor; and therupon he muſt uſe his endeavor, that the Cruſt may ſpeedily (even within the ſpace of twenty four hours) be removed; in regard that there may be danger in the delaying thereof. And indeed (for this purpoſe) they commonly uſe Butter, the Suet or Fat of a Hog, the Fat of a Gooſe, and ſuch like moiſtening and ſuppurating Remedies. But the Truth is, that *Horatius Augenius* and *Gulielmus Fabricius* do rightly inform us, that (in thoſe affects in the which there is otherwiſe ſo extream a danger threatned from putridneſs) theſe Remedies may not with any ſafety at all be adminiſtred; foraſmuch as by their humidity, and Emplaſtick virtue, they do in a wonderfull manner encreaſe the putridneſs, & cauſe that the rottenneſs and corruption of the part creep ſo much the further; and moreover theſe do but very ſlowly take away the Cruſtineſs. And therfore theſe conceive that we ought rather to uſe thoſe Remedies that do greatly cleanſe and dry, reſiſt putrefaction, and break aſſunder thoſe ſmal ſlender fibres by which the Cruſt adhereth unto the part affected. *Galen* (in his ſecond Book to *Glauco*, Chap. 9.) for the taking away of the Cruſt (after burning) in the caſe of a Gangrene, uſeth the Juyce of a Leek with Salt. *Gulielmus Fabricius* for the falling off of the Eſchar, and for the cleanſing of the Ulcer commendeth this following Unguent.

Cauteries.

Take *the meal of* Orobus *(or bitter Vetch) the root of Ariſtolochy, or Birthwort, the Flower-de-luce of Florence, and the leſſer vernal Gentian, of each half an ounce; Treacle two drams, with a ſufficient quantity of Honey of Roſes; and ſo make an Unguent.*

Horatius Augenius commendeth this.

Take *Vitriol two drams, the beſt Honey half an ounce, Hogs greaſe two drams, and mingle them.*

And that the Ancients did not alwaies uſe moyſteners and thoſe Remedies that forward the *Pus* or Purulent matter, for the removal of the Cruſts, is ſufficiently evident out of *Galen* his ſixth Book of the Compoſition of Medicaments according to the place affected, Chap. 6. and *Paulus Ægineta* his fourth Book, and Chap. 19. in the which ſaid place there are many more ſuch like Medicaments to be ſeen.

And as for my own part, I had rather (for the taking away of the Cruſts which for the moſt part the Carbuncle contracteth) uſe ſuch like Remedies, then Cauteries, whether Potential or Actual. For here the Putridneſs is not ſimple, as in a Gangrene, and other corruption of the parts (where that that is putrid is moſt commonly ſeparated from the ſound part; ſo that we may ſafely enough burn away what is corrupt and putrid. But in a Carbuncle there is preſent a malignant humor, and that diffuſed throughout the whole part; and therefore we are to make uſe of thoſe Medicaments that extract, that ſo by this means what is as yet ſound may be preſerved from putridneſs and Corruption. *Ætius* writeth, that wild Rue impoſed in a Cataplaſm with Honey and Raiſins of the Sun, doth likewiſe inſtantly ſeparate the Cruſts of Carbuncles: and therefore even thoſe medicaments alſo that reſiſt malignity (as Treacle and the like) are for the moſt part very properly herewith mingled. And therefore we conceive that the Unguent of *Gulielmus Fabricius*, erewhile mentioned, is exceeding profitable

in

in a Carbuncle, not only after the burning, but likewise at all other times. Others compound such a like medicament, which (as they affirm) wil in two daies space separate the good and sound Flesh from the corrupt.

Take *Rue one handful, Leaven one ounce, dry Figs three in number, Pepper a dram, Salt a dram and half; make a Cataplasm which may be applied mornings and evenings.*

In general, in Pestilent Carbuncles, to extract the Poyson we must prevent and hinder the creeping and further spreading of the putridness.

For the taking off the Scar this Emplaster is principally commended.

Take *of the best Treacle, and Mithridate, of each half an ounce, Leaven and Turpentine of each two ounces, Honey of Roses one ounce and half, fresh Butter two ounces, common Salt one ounce, Chimney Soot two ounces and half, Saracen Soap three ounces, Saffron three drams, three Yelks of Eggs, bake them altogether, and make an Emplaster.* Or,

Take *Scabious, the greater Comfrey, of each two ounces, of ful and fat Figs dryed three, an Onion roasted in Embers, Squils half an ounce, Raddish root cut into smal pieces two ounces, two Yelks of Eggs, Salt two ounces, Leaven and Chimney Soot of each one ounce, Honey & Turpentine, of each as much as wil suffice; and so make a Cataplasm: and having spread it upon a Linen Cloath lay it on hot, and let it be shifted almost every hour.*

If now we perceive the Crust to become round and a circular redness appearing, it is then a sign & token of ensuing health and recovery, and a manifest testimony that Nature hath now separated the corrupt from the sound. When the Crust is wholly taken away the Ulcer is then to be throughly cleansed with *Honey of Roses, and the Juyce of Smallage*, and such like. After the cleansing it is to be filled up, joyned together, and at length with a Cicatrice to be shut up. But touching the cure of a Carbuncle, see more in the fourth Book of Feavers, and the fourth Chapter.

Chap. 14. *Of the Tumor* Paronychia.

UNto Inflammations there also belongeth that Tumor that the Greeks call *Paronychia*, because that it is generated in the Confines or sides of the Fingers; the Latines term it *Panaritium*, the Germans *Der Wurm, Oder Das Ungenandte*. For the Vulgar are of Opinion, that in this Tumor there lieth hid a Worm, that by gnawing exciteth and causeth those so great pains; and that when it is mentioned and spoken of it is thereby exasperated, and that therefore it ought not to be so much as named: but these things are meerly fabulous.

What a Paronychia is.

Now a *Paronychia* is a hot Tumor or Swelling, arising from blood adust and atrabiliary in the extream part of the Fingers, at the sides of the Nails; and by reason of the neighborhood of the Nerves exciting most grievous and intollerable pains.

The Causes.

For this Tumor hath its original from adust, and (for the most part, likewise) malignant blood; which Nature thrusteth forth unto the Fingers ends; and there it causeth an Inflammation.

The Signs Diagnostick.

It is known by the Swelling, Redness, and pain, appearing in the Fingers ends about the Nails; together with a most extream and intense pain (by reason that the neer adjoyning Nervous parts are affected) which wil not permit the sick Person to sleep, or take any rest, neither night nor day; and this pain (in regard of the Nerves consent) is oftentimes extended throughout the whol Arm; and it hath to accompany it a continuall Feaver, and somtimes (by reason of the over-great pain) a Lipothymy, which we term fainting or swounding.

Prognosticks.

1. According to the benignity and inoffensiveness of the humor, the malady is somtimes more mild and tollerable, and somtimes again more grievous and intollerable. For if the matter be benign or moderate and favorable, the symptoms are then the less vehement.

2. On the contrary, if the Matter be Malignant, the Malady is dangerous; for it oftentimes so corrupteth the Ligaments and the neighboring Nerves, that the utmost Joynt together with the Bone Impostumateth; and somtimes the whole Finger is corrupted.

The Cure.

The Vulgar, as they have superstitious Opinions touching the Cause, so they have likewise concerning the Cure of this Tumor. For they think that if any one thus affected shall in the Spring time wash and besmear his hands with the Eggs otherwise called the seed or Sperm of Frogs, & shal then suffer them to dry leisurely & of their own accord; and shal afterward hold in this Hand that Finger that is grieved with this Inflammation, he shal by this means assuage and qualifie the said Inflammation. And some there be also that every yeer hold in their hand a live Mole, and then having conceived and mumbled over a certain form of words, with squeezing hard they kill the Mole they have in their hand; and then they brag and boast that for the yeer following they are able to kil and destroy all those Worms.

But, to omit these fopperies, the right and due way of Curing this Evil is then taken, when after the general evacuation of the humors by Blood-letting and Purgation hath been premised, in the first place we impose upon the part affected those things that moderate the pain, and mitigate the fervent heat of the humors, and such Medicaments likewise as help forward and further suppuration.

But Repelling and Astringent Remedies are by no means to be imposed upon the grieved part, lest that by this means the humor should be the more impacted into the part, the pain augmented, and the Nerves and Bone corrupted. If yet notwithstanding the Afflux be over great, then let Repellers be laid on very nigh unto the part next above it.

And therefore in the very beginning the following Cataplasm is to be imposed:

Take *Barley meal, and Bean meal, of each one ounce; Camphire one scruple; the Mucilage of the seed of Fleabane as much as will suffice, Mingle all these with Vinegar over the fire, and so make a Cataplasm.* Or,

Take *the juyce of Nightshade, of Plantane, of Navelwort, of each half an ounce; the Mucilage of Fleabane seed extracted with the Water of Nightshade three drams; Bole armenick half a dram; Camphire five grains; Oyl of Roses, and Myrtle, of each half an ounce: Mingle them, &c.* Or,

Take *the Mucilage of Fleabane seed extracted with the juyce or water of Plantane two ounces; Bole armenick one dram; Vinegar half an ounce: Mingle them, &c.*

Or else let the white of an Egg mingled with the Oyl of Violets be imposed.

There are likewise commended those little Worms that are found in the middle of the utmost rind of the Teazel or Fullers Thistle, if while they are alive they be bound about the Nails affected.

Where the matter tendeth to Suppuration,

Take *the Meal of Fenugreek seed, and Linseed, of each half an ounce; the Yelk of one Egg, fresh Butter one ounce; the fat of a Hen three drams: Mingle them without fire, and make an Unguent.* Or,

Take *the Mucilage of the juyce of Fleabane one ounce; the meal of Linseed and Fenugreek, of each three drams; the Yelk of an Egg; Saffron one scruple; the fat of a Hen, and Butter unsalted, of each one ounce: Mingle them, and make a Cataplasm.*

When the *Pus* is bred, the Impostume is forthwith to be opened, and the *Pus* or Snot-like filth (being seldom good, but rotten and corrupt) is to be drawn forth. The *Pus* being thus evacuated, such a like Abstersive and Incarnative is then to be made use of.

Take *Aloes Hepatick three drams; Myrrh, Frankincense, Sarcocol, of each one dram; pure and cleer Turpentine half an ounce; Honey of Roses two drams; Mingle them, &c.*

Gulielmus Fabricius (in the first Century of his Chirurgical Observations, Observ. 97.) doth not stay to wait for the Inflammation, or for any notable swelling up, and suppuration; but in a Woman that was afflicted with a most grievous pain in the end of her finger, together with a Feaver, a fainting and swounding, a nauseousness and vomiting, and other symptoms; he thus ordaineth his Cure. He first of al a little fomenteth the finger with Cows Milk in which Camomil flowers, Melilot flowers, the seeds of Fenugreek and Quinces were first boyled. And then by little and little he dissected the superficies of the Skin. The Skin being shaven away, there appeared smal red spots; which being cut with the edg of a knife, he findeth under the Skin a drop or two of red Water. That being evacuated, he applied a Linen Cloth dipt and moistened in *Aqua vitæ*, in which there was dissolved a little Treacle. By thus doing he soon qualified and quite took away the pain; and by this one only Remedy the very next day the finger was healed.

And likewise in another Matron, that for three daies together by reason of the vehement pain of the Paronychia could not sleep, nor take any rest at al (the skin being shaven off) he findeth under the skin in the very tip of the finger, a spot of this bigness O, in the which there was contained scarcely one smal drop of the Ichorous excrement. The spot being opened, & thereto applied Cotton dipt in *Aqua vitæ* wherein there was Treacle dissolved, and about the whol hand and wrist a linen cloth (after it had been first wel soaked in vinegar and water) doubled and wrapped, the pain immediately ceased; insomuch that the very next day following the finger was fully and perfectly healed. But the same Author addeth further, that this incision ought forthwith in the very beginning to be made; because that otherwise by the concourse of the Humors there wil be excited an Inflammation and Swelling, and so the flesh lying underneath, yea, and even the bones also wil be in danger of being eaten through. For the Skin in that place is of an extraordinary thickness; so that the matter of the *Paronychia* (which in it self is malignant) when it can by no means exhale, it then acquireth the greater acrimony and poysonfulness; and the finger also, yea, and the whol hand (by reason of the vehemency of pain) is swoln and blown up: and this incision very little or nothing availeth, unless that the matter be first concocted and converted into *Pus*.

Chap. 15. *Of Perniones or Kibes.*

THere is also found a peculiar kind of Inflammation, which they term *Perniones*; the Greeks cal this Affect *Chimethlon* and *Chemeithlon*

lon

lon (from the Greek word *Cheimon*) in regard of their appearing in the Winter time only. And it is such a kind of Inflammation as in the Winter time ariseth in the heels, and on the toes and fingers. I once likewise saw a Noble-man that had such a kind of Inflammation on the very tip of his Nose.

The Causes.

Now this kind of Inflammation ariseth from the Winters cold, whilest that by it not only the part is weakened and made more apt to receive, but that likewise from the pain there is caused an attraction of blood unto the part.

Yet notwithstanding this is worth consideration, how it cometh to pass that he who hath in the Winter time undergone and suffered some notable cooling of the extream parts should yet notwithstanding be wel, and altogether insensible of it during the Summer, and the Winter following again (and thus to continue for some yeers, and until the Malady be wholly removed and taken away by cure) should be so sensible of an extream itching, pain, and swelling in the part that was over cooled as aforesaid; and that although in the Summer time he felt no ill, instantly in the very first entrance of the Winter the Malady should again get head and return, and an itching be again felt in the part affected: al which argueth that there was some strong impression left behind in the part. For those that are thus greatly cooled do not only suffer a bare alteration; but that there is likewise somthing that is substantial communicated unto the part affected, appeareth even by this, That Apples and Eggs when they are frozen, if they be cast into cold Water, there is then an Ice taken out of them, so that it outwardly sticketh fast unto them like unto a crust, and then these Apples and Eggs return again to their former Natural state; whereas on the contrary, if they be put into warm Water, they become flaggy, turn black, and are corrupted; which notwithstanding could not possibly happen if there were only a meer and simple alteration; and therefore we may conclude, that by the pain that afflicteth the part there is blood attracted to the part affected, that exciteth and causeth the Inflammation.

Signs Diagnostick.

There went before a guarding and preservation of the extream parts of the Body (against the injuries of the external Air) that was but weak and sleight, and not sufficient to maintain a due warmth in them; and thereupon an undue cooling befalleth them; there is likewise an itching and a pain, that is not only once (and after that the sick person hath suffered a refrigeration from the external Air) perceived; but, although it cease in the Summer time and Autumn, yet notwithstanding about the beginning of Winter it again returneth; the part waxeth red, and swelleth up; and now and then also it is exulcerated.

Prognosticks.

This Tumor (to tel you the truth) hath in it no danger at al: yet notwithstanding if the Malady be not speedily cured, it wil prove tedious, and of long continuance, and this pain wil for many yeers be grievous and troublesom unto the Party thus affected; and somtimes likewise the part is wont to be exulcerated.

The Preservation.

Left that the parts should be hurt by the external cold, it is requisite that in the Winter time they should be sufficiently fenced and provided for against the injuries of the aforesaid external cold Air. And more particularly (left that the feet be hurt) it wil be expedient to wear Legharnesses (as they cal them) or linen Socks wel moistened in the Spirit of Wine, especially in that part of them by which they cover the feet. But seeing that it cannot wel be that al the parts should be sufficiently kept from and defended against the cold, yet notwithstanding, left that any one (after he hath for a while been in the cold Air) should suffer any dammage, the refrigerated parts are not first of al to be altered with the contrary quality; but rather we ought to do our endeavor, that the cause which hath insinuated it self into any part may be removed and taken away. And therefore (as it is commonly wont to be done in the cold Septentrional Regions; and of which as of a thing very wel known, *Gulielmus Fabricius* takes notice in his Treatise of a *Gangrene* and *Sphacelus*, Chap. 10) the refrigerated part is not to be put close to the fire, neither are those things that are hot to be imposed thereon; (for if this be done, the coldness, or indeed rather the cold Atomes retained in the part being by this means thrust down into the deeper parts of the place affected, a most intollerable pain happeneth thereupon to arise, yea and somtimes also a Gangrene is produced and excited) but the cooled part is to be wel rubbed with Snow that so by its like the coldness (or cold thing) may be extracted out of the affected part, after the same manner as Apples or Eggs being frozen and cast into the coldest water are restored unto their pristine Nature, the extracted Ice sticking fast without unto the rinds of the one, and shels of the other. And for this very reason the Inhabitants of the abovementioned Northern Regions, when they have been travelling do not accustom themselves to enter into Stoves or Hot-houses, or so much as to draw neer unto any fire, until they have first throughly rubbed their Hands, Nose, and the extream parts (or tips) of their Ears with Snow; or have plunged (as we may so say) their almost frozen feet into cold Water, or

Snow

Snow. And the same *Fabricius* (in the place alleadged) relateth, That a Noble man of good esteem and reputation told him, that when he travelled in those Regions he himself on a time lighted upon one travelling as he was upon the Road; whom finding to be stiff with cold and almost dead he caused to be put into a Cart; and having brought him into an Inne, his Host (the man of the house) immediately plunged him over head and ears, as we say, in cold water; which was no sooner done, but instantly there issued forth from al parts of him a kind of frostiness, in such a manner that his whol body seemed as if it had been al over covered with Ice, like as with an Iron shield: and then he gave him to drink a Cup of Hydromel, putting thereinto the pouder of Cinnamom, Cloves, and Mace; upon which he fel into a sweat in his Bed; and soon after the sick person returned unto his former state, and became perfectly wel recovered.

The Cure.

When now the said congelation is asswaged and qualified, and the cold for the most part extracted and drawn forth, or else hath exhaled of its own accord, (which is known by this, that the pricking pain is much moderated, if not quite ceased) then the part is to be fomented and cherished with sweet Milk made blood warm, in which there have been boyled Rosemary, Organy, Sage, the Leaves of Rue, and Bayberries. It wil be likewise very commodious (this being a remedy that is also very wel known) to thrust deep into warm Water (in which Rape Roots, especially those that were formerly congealed and frozen with col have been boyled) the Hands or the Feet. Or,

Take *White Wine one pint*; *Allum an ounce*; *boyl the Allum with the Wine, and let the part be wel washed therewith: the Decoction also of Lupines is good and helpful: and after it let the part be anointed over with Honey in which live Sulphur hath been boyled.*

This is likewise very efficacious:

Take *of the Oyl of Bayes two ounces*; *Honey one ounce*; *Turpentine half an ounce*: *Mingle, &c.* Or,

Take *Turpentine, unsalted Butter, and Mace, of each alike, and what you please for the proportion: Mingle them, &c.* Or else,

Let the part be anointed with Oyl of Wax.

If the part be already exulcerated, Allum poudered and mingled with a like portion of Frankincense poudered likewise is very helpful, and wel approved of, a little Wine being thereto added: or the Oyl of Roses boyled in a Rape Root (or in the Reddish Root made hollow, and the pith taken al out) and then squeezed and pressed forth.

Or else let an Unguent be made of River Crabs burnt, with Honey and the Oyl of Roses. Or,

Take *Rue, the Marrow of a Bull, the Unguent of Roses, of each as much as you think fit: mingle them, &c.* Or,

Take *Wax, the fat of a Hog, of each an ounce; Litharge of Silver or Lead ten drams; the rind of the Pine two ounces; of Manna thuris one ounce; Oyl of Roses a sufficient quantity. Make an Unguent.*

Chap. 16. *Of the Tumor* Ecchymoma.

THere is likewise somtimes poured forth blood (the Skin continuing stil whol and sound) into the spaces of the parts; from whence there ariseth an Affect, which by the Greeks is termed *Ecchymoma* or *Ecchymosis*, and by the Latines *Effusio*, *Suffusio*, *Sugillatio*. For an *Ecchymosis* is nothing else but *Chymeon ecchysis*, that is, an *Effusion* or pouring forth of the Humors, to wit, the blood, into the next adjoyning spaces, by reason of the opening of the Veins; to wit, if the Skin abiding whol the Veins pour forth that juyce which they contain, that is the blood, as *Galen* speaketh in his second Book of Fractures, Comment. 16. and either the orifices of the Vessels gape (which happeneth in an Anastomosis) or else the blood doth as it were sweat forth and strain it self out through the Tunicles of the Vessels being rarefied; which the Greeks cal *Diapedesis*; or else by contusion the Vessels are loosened; which chanceth if one fal from an high place, or else be oppressed and over laid by the weight of somthing that is heavy lying upon him; or else be smitten and hurt with a club, stone, stump of a Tree; or else lastly, that by some violent motion and extension a Vessel be broken. Then (the Skin remaining whol) the blood is poured forth into the neer adjoyning spaces; whereupon the color of the part is changed; and at first indeed it seemeth reddish; afterward it becometh Leaden colored, then yellowish, green, blackish: whereupon it is that *Galen*, in his Book of Preternatural Tumors, Chap. 10. and tenth Book of the Composition of simple Medicaments, Chap. 9. maketh two species of this *Ecchymosis*; one (which by the general name he calleth *Ecchymoma*) when the part obtaineth a middle color betwixt red and black; which indeed may properly be termed *Pelidna*, that is, of a livid or leaden color; and the Affect may likewise be called *Livor*, to wit, paleness, or wanness: the other he termeth *Melasmata*, that is, blackneses; which latter are especially familiar unto old persons, as often as their Veins are bruised, or opened upon any other cause, and these happen upon any smal or sleight occasion; like as on the contrary, *Pelidna* and *Livores* befal Children and those that are young, and Women, and such as are of a white color.

But

But now, although oftentimes, and indeed for the moſt part, the part is not lift up into a Tumor or Swelling, but the Blood poured forth doth ſo inſinuate it ſelf into the ſpaces of the parts that there is no Tumor at all appearing: yet notwithſtanding ſomtimes the part doth ſwell up, if there be great ſtore of Blood poured out; and this alſo is now and then wont to happen after Veneſection, to wit, if the whol Vein be ſmitten, or if the Wound that is in the Skin ſhall be cloſed up, but that which is in the Vein it ſelf left open and unſhut. For from hence by that Wound that is in the Vein the blood is poured forth, for which when there is no iſſue or paſſage open (the Wound in the Skin being cloſed up) it is oftentimes under the Skin poured out into the whole Arm; and ſomtimes it exciteth alſo a certain ſwelling; but however, it alwaies dyeth the Skin of a Red and livid or leaden colour.

Ecchymoſis But the Affect is various and different; and the *Ecchymoſis* ariſeth in a different manner, ſince that the blood is not evermore poured forth without the Veins; but oftentimes by reaſon of the great abundance of the Spirits and Blood the Veins and Arteries that are terminated in the Skin are filled full of blood, and thereupon the Body becometh coloured; as appeareth out of *Hippocrates*, Epid. 2. Sect. 4. in the end thereof, where he writeth thus; *That all diligence and care muſt be taken, that the paſſion and anger of the Mind may be provoked and ſtirred up, both for the repairing of the colour and the pouring in of blood.*

And to tel you the truth, in what place ſoever there is ſuch an effuſion of Blood, it may in general be called *Ecchymoſis*: yet notwithſtanding, *Paulus Ægineta* in his fourth Book, Chap. 30. (according to the diverſity of the parts affected) reckoneth up three kinds or ſpecies, all which may be called by their ſeveral diſtinct and peculiar names. The firſt is thoſe which we call *Hypopia* (and by *Hippocrates* named *Hypophthalmia*) that is, *Subocularia*, to wit, paleneſſes, or wanneſſes under the Eyes. Now it is termed *Hypopion* from *Ops*, that is, the Eye, becauſe it appeareth under the Eyes; and it is an Affect differing from that we call *Hypopyon* (the difference lying in this, that the former is written by ω and ι, the latter by ο and υ,) from *Pus* (which the Greeks call *Pyon*) becauſe it is a collection of *Pus* or purulent matter under the *Cornea* Tunicle. The ſecond Species is *Hypoſphagma*, which ſome in ſpecial term *Suggillatio*, to wit, an effuſion of blood into the *Adnata* or *Cornea* (both of them Tunicles) of the Eye; touching which we have already ſpoken in the firſt Book of our Practice, Part 1. Sect. 2. Chap. 32. The third Species is that which is cauſed by the Contuſion or bruiſing of the Nails; this Species *Hippocrates* calleth *Hyponychos*, and the Latine Authors term it *Subungulus*, in regard that it is an Affect under the Nails.

Contuſion. Somtimes with *Ecchymoſis* there is likewiſe conjoyned a Contuſion; yea and ſomtimes alſo there is ſo great an abundance of Blood poured forth, that it being collected under the Skin and the Muſcles, it there cauſeth a certain hollowneſs, and lifteth up the part into a Tumor, or Swelling. There is alſo ſomtimes (according to the Nature of the part) conjoyned therewith a pain; from whence it happeneth that more blood floweth thereto, and by this means an Inflammation, yea and ſometimes likewiſe at the length a Gangrene is excited. There is to be ſeen a notable Hiſtory of this in *Johannes Philippus Ingraſſias*, in his *Iatropologia*. When in the yeer 1537. (in an Hippomachie or Tilting, as we call it) the Marqueſs of *Terra Nova* ran with the Baron of *Volaterran*, it ſo chanced, that the armed Knee of the Marqueſs (by reaſon of the Fury and extraordinary fierceneſs of their Horſes) gave ſo great a blow upon the bare and unarmed Leg of the Baron, that the Contuſion or bruiſe that followed thereupon was ſo great and grievous, that the Baron died thereof four daies after. By reaſon of this his ſo ſudden and unexpected death the Phyſitians were queſtion'd and called to an account, for that they had not rightly and as was fitting managed the Cure. In whoſe behalf and defence *Johannes Philippus Ingraſſias* wrote thoſe two Books of Apology under the name and Title of *Iatropologia*. There is likewiſe extant in *Gulielmus Fabricius* (Cent. 2. Obſervat. 83.) another Hiſtory (which you may there ſee) ſhewing how dangerous Contuſions may be.

The Signs.

Suffuſions and theſe Suggillations are eaſily known. For the very colour it ſelf, and the Swelling (if at leaſt there be any) fal under the ſenſe, and are apparently to be ſeen. The Cauſes are known by thoſe things that went before, and ſuch as are likewiſe preſent. For if any external Cauſe went before (as a Blow, a Fall, and the like) the Phyſitian may underſtand it from the relation of the Patient. But if none of theſe ſhall happen, we are then to conſider the Blood in the Body; and well to weigh by what means it becometh thus peccant and offenſive.

Prognoſticks.

1. Although, in truth, theſe *Ecchymomata* are for the moſt part void of all danger, and the blood that is yet thin may eaſily be diſperſed: yet if this be not done, and that the blood be deteined any thing long in the part affected (out of its own Veſſels) it then may prove to be of dangerous Conſequence, in regard that by this means there may be excited both a Corruption of that very part that is affected, and likewiſe a damage and detriment unto the whol Body. For the Blood being clotted together unleſs it be forth-

with

with insensibly discussed, or turned into *Pus*, (which is necessarily done, where the Flesh is withall greatly bruised) so that hence the part yet continueth soft, it putrefieth and corrupteth, and breedeth a Gangrene, and very frequently bringeth Death and Destruction upon the sick Person.

2. But there is great danger threatned, and nigh at hand, when the part affected continueth not any longer green or wan, but inflamed, and becometh very red, hard and distended. Of which we related that former notable History out of *Ingrassias*.

The Cure.

As for what therefore concerneth the Cure, we wil first of all treat of the Cure of that *Ecchymoma* that followeth upon a Contusion. For even this also very often happeneth; and whoever he be that knoweth the Cure of this, he shal have a sufficient store of Medicaments with which he may cure the rest; since that the discussing Medicaments that are here to be drunk have their place likewise in the other. First of al therefore, if the contusion be great, we must use the best of our skil and care to prevent and hinder the afflux of blood unto the place, lest that thereby an Inflammation should be excited. This is to be done by Venesection; for which cause *Galen* commands, That in a fal from on high, and in beatings and bruisings, a vein be opened, and that although the blood doth not greatly abound, yet that by opening a Vein it be drawn forth, lest that an Inflammation should be excited; from whence not only evil symptoms, but oftentimes also even death it self hath its original. And the truth is, this Venesection is forthwith to be ordained and put in practise; & withal at the same time Defensives and Repellers are likewise to be placed neer about the part, that may impede and prevent the influx of blood into the part affected; such as are made up of *Bole-armenick, Terra sigillata or Sealed Earth of Lemnos, Dragons blood, Roses, Myrtles, the Nuts of the Cypress Tree, Galls, Pomegranate flowers, Roots of the lesser Consound*, and the like. As for instance:

Take *Bole armenick, Terra sigillat. of each an ounce and half; Chalk half an ounce; let them boyl in Vinegar: after they be boyled, Take Pouder of red Roses, the pure fine flour of the Root Consolida, or Consound, of each half an ounce; and with the Oyl of Myrtles make a Cataplasm.*

Or only, which is likewise in common use, the white of an Egg shaken together with Rose water; and with hurds or the courser part of flax, applied unto the place affected. Or,

Take *the white of four Eggs, the Oyl of Myrtle and Roses, of each one ounce; Bole armenick, Dragons blood, of each half an ounce; Cypress Nut two drams; a little Vinegar; Mingle them &c.*

And this is also here to be taken notice of, that there be not many moist and clammy Medicaments administred; for by reason of such humid things applied the blood fallen forth out of the Veins is easily putrefied: whereupon divers il and dangerous Symptoms are afterward wont to arise.

But in very truth, when from a fal from some high place, beating and bruising (and the like Causes) the blood is not only gotten together under the Skin and the external parts, but oftentimes also is poured forth into the more inward parts, after the same manner as it is in the Circumference of the Body when the Vessels are opened or broken (which said blood is there clotted and corrupted, and is wont to cause Inflammations, and the worst sort of Feavers, dangerous Symptoms, and very frequently death it self) we must therefore use the best of our endeavor that the clotting and growing together of the aforesaid blood may be hindered, that it may be dissolved, and that it may be evacuated by stool, urine, or sweats, and that with al due and possible speed. For when once the blood hath gotten a putridness the Malady is not so easily cured, nor indeed at al without the most exquisite and singular extraordinary Remedies. Wherefore so soon as there is any the least suspition that the blood is fallen forth without the Veins into the more inward parts, and that it cannot be dissipated by external Remedies, we must then use these things following: to wit, *Rheubarb, Rhapontick, Terra sigillat. Sperma Ceti* (in the Shops termed Parmasitty) *the Eyes of Crabs, Mummy, red Corals, Harts-horn, Madder* (such as the Dyers use in coloring) *with the Waters of Cherefoyl, Carduus, Marjoram, St. Johns wort, Fumitory, Alkekengy, Card. benedict. Scabious, the Syrup of Sorrel, Syrup de Acetositat. Citri, Vinegar*, and the like; which what they are will appear further from the following Receipts, and Prescripts.

Take *Rheubarb, Terra sigillat. Bole armenick, Mummy, of each one dram; make of these a Pouder*: of which give one dram at once, with the Water of Cherefoyl, or Shepherds-Pouch. Or,

Take *Terra sigillat. Crabs Eyes, of each one scruple; Sperma Ceti, Goats blood prepared, Angelica and Gentian Roots, choyce Rheubarb, of each half a scruple; seeds of Carduus Bened. seven grains; Cloves three grains*: Make of these a Pouder for two Doses, to be taken at twice, and drunk with the following Waters:

Take *the Water of the Infusion of Lavender one ounce; the Waters of Cherefoyl, St. Johns wort, Strawberries, of each one ounce and half; Wine Vinegar half an ounce, for twice.* Or,

Take *Terra sigillat. Madder, Mummy, great Comfrey, Rheubarb, of each a scruple: mingle them, and make a Pouder.* Or,

Take *Rheubarb, the Root of Madder, Mummy, Crabs Eyes, the seed of Carduus Mariæ, or Mary Thistle, the Root of round Aristolochia or Birthwort, of each one dram: mingle and make a Pou-*

in the which there is a certain moiſture like unto an Honey-comb. The ſecond is that we cal Ficoſa, *being round and hard; in the upper parts of which there is a certain redneſs, and in the concavity thereof ſomthing like unto the ſmal grains and ſeeds that are in Figs. There is likewiſe a third ſpecies that is called* Ameda: *and they are Ulcers with the which there are in the Head many little holes that are ſomwhat leſs than thoſe that are in the* Favoſa; *and out of theſe there iſſueth forth a certain humidity like unto the water of fleſh. There is alſo a fourth ſort of Puſtule; but they are ſmal and red ones; the figure and form whereof is like unto the Teats of Dugs; from which there floweth out a moiſture like unto the waterineſs of the blood. There is likewiſe a fifth ſpecies thereof, that is dry, and of a white color, like unto the* Lupina; *from which there flow forth as it were hulls, and white ſcales.* Where he conſtituteth four moiſt ſpecies of *Tineæ*, and the fifth ſpecies dry; and under the moiſt he comprehendeth not only *Achores* and *Favi*, but likewiſe even *Papulæ* and *Ficus*. But now by *Papulæ* we are to underſtand al ſmal Puſtules out of which there iſſueth forth an humidity like unto wateriſh blood; ſo called from their figure, by which they reſemble the Teats of the Breaſts. They are called likewiſe *Elcydria*: For although this name (in the general) ſignifieth any little Ulcer; yet notwithſtanding *Galen* in his firſt Book of the Compoſition of Medicaments according to the places, and laſt Chapter, attributeth this name in ſpecial unto the Ulcerous Puſtules in the Head. And indeed *Alexander* (in his firſt Book, and Chap. 7.) yet more eſpecially aſcribeth this name unto the ſaid *Papulæ*; and ſo doth *Paulus Ægineta* in his third Book, and Chap. 3. And *Aetius*, Tetrab. 2. Serm. 2. Chap. 70. And *Celſus* likewiſe under the name of a little Ulcer, ſeemeth in ſpecial to underſtand *Achores* and *Favi*, when (in his fifth Book, Chap. 28. Title, touching the ſeveral kinds of Puſtules, and the Cure of them) he thus writeth: *But out of Puſtules* (ſaith he) *there now and then ariſe likewiſe ſmal Ulcers that are either more dry, or more moiſt; and they are accompanied ſomtimes only with a kind of Itching, but otherwhile they are alſo attended with an Inflammation, or with pain: and there iſſueth forth either* Sanies *or* Pus, *or both of them. And this eſpecially happeneth unto ſuch as are yet in their Childhood, and then but very ſeldom in the midſt of their body, but very frequently in the higher parts thereof.* But now *Sycoſis*, or *Ficus*, is a Tumor ſo called from the reſemblance it hath with a Fig (becauſe that in the Cavity thereof there is ſomething found like unto Fig ſeeds) round, ſomewhat hard, reddiſh, and Ulcerous; from which there is ſomthing ſmal and glutinous or clammy, that now and then floweth out of it, breaking forth of the Chin, and eſpecially the Beard; and ſomtimes alſo it breaketh forth in the Hair. From whence it is that *Celſus* (in his ſixth Book, and Chap. 3.) conſtituteth two ſpecies thereof; where he thus writeth: *There is likewiſe* (ſaith he) *an Ulcer, that from the likeneſs it hath with a Fig, is by the Greeks named* Sycoſis. *And here the fleſh groweth forth; and this is indeed the general name thereof. But now under it there are two ſpecies: the one whereof is an hard and round Ulcer; but the other moiſt and unequal. Out of the hard there floweth forth ſomthing that is ſmal and glutinous; but out of the moiſt there iſſueth forth more, and that of a very ill ſavor. Now both theſe are in thoſe parts that are covered with Hair. But then indeed that which is callous and round breaketh forth more eſpecially in the Beard; whereas* (on the other ſide) *that which is moiſt appeareth chiefly in the Hair. It is bred likewiſe in the Arſe; and then the* Latines *cal it* Mariſca.

Sycoſis.

But here we meet with very great variety of names, eſpecially among the Arabians. And neither ſo only, but likewiſe there is great variety of diffecence that occurreth in explaining the cauſe thereof. For *Galen* in his Book of preternatural Tumors, and Chap. 16. afferteth that a ſalt flegm; but in his firſt Book of the Compoſition of Medicaments according to the places, Chap. 10. he ſaith that a humor mingled of a thin, wheyiſh, and corroding, and likewiſe of a thick, glutinous, and clammy juyce, is the cauſe as wel of the *Achores*, as of *Favi*. *Paulus Ægineta* in his third Book, and Chap. 3. writeth that a nitrous and ſalt flegm is the cauſe of both theſe Affects. *Alexander* in his firſt Book, and Chap. 8. mentioneth three Humors, viz. Choler, Flegm, and the Melancholy Humor. And indeed the upſhot of the whol Controverſie is this; That theſe Affects do ariſe from a Salt and nitrous flegm, with the which there is mingled one while Choler, another while Blood, and ſomtimes likewiſe a Melancholy Humor.

Pſydracia.

In ſpecial, as for what concerneth *Pſydracia*, the Author of the Book of Medicaments that are eaſily provided, unto *Solon*, thus defineth them, viz. That they are ſmal Efflorefcencies made in the Head, like unto thoſe Bladders that riſe high in the ſuperficies. And *Alexander Trallianus* in his firſt Book, and Chap. 5. and *Paulus Ægineta* in his fourth Book, and Chap. 3. following the aforeſaid Author, have reckoned up *Pſydracia* amongſt the Affects of the Head; and thus they define *Pſydracia*; Pſydracia *are certain ſmal eminencies, like unto little Bladders or Puſtules* (thoſe that we cal *Phlyctænæ*) *ſpread up and down upon the ſurface of the Skin.* Yet notwithſtanding that Author of the Introduction unto *Galen*, aſcribeth *Pſydracia* likewiſe unto the whol body; when he ſaith in his 15. Chapter, *That*

Psydracon *is commonly so called, because that it is an Efflorescence all over the Body, and about the white of the Eye, somwhat red in the top thereof.*

The Causes.

The Cause of this Tubercle is a humor mingled together, of Blood, Choler, and a salt and nitrous humor.

The Signs may easily be gathered out of the descriptions already delivered; neither do the *Psydracia* threaten any danger at all.

The Cure.

They are cured by these following Compositions; as *Al. Trallianus*, in his first Book, Chap. 5. and *Paulus Ægineta* in his third Book, Chap. 3. teach us.

Take *the Spume or Froth of Silver, and Ceruss, of each half an ounce; Alum, and the Leaves of Green Rue, of each two drams; these being well bruised and mingled together with Vinegar and Oyl, anoynt the part affected therewith.* Or,

Take *Rue and Alum; bruise them well with Honey, and impose them upon the Head after it is shaven.*

Chap. 33. *Of* Strumæ, *and* Scrofulæ.

THere is moreover another kind of Tumor, which is not excited simply from a humor poured forth into the external parts of the Body or diffused through them; but a humor in which the matter that is the cause of the Tumor is (in a peculiar Membrane) concluded and shut up; and the humor that exciteth this kind of Tumor is changed into almost another kind of Substance. Among these Tumors, in the first place we are to account *Strumæ* and *Scrofulæ*: and indeed touching *Strumæ* in the Neck (or the Kings Evil, as we commonly call it) and *Bronchocele*, we have already treated, in the second Book of our Practise, Part 1. Chap. 25. where we have likewise written much of *Strumæ* in general. And yet notwithstanding, here in this place likewise there is somthing more in general to be spoken touching the same; in regard that (as we shall by and by shew you) they do not only seiz upon the Neck, but also upon divers other parts.

But although this kind of Tumor may not unfitly be referred unto a *Scirrhus*; yet notwithstanding they are not called by this common name; but these Tumors are called *Choirades*, or *Scrofulæ*; the appellations being taken from Swine, that are more frequently troubled with this Malady. And yet notwithstanding *Paulus Ægineta* in his sixth Book, and Chap. 35. rendreth another reason of the name, to wit, from the Rocks *Chærades*: For *Chæras* is a black Rock in the Sea, that is rough and somwhat eminent, so that it seemeth like unto a swimming Hog: unto which Rock indeed (by reason of the roughness of the Tumor) this Disease may be resembled. But yet some there are that seem to make a Difference betwixt *Scrofulæ* and *Strumæ*, when they write that *Scrofulæ* are hardned Tumors, and such as are included within a certain Membrane in the Glandules or kernelly parts; the which if they be generated out of the Flesh, then they are to be called *Strumæ*; but most Physitians reject and approve not of this difference. For *Strumæ* are a Scirrhous Tumor of the Glandules, as *Galen* defineth it in his 14th Book of the Method of Physick, Chap. 11. and such as is shut up in a peculiar Membrane. For the Glandules or Kernels are the Subject of *Strumæ*; and the truth is they arise most commonly in the Neck (both the fore part and the hinder part thereof) and yet somtimes likewise in the Arm-holes, and the Groins. *Meges* a certain Chirurgeon (of whom *Galen* also maketh mention in his Book of the Method of Physick, the last Chapter) hath also observed that these *Strumæ* often arise in the Paps, as *Celsus* writeth in his fifth Book, Chap. 18. And we have told you before in the third Book of our Practise, Part 3. and Chap. 5. that *Strumæ* have been likewise somtimes found in the Mesenterium. If this Affect appear in the Throat then by a peculiar name they call it *Bronchocele*, *Bocius*, and *Hernia Gutturalis*. This is a great and round Tumor of the Neck, between the Skin and the rough Artery; in the which there is included somtimes Flesh, and another while a certain humor like unto Honey or Fat. But yet notwithstanding these *Scrofulæ* differ from other Glandulous Tumors; and that first in the number, because that in *Scrofulæ* there are very many Kernels that swel up; and one dependeth upon the other in the superficies of the Skin, like unto Grapes that hang down from one and the same Bough; and moreover, because that *Scrofulæ* have deeper Roots then the other Glandulous Tumors.

What Strumæ *are.*

The Causes.

But now these *Strumæ* have their original from a flegmy humor, and likewise (according to others) from a Melancholly, or else from a humor mingled of Flegm and Melancholly: whereupon it is that such as are Flegmatick, Melancholly, Glutoinous, that are wont to eat meats that are cold & moist, and to drink cold waters, are most especially troubled with these *Scrofulæ*. And hence it is that in certain Regions where the Inhabitants make use of Crude and snowy waters, they are all of them for the most part afflicted with the said *Strumæ*. But now these *Strumæ* are generated, not suddenly, and all at once, but by degrees, one after another; and first of all the matter floweth in unto one Glandule, in the which there is excited a Tumor,

soft

soft and loose; and then unto another, in which there is in like manner excited a soft Tumor, which in a short time is hardened; until at the length there hang down from the place affected many Glandules, as it were so many Boughs or Branches.

Aetius in Tetrab. 4. Serm. 3. Chap. 5. out of *Leonidas*, tels us of a twofold manner of the Generation of these *Strumæ*, where he thus writes: *These* Strumæ (saith he) *are a Flesh somwhat white, easily encreasing and growing, conteined in a Membrane; and in brief, they are Glandules hardned, that arise in the Neck, under the Arms, and in the Groyns, where the Glandules are situated under the Vessels, like as also in other Glandules already mentioned. And somtimes likewise (but this is very rare) they are bred from the Flesh of the self same places, which by a certain affinity is converted into the nature of* Strumæ, *and is augmented by the acceß of Matter.* For first of all, the Glandules of the said parts (in like manner as all other parts, the Flegm being dried, or the Melancholly humor, or both of them together mingled) become hard like as a *Scirrhus* doth. But somtimes the very substance of the Glandulous flesh being dried waxeth hard; which yet notwithstanding being afterward moistened by the melancholly or Flegmy humor, increaseth, and becometh preternaturally augmented. Yet notwitstanding, in regard that both those waies of generation are coincident, and in a manner one and the same, *Galen* thereupon seemeth for the most part to sleight this difference, and in his Book of preternatural Tumors, Chap. 11. he there saith, that such as are affected with hardened Glandules may properly be said to be affected with *Strumæ*.

But yet notwithstanding touching the Causes, we have before in the place alleadged acquainted you, that *Platerus* determineth, that Flegm alone, and the Melancholly humor, are scarcely sufficient to generate *Strumæ*, seeing that if they were from those alone, they would not then be of long continuance, but they would rather be obnoxious unto putridness or turned into *Pus*, like as are other Tumors; but that these *Strumæ* derive their original from a Juyce nourishing these parts. For whereas Glandules are nourished with a thicker Juyce than other fleshy parts; if this Juyce exceed in Quantity, it then generateth divers kind of Tumors. But although this be altogether to be granted; yet notwithstanding this is not altogether impossible, but that some melancholly and flegmy humor be mingled together with the aliment of the Glandules.

Now this matter of the *Strumæ* is included in a peculiar Membrane, which the formative faculty (that is seated and planted in all the parts that have life in them) produceth. For whenas there is some Membrane distended, or even broken, by the superfluous humor that floweth thereto, Nature extendeth and dilateth the same; and attempteth the structure and forming as it were of a new Membrane.

The Differences.

These *Strumæ* are by some distinguished into Malignant and Benign; and they will have those to be benign that are without an Inflammation, & without pain; and those they will have to be malignant that have with them both Inflammation and pain, and that are the more exasperated by Medicaments. But we must know, that those *Strumæ* that are termed malignant, are not properly *Strumæ*, but a Tumor as it were mingled of *Strumæ* and a *Cancer*; so that this Tumor doth not alone proceed from a flegmy and Melancholly humor, but it hath likewise mingled together with it a black Choler. They are likewise distinguished in this manner; that some *Strumæ* are free, others of them infiltrated. Those of them are said to be free, and simple, that are not complicated with any Vessel, or tied together with it: but such of them as are knit together either with some notable Vein, or some Nerve, and are as it were wrapt and folded within them, these we call *Strumæ* infiltrated, or haply (as by a name more fit and congruous) *Strumæ* implicated.

Those things that should have been further declared touching these *Strumæ*, have already been propounded in the place alleadged, *viz.* in the second Book of our Practise, Part 1. Chap. 35. and there they may be seen.

Chap. 34. *Of* Ganglium, *and* Nodi.

Anglion, so called by the Greeks, and by the Latines *Ganglium*, is by some reckoned up among the Affects of the Head. But by *Paulus Ægineta* in his fourth Book, Chap. 16. and Book 6. Chap. 39. and by *Aetius* in Tetrab. 4. Serm. 3. Chap. 9. it is attributed unto many parts, and it is an Affect of the Nervous parts; and by the Author of the Physical Definitions it is thus defined, *viz.* that it is a preternatural rowling together, or knot of a Nerve, which groweth together into one Body. The very same Tumor *Guido* in his second Tract, Doct 2. Chap. 4. seemeth to call it *Lupia*; and *Tagautius* in his Chirurgicall Institutions, Book 1. Chap. 13. writeth, that it appeareth in *Aetius* (out of the Cure *Philagrius*) that *Lupia* of the modern Physitians, the *Glandula* of *Avicen*, and *Ganglion* of the Greeks, is one and the same Affect.

But by what names these Tumors are called by the Germans is not very evident. For if we well weigh the Descriptions, and Signs, yea and the Cure likewise of *Ganglion*, and *Lupia* of the Greeks, and the latter Physitians, as also of the

Uberbein. Glandules of *Avicen*, *Ganglium* is that Affect which by the Germans is called *Uberbein*, so called, not that it is indeed a Bone, but because it is a Tumor upon a Bone, to wit, in that same place where the Bones are only covered with the Skin, or because it resembleth the hardness of a Bone. Notwithstanding *Platerus* doth not cal those Tumors that arise from the Nerves (and which Authors every where describe under the name of *Ganglium*) by the name of *Uberbeine*, but a peculiar kind of Tumor, when (the *Periostium* being shaven, or eaten through) there springeth up, and groweth unto the former as it were a new Bone. But now that Tumor which he propoundeth under the name of *Ganglium*, viz. which is bred about the joynts, especially the Knees, somtimes comprehending the whol Joynt (and this one while in a more narrow, and other while in a broader limit, and somtimes also so stopping and hindering the motion thereof that the Member is altogether either motionless, or else so that it cannot be wholly and entirely moved) seemeth to be that

Glied-shevva. Tumor which the Germans cal *Glied-shevva*; to wit, because (as it were a certain Mushrom) it ariseth under the Skin, neer about the Joynts, and especially the Knee, which is not alwaies round, but often overspreadeth the whol Knee; when yet notwithstanding *Ganglion* is alwaies a round Tumor, as *Ambrose Parrey* writeth in his sixth Book, and Chap. 20.

But (as I told you likewise before) there is a great confusion in the names. And therefore (as *Joh. Tagautius* in the first Book of his Physical Institutions, and Chap. 2. adviseth us) the thing it self is to be heeded with al care and circumspection; and as for the names, we need not much to regard them; since that oftentimes one and the same word hath in several Authors various and different appellations. *Ganglion* ariseth indeed in al, or the most parts of the body, (and yet more especially in those parts that are moved) neer about the Joynts, to wit, In the Hands and Feet, and in those very places where the Bones are only covered with Skin, and where there is a concourse of the Tendons, Ligaments, and Nerves. And yet notwithstanding *Aetius* addeth the Head and Forehead, as likewise the Elbows and Arms; but it is but seldom that it happeneth in these parts.

The Causes.

That it hath its original from a blow, or from hard labor, *Paulus* and *Aetius* teach us; which is indeed to be understood of the evident cause. But how these evident causes come to produce those Tumors, is not so evident and manifest. Vulgarly, the greater part determine that they arise from a dull, sluggish, thick flegm, or else from Melancholy. But others assert (and that more rightly) that by means of some fal, by reason of extension, or of some extraordinary hard labor, and over working, (by al or any of which either a Nerve or a Tendon is too far extended, or likewise, according to the Membrane, even as it were broken) the nutriment of the Nervous part doth as it were sweat forth, and adhere neer about the Fibres and the substance of the same Nervous part, and so becometh changed into this substance by reason of the formative faculty of the said parts, and then covered with a peculiar Membrane. After which manner (if the *Periostium* be opened) even in the Bones, their nutriment is turned into a boney knot, as *Platerus* giveth us to understand. For look as it is in Trees, if their Rind or Bark be wounded, or in any other manner opened, Nature sweating forth the aliment suffereth it not rashly to diffuse it self al abroad, but changeth it into a knot; so in like manner, albeit the Membranes that wrap about the Bones or Nervous parts may be broken, yet Nature permits not the aliment rashly to flow abroad through the open passages, but from thence (under the Skin) formeth a Tumor, included and shut up in a peculiar Membrane.

But now that *Ganglion* that *Platerus* describeth happeneth not from the default of one only Nerve or Tendon, but chiefly in those places where there is a concourse of Tendons, Ligaments, and Nerves; and especially about the knee, either when those parts by reason of their overgreat motion are very much exercised, or else while Wounds are in curing. For if the juyce of these parts, to wit, of the Tendons, Nerves, Membranes, and Ligaments, shal chance (upon the occasion of the aforesaid Causes) to flow forth abroad out of the said parts, and shal withal begin to be luxuriant, and to abound, and shal likewise adhere unto the Fibres of the same parts, it is then changed into such a like fungous or Mushrom-like matter, which oftentimes overspreadeth the whol joynt; and is thereupon by the Germans called *Der Gliedshevva*.

And yet notwithstanding it may likewise so chance, that a vitious humor abounding in the body may flow in into such a like weak part, and may be mingled together with the said thick juyce that nourisheth these parts, and may (through that open passage) flow together with it unto the aforesaid parts, and may there augment the Tumor.

Signs Diagnostick.

This Tumor is bred in those parts that are not covered with much flesh, but only by the Skin; and therefore it lieth not hid very deep: and it is now hard, now soft; now greater, now less; and somtimes it is in bigness equal unto (and many times greater than) an Egg; it is void of al pain, and yet notwithstanding if it be forcibly pressed together, it then manifesteth a certain kind of dul

and

and ſtupid ſenſe; it may be thruſt and moved unto the ſides, but neither forward nor backward.

That *Ganglium* which *Platerus* deſcribeth is a Tumor for the moſt part ariſing in the Knee, ſoft, without pain, and of a different color; from ſmal beginnings ſometimes encreaſing to ſo great a bulk and magnitude, that it comprehendeth the whol joynt; from whence it chanceth that the ſick perſon can neither ſtand upright, no go ſtraight; neither is he able in going to tread upon the ground, or at leaſt (as it were) only on tiptoe.

Prognoſticks.

1. This Diſeaſe is of long continuance, and oftentimes laſteth for many yeers; and accompanieth the ſick parties even unto their dying day.

2. Thoſe of them that are in the very junctures of the joynts, impede and hinder the motion of the whol Member.

3. The *Ganglium* likewiſe that is neer about the Joynt (unleſs it may be taken away by Medicaments) is altogether incurable. For it admitteth not of Section or cutting, in regard that it may eaſily happen, that by Section a Nerve, Tendon, or Ligament may be hurt.

The Cure.

Univerſal or general Remedies having been firſt premiſed, it is requiſite that the Tumor be mollified and diſcuſſed; or (if this cannot wel be done) that it be ſuppurated, or cut out. Therefore if *Ganglium* or *Nodus* (the Knot) be recent and new, and the little Bladder within which it is included be yet tender; we muſt then in the firſt place do our endeavor that the ſaid bladder may be broken. And therefore the Tumor is to be rubbed with the hand ſo long until it wax hot, and become ſofter; and afterward let it be cloſe preſſed together with ſome thin plate, or ſome other ſolid thing, ſo long that the bladder may be broken, and that the matter therein included may be thereby diſperſed. And therefore let a thin plate of Lead be impoſed upon the place affected, and bound cloſe upon it with a Swathe; which is not to be removed until after ten daies. Others there are that firſt of al anoint the Tumor with Ammoniacum diſſolved, in the form of an Emplaſter, and then after they apply a thin plate of Lead. *Oribaſius* made uſe of this that followeth:

Take Ceruſs, Pitchy Roſin, old Oyl, Ammoniacum, Galbanum, of each one ounce; Wax four ounces; mingle them, &c. Or,

Take Aloes, and Myrrh, of each ſix drams; Litharge of Gold one ounce; Ladanum half an ounce; Ammoniacum, the Fat of a Calf, and of a Fox, of each ſix drams; Oyl of white Lillies two ounces; Wax as much as wil ſuffice; make an Emplaſter. Or,

Take of unſlaked Lime, the Fat of a Gooſe, of each one ounce; Ammoniacum half an ounce; Turpentine one ounce; mingle them, &c. Or,

Take of the Emplaſter Oxycroceum one ounce; the Mucilage of Marſh-mallow ſeed, and Fenugreek ſeed, of each half an ounce; Galbanum, Sagapenum, and Ammoniacum diſſolved in Vinegar, of each three drams; Roſin ſix drams; white Wax half an ounce; Mingle them, and make an Emplaſter. Or,

Take Gum Ammoniacum, Bdellium, Galbanum diſſolved in Vinegar, of each one ounce and half; Oyl of white Lillies, of Camomile, of Bays, the Spirit of Wine, of each half an ounce; the pouder of the Flowerdeluce Root, and live Sulphur, of each half a dram; mingle them, and make an Emplaſter.

If the *Ganglia* give not way unto theſe Medicaments, we muſt then betake our ſelves unto thoſe Remedies that cauſe ſuppuration. As for Example:

Take the Roots of white Lillies, and Marſh-mallow Roots, of each an ounce and half; the Root of Fern one ounce; fat dried Figs, in number ten; the Root of Squils (or the Sea Onion) one ounce; the Flowers of Melilote, and Elder flowers, of each one ſmal handful; boyl them in the Broth of a Wether-Sheeps Feet, adding thereto a ſmal quantity of Vinegar. Afterward let them be wel bruiſed together, and then paſs them through a hair ſieve, and then add, of Wheat flour, and the flour of Lupines, of each half an ounce; the fat of an old Sow, Ducks fat, and Gooſe fat, of each two ounces; the Dregs or Lees of the Oyl of white Lillies three ounces; and ſo make a Cataplaſm.

Section.

Ganglia and *Nodi* may likewiſe be taken away by Section; ſuch alone of them that conſiſt in the Head, the Forehead, and other places without the Joynts. But thoſe of them that conſiſt in the Joynts are not ſafely to be cut, there being cauſe to fear leſt that the Nervous parts that lie underneath be hurt thereby, and ſo conſequently the motion of the Member quite taken away. As (in like manner) it is not fit to cut thoſe *Ganglia* that are neer about the Jugular Veins, for fear of an Hemorrhage or flux of blood. Now for the manner of Section, it is this; Firſt of al, there muſt be made a ſmal Wound in the Skin, even unto the bladder wherein the matter of the Tumor is included; through which a Probe of the thickneſs of a finger, and round at the end, but hollow in the midſt, is to be conveyed in betwixt the Skin and the bladder, and then to be drawn about even unto the very Root of the *Ganglium*: and then after this (upon it) the Skin is to have an Inciſion made therein deep enough, in the form of the letter X; and from the corner of the Bladder it is to be drawn along towards the Root: and if there ariſe any Hemorrhage from the

the thicker Vessels upon their being cut about the Root, it is in a fit and convenient manner to be stanched and stopt; and then upon this the whol Tumor (together with the Membrane) is to be extracted and drawn forth, and no part thereof to be left remaining behind; or if haply there should be any thereof left behind, it is then to be consumed with Caustick Medicaments.

Callous or Boney *Nodi* (by *Platerus* so termed in special) are hardly cured, and not at al, if they be inveterate and hardened. Such of them as are curable are to be cured by those or such like Emollients as were even now propounded. Here likewise those Cataplasms are very useful that are made of *Mandrake* Root, the Leaves of Hemlock, Henbane, the dead Nettle, boyled in Vinegar, and mingled together with Emollient Greates.

If these *Nodi* tend towards the Joynts, and so hinder their motion, and have their abode in those places that are naked, and only covered with the Bones, then the Skin is to be opened; and with a sharp Iron the *Nodus* (by a continued stroke) is to be cut away from the Bone; and the Wound is then to be cured in a fit and convenient manner.

Ganglia in special so called (or those Mushrom-like spungy Tumors that arise about the Joynts, and especially the Knees, somtimes wholly comprehending it, and hindering its motion) are not to be cured without much difficulty. For Section (in regard that it cannot be administred without hurting the Tendons, Ligaments, and Nerves) hath here no place. And therefore we ought to assay that by Emollients and Digestives they may be discussed: but yet notwithstanding we ought evermore to beware that there follow not any suppuration hereupon, which in these places is wont to excite incurable Ulcers, by which the Nervous parts neer about the Joynts are corrupted.

In this case the Medicaments before propounded are likewise very useful and profitable. Or else let a Fomentation be provided of the Roots of Marsh-mallows, white Lillies, Briony, the wild Cucumber, Sowbread, the Leaves of Mallows, Marsh-mallows, dead Nettle, Henbane, Ground-pine, Sage, Primrose, the flowers of Camomile, Elder, Wall-flowers, Melilote, Linseed, Fenugreek seed, Bayberries. Or,

Take *the Kernels of Wallnuts three ounces; the meal or flour of Lupines one ounce and half; the pouder of Flowerdeluce Root, and Earthworms, of each an ounce; Honey as much as wil suffice, and make a Cataplasm.* Or,

Take *Ship-Pitch two ounces; dissolve it in the Oyl of Earthworms, and the Oyl of Flowerdeluce, of each one ounce and half; and then ad thereto of Ladanum and Mastick, of each two drams; Bdellium, and Styrax Calamite, of each one dram; the pouder of Earthworms half a dram; mingle them, &c.*

The *Diasulphur* Emplaster of *Rulandus* is likewise here very useful, and of singular benefit: but especially, and in the first place, Natural Sulphury Baths.

Chap. 35. *Of* Meliceris, Atheroma, *and* Steatoma.

THese kind of Tumors have this one thing proper and peculiar unto them, to wit, That the matter that is contained in them is shut up in a peculiar Tunicle, or little Bladder. And they take their name from the matter contained in them. For if the matter that is shut up within be like unto Honey, it is then called *Meliceris*, (and the Latines usually cal it *Mellifavium*;) if it be like to Frumenty (which the Greeks term *Atheria*) we then cal it *Atheroma*; and lastly, if it be like unto Suet, it is then by the most called *Steatoma*. For *Meliceris* (as it appeareth out of *Galen* in his fourteenth Book of the Method of Physick, and Chap. 6. and out of *Aetius*, Tetrab. 4. Serm. 3. Chap. 7. as also out of *Paulus Æginet a*, in his sixth Book, Chap. 36. and lastly, out of *Celsus* in his seventh Book, and Chap. 6.) is a Tumor without pain, containing a matter like unto Honey that is shut up in a little Nervous Skin. But *Atheroma* is a Tumor without any pain, containing in a Nervous Tunicle a Humor like unto Frumenty, or a Pultis. And *Steatoma* is in like manner a Tumor containing within a peculiar Membrane a Humor like unto Suet.

Meliceris what it is.

Atheroma what it is:

Steatoma what it is:

But now touching *Meliceris*, it is here to be noted, That it is a Disease not one and the same with *Meliceria* (of which *Aetius* maketh mention in his fifth Book, and Chap. 28.) but a disease different from it. For *Meliceria* (as *Celsus* himself hath it) is a kind of Ulcer, that is so called from the resemblance it hath with a Bee-hive; which said Disease we have already explained in the second part, and Chap. 3. of Infants Diseases, and by others it is likewise called *Kerion*, *Favus* or Bee-hive; and it is an Ulcer that is very ful of holes, chiefly peculiar unto the Head, pouring forth at those holes a corrupt matter like unto Honey; and it hath its original from flegm that is salt or nitrous. But *Meliceris* (touching which we are here treating) without any hole at al, in whatsoever part of the body it happeneth to be, it containeth within under a Nervous Membrane a substance like unto Honey.

The Causes.

Now all these Tumors are referred unto the Pituitous or Flegmy, and they are vulgarly said to be

be excited from a Pituitous or Flegmy humor, which in progress of time is by degrees and slowly changed into a Matter that is sometimes like unto Honey, sometimes unto Frumenty, and now and then likewise resembling Suet.

Platerus (as we also before told you, in the second Book of our Practise, Part 1. Chap. 25. where we treated of *Strumæ*) hath a peculiar Opinion by himself touching the Causes of these Tumors. For he thinketh that these aforesaid Tumors are generated from excrementitious humors (for if any such thing should be generated out of these kind of excrements, he conceiveth that it could not be so stable and firm, but that it would rather be obnoxious to putridness and corruption) but from an alimentary Juyce, to wit, such as is by Nature ordained for the nourishing of the part. For if the humor be thicker than is convenient for the nourishing of a fleshy part, then (saith he) a harder sort of Tumors then are the *Sarcomata* are sometimes produced; and again, if this humor be extraordinary thick, then a *Scirrhus* is generated. But if the Tumor be not so hard, then in a short time it endeth in an Impostume, in the which there may be generated a different matter, according to the difference and Variety of this Juyce that hath bred this Tumor, & the mingling therof with other humors; which yet notwithstanding is not suppurated in like manner as other Impostumes are that are bred from the Blood; neither is it turned into *Pus*, but into another kind of substance that is included in a proper Membrane, or Bladder. And in this manner (as he writeth) are generated *Melicerides*, *Atheromata*, and *Steatomata*. But he addeth likewise that unto the generation of such like Tumors as these this conduceth very much, to wit, if together with this Juyce that ought to nourish the flesh, a portion of that Nutriment of some other part (that ought to be nourished by an extraordinary thick Juyce) departing from it, and being carried into the fleshy seats together with their Nutriment, there beget in them such an hardness. And this he likewise endeavoreth to prove even by this Argument, to wit, that in these kind of Impostumes bred from those Tumors there is to be found somthing like unto the substance of other parts resembling sometimes Hair, sometimes a Nail, sometimes a Bone, and now and then a Glandule; which (saith he) could not wel any otherwise be bred, or produced from any thing else then the juyce nourishing these parts, either in the Skin, or in the flesh neer unto it, as being hither brought & conveyed together with the proper Nutriment of the Flesh. And from the same he conceiveth that it cometh to pass, if at any time there be found in an Impostume any thing that resembleth a Bee-hive, a Pultise, or Honey; that this proceedeth from the fatter part of the Blood, that causeth a fatness; and this indeed he conceiveth to be from the fleshy Juyce that is not as yet converted into *Pus*, but by maturation by means of the heat boyled as it were and hardened into such a tenacious humor; the which if it be any further torrified, insomuch that this Juyce become more earthy, then it resembleth somthing else, as Coals, smal Stones, or Gravel, and the like. These things if they be in a proper and peculiar Membrane, then (as he writeth) these also are bred from a Membranous Juyce proceeding from hence.

But now, as touching this Opinion, there are certain things to be taken notice of. For first of al, it doth not yet from hence appear, what the cause is why such like tumors as these are not bred in al bodies, neither yet in all parts, out of that Juyce by which they are nourished. And hereupon, the Cause that is to be rendred why that humor floweth out of the parts, and that thereupon a Tumor is excited under the Skin, I conceive to be this, that the Membrane that covereth any part whatsoever, and encompasseth it, is (either by some external and violent, or else by some internal Cause) either broken or corroded and eaten quite through, and exulcerated (which in the Generation of *Nodi* or knots in the Bones, *Platerus* granteth that it may so happen in the *Periostium*) so that the way and passage being opened, the aliment or nourishing Juyce flowing forth is no longer kept in and shut up in the part affected, but that it sweateth forth through this open passage. Which yet notwithstanding Nature that is never idle permitteth not rashly to be done; but it beginneth further to extend the very Membrane it self, and to shut up the Juyce flowing forth; like as we see it to be done in Trees where (the external Bark being cut) there is in the very like manner a *Nodus* or knot formed. And moreover, that the Juyce which affordeth matter unto the Tumor is chiefly destined and ordeined for the nourishing of the part, this I wil readily grant; but yet *Platerus* himself cannot deny but that in progress of time vitious humors may be likewise driven forth thither. Neither is it requisite that it should be immediately converted into *Pus*; in regard that the vitious humors mingled together with the aliment may for a long while retain their own Nature, without any corruption, and conversion into *Pus*; as it evidently appeareth in the *Cachexy*, and *Scabies* or Scabbiness, and the like affects in the Skin. But I very much doubt and question, whether that different matter that is found in such Tumors hath its original from the proper aliment of the neer adjoyning parts, the Hairs, the Nails, and the Bones, flowing together into some other place, and there mingling it self with the proper aliment of the part affected. Neither is Matter sufficient, or all that is required unto the formation of Hairs, Nails, Bones, and the like, but first of all, and especially there is necessarily required the formative faculty, which in the fleshy part formeth Flesh, and in the membranous part a Membrane, and not Bones; and there

there is unto each particular part a proper and peculiar Membrane, which if it cannot attain unto its own end by reason of the unaptness of the matter, it then formeth something like unto it; and in a fleshy part it effecteth something that is like unto Flesh, and in a membranous part somwhat that resembleth a Membrane.

Signs Diagnostick.

All these Tubercles or smal Tumors have their rise from a very mean and inconsiderable beginning, and they are long, and by little and little increasing; and they are included each one in its own peculiar Tunicle. And *Meliceris* is indeed more round in figure, and more extended, and when pressed down by the Fingers (by reason that the thickness of the humor is not great) it speedily yieldeth and giveth place, and upon the removal of the Fingers it as speedily returneth back again. For although *Paulus Ægineta* in his sixth Book, Chap. 36. writeth that *Meliceris* yieldeth unto the touch, even as if it were some loose body; and that it is slowly diffused, but very soon collected and gathered together again; yet without doubt, the text is depraved, and something omitted by the carelessness and oversight of the Writers, which appeareth even from this, that he altogether omitteth the Signs of *Atheroma*. And therefore without all doubt it is thus to be read, the omissions being supplied out of *Aetius*; Steatoma *is harder then the other, and resisteth upon the touch, and having the bottom thereof more solid. But* Atheroma *yieldeth when it is touched, as it were a certain loose body, and returneth back but slowly; but* Meliceris *giveth place speedily unto the touch, and then it is very suddenly again collected.* And although *Steatoma* be hard,; yet notwithstanding it differeth from *Strumæ*, because it is nothing so hard as *Strumæ*; neither hath it an unequal Tumor, like as *Strumæ* hath.

But what these Tumors have within, as it may be guessed at by conjecture, so true it is that it cannot be certainly known, unless it be when they are cast forth; as *Celsus* tels us, in his seventh Book Chap. 6.

Prognosticks.

1. The truth is that these Tumors have no danger at all conjoyned with them: and yet notwithstanding they oftentimes continue long, & are (without any hurt) carried about, and neglected.

2. Yet notwithstanding they often of their own accord end in an Impostume. Which if they do not, they are not so difficultly cured as *Scrofulæ* and *Scirrhi*.

3. Those of them that are elevated, and exposed unto motion, and the touch, are easily curable. But such of them as are seated and fixed more deeply, and not exposed to the Touch, are more difficultly cured; and in Chirurgical attempts they require the greatest care and diligence, by reason of the imminent eruptions of Blood, and the pricking of the Nerves. For very many Chirurgeons there be that (for want of skil) together with these like Tumors cut away those Nerves that lie under them.

The Cure.

Although these Tumors differ in their names, and each of them contein a peculiar Matter: yet notwithstanding they have almost one and the same way of curing. For Universals and generals being premised, and the Body throughly purged from the vitious humor, the matter that is the cause of the Tumor is together with the Tunicle to be taken away: which is done if the matter be either discussed; or (if that may not conveniently be done) suppurated; or else if the Tumors be cut forth. In *Meliceris* this threefold kind of Remedy hath its place; *Atheroma* is Cured by Discussives and Suppuratives, and for the most part hath no need at all of Section. As,

Take *Laudanum, Bdellium, Galbanum, Ammoniacum, Propolis, and Turpentine, equal parts of them all; and mingle them.*

Very useful likewise is the Emplaster made of Ammoniacum, Pellitory, and the Oyl of the Juyce therof; by which I have seen such a Tumor cured in the Jaw-bone broken, and long white strings like threads (such as are sometimes found in Cancers) drawn forth.

Unslaked Lime also mixed with Grease or Oyl is very useful, and of singular benefit. Or,

Take *Ship-pitch one ounce, Ammoniacum and Sulphur, of each half an ounce, Mingle, &c.*

Take *of the Root of Sowbread, and Swines Grease, and a little Sulphur; and of these make an Empaster.*

If the Tumor open not of its own accord, then Section is to be ordained; that so the little Bladder (whether it contein a Substance like Honey, like a Pultise, or a fat substance, or any other) may be pulled forth, and taken away. But the Skin is not to be cut transversly or overthwart, but strait forward, or else somwhat obliquely, like unto the figure and form of a Myrtle Leaf; and the Membrane conteining the humor is to be freed from the Skin, and the part lying under it; great care and caution being had, left that the said Membrane or Bladder be hurt (which wil most certainly be, if the Skin be not dissected and opened with one touch of the Instrument) and so the humor that is conteined therein flowing forth all abroad hinder the operation, and by this means there be some of it, or something of the humor left remaining behind. And yet if this should chance, and somwhat should be left behind, it is to be consumed by these Remedies that we call *Cathæreticks*. For if there be any part of that Tunicle left to remain, the Tumor wil again return.

If

If theſe kind of Tumors be in the Head (the little Bladder being taken forth) let the *Pericranium* be cut, and the Skul ſhaven, leſt that there be any Root that may be able to generate a new Tumor left remaining behind. But if the ſick perſon wil at no hand admit of this ſaid Section, or if otherwiſe it may not conveniently be done by reaſon of the Veins, then the Skin is to be broken through by Cauſtick Medicaments. The little bladder being taken forth, the Ulcer is to be conſolidated; and if the Skin be more looſe and extended than it ought to be, ſo that it cannot conveniently be drawn together; in this caſe whatſoever is ſuperfluous is to be cut away.

Chap. 36. *Of* Teſtudo, Talpa *or* Topinaria, *and* Natta.

AND hither likewiſe belong thoſe Tumors, which (to ſpeak truth) are referred to *Melicerides*, *Atheromata*, and *Steatomata*. But becauſe they privily happen unto the head, therefore they have peculiar names impoſed on them; which yet notwithſtanding we find no where extant in the more Ancient Greek or Latine Authors; but they have been invented and hammered out by the more modern and barbarous Latines; to wit, ſuch as are theſe; *Teſtudo*, *Talpa* or *Topinaria*, and *Natta*.

Teſtudo what it is.

To wit, *Teſtudo* is a great Tumor, ſoft, or at leaſt not very hard, in the Head, of a broader form, like unto, and after the manner of the Tortoiſe; from the likeneſs whereof it hath taken its name; growing forth at the firſt in the form and faſhion of a Cheſnut, but afterwards in the figure of an Egg; in the which there is contained a ſoft kind of matter (a certain Tunicle being drawn over it; from whence it is by Authors referred to *Melicerider*) which ſticketh ſo faſt in the Skul, that for the moſt part it vitiateth and defileth it, and bringeth upon it a polluting rottenneſs.

Talpa

Neerly allied unto this is the Tumor *Talpa*, ſo called becauſe that look as the Mole (by the Latines called *Talpa*) runneth under ground, juſt ſo this Tumor under the Skin feedeth upon the *Cranium* or Skul. Some of thoſe aforeſaid Latine Barbarous Authors comprehend this Tumor under the name of *Teſtudo*, neither do they make any peculiar mention of *Talpa*. But others of them have their peculiar Tracts touching this Tumor *Talpa*; and *Vigo* in his ſecond Book, Tract. 3. and Chap. 1. doth expreſly diſtinguiſh *Talpa* from *Teſtudo*; and the truth is, they differ in their matter, which in *Talpa* is more thick and groſs than in *Teſtudo*. And therefore like as we have ſaid that *Teſtudo* may be referred unto *Melicerís*, ſo may *Talpa* be referred to *Atheroma*. Some cal it *Topinaria*. But others notwithſtanding ſay that *Topinaria* is a different Affect, and ſuch as is familiar and common unto Children; and that it is bred out of ſweet flegm; which is manifeſtly declared by the viſcouſneſs and clammineſs of the rotten filthineſs, as alſo by the whiteneſs thereof: and ſomtimes from a flegm mingled with Blood; as the color declareth, which is not very red, and it ſoon cometh to a maturity; and ſomtimes likewiſe from Melancholy, or Choler; as *Gulielmus Placentius* writeth of this ſame Affect in the firſt Book of his Chirurgery, and Chap. 5. *Johannes Philippus Ingraſſias*, in his Book of Tumors, Tract. 1. Chap. 1. without any the leaſt ſcruple conceiveth that this Tumor is to be referred to *Hydrocephalus*. But in regard that *Hydrocephalus* is bred of Water, and hath no blood at al mingled therewith, neither may be ſuppurated, this therefore cannot be granted unto the ſaid *Ingraſſias*, nor by any means allowed of.

Natta

And laſtly, there is another Tumor which they cal *Nata*, *Natta*, and *Napta*, being great and ſoft, without any pain and color; growing forth eſpecially in the back, and ſomtimes notwithſtanding breaking forth in the ſhoulders, and other parts; hanging by a ſmal ſlender Root: but yet ſo greatly encreaſing that it weigheth ſome pounds; and is in bigneſs equal unto a Melon, or Gourd; which becauſe it hath not alwaies one and the ſame form and figure, it hath likewiſe therefore by Authors divers and ſeveral names conferred upon it. The matter that is therein contained doth indeed now and then ſeem to be fleſhy; but in truth it is no fleſh, but like unto fat; and therefore it may not unfitly be referred unto *Steatoma*.

The Cauſes.

They refer the cauſe of theſe Tumors unto a ſalt flegm, or elſe a flegm mingled with Choler. But in regard that theſe Tumors may be referred to *Melicerides*, *Atheromata*, and *Steatomata*, it may therefore moſt fitly be determined and aſſerted, That theſe Tumors have the very ſelf ſame cauſe that thoſe ſaid Tumors have: only here lieth the difference, That in theſe there is greater ſtore of matter, and thereupon it is likewiſe that theſe Tumors arrive at a greater bulk and bigneſs than the former.

Signs Diagnoſtick.

Theſe Tumors are eaſily known from the deſcriptions before declared; for they are ſoft Tumors, or at leaſt ſuch as are not very hard; broad and large, and ſhut up in their peculiar Membrane.

Prognoſticks.

1. If theſe kind of Tumors be in the Head, they then are dangerous, by reaſon of the vicinity and neerneſs of the Skull, in regard that they corrode the Skul, and corrupt it; eſpecially about the Sutures.

2. If there be present a great corruption of the Skul, it is then far better to let this Tumor alone, and not meddle with it, than to cure it.

3. Those of them that are without any corruption of the Skul, are cured with more safety.

4. Like as it was in the Tumors mentioned in the former Chapter, so it is likewise in these; unless the whol Tunicle be drawn forth together with the humor, there is no perfect health and soundness to be expected, or hoped for; since that if there be any thing left behind, there wil from it a new Tumor arise, and break forth.

The Cure.

Universals and generals being first premised, and the body sufficiently evacuated, the matter constituting the Tumor is to be taken away, which is done by digestive and resolving Medicaments, or by those that suppurate, or by Chirurgery. And therefore if the Tumor be without any Ulcer and corruption of the bone, then let discussing Medicaments be administred. Now the Discussives are such as are wont to be used in *Scrofulæ* and Tumors. But it is somwhat rare that these Tumors are cured by Discussives. If therefore they cannot be so taken away and removed, to wit, by Discussives alone; then Maturatives and Suppurating Medicaments are likewise to be administred; such like as have been already propounded in the foregoing Chapter. Or,

Take *Onions roasted under the Embers, the Yelks of Eggs hard boyled, of each three in number; Swines Grease, or unsalted Butter half a pound; the Root of Marsh-mallows boyled to a softness, and bruised very smal one pound; and make a Cataplasm.*

And yet notwithstanding we are not to expect and wait for a perfect Concoction and generation of *Pus*, in regard that *Pus* easily and soon gets a sharp and malignant quality, and so corrodeth the Skul. And therefore so soon as any signs of Suppuration shal appear, the Tumor is maturely to be opened. The Incision is to be either simple and downright, or else it is to be made in the form and figure of a Cross, according to the bigness of the Tumor. The *Pus* being wholly evacuated, the Ulcer is to be throughly cleansed by convenient Medicaments; as for example, with such as this,

Take *Barley Meal two ounces; Myrrh half an ounce; Sarcocol one ounce; Honey as much as will suffice; mingle, &c.*

The Ulcer when it is throughly cleansed is to be filled up with Flesh, and consolidated.

If the bone be corrupted, it is then to be shaven, and to be cured in like manner as it is wont to be in the rottenness of the bones.

But as for the Cure by Chirurgery, it is to be ordained and instituted in like manner as was declared in the Chapter foregoing.

Chap. 37. *Of* Verrucæ *or Warts.*

THere are moreover other Tumors likewise that are said to have their original, not from humors, but from a solid substance. But since that these same humors take their original either from a vitious and luxuriant juyce nourishing the parts, or else from excrementitious humors mingled together with them, we wil therefore subjoyn this kind of Tumors unto those that were but even now explained, and treated of.

Verrucæ.

And first of al, there are indeed certain smal Tumors that arise in the Skin, like unto little hillocks, which are called *Verrucæ* or *Porri*. For with the Latines *Verruca* is properly the higher and more eminent part of a Mountain or Hil, and according to *Gellius* (in his third Book, and Chap. 7.) the rough part thereof; whereupon it is that those places are termed *Verrucosa* that are unequal, and have divers eminent parts. But now these *Verrucæ* from their several forms have gotten divers and several appellations. For one is called *Sessilis* (by the Greeks *Myrmecion*, and by the Latins *Formica*) which is fixed and fastened with deeper roots; broad beneath, and slender above; and this thrusteth forth it self in the Skin less than the other kinds of them; and it is likewise stable and permanent, and not altogether so movable as the rest. Now they conceive that it is so named either from their blackish color (such as there is in Ants or Pismires) or else because that when it is hard pressed, it exhibiteth a sense of pain like unto the bitings of those aforesaid Pismires; and it is for the most part bred in the Hands, or likewise in the Feet; neither is it altogether without pain; and in this there appeareth somtimes a hair or two, and that especially in the face. Another sort of them is called *Pensilis*, because that it hangeth down by a little foot, or as it were by a Harp-string; from whence it is by the Greeks called *Acrochordon*; it hath but a very smal Basis, but a long and great Head.

Verruca sessilis

Verruca Pensilis

This Tumor if it be not of the same color, but that it resembleth the flower of Thyme, and be less, and more unequal, and smal, they then cal it *Thymum*. But now if these *Verrucæ* be greater, they are then (from the resemblance they have with a Fig) called *Ficus*. And hither likewise may *Condylomata* be referred, as also *Cristæ ani*; touching which we have already spoken in the third Book of our Practise, Part 2. Sect. 1. and Chap. 10. where we treated of the Diseases of *Intestinum rectum*, or the straight Gut.

There

Clavus what it is

There is also another kind of *Verruca* like unto the *Sessilis*, which they cal *Clavus*, but the Greeks cal it *Helon*, and we in English a *Corn* or Quern. Those *Verrucæ* are white, round, like unto the heads of Nails; and for the most part they arise in the Toes, and the soles of the Feet, so that they excite and cause great trouble and pain in going. This kind of Tumor *Verruca*, in regard that it hath a dusky or black spot in the midst of the circumference of that Skin, which is likewise of the same color, like unto the *Pupilla* of the Eye, and by means of it resembleth the eye of the Pye, is by the Germans termed *Egsterauge*, which with us is as much as the Eye of that Bird we cal the Magpye.

Now these *Verrucæ* are bred in divers parts of the body; but more frequently in the hands and feet; and for the most part they appear many of them together.

The Causes.

All these Tumors, according unto the vulgar opinion, arise from a matter, thick, melancholick, and flegmatick; the which Nature (when she is no waies able to discuss it) formeth out of it this kind of Tumors.

But *Platerus* (as he did by the former Tumors that were neerly allied unto these) affirmeth that the *Verrucæ* likewise are bred of a juyce that is by Nature destined for the nourishing of the Skin, and the Scarf-skin, after the same manner. As the hardness that yet consisteth in their substance generateth a Callousness, and Cicatrices; even so a part and portion thereof breaking forth into one or more parts of the Skin, adhering unto the Skin, and growing unto the roots, and issuing forth it generateth a very smal portion, filling up the pore, hard, and callous; which one while is carried forth without the pore, as in *Verruca Pensilis*; other while it remaineth stil therein, as in *Verruca Sessilis*, and also in *Clavus* in the feet. But now, that this juyce should thrust it self into the pores, the dilatation and wideness of them may very wel be the cause thereof: which as it proceedeth from divers causes, so in the feet (the skin being in one place hard pressed down, and by this means the pore being widened) the Tumor *Clavus* is easily generated. In the hands likewise, whereas they there also often appear and expose themselves unto the view, *Platerus* conjecturech and conceiveth it to be very credible that these *Verrucæ* proceed from external injuries.

There are some also who determine that these arise likewise from contagion; as if the blood fal out of a *Verruca* (when it is cut) upon some other part, there may then a *Verruca* be generated in that part; and if any one shal use that linen with which the blood that came forth of these *Verrucæ* was taken up and cleansed away; even upon the use and wearing of the said linen *Verrucæ* (that is to say, Warts, and Corns) may succeed and follow thereupon.

Signs Diagnostick.

These *Verrucæ* are easily known from the descriptions already given; and so may also their differences; so that it wil be altogether needless here to deliver any peculiar signs; for indeed these Tumors are vulgarly and sufficiently known.

Prognosticks.

1. *Verrucæ* oftentimes vanish of their own accord, without the help and assistance of any Medicament.

2. *Myrmecia* and *Clavi* notwithstanding, unless they be cured, are scarcely ever known to disappear and vanish.

3. *Acrochordones* are not so hard to be cured, when they have roots that are but smal and slender: but now the rest of them when they are fixed and fastened with a broader root require more forcible and efficacious Medicaments.

4. Acrochordon *if it be cut out, it then leaveth no little root, and therefore indeed it cannot wel return, and arise anew.* Thymium *and* Clavus *being cut out, there ariseth underneath a round smal root, that descendeth very deeply unto the flesh; and so (the root being left behind) it again ariseth.* Myrmecia *stick fast with the most broad roots; and thereupon they cannot indeed be cut forth without some great and dangerous exulceration.* Thus *Celsus* in his fifth Book, and Chap. 28.

The Cure.

Now these *Verrucæ* are taken away either by Medicaments, or by Chirurgery. The Medicaments are such as effect this, either by an occult and secret propriety; or else such as dry up the aliment of them; so that the *Verrucæ* do afterwards wither and vanish away.

Fallopius commendeth the Leaves of the Willow or Sallow Tree, or the juyce of them. But if the green Leaves may not be had, he then maketh use of the pouder of the Willow Leaves, mingled with Vinegar either simple, or Scillitick. They likewise use Figwort, the Roots of Water Dragons, of Cuckowpint, and of Sowbread. They commend also the new and fresh gathered Roots of *Celandine*, with the juyce whereof they anoint the *Verrucæ* or Warts. Others first of al burn them (once and again) with the yong tender sprigs of the aforesaid Celandine, and then afterward they apply Water-cresses and Mustard. There are some likewise who think that these *Verrucæ* may be taken away by a certain specifical propriety that is in Purslain. The *Verrucæ* are likewise taken away, if they be rubbed with Nightshade and Urine, if they be washed with the

liquor that is gathered out of the Leaves of Mullein, and laid thereto with the Flowers of the same, with the Decoction that is made of Mustard, Sulphur, and Salt, with Vinegar; if the Leaves of Savine after they have been for three daies together macerated in Wine be imposed upon them; if Herb Robert, Rue, and Millfoyl, bruised together, be applied. That Cichory likewise which they call *Verrucarium* (the name being given it from *Verrucæ*) is of singular use and benefit; as also the milky Juyce of the stalks of the Herb Lions-Tooth, as likewise of all other Endive and Succory-like Plants; the Water that sweateth out of Vine Branches while they are in burning; the Meal or Flour of Chicheling Pease, as they vulgarly call them.

And for the *Verrucæ* or Warts, and *Clavi* or Corns, in the Feet, this following Emplaster is like wise very efficacious.

Take Ship-pitch one ounce, Galbanum dissolved in Vinegar half an ounce, Sal. Ammoniac. one scruple, the great Diachylon Plaister one ounce and half, mingle and make an Emplaster.

But if these and such like avail not, we must then betake our selves to those Remedies that are stronger, and such like as have in them a Caustick virtue, yea even unto the actual fire it self; and yet notwithstanding Caustick Remedies are not to be administred without a great deal of caution (especially in the Nervous or sinewy places) and so, that they may only touch upon the *Verrucæ*; and therefore the part that lieth round about is first of all to be wel guarded with Wax, or some kind of Emplaster.

For this end and purpose there is usually administred the Milk of Figs, and Spurge or Milkwort; and that indeed the Milk of the aforesaid *Tithymal* or Spurge is in it self alone very efficacious, *Valescus de Taranta* writeth that it is so found to be by experience. Unslaked Lime mingled with Sope is also profitable; which said Medicament will be the more effectual, if there be added a little calcined Vitriol, or Verdigrease, or a Cautery prepared of Sope Lye. Or,

Take the white of an Egg hardened in boyling, Verdigrease and Allum, of each one dram; mingle &c. Or,

Take Green Garlick, and when it is newly bruised let it be applied to the *Verruca*, and let there be a little Cap of Wax imposed thereon, and wrapt about with a Swath, to keep it fast on. Or,

Take Orpiment, and let it be mingled with Oxymel, or the Milk of the aforesaid Milkwort or Spurge, and let it be put upon the *Verrucæ*. Very useful likewise is the Oyl of Vitriol and Sulphur. And *Johannes Andreas a Cruce* doth here indeed in a wonderful manner commend the Oyl of Vitriol; and in this manner he applieth it. He provideth a little Knife of Lign-aloes, or the like, and this he dippeth in the Oyl of Vitriol, and by this means he freeth the *Verruca*; with which otherwise it is freed by an Iron Penknife.

The Chirurgery by which *Verucccæ* are taken away is described by *Galen*, in his fourteenth Book of the Method of Physick, Chap. 17. by *Paulus Ægineta* in his sixth Book, Chap. 87. and by *Rhases*, in his Book of Divisions, Chap. 124. And it is performed either by extraction, or excision, or else by adustion. They are extracted and pluckt forth with a Quill; the Circle whereof let it be equal unto the *Verrucæ*; with this Quil let the *Verrucæ* be on all sides streightened and hard bound; and then afterward let the *Verruca* be loosned and drawn round about, and so by this means it may together with its root be pulled forth. The same is likewise performed by the Silver Pipe. There was one at *Rome* that usually pluckt them forth by sucking, and his Teeth together, as *Galen* in the place alleadged informeth us.

They are cut off, either by something tied about them (to wit, the *Verrucæ Pensiles*) as for instance, by a silken Thred, or some other Thred that is strong, or else by a Horse Hair, still by degrees streightning and drawing close together the bond, until the *Verrucæ* fall off. And if there remain behind any of its Root, it is to be wasted and consumed by a Cautery. Or else it is to be performed by an Iron, or fitting Pen-knife, so that the *Verrucæ* must first of all be scarified round about; and afterward let it be cut off with a sharp Penknife, and with the Phlebotomy Instrument quite grub'd up by the Roots.

They are actually burnt, either by a little stick of the Beech Tree, lighted at one end; or else by a long sharp Iron Bodkin, heated red hot, and applied to the *Verruca* through a smal Cane, that so the neer adjacent parts may not be hurt or offended. Or if a thin Iron plate having a hole bored through it according to the bigness of the *Verruca*, be so applied unto the said *Verruca*, that the *Verruca* alone appear through the hole, and then afterward it may be burnt with a red hot Iron, or with the flame of Fire. The burning being performed and ended, the Escar is then to be taken away, and the Ulcer to be healed in a fit and convenient manner. *Fallopius* (if other Remedies be not sufficiently prevalent) burneth the *Verruca* with Sulphur, after this manner. He taketh the middle shel of a Walnut, and boreth it through according to the bigness of the *Verruca* or Wart, and so applieth the convex part thereof unto the place in which the Wart appeareth, so that it may strictly and closely comprehend the *Verruca* or Wart, and that the *Verruca* may appear forth through the hole into the Cavity or hollow part of the shel. After this he puts in Sulphur into the hollow of the shel, and kindleth it; which being melted, and kindled, the *Verruca* is so long to be burnt as the Patient can wel endure it; and if it cannot at once doing this be wholly extirpated,

extirpated, the aduſtion is to be repeated three or four times, in the manner aforeſaid. When the place ſhal be healed, it is then for ſome daies to be rubbed with the Leaves of Sallow, and ſo covered therewith that the *Verruca* may no more return, and ariſe anew.

Touching *Thymia*, and *Criſtæ ani*, we have already ſpoken in the third Book of our Practice, Part 2. Sect. 1. Chap. 10.

Chap. 38. *Of* Cornua.

VEry many there are that refer *Cornua* unto the aforeſaid *Verrucæ*: and they determine that they are a certain longer kind of *Verrucæ*, and ſomwhat crooked like unto a Horn. But this name is both by the Arabian Phyſitians, and thoſe of theſe latter times likewiſe extended far wider. *Avicen* in the ſeventh of his fourth Book, Tract. 3. Chap. 14. writeth thus touching theſe *Cornua*. *Cornua* (ſaith he) *are thick additions, crooked, ariſing above upon the Junctures, in the extremities, by reaſon of the vehemency of their operation; and the cure of them is Inciſion, that ſo that which is altogether inſenſible and without pain may be removed out of them; moreover let there be adminiſtred upon the reſidue thereof Medicaments that are vehemently ſharp and acute (out of thoſe Medicaments that are made uſe of in the* Verrucæ) *until it fal; and then let Butter boyled be adminiſtred and applied thereunto.*

Avenzoar in his ſecond Book, and Chap. 5. hath ſomthing to this purpoſe: *I have heard* (ſaith he) *my Father ſay, that he once ſaw a certain man that had bred in his back a bone like unto the Unicorns Horn, but it was leſs hard than a Natural bone. And my Father purged away the groſs humors that were in this man, and afterward he put exſiccative Medicines upon the bone; upon which the ſaid bone fel forth like as the Harts Horns ſhed and fall off in the Spring. And I my ſelf likewiſe had once a bone growing upon my back, which brought upon me much grief and pain: I then purged my ſelf from groſs humors, and I put upon the aforeſaid bone Reſolutives; ſo that it was for the greateſt part reſolved; and that little remainder thereof was no hinderance at all unto me in the exerciſe of my natural operations. Therefore whenſoever thou find the like, do as I have ſaid. And when thou purgeſt them, do not purge them only with the virtues of Medicines, but even with the very proper Medicines themſelves. And in the number of the better Minerals (for the purging of theſe) the* Lapis Lazuli *is one; but without all doubt there is great help to be had from the Load-ſtone, in this caſe: but for my own part I make little or no uſe of the Load-ſtone in my practice, in regard that the* Lapis Lazuli *ſufficeth me; and I commend unto you the operation thereof.*

But yet ſome there be of the latter Writers that reckon up theſe *Cornua* among the Affects of the Head; touching which *Lanfracus* (in his Tract. 3. Doct. 2. and Chap. 3.) thus writeth: *I have likewiſe ſeen* (ſaith he) *manifeſt eminencies of the Skul, like unto Horns. For I once ſaw a man that came unto me for advice that had in his Head ſeven eminencies, one greater than the other, and they were in divers places. Of which one was as big and acute as the Horn of a Kid, a finger long, or as long as ones thumb, and it much hurt and annoyed the Skin: and I admired that the Skin was not exulcerated. When therefore I ſaw that it had its original and root from the head, I would by no means be perſwaded to undertake the Cure, but rather perſwaded the ſick perſon that he ſhould put himſelf into no mans hands, in hope of Cure, for that it ſeemed unto me altogether impoſſible.* But *Johannes Philippus Ingraſſias*, in his firſt Tract of Tumors, and Chap. 1. relateth that he ſaw at *Panormus* a certain Noble Virgin (a Girl) that was afflicted with very many of theſe crooked excreſcencies, that were withal ſharpened in the top of them, like unto Calves Horns, almoſt in al the Limbs, and eſpecially in the Joynts of the Hands, the Arms, and the Knees, as alſo in the Head, and the Forehead. *But yet notwithſtanding* (ſaith he) *thoſe Tumors were not bred in the Skin, but upon it, and that indeed in a certain new order of generation. For like as the generation of the ſtone happeneth in the bladder, to wit, that one Tunicle as it were coming upon another, it encreaſeth unto a greatneſs; ſo in like manner we beheld in them very many (as it were) boney cruſts ſticking the one to the other, juſt in ſuch a faſhion alſo as if we ſhould put the half rinds of Filberds one upon another, the leſs ſtill upon the greater, that ſo they may be joyned together in an acute and ſharp form, and the ſhape of a Pyramid. But theſe when they were touched about the baſis and bottom of them, were extreamly painful; and they ſtuck ſo faſt in, and were of ſuch an extraordinary hardneſs that no Phyſitian being able by any kind of Remedies whatſoever to yield the Patient any help or relief, her kinred at the length (after that the Diſeaſe, and the growth of theſe* Cornua *had for many yeers continued) came unto me. For they were continually augmented both in their bigneſs, and (divers other new ones budding forth) in their number alſo: whom (by the gracious aſſiſtance of Almighty God) we recovered unto her former health and ſoundneſs, and alſo unto her former beauty, and comely feature. Who notwithſtanding was become ſo deformed and miſ ſhapen, that ſhe was now become more like an ugly Monſter, and frightful Devil, than to any Woman kind; inſomuch that her Parents much rather deſired her death than her life.*

Julius

Julius Cæsar Scaliger in his 199. Exercitat. Sect. 5. writeth, That for the growing of these *Cornua* upon men and women (making them like unto Monsters rather than unto what indeed they are) although he was told thereof by Prince *Aboalis*, and by that person of note *Abumeron*; yet notwithstanding their great Authority and credit, he could not beleeve a thing so strange, until he himself saw one of them on the back of a certain Rower, that had been for a long time in the *Triremis* (a long Boat with three Oars so called) of the *Ligurians*.

Alexander Benedictus in the first Book of his Anatomy, and 14. Chap. telleth us, that in *Crete* he saw a black horn most like unto the head of a wild Goat growing forth in a mans Knee that was wounded by an Arrow; and that the matter that ought to have been converted into the substance of a bone was easily (by the blowing in of the Air) turned into an horney Nature, and soon got unto it self an hardness, after the manner of Gums.

And *Fallopius* in his Book of the similar parts, Chap. 7. writeth, That sometimes likewise in whol bones as wel as in fractures there may be something bred like unto a horn; and that this same horn may grow forth without the flesh and the skin; and that he himself saw this at *Padua* in the thigh of a certain noble man; out of whose thigh there grew forth as it were a little long stake or post.

Zacutus his observation touching Cornu bred in the heel.

Zacutus in his second Book of the Administration of Practical Physick, Observ. 188. relateth that a certain poor man naturally melancholick, long complained of a pain he had in the heel of his right foot; and that he there felt a certain hardness, that afterward grew forth into a Tumor of the bigness of a smal Chesnut, hard, rough, and leaden colored; which in eight months time so encreased that it was become an hand breadth long, and resembled a true horn. Which after it had been cut off (by the advice of Physitians) no symptoms following thereupon, and the body purged twice every yeer, he lived for two yeers in sound and perfect health. But after this he suddenly grew sensible of extream and intollerable pain in the very same place, and in six months the *Cornu* grew forth again, hard, and encompassed about with most sharp pricks, and was in length at least one hand breadth and an half. The which being again cut, in the very bottom thereof there was left a little hollow place, out of which there flowed forth great store of a black stinking humor, of so corroding a nature, that it soon eat through the flesh neer unto it. We then indeed purged his body with Medicaments that were fit and proper for the evacuation of the melancholy humor; and there were likewise Sudorificks of the China Root administred; but al to no purpose. And therefore to intercept the flux there were several Issues made, one in the Leg that was sound, four fingers below the Knee in the external part; another in the Leg affected eight fingers above the Knee, or else in the Thigh in the inside thereof. He was every month purged; and so by this means the *Cornu* was hindered from growing again any more; and the Ulcer was healed of its own accord, and covered over with a Cicatrice.

Nodi.

And hither (without al question) belong and are to be referred the *Nodi* of *Platerus*, (touching which we spake above in the thirty fourth Chapter:) which are the hardest sort of Tumors, sticking firm and fast in the bones that lie under them, and which cannot be made to remove their place from the said bones; as if some new bone were now grown unto the former; which kind of Tumors are bred about the Temples, and the Forehead, and also about the length of the Ankles, in those naked Regions. And these Tumors either begin of themselves, or else they accompany other Diseases, as the French Pox, and one certain kind of the *Cephalæa* Affect.

The Cure.

These *Cornua* and *Nodi* are very hard to cure; and they often continue al the whol life time. And yet notwithstanding if they be neer unto the Joynts, so that they hinder the motion of them, or if they cause continual pain by pressing upon them, they are then to be amputated and cut off; which may be done the more safely in regard that they consist in the naked bones that are only covered with the skin. The skin is first of al to be opened, and the *Cornu* or *Nodus* to be made naked and bare; and after that it is to be cut away from the bone with a sharp Iron Knife, and the Wound to be cured in a fit and convenient manner.

Chap. 39. *Of* Fungi.

THat Affect which the Latines cal *Fungus*, the Arabians cal *Fater* and *Fatera*, and they refer them unto the Tumors of the Brain. *Galen* by the way and cursorily maketh mention hereof, when in his first Book of the place affected, Chap. 1. he thus writeth: *And now* (saith he) *even likewise of those things that spring up and grow unto other things, the notes and marks of the place or seat affected are to be sought for. For why, such things as adhere and cleave unto others obtain the propriety of Essence, like as do* Fungi (*which the Greeks cal* Mycetes) *if upon the breaking of the Head the Meninx or Membrane chance to be broken.* *Avicen* likewise maketh mention hereof, in the fifth of his fourth Book, Tract. 3. Chap. 2. where he saith thus: *And when the* Cranium *or Skull is broken, and the Vail or covering goeth forth, there is then also caused*

caused an Impostume that is named Fatera. And we treated of this Tumor in the first Book of our Practice, Part 1. Chap. 25. But (as sometimes we wrote unto that eminent and worthy man *Gulielmus Fabricius*, as is to be seen in the second Century of his Observations, Observat. 25.) this kind of Tumor as indeed it may arise very frequently from the Membranes of the Brain, so it may also be bred in other parts; as you may there find two Histories by me produced, for the further confirmation thereof. The former whereof is this. A certain Youth there was about ten yeers old, that in leaping hit his left foot hard against the ground, and by this vehement stroke he hurt the sole thereof over against the little toe. Upon this a Tumor began by little and little to increase, insomuch that it had soon gotten over al the foot, and exceedingly distended the skin; so that the toes (by reason of the tumor or swelling coming betwixt) stood at too great a distance the one from the other. And yet notwithstanding the skin in color was like unto the sound part. There were by divers Physicians (as the manner is) divers means attempted, and different Remedies put in practice, but al in vain. At length his Friends went unto a Chirurgeon for his assistance, who when he saw the place very soft, and found that the pain encreased, conceived that there was now already a suppuration made, and thereupon without any more ado he opened the place, out of which there issued forth a little blood, but no *Pus* at al. And in a short time after there ran forth as it were a certain kind of fatness, by the which the Wound was quite shut up. Within a few daies following there began to break forth these *Fungi* in great abundance, ful of black wheyish blood. And in the sole of the foot neer unto the little toe one night there happened as it were a benummedness and deadness as large and broad as half a Rix Doller. This being opened, yet notwithstanding there sel forth no putrid and corrupt matter; neither could any of the dead flesh be separated, but the flesh was in appearance like unto a burnt spunge, al bloody, swelling and strutting with blood, and destilling it. They began likewise to shew themselves in other places, to wit, at the sides of the foot, and above the ankles; most loathsom and frightful to look upon; insomuch that that part of the foot did equal (or indeed exceed) in bigness a childs head. At length he proceeded to Section, and the middle part of the foot, even to the Navicular bone, and the heel bone, was cut off. That which was thus cut off was wholly a hollow spungy flesh, partly putrid and corrupt, and partly curdled, thick, and like unto a clammy porous fatness, and weighing wel neer four pound. But on the following daies a Spungy flesh brake forth again with great violence; and look how much there was taken away in the day-time, there grew again as much in the night. And lastly, there arose a great swelling in the Thigh (nigh unto the left Groyn, in the place where the Glandules are) in shape much resembling that which at first was seen to appear in the midst of the foot; which afterward brake of its own accord; out of which there grew forth great store of spungy flesh. And so not long after the Boy died.

A History

The other History is this. A Boy twelve yeers old was greatly troubled with the pain of his teeth. At length it came to this, That they must be drawn. One of the upper teeth is accordingly drawn forth. Upon which there afterward arose a Tubercle in the Palate neer unto that Tooth, as big as a Prune stone. This being soft, and not opening of its own accord, it was conceived that there lay some *Pus* or purulent matter under it; whereupon it was opened, and at first there flowed forth nothing but some few drops of blood: but then afterward there brake forth a spungy and blackish flesh, which so far encreased, that it did not alone hang forth at the mouth, but grew forth likewise by the Nostrils, and at length brought death upon the Child.

Another History.

And *Gulielmus Fabricius* in his second Century, Observ. 199. relateth likewise an History of a *Fungus* that had its original from *Gurgulio*, that wholly filled up the Palate, and reached welnigh unto the fore teeth. And another he mentioneth in the following Observation, that arising from *Gurgulio* was altogether as big as an Hen Egg, and it so stopped up the little holes of the Nostrils that end in the Palate, that the sick party could hardly breathe; neither could he speak distinctly, and so as to be understood.

This *Gulielmus Fabricius* in his third Century, and Observat. 1. tels us yet likewise of another *Fungus* that he had seen growing out of the Ear, and that he cured the same. And in his fifth Century, and Observat. 62. he mentioneth yet another *Fungus* that sprung and was bred out of the very Center of the Navel. This kind of Tumor *Gulielmus Fabricius* in his third Century, Observat. 36. conceiveth, that it is to be referred unto those that we cal *Nattæ* or *Naptæ*. But what these *Naptæ* are, we have before declared in the thirty sixth Chapter. And although there be something of *Fungus* contained in the aforesaid Tumor *Natta*; and albeit these Tumors may in the general be said to be *Fungus*: yet notwithstanding that is covered over with the skin; but *Fungi* properly so called (and of which we are now treating) hang forth al naked and bare without the skin, and there they grow and encrease. And therefore likewise they breed not in the whol and sound Membranes of the brain, but they are bred in them when they are wounded, bruised together, and hurt.

The subject of these Tumors is a Membrane, that is any waies hurt, or wounded, or bruised.

The

The Causes.

Johannes Philippus Ingrassias (touching the Cause, and the manner of generation of these *Fungi*) writeth that this *Fungus* is wont to be bred in like manner as in Candles lighted or Lamps we see the *Fungus* (in the Winter time especially) that is wont to arise and appear in the top of the Wick of the one, and the match of the other; and which is with weak and simple Women a notable presage of Rain suddenly to follow; even as *Virgil* (in the first of his Georgicks) and *Pliny* likewise in his eighteenth Book about the end thereof, do both of them attest. For when the Air begins to be moist, the sparkles that were wont to pass forth with the smoke, being now prohibited and hindred, by reason of the thickness of the Air, do there reside in the Lights, and there they represent as it were certain resemblances and Images of *Fungi*. And just so it is in the Membrane of the Brain, when it is discovered and laid open, at the first there is a certain substance that representeth the likeness of that soft and Cotton-like tender Hair that is found upon the heads of new born Infants. But then afterwards the vapors being discussed by exhaling, and the Fumes being made to assume a round form in that substance by the coldness of the Air, they are by little and little burnt and extreamly dried by the more inward heat, until at length there appear also a substance like unto the said *Fungus*, signifying that the Membrane is altered by the Air.

But in very truth, it is indeed to be granted, that these kind of *Fungi* are generated from a superfluous humor, as it were sweating forth thorow the hurt Membranes; but that this matter may be even detained there by the coldness of the Air, and that it may likewise be there exsiccated meerly and only by the heat, is altogether false, and therefore not to be granted. For these *Fungi* cannot possibly be so suddenly generated after this manner, and get such a growth. But it is most agreeable unto truth, that the humor destilling forth into the soft Flesh (that is spungy like to the Mushrom in Trees) is changed by the formative faculty of the part; and that Nature which is never idle doth change and form into this substance the humors flowing thereunto, which by reason of their abundance (as likewise their unfitness for motion) and the debility of the part, it can by no means possibly convert into the aliment and substance of the said part.

Signs Diagnostick.

This kind of Tumor is very easily known. For out of a Membrane hurt and bruised, or wounded, there shoots forth a soft Flesh, spungy, and pale, and not covered with the Skin; and suddenly it attaineth unto a great and extraordinary growth.

Prognostick.

This Malady is very dangerous, and hard to be cured; and if it be not handled aright, it easily turneth into the Nature of a *Cancer*.

The Cure.

Universals having been first premised (the which it is not our purpose here to mention) the *Fungus* it self is to be taken away, which is done either by Medicaments that exsiccate, and corrode, or else by excision and cutting it our.

Medicaments that exsiccate and dry are far more safe then those that corrode and eat through: in regard that by Corrosives the matter is easily exasperated, and so obtaineth the nature of a *Cancer*. Now such are made of round Aristolochy, the roots of it, and of the Florentine Flower-de-luce, Angelica, the true and right *Acoruss*, the Leaves of Savine, of Card. Benedict. of Rosemary, of Plantane, Horstail, Storks bil, the Flowers of Red Roses, Mastick, Frankincense, Myrrh, prepared Tutty, burnt Lead, Sugar of Saturn, *Lapis Calaminaris*, the Ashes of Froggs and Sea-Crabs.

But they are to be cut out either by a Silken Thread (tying it about therewith) or else any other strong Thread; otherwise it is done by an Iron. So soon as the *Fungus* is taken away either by the aforesaid Ligature, or Iron, then there ought to be strewed and sprinkled thereupon Powders of the before mentioned Medicaments. As touching these operations, see further in *Gulielm. Fabricius* in the place alleadged; to wit, Century 3. Observat. 1. and Century 5. Observat. 62.

Chap. 40. *Of Tumors Malignant and Poysonous, and in special of* Elephantiasis.

WE are at length come to treat of a certain kind of Tumors arising from the humors, that have joyned with them a Malignity. Among the which the first we meet withall are the smal Pox and Measils. But because we have already handled them in the fourth Book of Feavers, Chap. 12. we shal here add no more as touching them; but rather refer the Reader thither, for his further information. And then the next we meet withall are those we call *Bubones* and pestilent Carbuncles; touching which we shall likewise here in this place spare our pains in the further treating thereof, in regard that we have also spoken of them in the place alleadged, to wit, the sixth Chapter. There likewise belong hither (in the third place) those Tumors that we term Venereal, of which we shall hereafter treat further in its proper place, among the malignant Tumors

mors. And lastly, there is this *Elephantiasis*, touching which alone we intend here to discourse.

That Affect which the *Arabians* call *Lepra*, we have told you above (in Chap. 28.) that it is by the Greeks called *Elephantiasis*. Now it is called *Elephas*, *Elephantiasis*, and *Elephantia* from the Elephant; by reason of the likeness and resemblance that this Disease hath with that Creature (the Elephant) to wit, as some conceive, because such as are affected with this Disease become great as the Elephants; but this is but a weak and simple conjecture of theirs, since that those who are affected with the *Elephantiasis* are not made hereby ever a whit the greater (unless haply we have respect not so much unto the greatness of the body in such as are thus affected, as unto the greatness of the danger of death thereby threatned; to wit, that look as the Elephant is the greatest of al the four-footed Creatures; even so among diseases this appeareth to be the greatest, and an Affect almost remediless and incurable) touching which thing *Macer* in his Book of the virtues of Herbs, and Chap. 15. speaketh unto the same purpose.

Elephantiasis.

Or else this Malady is so called, because that creeping along upon the Thighs it causeth them to become (as are those of an Elephant) rough and unequal: or else because that among other Diseases this is exceeding vehement, strong and violent, like as is the Elephant; or otherwise it is so called (and this indeed seemeth to be the most true and genuine reason thereof) because the members & the skin of those that are affected with this Disease are rendered tumid and swoln, scaly, rough and rugged, ful of swellings, and unequal, like unto the skin of Elephants. *Galen* in his Book of Tumors, Chap. 14. writeth that this Malady when is first beginneth, is likewise called *Satyriasmus*, in regard that the face of those that are afflicted with this Disease is rendered like unto the face of the said Satyres. For the lips of such as are troubled with *Elephantiasis* are thereby made thick, and the Nose swelleth; and thereupon it seemeth as if it were pressed down; the Ears become flaggy and much wasted, the Jaw bones are colored, as it were, and overspread with a certain kind of redness, and in the Forehead there appear here and there Tumors or Swellings, like as if they were certain Horns: although there be others indeed that think the *Satyriasmus* to be so called, even for this very cause, that in the beginning of this Malady the sick parties are extreamly libidinous and lustful, like as are the said Satyres. And yet notwithstanding *Aetius* in Tetrab. 4. Serm. 1. Chap. 120. out of *Archigenes*, rendereth another kind of reason of this resemblance (and that indeed different from the former) to wit, because the Cheeks and face in such as are thus affected are lifted up, together with a certain redness, and the Chin it self is dilated, upon the Convulsion as it were of the Muscles of the Jaws; even as we see it likewise to befal those that laugh, in a certain kind of likeness and resemblance unto the Pictures of Satyres; which *Cœlius Rhodiginus* in his 19. Book of the reading of Antiquities, and Chap. 25. conceiveth to be so called from the Greek word *Seserenai*, because that these Satyres sing and sport themselves with their mouths wide open and gaping, and their lips drawn forth like unto those that laugh. And there are some that give us a third reason and ground of this appellation, to wit, because that those who are affected with this *Elephantiasis* are like unto Satyres in their propension unto Venery, and lustfulness.

It is likewise termed *Leontiasis*, either in regard that this Malady is invincible, like as the Lyon; or else because (as *Aetius* hath it in Tetrab. 4. Serm. 1. Chap. 30.) the forehead of the sick person is with a certain swelling rendered and made more loose, after the resemblance of the flexile skin of the Lions Eye-brows; or else, because the breath and the very spirits of such as are affected with this Malady do even stink like unto the breathing of Lions, and their very excrements also; or else because those that are affected with this Disease have a most filthy and terrible face, insomuch that (like as do Lions) they strike a terror into those that come suddenly and unawares to behold it. This Malady is by our Physitians called the Malady of St. *Lazarus*; because that such as are Elephantiack do so abound and are ful of Ulcers, like as was that *Lazarus* the beggar, of whom there is mention made in the Evangelical History, *Luke*, Chap. 16.

Now this is a very sad and grievous Malady, and as it were an Universal, or Cancer of the whol body; whereupon it comprehendeth under it many more sorts and kinds of Diseases. For first of al, there is present magnitude augmented, and a swelling up and down in the body, especially in the external parts, whose beauty, feature, and figure likewise is hereupon corrupted: there is likewise present a hot and dry distemper, by which the parts are so exulcerated and corrupted that at length they fal off. *Celsus* in his third Book, and Chap. 25. thus describeth the whol Idea of this Malady: *The whol Body* (saith he) *is affected, so that the very Bones likewise may in a manner be said to be vitiated and corrupted. The highest and utmost parts of the body have in them both spots and swellings that stand thick and close one by the other. The redness of these parts is by little and little converted into a black color. The top of the skin is unequally both thick and thin, hard and soft, and is exasperated by certain scales; the body waxeth lean; the mouth, the calves of the legs, and the feet swel, and are puffed up. When the disease comes once to be old, the fingers and toes are quite hidden under the swelling;*

swelling; there ariseth also a light and gentle Feaver, that easily consumeth and wasteth the sick person, that is already overwhelmed with the aforesaid evils and mischiefs.

The Causes.

The containing cause is black Choler (and this not without malignity) diffused and spread abroad throughout the whol body. Now we find touching the generating of this humor, viz. black choler, a long and tedious dispute among Authors; and we find them holding divers and different Opinions. In this (the truth is) they al agree, that this humor is generated from the aduction and burning of other humors; but then in this they differ, viz. from the aduction of what humors this proceedeth. *Avicen* in the third Section of his fourth Book, Tract. 3. Chap. 1. seemeth to have comprehended them all; whiles he mentioneth five Species or kinds of this humor. The first is that which proceedeth from the Blood; the second that from the melancholly humor; the third that which is from the aduction of bitter Choler; the fourth that which ariseth from Flegm burnt; the fift and last, that that proceedeth from the thick, and hot part (as being very apt to be burnt) of the Chyle, as to Instance, from all salt Flesh, Fish, and the like. But although it cannot be denied, that there is here in this case an aduction of humors present, and that salt humors are the cause of this Malady; yet notwithstanding, since that there are very many other Tumors and Ulcers that have their original from adust humors, here therefore the very specifical cause is altogether to be sought for, which notwithstanding cannot easily be explained; but it consisteth in an occult *i. e.* an hidden and secret Malignity. But now this humor is diffused thorowout all the Veins; and an inductive Feaver is dispersed (without any putridness at all) thorowout the whol body, and is mingled together with the aliment.

But now there are many things that conduce and make to the generation of this humor. There are some thar contract the original seeds of this Malady from their very birth; to wit, such as either are born of Elephantiack Parents, or else conceived during the Flux of the monthly Courses, vitious, and corrupt, and declining unto black Choler. And moreover also the hot and dry distemper of the Members destin'd by Nature for Nutrition (as for example, the Liver, and the Spleen; from whence it is that the Blood and the humors are burnt) is deservedly reckoned up and accounted among the Causes of this Malady. And furthermore, the frequent and common use of salt meats maketh likewise very much hereunto, as also the eating of sharp and sowr meats, and food that is overgross and thick: the Air also being overhot and dry; or else thick and Cloudy: from wheuce it is that this Malady is in some Countries more frequent and usual, and in other Regions scarcely known; as the Poet *Lucretius* tels us in his sixth Book: *Elephas* (saith he) *is a Disease that* (*by reason of the overflowings of the River* Nilus) *is bred in the midst of* Egypt, *and no where else.*

But although it be true that the Disease is more frequently found there; as *Galen* likewise testifieth in his second Book to *Glauco*, and Chap. 10. (where he acknowledgeth that in *Alexandria* by reason of the fervent heat of that Region, and the unfitting Diet of the Inhabitants, who eat Meal boyled, Lentiles, and Cockles, many salt meats, and the flesh of Asses, with divers other sorts of food that generate and breed a thick melancholly humor, there are more that are troubled with this *Elephantiack* Disease) yet notwithstanding it is also to be found in other Regions. In *Germany* (especially in some parts thereof) these Elephantiack Persons are very common and ordinary; but in *Spain* and *Africa* they are far more frequently found; and in *Gallia Narbonensis*, and *Aquitain*, there are more of them to be found then in al *France* besides. *Pliny* in his twenty seventh Book, and Chap. 1. writeth, that before the time of *Pompey* the *Elephantiasis* was never known to happen in *Italy*. Living and Conversing likewise with the Elephantiack Persons much conduceth to the causing of the Disease. For the Air (that in breathing is attracted and drawn in) is infected by the stench of the Members, and the vitiated exhalation of the Breath. From whence it is that men deservedly shun the company of those that are thus affected; and for such as are domestick, and therefore necessarily constrained to abide under the same Roof, do yet (as there is good reason for it) shun their company, and all neer Converse with the sick Persons; and therefore even for this cause it is that these Elephantiack Persons are separated from the society and company of others; and are sent away, and disposed of in some open places, in the which they live with most benefit unto themselves, and less endangering others. But especially carnal copulation with the Leprous man or Woman is undoubtedly dangerous and infectious; and so is likewise that carnal society that any one hath with her that before hath had to do with a Leprous man. Unto these same Causes there belongeth also the retention of the Melancholly Excretions; as the suppression of the monthly Courses, and the Hæmorrhoids, and the sudden stanching and drying up of long continued Ulcers. For such a like humor as this (if it be detained long in the Body) becometh worse and worse dayly, and at length acquireth this malignity, and being retained in the Body it feateth and setleth it self in the Veins, and infecteth the whol mass of Blood. Moreover this Malady doth more frequently invade and seiz upon men then women; and among men, those especially that have in them

them Blood that is thick and viscous, tending to black Choler; and such as use a thick and inordinate kind of Diet.

Signs Diagnostick.

Although (as for what belongs to the signs of this Malady) we have given you some few of them out of *Celsus*, as they are by him recounted and reckoned up; yet notwithstanding it wil not be time & pains ill spent to enumerate and declare the whol entire History of the Signs and Symptoms. And therefore in the first place, whensoever this Malady is nigh at hand, there immediately goeth before it, and is present, a sluggishness or slothfulness, and slow and difficult breathing, unfitness for motion, a dayly and continual costiveness of the Belly, Urines like unto the stalings and waters that come from Beasts and the greater Cattel, a Breath slow and stinking, and an extream propension to Venery. When the Malady hath once gotten forward into the Skin, then the Native and flourishing fresh colour of the Face is changed, there arise red blewish and wan Pustules, the Cheeks and the Chin become thicker, the Veins under the Tongue are swollen up, and wax black, the Hairs fall off, there is present an extraordinary Thirst, and a drineſs in the mouth both by Day and by Night.

But now as it is in other Diseases, so it is here, that there are likewise certain times of this Malady. The beginning is, when the vitious humor and the malignity is yet but as it were laying siege and beleaguering the Bowels. The increment or increase, when the Malady now shews it self abroad and openly, and that the Symptoms are daily augmented. The state, when the Members are exasperated, and the whol concourse of the symptoms appeareth publickly, the which we shal immediately subjoyn. First of all the Eyes appear exactly round, and the looks thereof are fixed and immovable; which happeneth by reason of the consumption of the fat, and the extenuation of the Muscles; the Eye-lids and the Ears are contracted and drawn together; the Eye-brows fall down, the Nose swelleth outwardly, and is made flat, by reason of the afflux of the humor, and it is streightened within; from whence it is that the passage is obstructed, and the breathing hindred, so that they seem to speak as it were through their Noses; the colour of the Face is wan and Leaden coloured; the aspect and looks frightful; there appear Tubercles and red Pustules under the Eye-brows, about the Ears, and in divers places of the Face, and knots hard and round, like unto Grains; the Lips are made thick, the Bones neer unto the Ears stick forth; the Hairs of the Head shed and fall away; and if the Hair be pulled forth, a part likewise of the white Skin is pulled away together with it; which is a most certain and infallible sign of the Leprosie. This Malady discovereth it self likewise in other parts: the Veins under the Tongue swel, and become blackish; and the Glandules that lie neer unto the Tongue (and round about it) have in them round Tumors, like unto the *Scrofulæ* that are in Swine, which we call the Swine pox. The Breath stinketh, the Voice is hoarse, shril, and obscure, by reason that the Lungs and the parts serving for Respiration are filled and beset about with thick & adust humors, and by reason also of the drineſs and roughness of the *Trachæa Arteria*, or the great rough Artery. In the Hands the Muscles are extenuated, especially between the Thumb and the fore Finger; for whereas those Muscles are naturally lifted up into an hilly and manifest swelling, the depression of them and their being emaciated (happening by reason of the defect of aliment) becomes the more manifest and remarkable in them; the Nails are cleft; there is present a stupidity, and want of feeling in the Ankles, and the Calves of the Legs, and in the Feet also; so that although the sick Persons shall be pricked with Pins or Needles in those places yet they feel it not, in regard of the vitious matter filling up and obstructing the part & hindering the access of the spirits. The same likewise sometimes befalleth the Fingers and Toes, in the which there is also perceived a coldness and a certain privation of al sense and feeling; and sometimes likewise that stupidity and sleeping (as they cal it) chanceth unto the whol Skin between those Fingers, and extendeth it self even unto the Arm; & from the Foot it extendeth it self even unto the Knees, the Thighs, and the Hips; yea moreover the sense of feeling is diminished throughout the whol body in Elephantiack Persons. For all the Nerves and Pores being obstructed and in a manner shut up by the thickness of the humors will not allow and afford any passage unto the Animal Spirits. In some certain places under the Skin there is perceived and felt a kind of stinging (such as is caused by Emmets or Pismires) as if Nettles were rubbed thereupon; and likewise a certain kind of itching and tickling, as if there were Worms creeping there, and this is by reason of the adust fumes and burnt vapors ascending up under the Skin. The Skin it self is wholly Unctuous and Oyly (so that Water poured upon it wil hardly stick and abide) by reason of the melting of the fat under the Skin, and the effusion of fat excrements thereinto. Others there are that unto these signs add other signs also. They advise us to take some few grains of Salt, and to cast it upon the Blood; because that if the Blood be infected the Salt is presently resolved and melted; but on the contrary, if the Blood be not infected. They command us likewise to cast this Blood into the purest and cleerest Water; and if it swim at top, it is corrupted; but the contrary if it sink to the bottom. Others there be that take the Blood and putting it in a clean Linen Cloth they wash it;

for if there then appear in it certain blackish, rough, and as it were sandy bodies, it argueth a leprosie. But there are other signs also of this Malady; and indeed there is scarcely any evil, mischief, or inconvenience, that is not annexed thereunto; and in the which there is hardly any thing within or without that is sound. But yet notwithstanding the Face is especially to be considered; neither is any one rashly to be accounted Leprous, unless the figure of the Face be corrupted. And therefore since that in some Common-wealths there is instituted and appointed an Annual Examination and Search in and about these Elephantiack persons, and that this is the chief, if not the whol business of the Physician; he ought therefore to use the utmost of his endeavor, and to be very cautious, that through imprudence, or by a rash and precipitate Judgment he do not cause such to be exiled and banished from al society that are not infected with this Disease; and on the other hand, for those that are infected therewith, that he do not permit them to live and converse with such as are sound, to the great endangering of them. And this he may easily do, if he have in his eye al the signs before recounted and mentioned; and if he wil likewise but duly weigh and consider, which of them are proper unto them, and inseparable from them; and what they have common with other Diseases. In the serious examination of al which *Franciscus Valeriola* hath taken extraordinary pains, in the sixth Book of his Enarrations, Enarrat. 5. the Reader may do wel to consult the place alleadged. We must not here also pass by in silence that which *Marcellus Donatus* hath in his first Book of the History of things wonderful in Physick, Chap. 4. by which we have occasion given us to think and conjecture, how great the corruption of the blood may possibly be in those that are Leprous. *Annibal Pedemontanus* (saith he) *having been for two yeers vexed and afflicted with an incurable Lepra, he was at the end thereof taken and surprized with a Pleurisie; and having a Vein opened, this strange thing befel him; the hot Urine that came from him (being in quantity more than the pot could wel hold, and upon which there swam a blood at least six ounces in weight) so soon as it was cooled was by the said blood thickned in such a manner, just as if the water had been Milk, and the blood the Curd thereof; so that in its consistency it seemed to be very like unto curdled Milk; yet still retaining its own proper color; of the which there was not one drop indeed to be found that was severed from the rest, and not curdled.* The cause hereof is given by the Author before cited, who conceived it to be, and imputeth it unto the thickness and clamminess of the blood, which being throughly mingled with the Water, (the actual heat of both of them assisting and furthering the distribution in their mingling together) when it had abated of its great heat, and was now become cool, gave the occasion of the said coagulation or curdling. And he conceiveth likewise that here the very same thing happened that cometh to pass, when the smal parts and pieces that are cut from Hides and Skins are boyled in Water for the making of Glew. For so soon as ever that Water is cooled, it instantly is thrust and forced close together, by reason of the clamminess and sliminess of the juyce; and the like also happeneth in some kind of meats that we eat, that are made of Calves feet, and the feet of other living Creatures.

Prognosticks.

1. By al which it appeareth, That this Malady is most grievous and dangerous, hard to be cured, and (the truth is) not at al curable unless it be taken in hand in the very beginning and first rise thereof; neither then without much ado and difficulty. For an *Elephantiasis* inveterate and confirmed wil at no hand admit of any Cure. For if a *Cancer* (being but a particular disease only) wil allow of no cure; how much less wil the *Elephantiasis* that is an universal *Cancer* of the whol body, admit and receive any? And indeed there is hardly to be found any Remedy that can subdue and conquer the greatness of this Malady.

2. This Disease is exceeding great and grievous, to wit, from the great store of corrupt humors; and there is in the body an extream and intense heat, to wit, so great that if any one thus affected (but for a short space) hold in his hand a new and green Apple, it wil become wrinkled and withered, even as if it had been for some long time dried by the heat of the Sun and the Air. And this same very malignity hath now of a long time taken deep root. For this Malady discovereth it self but very slowly; neither doth it at al appear before that the malignity of the humors have besieged (as I may so say) and shal have corrupted the bowels. On the contrary, the strength of Nature is but very weak; as it may sufficiently appear from the actions of al the faculties that are generally hurt and weakened.

3. Wherefore like as we do but in vain, and to no purpose at al, take in hand those that are altogether overmastered by this malady, and the long continuance thereof; so on the other hand, it argueth an overgreat despondency and despair in those Physitians, that deny their help and assistance for the cure and recovery of those that but only seem to be affected with this disease, but in very truth are not so. For as *Aetius* writeth, Tetrab. 4. Serm. 1. Chap. 120. *It is a sign of humanity, and an argument of brotherly kindness, in the most extream and worst of Maladies, to condescend likewise unto those Experiments that in al likelihood and probability may tend to the quelling and keeping under the rage and violence of the Affect.*

The Cure.

As for what concerneth the Cure of this Diſeaſe; in the curing of an *Elephantiaſis* that is but new begun, it is above all other things neceſſary and requiſite that the vitious humors be wholly removed out of the body; which to attempt wil yet notwithſtanding be but in vain, unleſs there be withal ſuch a like Diet firſt ordained and appointed, as by the which there may be no more of the vitious and bad humors gathered and heaped up together; but that thereby rather the fault and whatever is amiſs in the humors and the body may be rectified and amended. And this is done by ſuch things as cool and moiſten, to wit, as they are contrary unto the preternatural diſtemper, being hot and dry. Broths and ſuppings are in this caſe therefore very fit and proper; which may be qualified with Sorrel, Bugloſs, and Borrage; unto which likewiſe (as unto al other food the Patient eats) Harts-horn may be added and mingled therewith; as having in it an eſpecial and peculiar virtue of oppugning and ſubduing that aforeſaid malignity. Let his Meats be ſuch as afford a good and commendable juyce, and withal eaſie of digeſtion; his fleſh rather boyled than roaſted; or if at any time it be roſted, then among other Condiments, Sauces, or Sallades, let there be appointed him theſe that follow, viz. Sorrel, Lettice, the juyce of Citrons, Vinegar of Roſes, and Capars. But chiefly we commend the cream of Barley, with the Milk of ſweet Almonds. And on the contrary, let the Patient carefully avoid al ſalt meats, and ſuch as being ſalted are then ſmoke-dried, and ſo hardened; al fried and aduſt food, al ſpiced meats; as alſo Peaſe, Beans, Onions, Garlick, Muſtard, Hares fleſh, Harts fleſh, Beef, Swines fleſh, Fiſh (that have a viſcous and clammy juyce) and generally al other meats that breed a thick, melancholick, and aduſt humor. And when the ſick perſon is at his meals thirſty, mere and undiluted Wine is very hurtful for him, in regard that the heat and drineſs of the Patients body is thereby augmented: and as for Beer, thick humors are for the moſt part thereby generated; and therefore it wil be requiſite to find out for him another kind of Drink that he may dayly make uſe of without any the leaſt inconvenience. Of which ſort, the chief and principal is that drink that is made of the juyce of ſweet ripe Apples, and then throughly cleanſed from its Lees and Dregs. For this Drink is of ſingular uſe and benefit, not only for thoſe that are Elephantiack, but likewiſe for al Melancholy and Hypochondriacal perſons, as alſo for al others, whoſe Liver and Meſentery or Midrif afford matter and cauſe of a diſeaſe. For it tempereth and qualifieth the melancholy humor, diſcuſſeth the vapors thereof, recreateth the Heart, begetteth cheerfulneſs, tempereth and moiſteneth the dryneſs of the Bowels, and yieldeth a good aliment.

Another Drink there is that is uſeful and fit for al hot Natures, and hot Diſeaſes (provided that the ſtomach wil but bear it) and it is made after this manner:

Take *of the pureſt Water three quarts; Sugar ſix ounces; the juyce of Lemmons, or of the Citron, three ounces; (according to what the ſtomach of the ſick perſon, the ſtrength of the heat, and the taſt require) of Citrine Sanders two drams; let them boyl a little; and afterward add, of Cinnamom one dram; and ſtrain them.*

Thoſe that are of mean eſtate and condition may make uſe of the Piſan, or Barley boyled with Fenel ſeeds. But this following wil ſerve them for a more efficacious Drink.

Take *Sorrel, Marigolds, Meadow-ſweet, of each one handful; Pimpernel two drams; Shavings of Ivory, and Harts-horn, of each one dram; Raiſons ſtoned and wel waſhed two ounces; Liquoris raſped and cut into thin ſlices one ounce; Barley one pound. Boyl them in a gallon of Water until one quart thereof be waſted away. And what is ſtrained forth let it be ſweetened with the Syrup or Julep of Violets.* Or,

Take *the Root of Succory one ounce; Raiſons three ounces; Liquoris cut thin half an ounce; Harts-horn, Fenel ſeed, of each one dram; boyl them in a gallon of Water, almoſt unto a third part. And what is ſtrained forth, ſweeten it with the Syrup of Violets.*

Furthermore, as there ſhal be occaſion, let a vein be opened, and the body be purged, according to what the variety of circumſtances ſhal require; as for example:

Take *Caſſia one ounce; Elect. Diacatholic. two drams; Fenel ſeed half a ſcruple; and with Sugar make a Bole.* Or,

Take *Elect. Diacatholic. half an ounce; Confect. Hamech one dram or two; Conſerve of Borrage half a dram; Sugar a ſufficient quantity, and make a Bole.* Or,

Take *the Roots of Succory, and Scorzonera or Vipers Graſs of each three drams; Sorrel, Borrage, Bugloſs, Fumitory, Harts-tongue, of each one pugil or ſmal handful; of al the Cordial flowers two pugils; of the four greater cold ſeeds, and Fenel ſeed, of each half a dram; the Leaves of choice Sene half an ounce; Polypody of the Oak, and Mother of Thyme, of each two drams; Raiſons cleanſed half an ounce; boyl them in a ſufficient quantity of cleer running Water; and in four ounces and half of the ſtraining infuſe one dram and half of Rheubarb, and half a dram of Cinnamom; unto the ſtraining when it is preſſed forth, add of the Syrup of Fumitory, and Borrage, of each half an ounce; and mingle them well together.* Or,

Take *the root of Succory, Monks Rheubarb, Elecampane, of each half an ounce; Sorrel, Fumitory, Scabious, Bugloſs, Maiden-hair, of each*

one

one handful; Flowers of Borrage and Bugloss, of each half a handful; Liquorish thin sliced, and Raisins cleansed, of each six drams; boyl them in a sufficient quantity of spring Water; then take of the straining one quart, and infuse therein the Leaves of Sene, Polypody of the Oak, of each one ounce; the rind of black Hellebor half an ounce, Fenel seed and Anise seed, of each two drams; Citron one dram, Mother of Thyme (commonly known by the name of Epithymum*) five drams, Cinnamom one dram; afterward let them boyl gently, then strain them, and sweeten all with Sugar*, and of this let the Patient take (every or every other day) two or three ounces with the Broth of a Chicken. Or else there are other preparations and Purgations to be appointed, *Of the Whey of Milk, Fumitory, Harts tongue, Maiden hair, Borrage, Bugloss, Violets, Succory, Endive, Sorrel, Scabious, Thyme, Scordium or Water Germander, Liquorice, sharp Dock, called by some sowr Sorrel, &c. Of Epithymum otherwise called wild Tyme, or Mother of Tyme, Polypody, the Leaves of Sene, black Hellebor, &c.*

Now the Purgers and Preparers are often to be repeated; for so great and contumacious a Malady as this cannot be taken away by a Digestive or two, neither without frequent Purgations.

But there are likewise in the mean time Cordiall Medicaments to be made use of, and such as extinguish and abolish malignity; As,

Take *Conserve of Bugloss, Borrage, Violets, Water Lillies, Roses, of each two drams; Leaves of Gold three or four (or more if there be occasion) Harts-horn prepared, the best Treacle four scruples, Syrup of Apples, or Borrage, as much as is sufficient; make an Electuary.* Or,

Take *Conserve of the Flowers of Borrage, Bugloss, and Roses, of each one dram and half; the Species Diarrhodon Abbatis, and the best Venice Treacle, of each two drams; and with the Syrup of Apples make an Electuary; of which let the Patient take every day in the morning the quantity of a Walnut, and twice or thrice besides every week.*

So soon as the Patient hath taken his Electuary, let him presently be put into a Cestern filled with sweet Water; and let him sit herein for the space of one hour. But let the Bath be so temperate that there be no sweat caused, either in the Bath, or after his going out of it. For if any Sweat be excited, it is a sign that the Bath is hotter then it ought to be. There are many Physitians that forthwith send away the Patients unto the Natural and Mineral Waters. But in regard that they dry exceedingly, there oftentimes ariseth thence more hurt then good; especially in the beginning of the Disease, while the heat and driness are at the highest. And there a Bath of sweet Water is far more commodious and safe, which tempereth the driness, discusseth the excrements, and looseneth the Skin. After Bathing, the body may be anointed over with this Medicament following, or such like;

Take *the Juyce of Nightshade, and of Scabious, of each one ounce; the Root of the sharp Dock six drams, Vinegar of Roses one ounce, Elecampane root and Pimpernel, of each half an ounce; Oyl of Roses four ounces; the Rinds of black Hellebor tied up in a piece of skin, three drams; boyl them them until the Juyces be boyled away, and after this cast away the black Hellebor; and then,*

Take *fresh Butter one ounce and half, Vipers fat, or if that cannot be had, the best Treacle one ounce, burnt Lead half an ounce, Litharge and Ceruss, of each two drams; Frankincense a dram and half, Storax Calamite and Nitre, of each two scruples; Mingle and stir them wel about together with the Juyce of Lemmons, in a Leaden Mortar with a Leaden Pestle, untill it hath gotten the form of a Liniment.*

After bathing let him likewise use this Remedy, which some hold for a great secret: They burn in a new Pot the Head of a Kite, which after it is pulled and made bare of its Feathers, they cut off, as also the Feet and the Bowels being taken out; and of the Powder hereof they administer what they think requisite in a fit and convenient Liquor; and they prescribe likewise the eating of the rest of the Flesh at thrice, that is to say, a third part each day, for three daies together.

Solenander writeth that he himself made use of this following Remedy, and that with very good success. He taketh two or three Vipers or (if they cannot readily be gotten) other Snakes, and dissecteth them alive, and then together with good store of Barley he puts them into Water, and boyleth them until the Barley become soft. With this Barley, as also with the very Flesh it self of these Snakes he feeds many Pullets or Chickens, and gives them no other food; with the which after they have been for some few daies nourished they lose their Feathers, and within a short time they again get new ones; and afterward with this Flesh and Broths made of them he nourisheth the sick Person by little and little. And indeed this Remedy out of Vipers we find to be much used by the Ancients. For the body being first purged, in the spring time especially, they took Vipers and cutting off the Head and Tail (casting away the Skin) they gave the Flesh of these Vipers to be eaten by their Patients thus affected. But *Julius Palmarius* assureth us that *Fernelius* (although he made it a good part of his Study) yet he could not once in all his life time effect what he so much wished and so diligently studied for, to wit, the recovery and restoring of any by the use of Vipers. And by his advice likewise *Palmarius* himself administred these Vipers, and not only the flesh of them prepared

prepared divers waies (thus and thus) but the very Treacle it self also that is made of them; and yet notwithstanding without any the least success. For although at the first in the beginning of this Disease, this kind of Remedy may seem to benefit much; yet notwithstanding at the length by it the Elephantiack poyson and virulency is thrust forth into the Skin, and all the symptoms so exasperated (as he writeth) that in the end the putridness being augmented, they are as it were torn in sunder Limb after Limb. But however in regard that the Ancients have so much commended the use of Vipers, and some likewise of our latter Physitians have extolled the use of them, we therefore in this particular advise you to consult experience.

The Ancients likewise for a Remedy used Castration or Gelding; and they tell us in their writings, that many have been recovered by this means: Which (as *Valescus de Taranta* conjecture th) therefore cometh to pass, because that the Leprosie proceeding from an overdrineſs, the body by the taking away the Stones becometh much moystened, being hereby much effeminated; and so by this means the humidity thereof is in great measure retained.

And that we may conclude this Discourse, the *Elephantiasis* alone (as *Palmarius* writeth) more than any other of those Diseases that are of long continuance seemeth to rejoyce it self as it were in the variety and interchange of Remedies. And there are in this affect (if in any other) certain cessations and intermissions (almost from all Remedies) oftentimes to be allowed unto the sick Person; and then the same Remedies are anew to be repaired, and new ones to be added; since that scarcely ever did any recover of this Disease, that placed the hope of his safety in one only Remedy, though it were never so generous and prevalent.

Julius Palmarius puts much confidence in Hydrarge, which as he writeth doth every whit as much in this case as the flesh of Vipers, or the Viperine Treacle, or the Iron Instrument, or the Fire. But in regard that it will take up too much of our time, and cost much pains here to acquaint you with all that we might touching this subject; And in regard also that the same *Palmarius* in his Book of the *Elephantiasis* hath taken notice of many other such like Observations as touching this Disease; and that *Aetius* likewise, Tetrab. 4. Serm. 1. Chap. 121. &c. hath collected very many things concerning it; and that much also may be found in *Forestus* his *Rosa Anglica*, and in other Authors that have written upon this Subject; and lastly, in regard that *Schenkius* likewise in the sixth Book of his Observations hath collected many strange and rare things touching this *Elephantiasis*; in all these respects, I think it not amiss to refer the Reader unto those aforesaid Authors, for his more full satisfaction. And *Petrus Palmarius* likewise in his *Lapis Philosoph. Dogmatic.* Chap. 24. reciteth an History of a certain Leprous Woman, whom he Cured with *Aurum Potabile*, exuberated, and exalted upon a Sphere, as Chymists speak, and with the Antimony of *Alexander Suchtenius*.

Chap. 41. *Of a flatulent or windy Tumor.*

AND thus have we now at length dispatched and finished the Explication of al those Tumors that have their original from the Humors; it now remaineth that in the next place we treat of those Tumors that arise from winds. For there are peculiar Tumors that have their original from flatulency, or a flatulent and windy spirit; which the Grecks call *Pneumatoseis*, and *Empneumatoseis*, and *Emphysemata*; but the Latines call them *Inflationes*. Now this flatulent Tumor (as *Galen* tels us, in his Book touching the course of Diet in acute Diseases, Comment. 4. Text. 21.) is generated after a twofold manner; to wit, *By a flatulent Spirit collected in certain Cavities these Cavities being either exposed to the sense, or else such as are Contemplable by Reason.* Now by Cavities contemplable by reason (as he explains himself in his second Book to *Glauco*, & Chap. 5.) he understandeth those very Pores of the similary parts, and those little spaces that are interposed betwixt the said similary parts.

The Causes.

The Proxime, *i. e.* the neerest and conjunct Cause of this Tumor is a Wind, or flatulent Spirit. Now this is generated (as *Galen* writeth in his third Book of the Causes of Symptoms, and Chap. 4.) from a heat weak and languishing. For as absolute Cold cannot possibly excite any Vapor, so on the other side, vehement heat discusseth the Vapor. That which supplieth matter unto these flatulencies, is a humor, thick, flegmatick, or melancholick. The same do both flatulent Meats and Drinks afford, as also a cold, moist, and cloudy Air, an idle and sedentary life, and the suppression of accustomed Evacuations. The thickness of the part likewise that will not permit the Vapors to breath forth maketh much for the accumulation and heaping up of Winds.

The Differences.

Now there are of these flatulent Tumors many Differences; and this especially in regard of the parts affected; whiles that sometimes these Winds are collected under Skin, and about the Membranes of the Muscles; sometimes in the Membranes of the Bowels; sometimes in the very Cavities of the Bowels, *viz.* the Stomack, Womb, Abdomen, and *Scrotum*, or Gods.

Signs

Signs Diagnostick.

The flatulent Tumor is known by this; That the part is sometimes lifted up into a greater, and sometimes into a less heighth; and oftentimes likewise there is from the distension a pain excited; but yet notwithstanding there is no kind of heavinels felt and perceived in the parts; and unless the wind be shut up in some cavity, it doth very seldom continue long in one place, but wandereth up and down. If the Tumor may be pressed with the finger it leaveth no pit; but the Tumor either resisteth the touch of the finger, or else the wind passeth unto some other part; and if it be smote with the hand, it then sendeth forth a noise like that of a Drum; and by how much the cavity in the which the wind is contained is the greater, so much the greater is the noise or sound.

The *Emphysema* differeth from *Oedema*; because that the cause of *Oedema* doth alwaies stick in the pores, and the spaces of the parts that are contemplable by Reason; now what those parts are, you may understand by what we have said in the beginning of this Chapter. But the cause of *Emphysema* is often collected in some one certain Cavity. And albeit that same flatulent spirit be likewise sometimes dispersed through the streightest passages of the parts; yet notwithstanding (as we have told you) these *Oedema's* being prest do leave a hole or pit behind them; but as for the *Emphysemata*, they are not hollowed into a pit; and the *Oedemata* likewise if they be touched by the hand make no noise at al, as do the *Emphysemata*.

Prognosticks.

1. Flatulent Tumors if they be smal, and be not cherished by some pertinacious cause, they are then without danger.

2. If the flatulent Tumor be great, it then argueth a great debility of the heat, and an abundance of matter; and therefore it is more dangerous, because more contumacious and stubborn.

3. If the flatulent matter be detained in the Muscles, it is then hardly cured; in regard that the spirit is dispersed from the ambient Membranes into almost al the parts of the Muscle, as *Aetius* writeth, Tetrab. 4. Serm. 3. Chap. 2.

The Cure.

The wind that distendeth the part is to be taken away, and means used that it may not breed again, and flow unto the part; and the pain (if any there be) is to be mitigated and moderated. And therefore such a kind of Diet is to be ordained that maketh not for the generation of winds; and the matter out of which the wind is bred is to be evacuated; and the heat of the part that generateth the windiness is to be corroborated, and corrected, touching which we have already spoken in the places that shal be presently alleadged.

Such things as are hot and dry discuss windiness; and of this sort are the seeds of Caraway, of Cummin, Annis, Fennel, Carrot, Millet or Hirse, Juniper Berries, and Bay-berries, Camomil, Dill, Rue, Calaminth, Marjoram; as for example;

Take *Seeds of Caraway, Fennel, and Cummin, of each one ounce; Rue, Calamint, and Camomile flowers, of each one handful and half; Millet seed three ounces; then make a little bag or two, which throughly moisten in warm Wine, and apply them by turns one after the other.* Or,

Take *of Rue, and Betony, of each one handful; Parietary half a handful; boyl them in Ley until they be soft, and bruise them; then add pouder of Camomile flowers, and Bean Meal, of each two ounces; boyl them and make a Cataplasm.* Or,

Take *Oyl of Rue, and Camomile, of each one ounce; the destilled waters of Caraway, Fennel, Cinnamom, of each half a scruple; a little Wax; and make an Unguent.*

Chap. 42. *Of Tumors proceeding from the solid parts falling down into, or resting upon some other parts, in general.*

THere remaineth now to be spoken of the last kind of Tumors, which the solid and living parts excite. For these if out of their own proper place they fal down into another place, or else rest and lie thereon, they then elevate the parts incumbent, and more especially the skin; and so by this means they excite a Tumor or Swelling. But now, the Bones are those that principally do this. For these if in either their disjoyntings they fal out of their proper places or seats, or if being broken they change their scituation, they then lift up the part incumbent into a Tumor. But there is no need that we speak any thing in special, and particularly, touching these kind of Tumors. For like as they proceed from, and depend upon disjoyntings, dislocations, and fractures, so they are by them well known; and these being cured, they vanish.

And hither likewise belongeth Gibbosity, touching which we have already spoken in our second Book of the Practice of Physick, Part 2. Chap. 21.

There is likewise mention made by *Galen* (in his Book of Tumors, Chap. 14, & 15. and 14. of the Method of Physick, Chap. 17.) of a peculiar sort of Tumors arising from the Bones, and this he calleth *Exostosis*, you may cal it *Exossatio*, to wit; Eminencies and standings out of the Bones, and especially those of the Temples, and in other parts also: but as touching these, (in regard

referred unto *Nodi* and *Cornua*, Tumors above propounded, Chap. 38.) there is no need at al that we speak any thing further here in this place.

Furthermore, there are Tumors oftentimes excited by the soft parts moved out of their places, and falling down. And hither belongeth that kind of Tumors that the falling forth of the *Uvea* causeth, of which we have already treated in our first Book, Part 3. Sect. 1. Chap. 25. *Hernia* or Rupture of the Intestines, of which likewise above, in the third Book, Part 2. Sect. 1. Chap. 6. and the Umbilical or Navel *Hernia*, touching which also we have spoken sufficiently in the same place, Part 10 Chap. 2. And lastly, the Uterine procidency, and *Hernia*; and of this we have spoken likewise before, in the fourth Book, Part 2. Sect. 2. Chap. 16, and 17.

There remain yet only two sorts of Tumors, having their original from the living parts; the one from the Arteries, the other from the Veins: of which the former is termed by the appellation of *Aneurysma*, and the latter by the name of *Varices*; which Tumors we shal speak unto and explain in the two following Chapters, and with them we wil conclude and shut up this Tract of Tumors.

Chap. 43. *Of* Aneurysma.

Aneurysma, which is so called, not from the Greek word *Neuron*, but from *Anaeureumein*, which is as much as to dilate above; which word the Latines likewise retain, being not provided of a better and more proper; (for as for those that the Arabian Interpreters make use of, such as these, *Hyporisma*, *Emborisma*, *Emborismus*, *Aporisma*, they al of them have their original from the Greek word corrupted) that this *Aneurysma* (I say) is a Tumor arising from an Artery preternaturally affected, is a thing out of al doubt and controversie. For although the Author of the Medicin. Definitions saith that *Aneurysma* is a relaxation of a veiny little Vessel; yet notwithstanding, without al doubt the word *Venosum* is there taken for *Arteriosum* (that is to say, Veiny for Arterial) since that it is a thing generally wel known, that the Ancients did oftentimes cal the Arteries by the name of Veins.

But now what this *Aneurysma* is, and from what cause it ariseth, is a thing not altogether so manifest and evident. *Galen* indeed in his Book of Tumors, Chap. 11. writeth thus touching this Aneurysma: *But now* (saith he) *a mouth being made in an Artery, the Affect is called* Aneurysma. *Now this happeneth when the Artery being wounded, the skin that lieth neer unto it cometh unto a Cicatrice; but yet the Ulcer of the Artery still remaineth, the said skin being neither conglutinated, neither together brought unto a Cicatrice; neither filled up with flesh.* And the same *Galen* in his fifth Book of the Method of Physick, Chap. 7. hath left this written: *Unless* (saith he) *flesh produced do first fill up the place that is neer about the Artery cut asunder, but that there still remaineth some void and vacant place, then verily there followeth that Tumor we call Aneurysma.* Other Greek Physitians there are that are of the same Judgment and Opinion with *Galen*. For thus *Aetius* writeth touching this *Aneurysma*, Tetrab. 4. Serm. 3. Chap. 10. *Aneurysma* happeneth in every part of the Body, but more frequently in the Throat; where it produceth that Tumor we cal *Bronchocele*. It befalleth oftentimes unto Women in Child-bed, by reason of the violent detention and holding of their breath: but it happeneth likewise in the Head, nigh unto the places of the Arteries; and in the rest of the body also, where ever the Arteries are wounded: like as when ignorant and unexpert Physitians intending and attempting to open a Vein in the Arm, do withal prick, and oftentimes cut asunder the Artery lying underneath it. The very same is told us by *Paulus Ægineta*, in his fourth Book, and Chap. 53.

The same Opinion is borrowed from the Greeks by *Avicen* the Arabian, as appeareth by what he writeth in *Quart. quarti*, Tract. 2. Chap. 16. *And when the place of the Artery* (saith he) *is not from above coarctated and conjoyned close together, after the solution of its continuity, and that it findeth a voidness or vacuity, then the thing comes even to an* Emborismus, *which is named the Mother of Blood.* And a little after, thus he writeth: *And very many times* (saith he) *the Artery is not indeed covered over with flesh, but that which containeth the Artery is incarnated and covered with flesh, and is coarctated and closely conjoyn'd upon it. Wherefore the blood cannot have nor make any superfluous course; yea, somthing goeth out of it even unto the ends of the skin, which it receiveth and taketh in the quantity; and whensoever it is easily and gently pressed together, it returneth, and it's altogether bidden, like as we see it to happen in Ruptures.*

And this Opinion very many, and indeed most of the latter Physitians do follow. Yea, and *Platerus* himself likewise, who is otherwise wont to take liberty enough in examining the Opinions of the Ancients, writeth, That *Aneurysma* doth not only arise from the dilatation of the Artery (it yet remaining shut and entire) but also that more frequently (if not alwaies, if it be in the exterior parts) it proceedeth from a certain manifest and apparent opening thereof. For then the thin and sprightful blood breaking forth of the Artery under the skin lifteth it up into a Tumor or Swelling, and there formeth and frameth unto it self a hollow nook, and there in the Artery causeth this pulsation in this Tumor; even almost in the same manner as the Arteries are wont to empty themselves naturally into the hol-

low nooks of the thick Membrane of the Brain; so here they do it preternaturally, by pouring forth the blood (with and in breathing) in its *Diastole*, and in its *Systole* receiving it in again.

But this is an Opinion that I could never approve of; and therefore in the yeer 1606. (when I interpreted *Galen*'s little Book of Tumors) I altogether rejected it; and I then likewise propounded another, which out of those Lectures of mine, that noted and famous man Dr. *Bernhard* of *Sweden* made use of and Inserted likewise in his Treatise of the Inspection of Wounds. For if *Aneurysma* should proceed from the Effusion of the Arterial blood under the Skin; then certainly the said blood would diffuse and disperse it self, in length, and breadth, and round about; and would dye and colour the Skin of another Hieu; like as we see it to happen in Contusions, and in the opening of a Vein, when it is not exactly and rightly performed; to wit, when either the Vein is wholly cut through, or else when the Wound thereof by reason of the impetuousness and violence of the Blood is not rightly closed. For then the blood is very often poured forth under the Skin, even unto the extream and utmost part of the Hand; and the Skin is dyed with a Red, Green, and Yellow colour. Which must necessarily happen somuch the more, if an Artery be opened; in regard that the Arterial blood is thinner, and floweth forth with a greater force & violence: which yet notwithstanding never happeneth in *Aneurysma*, in the which that Tumor is conteined within its own Limits, and as it were in a Bladder; neither is the Skin dyed with any other color. And moreover if *Aneurysma* proceeded from a Blood poured forth under the Skin, in progress of time it would so happen that this Blood consisting and abiding in a strange and unfit place would putrefie like as we see it usually doth in *Ecchymoma*, as we told you before in the seventeenth Chapter.

Antonius Saporta indeed in his first Book of Preternatural Tumors, and Chap. 43. doth his endeavor to salve and answer these objections, whiles he thus writeth; *The Blood* (saith he) *if it altogether leaveth its own proper Vessels, and cast it self forth into a greater* Venter *or Cavity, being left destitute of the influx of the heat that should flow in unto it, wil necessarily putrefie: but in* Aneurysma *(which proceedeth from the opening of an Artery) it is not so far forth left destitute by the heat thereof, and by the rest of the Blood that is contained therein, that its native heat and colour should perish; neither is it expelled forth into any great space or* Venter, *that it should corrupt and putrefie. For it is cherished by the vital spirits contained in the Artery, since that its matter remaineth yet entire and continued. For albeit the Artery be divided, and the Blood causing the Tumor doth pass forth; yet notwithstanding the Flesh and the Skin that cover the Artery, continuing stil whol and entire it doth not alwaies so insinuate it self into any large and ample space, that it should be made thereby to putrefie, and rendered destitute of the help and assistance of Nature.* But the truth is, he doth not here by all that he alleadgeth acquit and free the Ancients from the aforesaid Objections. For if the Blood that is flown forth may be cherished by the vital Spirits and the heat of the Artery; why then is not the same done likewise when a Vein is smitten and pierced through, and when the Blood (the Vein being not as yet consolidated and exactly closed) issueth and floweth forth? Neither doth the Blood only then putrefie when it is poured forth into a large and sensible Cavity, but likewise whensoever it is shed forth under the Skin. Furthermore (as we have said) that Blood which we call Arterial is not poured forth round about, as the Vein Blood is; which yet notwithstanding it ought much rather to do, in regard that it is thinner, and more spiritful. For it is not sufficient (what *Platerus* writeth) that the Blood poured forth under the Skin doth there form and frame for it self a *Sinus* or hollow nook, not unlike the hollow spaces into which the Arteries in the thick Membrane of the Brain do insinuate themselves; and that the Skin is instead of an Artery unto that Blood that is poured forth out of the Artery; and that the Blood may from thence uninterruptedly repass, and flow back again into the Artery, without any Corruption. For the *Sinus*'s are framed by Nature, and so exactly shut up with Membranes, that nothing at all can possibly flow forth of them. But now the Arterial blood can no manner of way frame for it self any such *Sinus*, but whensoever it falleth forth without the Artery it diffuseth it self every where round about; and in regard that under the Skin all things are confluid, therefore the Blood easily maketh an irruption into the adjacent parts by that way and passage that is opened; the which we may likewise see the Veiny Blood to do (which is much thicker) and then the said Blood being out of its own, and in a strange place, soon putrefieth. Which appeareth even from that very History that *Antonius Saporta* writeth, as conceiving it to make much for the confirmation of what he had written touching *Aneurysma*, in his first Book of preternatural Tumors, and Chap. 43. Neither in truth was that Disease which he there describeth an *Aneurysma*, but only an effusion of the Arterial Blood, upon the rupture of the Artery, into the places lying neer about it, and there corrupting. But this is the Story that he telleth us. *Whenas* Johannes Fabri *that most acute and sedulous Scribe of the Palace at* Montpelier *had spent the chiefest part of his youth in riotous and inordinate Revellings and Feastings, and in a frequent and unseasonable Drinking of the strongest*

strongest sort of Wines, without any diluting, or qualifying the heat thereof, he began about the fiftieth yeer of his age to draw his breath with much difficulty, and to be affected with an extream troublesome palpitation and beating of his Heart. For the removal of this great Distemper there were many Remedies prescribed and administred, not only by my self, but likewise by the most expert Physitians of our University there. All which when they could not in the least prevail over this contumacious and head-strong Disease, by reason of the Patients continuing and persevering in his accustomed ill course of Diet, he grew the worse thereby; and after some few months were passed, in the which by the advice of the Physitians he took no Physick at all (for they were willing to commit unto Nature a part of the Cure of this Chronical Affect) he began to complain of that part that lieth under his left Shoulder-blade. The place of his grief being look't upon, and throughly considered, there appeared unto me a notable Tumor, soft unto the touch, and attended with a beating; and when pressed down with the Fingers, it was then seemingly wholly hid and non-apparent; but these were no sooner taken off, but forthwith it returneth as before. In short, the Disease having gotten deep rooting, & being now become incurable, our Patient within a very short time after departed this life. But now that we might get the truth and certainty both of the nature and constitution of this Disease, as also of the Cause thereof, we dissected that part that was affected with the Tumor; out of which there issued forth great store of Blood, unsavory and stinking as it was; all which Blood being wholly evacuated and throughly cleansed, there appeared the prime and principle Artery under the Heart (having its original from the great Vein in its ascending up into the Head) exceedingly dilated, and extreamly torn. This Vein descending downward creepeth along through the Region of the Intercostal Muscles; the Blood that flowed forth of it being heaped up in the spaces of the Muscles, and in tract of time putrefying and corrupting, had so vitiated and marred the Vertebra and Rib of that place, that it seemed unto us altogether rotten and putrefied.

And therefore (say we) some other way and means of the generating of this Tumor is to be sought and found out.

The Author of the Book of the Medicin. Definitions defineth *Aneurysma* by the relaxation of an Artery. And so likewise *Fernelius* in the seventh Book of his Patholog, and Chap. 3. asserteth that *Aneurysma* is a dilatation of an Artery ful of spiritful blood: but all this while they do not express the manner how this is done. Neither is it ever a whit credible that *Aneurisma* is caused by the dilating of both the Tunicles of the Artery, but only by the widening of one of them. For the Arteries have indeed a double Membrane, one external, which is slender, thin, and soft, having of straight Fibres very many, but of oblique ones very few, and of transverse ones none at all: the other internal, which is close, thick, and hard, having transverse Fibres, but wanting straight and oblique ones. And therefore if the Internal Tunicle be either broken by extension (as easily it may be in regard of its hardness) or else if it be opened by Section, it doth not easily Cement and close together again, because it is hard; but now the external Tunicle in regard of its softness doth easily and soon grow together again; and because it is so soft, and wanteth both oblique and transverse Fibres, it is thereupon extended by the Blood and the vital Spirit, seeking their passage forth in an imperious and violent manner; and so this kind of Tumor cometh to be excited; in the which the force and the impetuous violence of the blood and the vital spirit may be discovered by the very touch. Neither is that which *Platerus* objecteth of any weight or moment; to wit, when he tels us, that upon the alone bare Section that he saw made in the skin that covered over the Tumor, the blood forthwith at first bid it self, but then instantly sprang forth amain; and this oftentimes, saith he, is in so great abundance, that it cannot by any one (use he what means he wil) be any more stanched; but that it issueth forth in greater abundance, insomuch that the whol stock of Blood being almost spent it hath oftentimes brought a sudden Death upon the sick Person. But indeed if we should determine that the *Aneurisma* proceedeth from the dilatation of these Tunicles of the Artery, this Objection would then carry some weight along with it. But in regard that (according to the truth of the matter) we have already asserted and determined that an *Aneurysma* ariseth from the dilatation of the exterior Tunicle alone of the Artery (the internal being opened either by Section, or by Rupture) we cannot therefore by any means grant, that the Arterial blood lieth hid under the whole Skin: but because the external Tunicle is extraordinarily extended, it cohereth and sticketh so close unto the Skin, that it is extended together with it, and is in a manner so become one therewith, that it is almost impossible to cut the Skin without cutting the external Tunicle of the Artery.

The nigheſt cauſe of Aneuriſma.

And so then the result of al that hath been said wil be this, to wit, That the proxime and nigheſt cause of *Aneurysma* is, the opening of the interior Tunicle of the Artery, and the dilatation of the external. Now it is very frequently opened by Section, when unexpert Chirurgeons instead of a Vein open an Artery; or when at least together with the Vein they cut through the Artery that lieth under it. Now if this at any time happen, the external Tunicle in regard of its softness and neer alliance with the

Tunicles of the Veins very easily and soon closeth together again; but the interior (by reason of its hardnes) remaineth open; from whence through the patent and open place the Blood and vital Spirit endeavoreth to break forth, and by this means distendeth the external Tunicle, and causeth this kind of Tumor. The same may likewise happen if the internal Tunicle of the Artery be broken either by the violent and impetuous motion of the Arterial blood, or by any violent external cause, and the overgreat distension of the Artery; the external Tunicle (that is more apt for extension) being al this while safe and sound.

But now, Whether or no that pulsation of the Arteries, of which *Platerus* maketh mention in his Tract touching the palpitation of the Heart, (and touching which out of *Fernelius*, and *Ludovicus Mercatus*, we have already treated in the fourth Book of our Practice, Part 2. Sect. 3. Chap. 9.) may or ought properly to be referred unto *Aneurysma*, I very much doubt. For whenas the Membrane of either Artery is then whol and entire, it seemeth rather to be an Affect in the Veins, of kin to the swoln and distorted Veins that we cal *Varices*, than this Tumor *Aneurysma*, of which we are now treating.

Signs Diagnostick.

The *Aneurysma* is easily known and discerned from *Ecchymosis*, because that in *Aneurysma* the color is like unto the rest of the skin, and the Tumor is soft and loose, and for the most part giveth way and yieldeth unto the compression of the fingers, the blood running back into the Artery, from whence it instantly again floweth forth. There is likewise a Pulse to be felt in an *Aneurysma*. Although that *Paræus* hath observed, that somtimes in the *Aneurysma* (if it be great) there is neither any pulse to be perceived, nor any return of the blood (upon the compression) unto the more internal parts; and this I also observed my self in a certain Woman: but then notwithstanding there is to be perceived a motion, and as it were the loud noise of boyling water; and that not only when it is pressed down with the fingers, but likewise at other times; and this hissing or singing noise is not only to be perceived upon the touch of the fingers, but also upon the putting of the Ear close thereto; which proceedeth from the motion of the vital spirit in its passage through streight and narrow places. All which signs proceed not from the effusion of the blood under the skin, but from the dilatation of the Artery.

Prognosticks.

1. Al *Aneurysma's* are very hard to cure.

2. Yet notwithstanding those of them that are less, and newly arisen, wil admit of a Cure. But such of them as are old, and greater (in regard that blood cannot be driven back by Astringents, neither may the Artery be consolidated; and so they are no waies to be cured but by Section) wil hardly admit of any cure at al. For the Tumor being opened, and the Artery (as it is necessary) being cut, the Arterial blood floweth forth (together with the vital spirit) abundantly, al as it were at once, and with great violence; so that the sick person is oftentimes precipitated into extream hazard and danger of death. And there are many remarkable instances that might be given of such sick persons as in the opening of the *Aneurysma* have died under the hands of unskilful Chirurgeons.

3. Neither hath the Tumor that is joyned with an *Aneurysma* any great danger in it; but that the life may together with it be lengthened out for a long time. I knew a certain neer Neighbor of mine, in whom an unskilful Chirurgeon when he should have opened a Vein, cut an Artery; and it is now already above thirty yeers that she hath had an *Aneurysma* as big as a Walnut in the inward bending of the Arm, and al this while hitherunto she hath enjoyed (and stil even at present doth) perfect health, as if she ailed nothing at al. And therefore we conclude that better it is somtimes for the Patient to bear and undergo this sleight inconvenience, than to submit himself unto a dangerous Cure.

The Cure.

And therefore forthwith (even in the very first rise of it) so soon as ever we perceive that there is an *Aneurysma* excited, (for it is not suddenly done, but that dilatation of the exterior Tunicle of the Artery is caused sensibly and by degrees) let Astringents and Repellers be imposed upon the place affected, that so the force of the blood may be abated and qualified, and the open hole of the Artery may be shut up. For which end and purpose there may likewise very fitly be administred a thin Leaden plate, which doth repel, thicken, and bind close together the loosened Artery. There may also be administred astringent Cataplasms, and the Emplaster against a Rupture. And because that the *Aneurysma* somtimes also ariseth from the cutting of an Artery, we must do our endeavor, that if an Artery be cut (whether it be purposely done, or whether it happeneth by any ill accident) that it may immediately shut and close up again, and that in a right manner: which in regard that it is not here so easily effected (because of the violent and impetuous motion of the Arterial blood) as it is in the Veins, therefore we prescribe the following Medicament as very fit and proper for the Consolidating of the Wound of the Artery.

Take of Frankincense two parts, of Aloes one part and an half; Mingle them; and having shaken them wel together with the white of an Egg, tye up all with the Flix of a Hare as much as wil suffice,

ſuffice, and let them be laid upon the Wound of the Artery.

And of this kind there are divers other Medicaments to be prepared, of the Roots of the greater Comfry, Maſtick, Frankincenſe, Pomegranate Rinds, Acacia, or binding Bean-tree, Hypociſtis or the hardened juyce of Cyſtus, Myrtle, Gals, Aloes, ſealed Earth of Lemnos, Bole-armenick, Lapis Hematites or the Blood-ſtone, and the Emplaſter Diachalcitis.

If in this manner and by theſe means the growth and encreaſe of the *Aneuryſma* cannot be hindered; there are indeed ſome that adviſe and perſwade us unto Section; and the Tumor being opened, the Artery that is to be cut muſt be intercepted by binding it about with two bands; and then it muſt be diſſected between the two bonds; and theſe bonds (as they teach us) are not to be looſened, until that Nature hath covered over the wound with fleſh, and that now al the fear of the bloods iſſuing forth, and al the danger of an Hemorrhage be paſt and gone. Now as for the manner of cutting the *Aneuryſma*, *Ægineta* acquaints us with it in his ſixth Book of Phyſick, Chap. 37. in theſe words: *If the Tumor* (ſaith he) *be cauſed by opening, then we uſe to inflict upon the skin a ſtraight Section made longwaies; and then after this the lips of the skin being parted and far ſundred by little hooks, we make bare the Artery, ſevering it from its Membranes by Inſtruments very fit for this purpoſe; and then after the tranſmiſſion of a Needle under it, we tie it with two threds; and then ſo ſoon as we have pricked with a Pen-knife the middle part of the Artery, and have evacuated what was therein contained, we then betake our ſelf unto the ſuppurative cure, until at length the ties of the threds fal off. But now if the dilatation be cauſed from the rupture of an Artery, then it behoveth us (as far forth as poſſibly we can) to lay hold upon the whol with our fingers, together with the skin: then to caſt through it (beneath that we have laid hold on with the fingers) a Needle, that may (if you pleaſe) have in it two threds, or rather one thred doubled: and after the caſting through of the Needle and thred, we are then to cut in two the very handle (as I may ſo cal it) of the double thred, and ſo to bind about the Tumor (on this ſide, and on that) with the two threds. But if there be any cauſe to fear leſt theſe threds ſhould ſlip and fail, then in this caſe there is likewiſe another Needle to be caſt through, that may throughout lie and preſs upon the former, and this Needle may likewiſe draw after it two threds, or a double thred; and the handle thereof being cut in ſunder we then bind about the Tumor with four threds, or elſe the Tumor being opened about the midſt of it, after the emptying forth of what is therein contained, we cut off the skin, that being left remaining that was tied about; and then a long ſpleen-like Plaiſter wel moiſtened in Wine and Oyl being laid thereon, we conclude and perfect the Cure by Liniments.* But who is he that ſeeth not, that this kind of Cure is not only cruel, and ſo cruel that few or none wil ſubmit unto it; but that it hath likewiſe much danger in it, and yet for al that doth not heal the ſick perſon? For although the Artery be bound about; yet notwithſtanding after the threds are looſened there is cauſe to fear, leſt that either an Hæmorrhage follow, or elſe that a new *Aneuryſma* be cauſed. And therefore the more ſecure and ſafe courſe is, only to bind hard, and preſs together the Tumor with Bands and Medicaments, that ſo it may not gain any further augmentation.

Chap. 44. *Of the ſwoln Veins, called* Varices.

Varix, with the Greeks *Kirſos* (this being the name given unto it by the Greek Phyſicians only, for we find *Ariſtotle* in the third Book of his Hiſtory of living Creatures, Chap. 11. and 19. and *Plutarch* in the Life of *Caius*, calling it *Ixia*; as *Galen* in his tenth Book of the Method of Phyſick, and laſt Chap. defineth it; and as out of him *Paulus Ægineta* hath tranſcribed it in his ſixth Book, Chap. 82. and *Aetius*, Tetrab. 4. Serm. 2. Chap. 48.) is the dilatation of a Vein; this ſaid dilatation of a Vein being called *Varix*, as that before mentioned dilatation of an Artery was termed by the Greek Phyſitians *Aneuryſma*; of which in the foregoing Chapter.

But now theſe *Varices* happen in divers parts of the body, but moſt frequently in the Thighs, and yet notwithſtanding ſomtimes likewiſe in the Temples; as *Paulus* telleth us in the place before alleadged; and ſomtimes in the loweſt part of the Belly, under the Navel; and oftentimes alſo about the Teſticles, and the Cods; which ſaid Tumor is (in ſpecial) called *Kirſocele*.

The Cauſes.

They are generated from great ſtore of Melancholly blood, which (as *Galen* writeth in his Book of black Choler, Chap. 4.) Nature oftentimes tranſmitteth unto thoſe Veins that are in the Thighs, by the which being diſtended and dilated they are rendred *Varicoſe* or ſwoln up; and the skin that toucheth upon theſe kind of Veins in proceſs of time becometh of a blackiſh color. But now as for ſuch in whom there is only great ſtore of blood flowing in that is not Melancholy; it reſting indeed, and wholly relying upon thoſe Veins which there in that place are naturally more weak than elſwhere, doth dilate them, but ſcarcely ever dye them of ſuch a like color, as it happeneth when Melancholy blood ſhal produce theſe *Varices*. For ſuch are in very great danger (if any one aſſay to cut forth the Veins affected) of being

ing surprised with Melancholly. For this is frequently seen to happen, not only in *Varices*, but even in the Hæmorrhoids also that consist of the same kind of humor, even as the coming of them upon those that are mad is wont to be a freeing and discharging of them from their madness; as *Hippocrat.* in the sixth of his Aphorisms, Aphor. 21. And yet notwithstanding, scarcely ever doth good blood (though it abound never so much) by its great plenty alone produce and cause *Varices*, as it doth if it be both plentiful, and withall if it be thick; which by its weight tendeth downward unto the Thighs. Whereupon it is also that the *Varices* have not their being until the ripeness of age; as *Hippocrates* in *Coac. prænot.* toward the end teacheth us; in regard that a thick and melancholly blood is not generated sooner in the Body. And likewise *Pliny* in his eleventh Book and Chap. 45. writeth that the *Varices* happen in the Thighs of Men only, and very rarely in Women. Such likewise as are bald, in these the *Varices* become not great: but for such as (while their baldness is upon them) are afflicted with these *Varices*, these come again to receive their Hair; *Hippocrat.* in the sixth of his Aphorisms, Aphor. 34. Which yet notwithstanding *Galen* affirmeth to be a falshood (in his Comment) unless haply any one will understand his of that affect that Physitians call *Madarosis*, that is, the shedding or falling off of the Hair. For this Affect since that it hath its original from vitious humors (as likewise the *Alopecia* hath, and also that we call *Ophiasis*) if those very depraved humors being translated into the Thighs do cause the *Varices*, the sick Persons may then possibly recover and receive their Hair again. For if at the first the loss of the Hair proceeded from vitious humors their corrupting and corroding the very roots of the Hair; then (questionless) these said humors taking now their course into some other place, the Hairs will again return unto their naturall State.

The more remote Causes are all those that make for the generating and breeding of thick and melancholly blood; and especially the Spleen when it is distempered maketh much unto, and helpeth forward the generation of these *Varices*. And that likewise which much furthereth the flowing of the aforesaid humors unto this part, may be comprised under on of these Heads, to wit, either a blow, or streining overmuch, long and tedious foot journeys, extream hard labor, and the like.

Signs Diagnostick.

These *Varices* are easily known, whenas swelling Veins in the very superficies of the Members (and especially of the Thighs) appear unto the very sight it self; and the part affected appeareth either Leaden coloured or black; and the Tumor being pressed down seemingly retreateth back, but forthwith returneth again.

Prognosticks.

1. These *Varices* of themselves carry little or no danger in them; neither bring they any unto the Party thus affected; but they rather preserve and free such as have them from other Diseases, especially Melancholly Diseases; touching which *Hippoc.* in the sixth of his Aphorisms Aphor. 21. thus writeth; *If Varices, or the Hæmorrhoids happen unto such as are mad, they are thereby freed of their madness; and the whole Body is by them throughly purged from all flatulent Blood.*

2. But if they be unseasonably taken away (as *Galen* in his Book of Venesection against *Erisistratus*, and Chap. 6. and in his Book of black Choler, and Chap. 4. teacheth us) Madness, the Pleurisie, the pain of the Reins, the Hæmorrhoid Flux, the Cough, and spitting of Blood, the Apoplexy, Cachexy, Dropsie, and other Diseases arise.

3. Sometimes these *Varices* do pass into the *Elephantia* of the *Arabians*, touching which we shal speak further in the next following Chapter.

The Cure.

Unless therefore the *Varices* be of the biggest size, and that the Veins and the Skin by reason of their extension be so extenuated that there be great cause to fear a Rupture, a profusion of blood, and Death it self; and again unless they be inflamed, and extreamly painful; or that there be present some great and malignant Ulcer; they are by no means to be healed, lest that these being removed, some more grievous Evils befall: Since that those things only may be said to heal that do altogether free the Party; and not those things that generate another Affect more dangerous then the former; as *Galen* teacheth us, in the sixth of his Aphorisms, Aphor. 26.

And therefore if it like you to Cure these *Varices*, this ought to be done with great Caution; there must be some of the blood let forth; the Body must then be purged, and that not only once, but twice or thrice; and whatsoever is amiss in the Liver and the Spleen (if they be ill affected, and administer cause unto the *Varices*) is first of al to be corrected. And afterward we are to make use of Astringent, Drying, and Digestive Medicaments; as also of Swath-bands, and Ligatures, that may thrust forth the blood from the inferior parts unto the superior.

These things if they profit not, but prove successless, the Ancients were then wont to betake themselves unto Section or Cutting. *Oppius* is our Author (as *Pliny* relateth it in his eleventh Book, and Chap. 45,) that *Caius Marius* (who had been seven times Consul) was the one man that standing suffered these *Varices* to be taken out of him; the one man (saith he) I cal him, because

cause that as he was the first, so he was the only man in those times. But after him there were others also that suffered the same to be done unto them standing, and even without any bonds. For so *Cicero* tels us in the second Book of his Tusculane Questions, towards the end thereof. *But in good truth* (saith he) Caius Marius, *a Country-man* (but yet *a man every inch of him*) *when he was cut of the* Varices, *at the very first forbid them to bind him: Neither before* Marius *was there ever any heard of that was cut without being bound. Why therefore were others afterwards? His Authority and Example caused it so to be. Seest thou not therefore that the Evil of this Affect was more in Opinion, then it was really, and in Nature. And yet notwithstanding that this Affect was not without its sharp biteing pain, the same* Marius *sheweth: for he yielded up only one Thigh* (*whereas they were both of them affected*) *to be cut, and not his other Thigh that ailed altogether as much; so that he as a resolved man was contented to suffer pain, but then as a Rational Man he refused to undergo a greater pain then there was necessary Cause for: the whole of what thou art taught by his Example consists in this,* viz. *that thou carry a Commanding power over thy self. And of the same thing* Plutarch *writeth in the life of* Caius Marius: He may be for an example unto us (*saith* Plutarch) *in that when he was diseased in both his Thighs, and having them both ful of these* Varices, *and bearing the deformity of them with a very ill will, he took unto him a Physitian for the curing of one Thigh only; in the cutting whereof he did not so much as blinch, or once stir his body, neither was he heard so much as once to sigh; but when in silence, and with fixed Eyes he had rendred himself to be cut, he was not at all affraid* (*during the time this cutting took up*) *to suffer and undergo certain intervals of pains caused by pauses and delaies. But yet he would not in the least consent unto the Physitian requiring him to render & yield up his other thigh to be cured; but thus he said, I know wel that the Remedy can no waies countervail these so great pains. And haply these are those things, of which* Seneca *in his eleventh Book, Epist. 79. saith;* He, that whilest he was suffering those *Varices* to be cut forth continued al the while reading of a Book. *But yet at this day there is hardly any one that wil admit of this Remedy, for the removal of that deformity that is caused by these* Varices. *As for the manner of cutting them out,* Paulus Ægineta, *in his Book 6. Chap. 82. teacheth us how it ought to be performed. The man being washed* (saith he) *and a string tied about on the upper part of his Thigh, we command him then to walk; and then when the Vein is filled ful, with writing ink or with a Colliry we mark it, according to its situation, the length of three fingers, or somewhat more; the man being then laid upon his back with his Thighs extended, we then bind about another String above the Knee, and by this means the Vein being elevated into a considerable heighth, we cut with a Penknife in that very place which we marked, no deeper then only through the Skin, that so we may by no means divide the Vein; and then the Lips of the Section being distended with little hooks, and the Membranes being excoriated and fleyed off by those crooked Penknives that are provided in Watery Ruptures, and the Vein being altogether made bare and naked, and laid open to the view on all sides, we then loosen the Thighbands; and the Vessel being elevated by a little hook, we cast under it a Needle drawing along in it a double Thread, and cut in two the nook of the Thread; and then* (*the Vein being divided in the midst by a Venesectory Penknife*) *we evacuate and let forth as much of the blood as is needful: then after this, with one of the threads we tie close together the upper part of the Vessel, and the Thigh being extended straight forth, by the expression or hard pressing of the Hands we empty forth that blood that is in the Thigh: and afterwards we again beneath tie the vessel close together; or we cut off and take quite away that part of the Vein that lieth between the bonds, or otherwise we permit it to remain, until that at length together with the bonds it fal out of its own accord: & then putting in dry Liniments, and a long spleen-like Emplaster after it hath been throughly moystened in Wine & Oyl being laid thereupon, we bind it down close, and so we cure it by the continued course of suppurating Medicaments, that are to be administred and applied in the nature, and after the manner of Liniments. Neither am I ignorant, that some of the Ancients used none of these bonds and Ligatures; for some of them presently cut forth the Vessel so soon as ever they had made it naked and bare; and certain others of them with violence draw forth and break off the said Vessel, so soon as they have extended it from the bottom. But the truth is, that before mentioned way of Manual operation is absolutely the best, and of all other the most secure. Moreover, as for the* Varices *that consist in the bottom of the Belly, we handle them in like manner; as likewise those that consist in the Temples.* Thus far *Ægineta.*

Cornel. Celsus in his seventh Book and Chap. 31. telleth us of a twofold manner and Method of curing these *Varices* by Chirurgery, when he thus writeth; Every Vein (saith he) that is hurtful either withereth and wasteth away upon its being burnt, or else it is cut forth with the hand. If it be straight, or if though it be transverse, yet notwithstanding if it be simple; or else thirdly, if it be not overgreat, it is the better burnt. If it be crooked, and be as it were implicated into certain Orbs, so that many of them are as it were involved, and folded one within the other, it is then more convenient to take them forth. The manner of burning is this. The Skin having first an incision

incision made upon it, then the discovered Vein is to be a little pressed with a thin and blunt piece of Iron heated red hot; and great care must be had lest that the sides of the orifice it self be burnt, wch to draw back again with smal hooks wil be no very hard matter. This is to be done by interposing welnigh four fingers in a rank throughout the whol *Varix*; and then there is to be imposed thereon such a Medicament whereby those things that are burnt may be healed. But then it is to be cut forth after this manner. The Skin (like as before) having an incision made in it upon the Vein, the orifice is to be kept open with a little hook, and with a penknife the Vein is to be drawn a little and loosened from the body; and here great care must be taken lest that in the doing of what went before the Vein it self receive any hurt: and under it a blunted hook is to be cast, and there being interposed almost the same distance as we shewed you above, in the same Vein there is the very same thing to be done as aboveseid; which said Vein whither it tendeth, is easily known by the extended hook. And so soon as the same hath been done whersoever the *Varices* are, the Vein being brought unto some one place by the hook is there to be cut off; and then after this, in that place where the little hook is next unto it, it is there to be drawn forth, and there again it is to be cut off. And so the Thigh being on al sides freed from the *Varices*, then the mouths and orifices of the incisions are to be united, and strictly closed together, and upon the same there is to be imposed a conglutinating Emplaster.

Avicen (Book 3. Fen. 17. Tr. 1. Chap. 18.) cutteth the Skin until the *Varix* appeareth, and this he doth indeed longwaies, and not either obliquely or transversly: and then he extracteth and draweth forth al the blood that is in it; and then he cleanseth it by cutting it in length. But somtimes (as he writeth) it is to be drawn forth with a Needle, and so to be cut. He addeth moreover, that a drawing of it out with a Cautery is better than the cutting of it forth.

But in regard that the Cure of *Varices* by excision or cutting forth is not only rough and very difficult, but also because that for the most part it is not attended with an happy success, by reason of the flux and effusion of blood that hindereth the operation; therefore *Hieronymus Fabricius ab Aquapendente*, in his Treatise of Chirurgical Operations, teacheth us how we may cure these *Varices* in another manner, that is far better, to wit, without the extraction and drawing them out; on this wise. *Since that there are* (saith he) *three things to be considered that concur unto the constituting of* Varices, *viz. The Blood that floweth, The Flux thereof, And the Dilatation of the Vein; therefore there are three things likewise that are shewn and pointed out hereby; to wit, That the flowing Blood is to be intercepted, That which is already flown in to be evacuated, And the widened Vein to be streightened and made narrower. For the intercepting of the course of the blood, in the beginning and the end of the* Varix, *we ought to cast a bond and tie upon it; which is done either by that we cal* Sella recurvata, *or by a Hook, or by laying hold upon the vein with the top of two fingers, and lifting it up thereby, and then transmitting a needle drawing a thread along with it through the lower part of the vein, and there tied together: upon which part the skin is to be cut, that so the vein may appear, and may be tied; and it is not to be cut when it hangeth forth unto the external parts. We might likewise administer the same means, and use the very same way to intercept the blood, that Farriers use in intercepting the blood in Horses, that is, to press the Vein close together with a little thin Iron Plate fastened unto the Vein with a pair of Tongs. But then for the Evacuation of the blood that hath already flown in,* Hippocrates *in his Book of Ulcers, about the end thereof, teacheth us how and in what manner this is to be done. In the place alleadged he giveth in charge, that the Varicose or swoln vein be not cut with any great and wide gash left that thereby a great Ulcer be caused, by reason of the influx of the* Varix; *but rather (as* Hippocrates *saith) the* Varix *it self is again and again to be pricked whensoever we have any opportunity, and shal find it to be fit; from which said prickings the blood that hath already flown in, and filleth the swoln Vein, is evacuated and emptied forth; and this is done by degrees, and by little and little; and not al at once, and on a huddle as it were, and with much danger unto the Patient. But however, it is evacuated, if not wholly, yet at least so much thereof (even to the greater part of it) that the vein may withal likewise sink and fal down in some one part or other. This being accomplished, we come then unto the third and last scope, that is, the astriction and streightening of the dilated and over widened vein. For my own part I am wont to make up a Medicament of Tragacanths macerated in the Wine of Pomegranates, or the juyce of unripe Grapes; and then after this, I add the Pouder of Bole-armenick, Mastick, and Dragons blood, in equal portions, until the Tragacanths being melted or softened become as thick as Wax, so that in the hollow of the Hand they may be reduced unto the shape and form of a Candle: which being done, I put the Medicament longwaies upon the* Varices, *and above upon it the rind of a Reed, that by its Cavity may answer unto the Convexity of the Medicament, and that may the better keep down the Medicament: it is to be laid on in the length of it, and to be tied about the Thigh with bonds, or else with a narrow Swathband: for so both by this compression of the Swathband, as also by the astriction of the Reed, and*

and the Medicament, the Varices *have been oftentimes so streightened and close bound, that they have seem'd even to consume and wither away. I have now and then likewise made use of the condensed Juyce of* Hypocistis *or the excrescence of the Plant* Cystus. *And lastly, I have sometimes made use of a more mild and yet more gentle kind of Chirurgery, and especially when the* Varix *hath been but smal and inconsiderable. For laying aside the Ligaments, and the compunctions or prickings of* Hippocrates, *I made use only of the Medicament before mentioned, according to the length of the* Varix, *and binding it down with a part of the Reed tied fast thereupon; or else a Spunge somwhat long and writhed, and of the thickness of the* Varix, *bound about with a thred, and moistened in the juyce of Pomegranates, or of Hypocistis, and then rightly tied and bound on with a narrow Swathband: and for this purpose very beneficial likewise are the unripe fruits of the Wood* Guajacum *wel bruised, and imposed; all which by their astriction do intercept the blood, and bind the veins together, and by their much drying they likewise evacuate. And lastly, for preservation of the part, I made use of a hose or buskin made of a dogs skin, which was to be put on, and exactly fastened on about the Thigh.* Thus *Fabricius.*

Gulielmus Fabricius, in his fourth Cent. Observ. 85. relateth a History; as also the Cure of a monstrous *Varix*. The story is this: There was (saith he) a certain extraordinary strong man who had in his left Leg a malignant and inveterate great Ulcer, together with a *Varix* of a vast magnitude. For in thickness it was equal unto that part of the Arm that is next unto the Wrist; and it was welnigh a span long. Now it began in the very Ham, and descending toward the Foot it made a Ring, and two Circumvolutions. But that which was here worthy of observation, was this, That so soon as ever the man lift up his Leg any thing high, forthwith the blood drew back; and no sooner did he put it again upon the ground, but it again descended, and that in an instant and moment. And (in short) the blood did ebb and flow no otherwise than as if it had out of some narrow pipe been cast forth somtimes into this, and somtimes into that part. As for the Cure, he thus proceeded in it: Having appointed unto the Patient a fit course of Diet, and several times likewise purged his body, and having also opened a Vein in the Arm of the same side, he placed the sick person upon a Bench, and then in the very Ham he gently separated the Skin from the Vein it self. Then with a thread twice doubled, and put into the Eye of a crooked Needle, he woond about the *Varix*; and in the lower part of the *Varix* he proceeded in the very same manner. But before he tied the thread, and made fast the knot, he caused his Leg to be taken off the Bench and set upon the ground; and this he did, to the end that the blood (according to its custom) might flow downward. At length he first of al tied the thred hard in the upper part of the *Varix*, and then he fastened it with a knot; thus he did afterward likewise in the lower part. This being done, with a Penknife he maketh an incision in the almost uppermost part of the *Varix*, that so the blood that was contained in the *Varix*, as in a long and little bag, might the better flow unto it. But when the flux of blood proved to be greater than what was proportionable unto the greatness of the *Varix*, and that he attentively and exactly viewed the place, there was found a blind passage, which from out of the lower part of the Ligature entered into the *Varix*. This passage whenas it could not be tied with a thread, he first applied unto the entrance thereof some of the Escharotick Unguent; and after that he applied in great abundance his own Pouder together with the white of an Egg, for the stanching of the blood flowing from it; and al these things he bound fast on with a Swathband throughly moistened and wet in *Oxycrate*; and thus he left it even until the day following. At length he cured the Wounds that himself had made, after the manner of others. And so this man (by Gods gracious assistance) became perfectly whol and sound.

Chap. 45. *Of the* Elephantiasis *of the Arabians.*

WHat kind of Affect *Elephantiasis* and *Elephantia* of the Greeks is, as likewise *Lepra* of the Arabians, we have told you before in the 40. Chapter; to wit, that it is a malignant Tumor of the whol body, and as it were an universal Cancer. And of that Tumor *Avicen*, in his third Book, Fen. 3. Tract. 3. Chap. 1. And *Rhases*, in his sixth Book to *Almansor*, and Chap. 35. have discoursed at large.

Elephantia of the Arabians.

But as for the *Elephantia* (of which the Greeks speak not one word) the Arabian Physitians make frequent mention thereof, as being neerly allied unto the aforesaid *Varices*, and having its original from them, and being only a Tumor of the Feet. Of this *Elephantia Avicen* treateth in his third Book, Fen. 22. Tract. 1. Chap. 18. where he likewise handleth *Varices*; *Rhases* in his ninth Book to *Almansor*, Chap. 93. Yet notwithstanding *Haly Abbas* dissenteth from these, and followeth the Greek Physitians, in the eighth Book of his Theoric. Chap. 15. and in the fourth Book of his Practice, Chap. 3. Which last saith that *Elephas* is a disease corrupting al the Members of the Body, and as it were an universal Cancer. But neither do we find this Author alwaies in one and the same opinion; for in the eighth of his Theoric. Chap. 18. we have

him writing thus: *Those Ulcers* (saith he) *that arise in the Feet, and in the Thigh, are called* Elephas. *And the Elephantiack Disease is a melancholly Apostem, that appeareth in the Thighs, and in the Feet; and the sign thereof is this, that the shape and figure of the Foot is like unto, and much resembleth the figure of an Elephants foot.* All the rest of them treat of *Lepra* and *Elephantia* apart and severally; and they say that *Elephantia* is a Tumor of the Feet, arising from melancholy and flegmy blood, and from *Varices*; by reason of which blood the feet of the sick person are in their figure and thickness very like unto the Feet of an Elephant. And this kind of Tumor is oftentimes to be seen in the highway Beggars, that get their livelyhood by asking relief in those publick and common places.

Signs.

The Affect it self is manifest enough; whenas the Thighs of the sick persons are tumid and much swoln, very red, and somtimes wan and leaden colored, and oftentimes black, and for the most part ful and abounding with Ulcers.

Prognosticks.

But it is very rarely cured, not only because such as are herewith affected are for the most part of the meaner sort and condition, and therefore are not able to allow themselves Phyfick; but also because that from al parts of the body there are abundance of Humors thrust forth thither, viz. unto the Feet.

The Cure.

And therefore there is no Cure at al to be hoped for, unless those vitious humors be oftentimes evacuated and emptied forth of the body; and the vitious dispositions of the Bowels (from whence there is a continual supply of those naughty and corrupt humors) be corrected; and as *Avicen* in the place alleadged writeth, The whol sum and substance of the Cure consisteth in the continuing and perpetuating of the cure, until it be perfected. Which, how and by what means it may and ought to be accomplished, we have hitherto oftentimes declared unto you.

And now when this is done, the growth and encrease of the Tumor is to be prevented by astringent and drying Medicaments; and that which is already in being ought to be discussed by strong Resolvers.

But if the Malady hath been of long continuance, and be now confirmed, there is scarcely any the least hope of recovery left; of which see further in *Rhases* his ninth Book to *Almansor*, Chap. 93.

The Tumor of the Hands.

Antonius Saporta in his fourth Book of Preternatural Tumors, and Chap. 25. applieth al whatsoever the Mauritanians assert touching this *Elephantia*, unto a certain Tumor of the Hands; but this he doth much besides their minds. For when the Mauritanians speak of this *Elephantia*, they do not so much as make any the least mention of the Hands, but only of the Feet. And yet in the mean time it is not to be denied (which I have somtimes observed, and in the second Book of our Practice, Part 1. Chap. 25. given the Reader notice thereof; although I have not as yet met with any Author that maketh any mention in special of this Tumor) that oftentimes also the Hands (the rest of the body being sound and wel) do so swel up; & that being pressed down by the fingers, in the manner of the *Oedema*, they leave a pit or dent behind them. Which Malady without al doubt hath its original from humors cold and thick. And unless it be timely and in the very first rise of it met withal, and presently cured, it is very rare that it afterward admitteth of any Cure; in regard that the sick persons refuse for the most part universal evacuations of the body, without which this Malady is not to be removed, and wil not away with the tediousness of a long Cure.

Universal Evacuations of the body having gone before, and the Bowels in which the vitious humors are generated having been first strengthened; then afterwards the stronger sort of discussers are to be administred, viz. Such as are made of Camomile, Flowerdeluce Root, round Aristolochy or Birthwort, Walflowers, Ammoniack, Bdellium, Opopanax, and the like.

Chap. 46. *Of Particular Tumors.*

THere is likewise by Physitians frequent mention made of other Tumors; but they are such as either may be referred unto those Tumors that have been already hitherunto treated of by us; or else they have been spoken of and explained among the particular Affects of Mans body; so that it wil be altogether needless here to add any thing more in special unto what hath already been said of them in general. We treated of the Tumors of the Brain, in the first Book of our Practice, Part 1. Chap. 28. Of the *Fungi* of the Brain, *ibid.* chap. 26. Of *Hydrocephalus*, *ibid.* chap. 29. Of the Tumors of the Eyelids, *ibid.* Part 3. sect. 2. chap. 2, 3, 4, 5. Of the Ophthalmy, *ibid.* chap. 12. & 13. of *Unguis Oculi*, *i. e.* the Nail or web of the Eye, *ibid.* chap. 14. of the adnate Tunicle, *ibid.* chap. 17. of the Cancer of the Cornea Tunicle, *ibid.* chap. 19. of Suggillatio of the Eyes, *ibid.* chap. 22. of Encanthis, *ibid.* chap. 31. of the Inflammation of the Ears, *ibid.* part 3. sect. 3. chap. 2. of the Cancer of the Nostrils, *ibid.* sect. 4. chap. 2. of Polypus, *ibid.* chap. 3. of the Tumors of the Lips, in the second Book of our Practice, part 1. chap. 1, & 2. of the Tumors of the Gums, *ibid.* chap. 10. of the Inflammation of the

the Mouth, *ibid.* chap. 18. of the Inflammation of the Weſand, *ibid.* chap. 21. of the Inflammation of the Tonſils, *ibid.* chap. 22. of Angina, *i.e.* the Quinſie, *ibid.* chap. 24. of Strumæ in the Neck, and the Dropſie in the Throat, *ibid.* chap. 25. of the Inflammation of the Lungs, *ibid.* Part 2. chap. 3. of the Tubercles of the Lungs, *ibid.* chap. 9. of the Inflammation of the Midrif, *ibid.* chap. 13. of the Tumors of the Diaphragm, *ibid.* chap. 14. of the Pleureſie, *ibid.* chap. 16. of Gibboſity, *ibid.* chap. 12. of the Inflammation of the Stomack, Book 3. Part 1. chap. 12. of the cold Tumors of the Stomack, *ibid.* chap. 13. of the Inflammation of the Inteſtines, *ibid.* Part 2. Sect. 1. chap. 2. of the Tumors of the ſtraight Gut, and in ſpecial of the Hæmorrhoids, *Condylomata* (ſwellings in the Fundament ſo called) Thymi and Ficus, *ibid.* chap. 10. of the Inflammation of the Meſentery, *ibid.* Part 3. chap. 4. of the Tumors of the Cawl or Kel, *ibid.* chap. 7. & 8. of the Inflammation of the Spleen, *ibid.* chap. 5. of the Scirrhus of the Spleen, *ibid.* chap. 6. of the Inflammation of the Liver, Book 3. Sect. 1. chap. 4. of the Scirrhus of the Liver, *ib.* chap. 5. of the Dropſie Aſcites, *ibid.* Part 6. Sect. 2. chap. 3. of the Inflammation and Tumors of the Reins, *ibid.* Part 7. Sect. 1. chap. 8. & 9. of the Inflammation of the Bladder, *ibid.* Part 8. Sect. 1. chap. 4. of the Tubercles in the Urinary paſſage, *ibid.* chap. 9. of the Tumors of the Teſticles, *ibid.* Part 3. Sect. 1. chap. 3. of the Rupture and Tumors in the Scrotum or Cods, *ibid.* chap. 7. of the Tubercles & Warts of the Yard, *ibid.* chap. 9. of the Inflammation of the Navel, *ibid.* Part. 10. chap. 3. of the Inflammation of the Muſcles of the Abdomen, *ib.* chap. 9. of the Puſtules of Womens Privities, Book 4. Part 1. Sect. 1. chap. 4. of the Condylomata of the Womb, *ibid.* chap. 5. of the Warts of Womens Privities, *ibid.* chap. 6. of the Cancer of the Womb, *ibid.* chap. 11. of the Dropſie of the Womb, *ibid.* Sect. 2. chap. 11. of the Tumor of the Womb from Blood, *ibid.* chap. 12. of the Inflammation of the Womb, *ibid.* chap. 13. of the Scirrhus and Cancer of the Womb, *ibid.* chap. 14. of the Tumors of the Teſticles in Women, *ibid.* chap. 20. of Cruſta Lactea, Achores, and Favi, Tract. of the Diſeaſes of Infants, Part 2. chap. 3. of Tinea, *ibid.* chap. 5. of Hydrocephalus, *ibid.* chap. 6. of Siriaſis, *ibid.* chap. 7. of Aphæ, *ibid.* chap. 13.

Touching the flatulent Tumors, we have likewiſe (in ſpecial) treated of them in our former Books: to wit, of the Inflation of the Eye-lids, in the firſt Book of our Pract. Part 3. Sect. 2. chap. 2. of the Inflation of the Stomack, Book 3. Part 1. Sect. 1. chap. 11. of the Colick pain, *ibid.* Part 2. Sect. 2. chap. 4. of the Inflation of the Spleen, *ibid.* Part 4. chap. 4. of the Inflation of the Liver, *ibid.* Part 6. Sect. 1. chap. 3. of the Tympany, *ibid.* Part 6. Sect. 2. chap. 4. of the windy Rupture. *ibid.* Part 9. Sect. 1. chap. 7. of Satyriaſis and Priapiſmus, *ibid.* Sect. 2. chap. 3. of the Inflation of the Womb, Book 4. chap. 10. of the Inflation of the Head, Tract of Infants Diſeaſes, Part 2. chap. 6.

Touching thoſe Tumors that ariſe from the ſoft parts when they are removed out of their own proper places, we have likewiſe ſpoken of them, in ſpecial; and firſt of all, of the falling down of the *Uvea*, in the firſt Book, Part 3. Sect. 2. Chap. 25. of the *Hernia* of the Inteſtines, Book 3. Part 2. Sect. 1. Ch. 6. of the Umbilical *Hernia*, ibid. p. 10. Ch. 2. of the falling forth of the Womb, and the Uterine *Hernia*, B. 4. Part 1. Sect. 2. Chap. 16. and 17.

Of the Atrophy in general.

And moreover as touching the Scorbutick Atrophy, we have written ſufficiently therof in its proper place. But now whereas we have in the general ſpoken of the augmentation of magnitude in the whol body, and in general (above Chap. 4.) thoſe things therefore which may in general be further ſpoken of the Atrophy, we think it not amiſs to ſubjoyn them here in this place.

Certain peculiar Species of an Atrophy.

When the Body is not nouriſhed ſo much as it ought to be, but is diminiſhed and leſſened by reaſon of the denying of food unto it, this may indeed in the general be called an Atrophy. But yet notwithſtanding the peculiar Species of an Atrophy have likewiſe their peculiar names. That which proceedeth from the Ulcer of the Lungs is properly called *Phthiſis* and *Tabes*: that that is from an Hectick Feaver is named *Maraſmus*, and *Marcor*. And that which happeneth without theſe cauſes, is called in general, *an extenuation of the Body*. We here in this place uſe the word Atrophy in a general ſignification; and under it we will comprehend all and every preternatural Extenuation of the Body, by reaſon of the defect of Nutriment.

Atrophy in general what it is.

But now an Atrophy is twofold; the firſt is of the whol Body; the other of ſome one particular part, as of the Arm, the Foot, &c. The Atrophy of the whole (in general ſo taken) is a preternatural extenuation of the whole Body, by reaſon of its being fruſtrated of its food, and its being denied its due and requiſite Nutrition.

The Cauſes.

As touching the Cauſes of an Atrophy, this in the firſt place is to be taken notice of, viz. that the Cauſe that invadeth the whole body is either in its own quality and diſpoſition according to Nature, or elſe it is preternatural. And then likewiſe that which is Natural, or according to Nature, is the *Maraſmus* (as we cal it) in old age, and in aged Perſons. For there was never yet that living Creature born, or brought forth, that was not obnoxious to old age, and which in old

age did not wither and consume away. But since that this Atrophy cannot by any Art whatsoever be prevented; we wil therefore in this place speak only of that Atrophy which happeneth preternaturally unto some Bodies alone, and not unto all in general.

1. *By reason of the Nutriment.*

But now, whereas there are two things that concur and are necessary unto Nutrition, to wit, Nutriment, and the nourishing faculty; in both these likewise the Cause of Nutrition diminished (and consequently of an Atrophy) is to be sought after. In regard of the Aliment, the body consumeth and wasteth away, by reason of its either defect, or vitious quality, which we may cal its pravity. For if there be not dayly as much of this Aliment again taken into the body, as is every day insensibly discussed, then the body wasteth. But if there be indeed a sufficient store and stock of blood treasured up in the Veins; yet notwithstanding this is vitious and naught: and either it is not at all attracted by the parts; or if it be attracted, yet can it not be assimilated. The body is exenuated and pineth away, in the defect and want of Food and Nutriment, when in place of that Substance that is dayly wasted and diffused by an insensible transpiration, and exhalation, there is no other Nutriment, or at least not a sufficient store thereof, substituted and supplied. Now whereas the blood is the proxime and nigheſt Nutriment of the whole body; there the Nutrition is especially hurt through the defect and failing of the blood. Now the blood faileth (first of all) in regard of some default and error in the first Concoction; when there is not a sufficient quantity of Chyle (from whence the blood ought to have its original) generated and bred in the Stomack: and this may happen unto such as are sound and in perfect health, by reason of a dayly and continued scarceness of Food, and their frequent spare Diet; but it happeneth in such as are sick and unhealthy, when by reason of the want of appetite (it being now much dejected and weakned) they are averse from all kind of Food, and refuse to take any; or else when by reason of their Disease they are fed with but little Food, and that likewise not much nourishing. Which may also happen, if the Food that is taken in be presently sent and driven down into the Guts (either Crude or Raw, or else turn'd into Chyle) and so is by the Belly ejected, without its ever coming unto the Liver. The same may likewise happen if (by reason of any Disease whatsoever in the Stomack, its Concoction being thereby much weakned) the Chyle that is generated be either but little in quantity, or (that which is as bad or worse) imperfect and not sufficiently elaborated. Moreover Nutrition may be hindred because of the hurt of the sanguifying faculty, to wit, when by reason of something amiss in the Liver or Spleen, the blood that is generated is impure, and not good: and this cometh to pass in the *Cachexy*, *Leucophlegmatia*, *Tympany*, the Dropsie *Ascites*, the *Scorbutick* atrophy, and the long lasting Scabbiness. Now as for the Causes of Sanguification, they have been already (in the third Book of our Pract.) mentioned and explained. From whence it happeneth, that albeit there be a sufficient quantity of Food taken into the body, yet notwithstanding there followeth no Nutrition; and this again happeneth for two Causes, to wit, because either there is no aliment appointed by Nature for the nourishing of the parts; or if there be any appointed for this purpose, yet notwithstanding it cannot be rightly assimilated. There is no aliment appointed unto the parts, either because the Chyle is not so exactly elaborated in the Stomack that it may be converted into good blood; or else, because although the Chyle be sufficiently and rightly elaborated in the Stomack, yet by reason of some fault in the Liver it is not converted into good blood; or else because, that although there be Chyle generated in the Stomack, and that accordingly blood be bred in the Liver; yet it is oftentimes discussed and wasted by some certain Causes; such as are overmuch exercise, Watchings, Cares, Griefs, and Diseases, which melt away, dissolve, and discuss the aliment; so that there is too great an evacuation hereof by the Belly, by Sweats, and by the flux of Blood; and such likewise are, immoderate Rest, Meats and Medicamens that dry excessively, Fevers, especially such of them as are acute and Malignant. But the Nutriment is not rightly assimilated by the parts, in regard of some vitious quality it hath in it, by reason of which it cannot be assimilated by the parts; and so likewise the Nutrition may be frustrated by some external error; or else by reason of the Object, to wit, because the Blood is such that it cannot by the nourishing faculty be perfectly overcome and assimilated.

2. *In regard of the nourishing faculty.*

But now in regard of the faculty, there is not a sufficient Nutrition, by reason of some defect and want of native heat, and radical moysture. For Nature maketh great use of this Native heat, as of the next instrument in nourishing. And this especially happeneth by reason of the preternatural affects of the Heart, and principally its heat and driness; whether it be that the Heart be primarily affected (as it is in the Hectick Fever) or else that it suffer through some default of the neighboring parts, as it happeneth in the Ulcer of the Lungs. For whereas the nourishing faculty (as we said erewhile) maketh great use of the innate and Native heat (as its principal Instrument) in retaining, Concocting, agglutinating, and assimilating, and it being so that the innate heat is cherished by the heat that floweth in; if the temper of the Heart be not right, and as it ought to be, then the heat that floweth

in

in, and consequently the innate heat likewise wil be much amiss, and not rightly tempered; and so it can be no fit Instrument of the nourishing Faculcy. And that that Hectick Feavers do but slowly and sensibly bring to pass, this the burning and melting Feavers accomplish in a very short time; by the heat whereof not only the aliment and substance of the body is consumed and melted away, but likewise the temperament both of the Heart, and also of the whol body is converted into that which is more hot and dry. The same happeneth by reason of over hard labors, cares, long continued diseases; and in general, al causes that are able to consume the Radical moisture, and weaken the Native heat.

The subject: Now this Atrophy happeneth especially in the softer parts, the fat and the flesh; and indeed the fat is first of al wasted; and then afterward the flesh is likewise extenuated. But now as for the harder parts (such as are the Membranes, Cartilages, and especially the Bones) although these may also in the like manner be dried; yet notwithstanding they cannot possibly be so extenuated and diminished, that thence the whol body should decrease. And hence it is likewise that the said extenuation and Atrophy of the body doth appear especially in those parts in which there is much fatness, and where there are more or greater Muscles, as in the Eyes and Temples.

The particular Atrophy The Atrophy that happeneth in the parts is various; It happeneth oftentimes privately in the Limbs, the Arms, and the Thighs. And hither belongeth the Atrophy of the Eye.

The causes thereof, which are the same As for the Cause of the particular Atrophy, like as the Causes of the Atrophy of the whol body consist in some one principal Bowel, whose action is necessary for the nutrition of the whol Body, or is indeed universal, and such as may exsiccate and dry the whol body: so in like manner the particular Atrophy of any one part hath a private cause, or at least such a one as belongeth unto that particular part. Yet notwithstanding the Causes are the same as of the universal Atrophy, to wit, the weakness of the Nutritive Faculty, and the defect of Aliment. The Faculty is hurt when the part is over cooled, and left destitute of its proper heat. For if this happen, the part can neither attract, nor retain, nor alter, nor assimilate the Aliment. Now the part is refrigerated, and the heat decayed, and rendered dul, and unfit for action, not only from the external Air, as also from cold water; but likewise it may proceed from overmuch rest, in the Palsie, or else from the streightness of the passages through which the Spirits flow in.

The weakness of the Nutritive Faculty.

The defect of nutriment The Nutriment faileth especially by reason of the narrowness of the passages through which it floweth unto the part that needeth it. And this happeneth for the most part from external causes, when the Veins that carry the blood unto the part for its Nutriment, are pressed together by the bones when they are loosened and out of joynt, or else from some certain Tumor that is nigh unto it, or by the brawniness and hardness of the flesh; or else lastly, when the Veins that convey the Nutriment are cut in sunder. See likewise *Galen*'s Book of *Marcor*, a Species hereof, arising from an Hectick Feaver.

Signs Diagnostick.

The extenuation of the whol body, as likewise of some one particulart part thereof, is visibly apparent to the sight, so that there wil be no need of many signs. For if the whol body be greatly wasted by an Atrophy, then the Face fals away, and becometh lean, the Temples fal down, the seat of the Eyes is rendered hollow and deep, the Nostrils become sharp; and such kind of Face (because that *Hippocrates* describeth it in his Prognosticks) they commonly cal an *Hippocratical* Face. Al the Ribs are conspicuous, the shoulder blades and the Chanel bones stick out, the Neck is extenuated, and the *Larynx* (or the top of the rough Artery) buncheth forth; the Belly falleth down, the Buttocks become withered and weak, the Thighs, Arms, Hands, and Feet, are emaciated and grow lean. But in regard that the Atrophy hath its dependance upon many and several causes, they are therefore al of them to be inquired into, that so the Cure of them may the more rightly be proceeded in. And therefore enquiry must be made whether external Causes, to wit, fasting, cares, grief, over hard labor, and the like, went before. If we find no such thing, we are then to make enquiry into the internal Causes; to wit, whether there be present a Hectick or any putrid Feaver, or whether there had not been one a little while before; and likewise a discovery must be made touching the Stomach, Spleen, and Liver; in what state and condition they are: for by the Diseases of the Bowels it may easily be known what the Cause of the Atrophy is.

Prognosticks.

1. By how much the more the Atrophy is but recent and newly begun, by so much the more easily it is cured; but by how much the longer it hath continued, by so much the more difficult it is to be cured.

2. When only the Alimentary humor is consumed, there is then hopes of an easie and speedy Cure: but that Atrophy is more difficulcly cured, in which the substance of the flesh is already wasted; and most difficult of al, when the Membranous and fibrous parts are already exsiccated and extreamly dried. Yea, such an Atrophy can no

more

more be cured than that Atrophy that befalleth all persons whatsoever that live unto an old age.

3. If the Native heat be not as yet so far forth weakened but that it may possibly be repaired, there is then some hopes of recovery; since that the Cause being removed, and the heat restored, there may be nutrition again procured unto the body.

4. And therefore we altogether conclude, that from the Causes especially we are to conjecture what we are to hope for as touching the Cure. For if those causes may be taken away and removed, there is then some hopes of the recovery of health; but if they may not, there is likewise then no hopes of safety.

The Cure.

As for what concerneth the Cure of an Atrophy; when the Body is over dried, and that the Atrophy dependeth upon the defect and failing of Nutrition, it sheweth that then humectation or moistening of the body is first of al to be procured. Now the body is moistened, if we do our endeavor that the Aliment may be drawn forth out of the Veins unto al the parts of the body; and that being attracted it may be retained and assimilated by the parts of the body. But first of al, all the Causes, whether they be evident and external, or internal, they are to be removed. And therefore if fasting and hunger went before, let fitting food be again administred; if overmuch labor, sollicitous cares and troubles of the mind, and the like, these al of them are to be removed. For these Causes being taken away, and convenient food being exhibited, the body is easily restored.

In those that are sound.

But in those that are sick, if by reason of the dejected apperite, and some disease, either the Aliment be consumed, or the Faculty weakened; that disease being removed, and the sick person taking food again, the restauration of the body followeth. But now for the curing of the diseases of the Stomach, Liver, Spleen, Lungs, and in what manner these and the like Diseases are to be removed, we have abundantly taught you in our Practical Physick. From whence this likewise appeareth very plainly, that it is but in vain for us to use our utmost endeavor for the nourishing of the body, whiles the body is replenished with vitious humors; *For the more we nourish impure bodies, the more we hurt them,* as *Hippocrates* tels us in the second Book of his Aphorisms, Aphor. 10. For even the good juyces and meats are likewise corrupted by the said vitious humors, and so the Cacochymy is augmented. And therfore these bad and offensive humors are first of al to be prepared and evacuated. And this is altogether true in the Cure of al and every Atrophy, that our main care and regard must be in reference unto the cause upon which it dependeth; and that our first and chief pains must be bestowed in the removal thereof: and afterwards we are to bethink our selves how the extenuated body may again be fetcht up and restored by Aliment. There ought also to be great care taken, that this very restauration of the body be rightly accomplished. And therefore first of al there ought to be given Aliments that are soon and easily concocted; and next of al, such as do a little nourish, although they be more difficultly and slowly concocted. Unto such as are free from Feavers and Obstructions, and that are not troubled with any pain in the Head, neither have their Hypochondria distended, Milk may very fitly be allowed; Womens Breast Milk especially, then Sheeps Milk, thirdly Cows Milk, adding thereto a little Sugar; as also the juyces and Broths of Flesh, as of Partriges, Hens, and Pullets, Capons, Wether Mutton, Veal, together with Bread; and especially those Broths that they cal consummate and restoring Broths. Those Emulsions likewise are singularly good that are made of Almonds, Barly, with Wheaten flour. But this is especially useful (and here in this case much approved of) that is made of the bruised pulpy flesh of a Capon, Almonds, Sugar, Milk, and the flour of Rice. They likewise here very much commend the Indian Nut; and they write, That by the alone use hereof extenuated bodies have been fatned. In a cold *Marcor* Wine is allowable, and may benefit; but in a hot and torrid *Marcor* it is altogether to be avoided.

A note touching the manner of refection.

But now in the manner of Refection and Nutrition, *Hippocrates* his seventh Aphorism of the second Section is to be observed. *Those Bodies* (saith he) *that have been a long time extenuating, are slowly and by degrees to be repaired again; but those that have had but a short time for their wasting, must in as short a space be restored to their wonted fleshiness.* For (as *Galen* explains it) those bodies that are in a short time extenuated, they suffer this, not from the colliquation and melting of the solid parts, but from the evacuation of the humors and the spirits: but those bodies that have been long extenuating, in those the very flesh melteth away; and the other parts likewise (by which the concoction and distribution, and sanguification is perfected in the whol body) are rendered and made lean: wherefore there cannot be so much aliment concocted as the body stands in need of. And because of this we are to take the longer time in the refection and repairing of such like decayed bodies, and their Nutriment must be but thin and spare; this spareness of Nutriment being by *Hippocrates* termed slowness in nourishing. But as for such as have only their humors and spirits evacuated, in these we may safely and without any the least danger cause a speedy and ful refecti-

on

on and reſtauration; in regard that the ſtrength of the ſolid parts ſerveth here for a firm foundation.

The friſtions and baths that are to be adminiſtred

After ſleep, gentle Friſtions may be inſtituted, the hands being firſt anointed over with the Oyl of ſweet Almonds. A Bath of Waters is likewiſe very uſeful: for it evidently moiſteneth thoſe that are over dried; as we may eaſily perceive in ſuch as have travelled long in the hot and ſcorching Sun, or elſe have been over exerciſing themſelves any other way, and thereby are made over hot; as alſo in ſuch as have their moiſture overmuch dried up by watchings, cares, or by any other waies and means. And *Galen* is very frequent in the mentioning of Baths; which here and there he largely treateth of; inſomuch that unto us (who have no ſuch great regard unto baths) he may ſeem ſomthing too curious. But at this very day many in *Aſia* do imitate the Care and Cuſtom of the Romans in their bathings; and theſe Aſiaticks place almoſt al their whol delight in their Baths; imitating the magnificence of the Ancients in their ſtately ſtructures for this very purpoſe, and with emulation endeavoring to exceed them in this their luxury and prodigality. For there in their Baths are al things to be had that may poſſibly be deſired either for health or pleaſure; touching which ſee further in *Proſper Alpinus* his third Book of the Egyptian Medicam. Chap. 15, 16. and ſo the following, even unto the end of that Book.

The Cure of a particular Atrophy

But now as for the Cure of a particular Atrophy, *Galen* (in his Book of the Office of a Phyſician, Chap. 3. Text 32. and in his fourteenth Book of the Method of Phyſick, Chap. 16.) hath taken great pains to ſhew us in what manner it is to be performed. For whenas the private parts do wither away, and are extenuated by reaſon of the hinderance of the afflux of the Aliment, and the languiſhing heat of the part; the Phyſitian ought then to uſe his utmoſt endeavor, that ſo ſtrength and heat may again be reſtored unto the part, and that the afflux of blood unto the part may again be procured. Thoſe means that reſtore ſtrength and heat unto the part, are, a gentle and moderate rubbing of the Member, Motion, and the ſuppling of it with warm water: the ſame means do likewiſe draw and allure the blood unto the part. Now this friction, and ſuppling with warm water ought ſo long (and no longer) to be continued until the part be made ſomwhat red, and be as it were a little ſwoln, but not ſo long, until it be again aſſwaged and fallen. The parts may likewiſe be fomented; or (if their condition wil beat it) even ſoaked and bathed in baths made of Sage, the tops of Juniper, Lovage, Lavender, Mallows, and Marſh-mallows; with which when the part is ſufficiently fomented, it may afterwards be anointed with Oyls or convenient Unguents.

Unguents.

There are many ſuch like Unguents and Emplaſters to be had: as for inſtance,

Take *Unguent Dialthæa, Aragon, and Martiatum, of each one ounce and half; Oyl of Lawrel, of Spike, and of Caſtoreum, of each two drams; Mingle them and make an Unguent.* Or,

Take *Mans Fat, the Yew Tree, of each as much as you wil, the Pouder of Savine as much as will ſuffice, and make an Unguent.* Or,

Take *Bdellium, Opopanax, of each one ounce; Diſſolve them in Wine, and ſtrain them. Then add of Hogs fat three ounces; Gooſe fat and Hens fat, of each one ounce; Oyl of old Olives four ounces; Turpentine and Wax, of each one ounce; mingle them over the fire, and boyl them until the Wine be conſumed: and at length add of the Pouder of Maſtick, Frankincenſe, and Fenugreek, of each one ounce, and make an Unguent.*

Emplaſters.

There may likewiſe ſuch a like Emplaſter be impoſed: Viz.

Take *Wax, Roſin, Turpentine, of each one pound; mingle them upon the fire; and afterwards add, of Maſtick, Frankincenſe, Galbanum, Saffron, long Pepper, Cinnamom, Nutmeg, Mace, Cloves, Zedoary, Galangal, Ginger, Grains of Paradiſe, and Nettle ſeed, of each half an ounce; and make an Emplaſter.* Or,

Take *the Leaves of Lovage freſh and new, the tops of Savine, and Juniper, of each two handfuls; Camomile flowers half a handful; Juniper Berries half an ounce; when you have ſliced and bruiſed them wel, then pour upon them the Oyl of Bayes, and Lillies, as much as wil ſerve to cover them all; of Hogs Greaſe three ounces; of Wine two ounces; boyl them until all the moiſture be waſted; and then add Oyl of Spike, and Juniper Berries, of each one dram; Muſtard ſeed poudered one ounce; the Root of Pellitory three drams; Muſtard two drams; Wax as much as will ſuffice, and ſo make a Liniment.*

A Fomentation.

For thoſe that are offended by Remedies that are fat, they may have a Fomentation made of the Water following, wherewith the Member may be bathed; Viz.

Take *Caſtoreum one dram; long Pepper, Pellitory, Grains of Paradiſe, of each two drams; the Berries of Spurge-Olive, (by the Greeks called* Coccognidia) *or of Nettle half an ounce; Rocket one dram and half; Juniper Berries one handful; Sage, Mint, Organy, Mother of Thyme, St. Johns wort, of each one handful; Spirit of Wine three pints, deſtil them; or at leaſt let them ſtand infuſing a long while, to wit, for ſome certain daies time; and afterwards let them be ſtrained.*

Dropax.

Dropax.

After this, the Ancients did also on the fourth day administer those Remedies that were vulgarly called *Pications*. Now a *Dropax* or *Pication* was a Medicament that they made of Pitch dissolved in Oyl, with which blood-warm they made a Liniment for the extenuated part, and there they kept it on until it was cold; then they removed it, and applied a fresh one; and this was often repeated, until at length the part became red, and turgid or puffed up. Then after this, the Pication being removed, they anoynted the Member with the Oyl of sweet Almonds, or some kind of fat; and in the Evening the same was repeated as before; and in this manner they handled the part so long, until it again waxed thicker.

Epicrusis, and Catacrusis:

Which if they could not effect by the said pication, the Ancient Greek Physitians then made use of a Remedy, that was by them termed *Epicrusis* and *Catacrusis*, *i. e.* a *Percussion*. For they smote the lean part with certain Ferula's (provided purposely for this use) untill such time as the part became turgid, swoln and red; and then immediately thereupon they anoynted it with some fat Medicament or other: but our Physitians for these Percussions do make use of those Nettles that are Green and Stinging.

THE FIFTH BOOK.

THE SECOND PART.

Of Ulcers.

Chap. 1. *Of the Nature and Differences of an Ulcer.*

ALthough the word *Helcas*, *Ulcus* (an Ulcer) be in general taken for every solution of Continuity in a soft part, as we may see in *Galen* his thirteenth Book of the Method of Physick, Chap. ult. where he under the same signification comprehendeth likewise a Wound that is properly so called, in which manner *Celsus* in his fifth Book, and Chap. 6. doth oftentimes without any difference at all take both a Wound and an Ulcer: yet notwithstanding properly & in special, the solution of Continuity with magnitude diminished, in a soft part, having its original from a corroding matter, is called an Ulcer. To wit, a Wound and an Ulcer differ in this, that in a Wound there is only a solution of Unity, but there is not any thing of the part necessarily lost; but in an Ulcer there is something diminished and lost from the part affected; and if nothing else, yet at least the Scarf-skin. For seeing that an Ulcer is always from a corroding Cause, it cannot possibly be but that something must be taken away from the part. For although in an Ulcer there be sometimes some kind of superfluous flesh growing forth; yet notwithstanding there is nevertheless the Skin, yea and the very natural flesh it self wanting: and that Ulcer is no simple and single Disease, but a Compound one, & such as is conjoyned with magnitude augmented. There may likewise together with an Ulcer be conjoyned divers other Diseases, a Distemper, an Inflammation, an *Erysipelas*, an Excrescent Flesh, and other Diseases, which yet notwithstanding belong not unto the Essence of an Ulcer, but may be taken away the Ulcer still remaining; the essence whereof doth consist only in the solution of Continuity, together with some kind of diminution of the part affected.

An Ulcer what it is properly.

The Subject of an Ulcer is a part soft or fleshy, the word Flesh being here taken in a large acceptation; *viz.* not only for the Muscolous flesh, but for that likewise that comprehendeth the flesh, of which the Intestines, the Bladder, and other of the Bowels consist; and herein lieth the difference between it and the rottenness that is in the Bones.

The Subject:

The Causes.

The neerest Cause is any matter whatsoever it be that hath in it any corroding quality; which comprehendeth under it not only the sharp humors that are bred in the body, but likewise all those external Causes that have in them a corroding power, such as are corroding Medicadicaments and poysons: for it is false (that which some assert) that the very same Ulcers arise only from internal Causes; since, that experience teacheth us, that the very same Ulcers may be excited also from external Causes. And so (*Galen* himself being witness in his fourth Book of the Method of Physick, and Chap. 9.) it is most apparently known even by experience it self, that by the Fire, scalding hot water, Oyl, and other the like fervent juyces, in burnings and scaldings, they are not Wounds that are excited, but Ulcers; like as also Medicaments, and Poysons that cause putrefaction and burning, excite Ulcers. And so poysonous and contagious vapors breed Ulcers; like as Scabbiness by contagion and infection breedeth Scabbiness;

Scabbineſs; to wit, whileſt the Contagion that is imparted and communicated unto the Skin, corrodeth it. And in the very ſame manner the vapors that are drawn in (by breathing) from the Lungs of Phthiſical Perſons do exulcerate the Lungs, and by contagion do breed a *Phthiſis* or Conſumption. And in the like manner, upon the very ſame ground, Venome and Venereal Poyſon being rub'd and chaf'd into any body, or by any means communicated thereunto, infecteth and exulcerateth the ſame. Neither is it of any weight or moment, that *Euſtachius Rudius* endeavoreth to reduce ſuch like Ulcers as theſe rather unto Wounds then unto Ulcers. For by this means he confoundeth altogether the Difference that is betwixt Ulcers and Wounds; in regard that Ulcers & Wounds do not differ only in this, that Ulcers are evermore with a loſs of ſome of the ſubſtance, whereas Wounds may be without any ſuch loſs; but likewiſe, in that Wounds ariſe from ſome Cauſe that either cutteth into the part, or pricketh it; or breaketh, or bruiſeth it; but theſe, to wit, the Ulcers, proceed from a Corroding Cauſe, whether it be external, or whether it be internal. And this is alſo manifeſt in Medicaments that putrefie (for who can deny that to be an Ulcer that is excited from the *Juyce* of *Spurge*?) from the which ſaid Medicaments that Contagion that is in *Scabies*, the French Pox, and the *Phthiſis* or Conſumption, differeth but very little. For although (as *Rudius* there Objecteth) we do not deny that ſuch like Poyſons have likewiſe in them a power of infecting the humors, which being corrupted may afterward alſo promote theſe Ulcers: yet notwithſtanding we ſay, that all power whatſoever of corroding is not to be denied unto this very Contagion it ſelf, although afterward (when the corruption of the humors happeneth in the body) the increaſe of the Ulcer be thereby much promoted and furthered.

The Differences.

The Differences of Ulcers, ſome of them are Eſſential, others of them only Accidental. The Eſſential are thoſe that are taken from the very form of the Ulcer, from the Subject, and from the efficient Cauſe thereof. Thoſe that are taken from the form of the Ulcer are drawn from its figure, its magnitude, and the like. For ſome Ulcers are great, others but ſmal; ſome of them long, others ſhort; ſome of them broad, others but narrow: ſome ſtraight, others again oblique, wreathed in, and fiſtulous; ſome of them equal, in which the fleſh in all the parts of the place affected is equally waſted; others unequal, in which there is a greater part of the fleſh conſumed in this place, and a leſs portion in another place of the ſame Ulcer. From the part affected ſome Ulcers are ſaid to be External, others Internal; ſome ſleight and ſuperficial, others of them profound and deep; and they may be in this, or in that part. The Differences ariſing from the Cauſes ſhall be ſhewn in the next following Chapter, wherein our purpoſe is to treat of the Cauſes of Ulcers.

But now the Accidental Differences of Ulcers are thoſe that are taken from ſuch things as are without the Nature & Conſtitution of the Ulcer; and they are ſuch as are taken from the ſcituation of the Ulcer, or elſe from their time; viz. that ſome of them are Recent and new; others of them old and inveterate.

And hither likewiſe there may not unfitly be referred thoſe Differences that are taken from Cauſes accidental, and ſuch as are not common unto all Ulcers; to wit, that ſome Ulcers are joyned together with a fluxion, but that others of them want the ſaid afflux; that ſome of them are pure, others of them ſordid and foul, corroding, eating up, and Creeping along. For theſe Differences depend upon the Cauſes. And hitherto likewiſe belong thoſe Differences that are taken from the Accidents and Symptoms of the Ulcers; to wit, that ſome of them are altogether void of pain, others of them accompanied with a pain, an itching, pricking, and burning; ſome of them eaſie to be cured, others difficult and rebellious, by the Greeks called *Dyſepulota*; ſome of them benign and favorable, others ſuch as have contracted a moſt peſtilent and malignant quality. And hither likewiſe are to be referred thoſe Ulcers that they commonly call *Chironia* and *Telephia*. And yet nevertheleſs beſides theſe Differences, that may be properly called ſuch, there may yet ſome others be given, that are improperly ſo called; and ſuch as may rather be termed the Complications of Ulcers with other Diſeaſes, then Differences; and ſuch like Differences are theſe, to wit, that ſome Ulcers are conjoyned with Pain, a Diſtemper, a Phlegmone, a Callous or Brawny Fleſh, a Gangrene, a *Cancer*, Worms, and the Rottenneſs or Corruption of the Bones.

And (the truth is) the Differences and Diſtinctions of Ulcers are drawn from the Springs aforeſaid. But it being a truth likewiſe that ſome of the ſorts of Ulcers are taken and drawn from divers and ſeveral Fountains (that ſo we may not treat of Ulcers without any Method) I conceive that our Diſcourſe touching theſe Ulcers will be moſt Methodical if we handle them in the order following; to wit, 1. If we firſt of all treat of a ſimple Ulcer, or an Ulcer conſidered in the General. 2. Of an Ulcer with a Diſtemper. 3. Of an Ulcer with an afflux of humors. 4. Of a ſordid and foul Ulcer. 5. Of an Ulcer with Tumors. 6. Of Fleſh growing forth luxuriant and proud. 7. Of an Ulcer that is wan or Leaden coloured, and withall Callous. 8. Of an Ulcer that is hollow, and fiſtulous (which we commonly call the Fiſtula.) 9. Of an Ulcer with Worms. 10. Of an Ulcer with a rottenneſs of the Bones. 11. Of the Ulcer by the Greeks called *Dyſepulot*, Malignant, the Ulcers *Telephia* and *Chironia*, and *Phageda-*

na. 12. Of pain with an Ulcer. 13. Of the Ulcers of the Legs and other parts. 14. Unto which we wil add something touching Burnings. 15. We wil conclude all with a short Discourse touching a Gangrene, and *Sphacelus*.

Chap. 2. *Of a simple, or single Ulcer.*

IN the first place therefore we wil handle a simple Ulcer; and shew you what are the Causes of an Ulcer considered in the general; and what differences it hath according to its form, its causes, and the place affected: by what signs the Ulcer and its essential differences may be known; and what is to be pre-advised as touching the cure; and what the Ulcer in general indicateth and pointeth out; and lastly, what kind of Method and course it requireth for the curing of it.

The Causes.

We have already told you in the precedent Chapter, that the neerest cause of an Ulcer is a matter that hath in it a corroding quality, whether it be bred in the Body, or whether it happen unto the body from without.

Of the first sort are al Humors whatsoever that are sharp, and endued with a corroding Faculty bred in the body. But now this humor is either bred without the part affected, or else it is generated in the very part it self that is affected. Without the affected part there is generated a cholerick humor, a salt flegm, a Whey that is salt, nitrous and sharp, and black Choler or Melancholy. For these if they be bred in the body, and flow unto any one part, they may corrode and exulcerate the said part. But from what Causes such like humors may be generated in the body, we have already shewn you in the second Book of our Institutions, touching the causes of Diseases, and elsewhere. Now they flow unto the part affected, either by transmission, or by attraction; both which from what causes they proceed, we have declared above, in the first Part, and Chap. 5. of an Inflammation. And more especially in the Spring time, various Ulcers are wont to arise from some internal vice of the Humors, as likewise from unseasonable and immoderate exercises. *For if* (as *Galen* writeth in his third Book upon the Aphorisms, Aphor. 20.) *in the Spring the Body be impure, there happeneth indeed then some such like thing in the Spring time, even as we see there is wont to be in the exercises of the Body. For although these exercises be never so safe and healthful in themselves; yet nevertheles if you bring forth a man that is full either of flegm or yellow choler, or black choler, or even also of blood it self to exercise, you shal undoubtedly by this exercising of him procure unto him either the Falling-sickness, or the Apoplexy; or if not these, yet most assuredly the rupture of some Vessel in the Lungs, or a most acute and violent Feaver. But unto such as have had exercise enjoyn'd them, for the purging out of humors that lie low and deep, this their exercise drawing forth unto the skin a Cacochymy, that is to say, abundance of bad and offensive humors, and scattering it throughout the parts, doth for the most part excite and cause Ulcers, and the* Scabies *or Scabbiness. For this is that which* Hippocrates *hinteth unto us, when he saith, That if we exercise an impure and impurged body, Ulcers wil from thence arise. And so indeed in the very like manner, in the Spring time, the heat of the ambient Air dissolving the humors calleth them forth unto the skin, by an effect altogether like unto that of exercises. For the effects of the Spring do not only resemble the effects of Exercises, but they are also most like unto the works and operations even of Nature her self. For indeed the parts that the Spring time acteth (like as doth Nature her self) are, as wel to cause that occult and secret perspiration throughout the whol body (by the which all the superfluities of the body are emptied forth) as throughly to purge the body also by diseases, after a various and different manner.* Thus far *Galen*. But then these Humors get their acrimony in the part it self, by reason of some distemper in the said part. And after this manner, like as even the *Pus* or purulent matter it self, by its concoction and long abode in the part becometh more sharp, and stil so much the sharper and corroding, by how much the humor (out of which it is generated) is more tart and sharp; so likewise doth the blood, which is corrupted by the part affected, and so putrefieth.

But now the Causes that happen unto the body from without, are Septick (or putrefying) and Caustick Medicaments. Neither do I here exclude the very actual fire it self, from bearing a part in the number of the external causes; in regard that the Eschar that is left remaining appertaineth rather unto ulcers than unto wounds. And hither likewise is to be referred that contagion, by means whereof the vapors exhaling from the Lungs of Phthisical persons, & by others attracted & drawn in with the breath, do likewise exulcerate their Lungs, and so cause in them a *Phthisis* or Consumption; and also the nastiness and infections of such as are scabbed, Leprous, and affected with the foul Disease, being communicated unto the skin, do exulcerate it, and there generate a like disease. But that attraction which is caused in gauling & interfairing, or in wearing of the skin by the wringing and streightness of the shoo, is not rightly and fitly referred unto, and reckoned up amongst the nigheft and most immediate Causes. For by the said attrition the humor only is attracted, that afterwards corrodeth the Skin, and exciteth therein little bladders or blisters. But now what the special causes of special Ulcers are, we shal afterwards shew you in its proper place, where the peculiar causes of each particular Ulcer shal be explained.

Signs

Signs Diagnostick.

External Ulcers are visible and apparent both unto the sight and touch; neither need there any signs be given whereby they may be known. But as for the internal ones (that oftentimes lie hid) they are known by the Chirurgeons searching Instrument (or Probe) if way be made for it to pierce unto them; by the touch, or else by the excrements that come from them, by the pain, and by the hurt that the action hath received. For the excrements do shew forth and declare the part affected; and if by any passage whatsoever of the body (whether it be the Arse, or the Bladder, or the Nostrils, or the Ears) *Pus* or rotten filth and corruption floweth forth; or otherwise if it be rejected and cast up by vomit, or by coughing and spitting, it is a sure and certain sign that there lieth hidden within some kind of Ulcer; but then in what part it lieth hid, the property of the pain, and the scituation, and the action of the part that is hurt, wil teach and inform us. A pricking pain is a sign that the hurt and affected part is nervous; but a beating pain acquainteth us that an Artery is hurt. The seat of the pain wil in like manner manifest the part it self that is exulcerated. If in the exulcerated part the sense or motion shal be hurt, it betokeneth that the part affected is Nervous. If there be felt after meals a biting or twinging pain, it is a certain sign that the Stomach is exulcerated. External Causes do here likewise furnish us with signs: If any one hath drunk or eaten the Flies *Cantharides*, the Bladder will then be exulcerated; if he hath drunk any Medicament, or any thing else that burneth (as for instance, *Aqua fortis*, or the like) then the Jaws and the Stomach wil be exulcerated. See more hereof in the 3d Book of our Institutions, Part 2. Chap. 4.

Whether the Ulcer be great or smal, straight or oblique, or whether it be of any other figure (and so for al the rest of the like differences) in the external Ulcers they are known by the sight, and by the Chirurgeons Probe. But in al Internal Ulcers they cannot so easily be known. But yet nevertheless, whether an Ulcer be great or but smal, the store of filth and corruption that issueth out of it wil manifest; for in a greater Ulcer there wil be greater store of this *Pus*, or purulent matter, and in a less Ulcer there wil be less hereof.

Causes.

As for what concerns the Causes (and first of al the internal ones) if the Ulcer hath its original from the afflux of the humors, then there wil be present signs of a Cacochymy, either in the whol body, or else of a vitious and faulty constitution of the Liver, Spleen, or of some other Bowel. Which if they be absent, and do not appear, but that on the contrary there be present a distemper and weakness of the part affected, it is then a sign that the Cause of the Ulcer was generated in the part it self that is affected. But then what kind of Humor it is that causeth the Ulcer, whether Choler, or salt flegm, or a serous and wheyish Humor, or black Choler, wil manifestly appear from the signs of each particular Bowel; and especially by the *Pus* and rotten filth that floweth out; as also by the color of the Ulcer, and the pain thereof; by the pricking likewise and the twinging thereof; and the signs of special Ulcers wil also instruct us in the same.

As for the external Causes, they are known by the relation of the sick party, who wil acquaint us, whether he were hurt by any sharp and corroding Medicament, or by poyson, or even by the fire it self; or otherwise whether or no he hath conversed with any one that was diseased with these contagious Ulcers, and whether or no he were not infected by him.

The times of these Ulcers have likewise their signs. For when that which first issueth forth is wateriish, crude, thin, and great store of it, it is then in its beginning, which very beginning may likewise nevertheless be discovered by the sense, by the touch, and by the sight, as also from the causes of the Ulcers, both external and internal, and by the present and subsequent symptoms, the pain and itching. When afterward the *Pus* or rotten filthy matter beginneth to be better concocted, and that its store and plenty is diminished, then the Ulcer is said to be in its increment or increase. In the state the *Pus* is at the best; and in the declination of the Ulcer the *Pus* is most of al lessened and diminished. And yet nevertheless the same times are likewise known by the pain, by the itching, and by the hurt actions; which if they be augmented, we may then likewise conclude that the Ulcer is encreased; but if they remit and slacken, and that al things return unto their Natural state; they then demonstrate and shew that the Ulcer is then diminished, and in its declination. Which very thing may likewise be learned both by the sight and by the touch, in the external parts. But as for the signs of special Ulcers, they shal hereafter be propounded in their own proper places.

Prognosticks.

1. What is to be hoped for touching the Cure of an Ulcer, may be known by the greatness and heavines of the Ulcer it self, and the condition of the part affected.

2. For if the Ulcer seize only upon the Skin, and be only superficial, it is then the more easily, (and in the shorter time) cured: but by how much the deeper it is, and by how much the part that is affected is more noble, and to be preferred before the Skin, by so much the more difficult wil the Cure thereof be.

3. And in this regard, those Ulcers that are in the extremities of the Muscles are more dangerous

than those Ulcers that are in the middle of the Muscles.

4. And for this very cause, those Ulcers are more dangerous that are in a noble part, and do belong also unto a noble part; as also a Nerve, a Vein, or an Arrery. And in the general, the more internal Ulcers are altogether more dangerous than the exterior Ulcers.

5. Those Ulcers that are able to draw a principal part (or a part neer unto a principal one) into a consent and agreement with them, oftentimes cause death unto the sick person.

6. Those Ulcers are more easily cured, unto which the Medicaments that are to be administred do easily reach and attain unto, and more easily adhere and stick unto them: but those Ulcers are more difficultly cured, unto which the Medicaments cannot be rightly applied; and unto the which they do not so easily stick and adhere.

7. Ulcers are hardly cured in those parts that do naturally abound with many humidities and excrements.

8. And so are likewise those that are of an exquisite sense, and such as are able to draw into consent with themselves those parts that are endued with an exquisite sense.

9. As likewise they are necessarily altered by the external Air, or upon any other Causes.

10. Those Ulcers are likewise dangerous, and of long continuance, in the which the rottenness of the bones is to be feared.

11. A great Ulcer (all other circumstances being answerable) is more difficultly cured than a smal Ulcer. For in a great Ulcer many parts are exposed unto the external ambient Air, and the parts lying underneath (to wit, the Veins, the Arteries, and the Nerves) are more hurt. As also those Ulcers that are narrow and somwhat long are easily, but the round are hardly cured.

12. If the Body be pure, and the principal Bowels in good state and constitution, and if the part affected it self be otherwise wel and in a good temper, there is then hope of an easie cure. But on the contrary, if the Body be Cacochymical, the principal Bowels ill affected, and the part exulcerated likewise ill affected, we may then wel conjecture, that the Cure wil prove difficult, and that the Ulcer is like to be of long continuance.

13. And hereupon it is that those Ulcers that succeed other diseases are for the most part not cured without much difficulty, in regard that Nature thrusteth forth and transmuteth those vitious Humors that are in the body unto the external part.

14. And so it is likewise in those Ulcers that tend to a greenness or blackness of color; because that this signifieth that the heat of the affected part is very weak, and almost extinguished. And in those that are nigh unto death, a little before they die, the Ulcer appeareth pale, black and blue, or leaden colored, and withered, by reason of the extinction of the Native heat.

15. When after a long flux of bad and il colored filth and corruption, good and laudable *Pus* begins to appear, it affordeth good hopes of the recovery of health; and it is a sign, both that the strength of Nature is uniting it self together, and that the matter is changed and turned into better than it was before.

16. And the *Pus* it self doth altogether supply us with a sign and token whereby we may guess what hope there is of the Cure of the Ulcer. For if the *Pus* that is dayly thrust forth be good, it then yielderh unto us hopes of an easie Cure; but il and naughty signifieth the contrary. For good *Pus* signifieth unto us both the good condition of those humors out of which it is generated, and likewise the strength of the part affected: but bad *Pus* sheweth the contrary. Now the *Pus* that we are to account good, is of a middle consistence betwixt the thick and the thin, white, smooth, equal, and little or nothing noysom and stinking. But then the evil *Pus* is that which is very thin and fluid, pale, leaden colored, dreggy, and il favored.

17. The *Sanies* likewise it self (which is a humor somwhat thinner than the *Pus*, and more waterish) flowing forth from Ulcers, and likewise sometimes from Wounds, sheweth evidently what we are to hope as touching the Cure. For much *Sanies* that is over thin, pale, leaden colored, black, and stinking, and that which corrodeth the Skin that is nigh unto it, evidenceth that the Ulcer is hard to be cured. But if the said *Sanies* be but indifferently thick, not much of it, somwhat red, or something white, it then sheweth that the Ulcer may easily be cured.

18. *If the Ulcers be Annual* (viz. *such as return yeer after yeer*) *or of a longer continuance than ordinary, it wil then follow of necessity that the bone must impostumate, and that hollow Cicatrices must be made therein.* So saith *Hippocrates* in the sixth Book of his Aphorisms, Aph. 45. For if the Physitian take in hand the Cure of an Ulcer, and put forth the utmost of his art and skil in the prosecution of the same, so that he neither omit nor intermit any thing that is therein necessary, and yet nevertheless the Ulcer shal not after a long time be cured, or else being covered over with a Cicatrice shal become crude and raw again, it then signifieth that the cause why the Ulcer is not healed lieth in the bone that is corrupted: the continual afflux likewise of the excrements that are generated in a long lasting Ulcer may easily corrupt the bone that lieth underneath it. For by reason of the distemper of the part that hath been of a long time encompassed about and surrounded with an Ulcer, and by reason of the impostumated bone, the Cavity

vity of the Ulcer cannot be filled up, neither can there fleſh enough grow forth; from whence it is that an hollow Cicatrice is cauſed.

19. If the Ulcer after ſuch time as it is filled up with fleſh, and that a Cicatrice ought to have been brought thereupon, wax crude and raw again, there is then great cauſe to fear, that the Ulcer wil turn into a Fiſtula.

20. Ulcers that are in the Feet, and in the Hands, are wont ſomtimes to haſten on Inflammations of the Glandules in the Arm-pits, or in the Groins, and Tumors in bodies that are plethorical and cacochymical. For the matter flowing down unto the ulcer in the Hand, or in the Foot, thoſe very parts themſelves likewiſe being become more looſe and weak do firſt of al receive and drink it in.

21. The ulcers of the Thighs are for the moſt part hard to be cured, and eſpecially if they be cheriſhed by any diſtemper and default in the Spleen: for then the thick and melancholy humors that flow unto the ulcer do hinder the Cure thereof.

22. Ulcers that have continued long, and are now become inveterate, are not to be cured without much danger, unleſs the body be firſt of all carefully purged, and a good courſe of Diet be obſerved; of which very thing *Gulielmus Fabricius* (in his third Century, and Obſerv. 39.) giveth us an inſtance in a certain man, who having had an inveterate ulcer cured in his left Thigh by an unskilful and immethodical Empirick, after ſome few months was ſurprized with a Pleuriſie in his left ſide, upon which he died: and that during his ſickneſs he ſpit forth juſt ſuch ſtuff and excrements as before were wont to flow forth of the ulcer. See likewiſe *Ambroſe Parry* (in his ſeventeenth Book, and Chap. 51.) touching *Pus* likewiſe from an ulcer in the Arm evacuated by the Urine.

The reſt of the Prognoſticks ſhal be handled in the ſpecial differences of the ulcers.

Indications.

Since that the Eſſence of an ulcer conſiſteth in the ſolution of unity, and the diminution of the magnitude of the affected part; the ſolution of unity ſheweth that union muſt be endeavored, and that which is loſt and diminiſhed indicateth its own reſtauration: to wit, the ulcer (as an ulcer) is to be filled up with fleſh, and united, and then ſhut up with a Cicatrice. But then when the ulcer is conjoyned with its cauſe, that either excited the ulcer from the very beginning, or elſe if (in the Cure) it obtain the Nature of that cauſe without which the ulcer had not been, the ſaid cauſe is then firſt of al to be removed. But then it is requiſite likewiſe that the temper of the part affected, as alſo the blood that floweth thereto be ſuch as it ought to be: but if there chance to be any thing amiſs in theſe, it is to be corrected; touching which we ſhal hereafter ſpeak further in the ſpecial differences of Ulcers.

If therefore that Humor that excited the ulcer be ſtil preſent, it is to be evacuated: for in every affect in which the cauſe is ſtil preſent, the Cure is evermore to be begun from the removal of the Cauſe. And moreover, becauſe that in the beginning there wil alwaies fal forth ſome of the blood without their proper veſſels, and becauſe that oftentimes together with it other vitious humors in the body flow thither; leſt therefore that which ſticketh in the pores of the parts ſhould putrefie and breed an Inflammation, this blood is to be concocted, and changed into good and laudable *Pus*. From whence likewiſe it is that *Galen* in his Book of the times of the whol Diſeaſe, and Chap. 3. writeth that ulcers have their peculiar times; and that in the beginning there is thruſt forth a thin, inconcocted, and wateriſh *Sanies*, which in the augmentation by the help and benefit of concoction becometh thicker; and at length (in the ſtate) is changed into *Pus* that is good and white. And therefore in the beginning of an ulcer it wil be requiſite to uſe Concocters, which they commonly cal Digeſtives. And furthermore the filth and impurities which are wont to be generated in an ulcer (in regard that they hinder the curing thereof) are to be wiped clean away. So ſoon as the ulcer is cleanſed, the Cavity thereof is to be filled up with fleſh: and at the length the ulcer is to be ſhut up with a Cicatrice.

There is yet nevertheleſs likewiſe regard to be had unto the parts affected. For in the ulcers of the external parts, the green ruſt of Braſs, burnt Braſs, Vitriol, Antimony, and the like, have their place; which nevertheleſs are by no means to be admitted of in the internal parts. If likewiſe the part be ſo conſtituted and framed, that it may give a paſſage unto other things (like as the Gullet doth) the Medicaments are then ſo to be ordered, that they adhere unto the part. Thoſe parts that are endued with an exquiſite ſenſe wil not admit of ſharp Medicaments; which thoſe parts that are of a more dul ſenſe wil wel enough ſuſtain: touching which we ſhal ſpeak (here and there) in the particular ulcers.

But now how an ulcer may be filled up with fleſh, *Galen* teacheth us in his third Book of the Method of Phyſick, and Chap. 3. To wit, unto the generating of fleſh there are neceſſarily required the efficient Cauſe, and the matter. The efficient is Nature, which (as it doth in the whol body, ſo likewiſe) in each particular part doth attract and draw ſo much Aliment as is neceſſary, and there ſhe retaineth it, concocteth, applieth, and aſſimilateth it. The matter is a pure and ſincere blood, that is generated from meat and drink. But becauſe (in every concoction) there is generated a twofold excrement; (one more thin, that inſenſibly exhaleth, or elſe is diſcuſ-

ſed

sed by Sweat; the other more thick;) the same likewise happeneth in the generation of Flesh in the Ulcer; and if they be left remaining in the part, they wil moisten it, and hinder the generation of Flesh. And therefore these Excrements in the Ulcers are to be clean wiped away, and dried up. And this is that which is so frequently & commonly alleadged out of *Galen* (in his third Book of the Method of Physick, and Chap. 4. and in his fourth Book of the Method of Physick, and Chap. 5. and in other places, here and there) where he saith that every Ulcer requireth exsiccation. And *Hippocrates* (in the beginning of his Book of Ulcers) thus writeth: *That which is dry* (saith he) *commeth near unto that which is sound; but that which is moist cometh very nigh unto that that is vitiated.* And so the Cure of an Ulcer it is indeed the work of Nature, that restoreth the flesh that is lost from the Blood flowing unto the part, and bringeth a Cicatrice over the Ulcer being filled up with flesh. The Physitian he only removeth those impediments that are an obstacle to Nature in her operation, whilest he cleanseth away the Excrements, and drieth the Ulcer; and when he doth this, he is then said to generate Flesh, and to introduce a Cicatrice.

The Cure.

At the beginning therefore, if the body be plethorical, or Cacochymical, then the abundance of Blood is to be diminished, or the Body evacuated, lest that the humors flow yet longer unto the part affected. And withall let there likewise be a good and wholsome Course of Diet appointed unto the Patient, that so there may no more of these bad humors be generated in the Body. And for all those things likewise that we call not natural there ought to be such a course taken, that nothing unbefitting or inconvenient may happen, nor any hurt be offered unto the Ulcer.

Moreover in regard that it cannot well be, but that there wil somwhat of the Blood that is poured forth of the Veins, and something of the humors likewise stick in the Pores of the parts; that so therefore this may be Concocted, and converted into *Pus*, Digestives or suppurating Medicaments are to be made use of, which in softer Bodies ought to be more mild and gentle (such as are those that are provided of the Oyl of Roses, and the Yelks of Eggs;) and in those bodies that are not so soft, but harder to be wrought upon, they are made of Turpentine, the Oyl of Egs, the Oyl of Roses, the Oyl of Mastick, the Yelks of Eggs; in Bodies that are more dry they are made of Rosin Turpentine, or Rosin of the Fir Tree, the Powder of Frankincense, the powder of Linseed, Wheat flour, Fenugreek, and Hens fat.

After this Cleansers are to be made use of. Yet notwithstanding it often so happeneth, that with one Medicament we satisfie two ends and Scopes, to wit, both concoct and Cleanse. Whereupon it is, that then in this case suppurating Medicaments are to be mingled with Detersives or Cleansers; and so the Suppuratives are made more hot, and more dry then otherwise they are wont to be. Yet nevertheless, in this commixture, there is a regard to be had unto the times; since that in the beginning Suppuratives, in the end Detersives ought to prevail. And indeed it is more safe (forthwith in the very beginning) to mingle Abstersives with Suppuratives, then to use Suppuratives alone by themselves. For Nature is never idle, but even in the beginning betaketh her self unto the generating of Flesh; and to this end she separateth the excrements, which are therefore to be wiped away: neither must we be easily perswaded to make use only of Suppuratives; since that it may then happen that by the use of them the Ulcer may be rendred more moist and fordid: which haply might be the Cause, why *Galen* in the Cure of Ulcers maketh no mention at al of Suppurating Medicaments. And therefore most commodiously unto these Suppuratives, or Digestives (as they are usually called) there are presently added, Frankincense, Rosin Turpentine, and Rosin of the Fir Tree, Oyl of Mastick, the Juyce of Smallage, and the like.

But now such like Medicaments as these may be made in a various and different manner, according to the various Constitution of several Bodies. In a Body that is soft and moist let such a one as this following be made.

Take *Oyl of Roses one ounce, Turpentine two ounces, the Yelk of one Egg, and so mingle them, &c.* That following is yet more dry.

Take *Oyl of Mastick, and of Turpentine, of each half an ounce; the Yelk of one Egg, and so mingle them, &c.* This following is yet stronger.

Take *Rosin of the Fir Tree one ounce, Oyl of Roses six drams, the Powder of Frankincense, one dram; mingle &c.* If there be need of more abstersion, then,

Take *Honey of Roses one ounce, Turpentine, half an ounce, the Juyce of Smallage one ounce, the Powder of Frankincense, and Barley flour, as much as wil suffice, mingle &c.*

The Ulcer being once cleansed, Sarcoticks (that is to say, Medicaments that breed Flesh) are to be made use of; touching the faculty of which we have already spoken, in the

the fifth Book of our Institutions, Part 1. Sect. 1. Chap. 9. Now these are of a threefold rank and order. In the first rank there is the Meal or Flour of Barly, of Fenugreek, and of Beans, Frankincense, Manna of Frankincense. In the second rank there are Rosin Turpentine, Rosin of the Fir Tree, and of the Larch Tree, Honey clean scummed, Honey of Roses, Aloes, the Meal of Lupines, of the bitter Vetch Orobus, *Pompholyx*, or the soil of Brass. In the third rank and order there are, the Meal of the Vetch *Ervum*, raw Honey, the Roots of Aristolochy, of Flower-deluce, Myrrh, Antimony, *Chalcitis* or red Vitriol.

Among the Compound there are these, *Viz. Unguentum Basilicum* the greater & the less of *Galen*, *Unguentum Aureum*, *de Tutia*, *de Matrisylva*. Touching the Emplaster that is made of *Hydrelæon* (Oyl and Water) and the Spume or Froth of Silver, see *Galen* in his first Book of the Composit. of Medicam. according to the kinds, Chap. 6. Or,

Take *Myrrh*, *Aloes*, *of each half an ounce*; *Frankincense one ounce*, *Mastick half an ounce*, *Gum Elemi two drams*, *Turpentine one ounce*, *Colophony half an ounce*; *Make an Unguent according to Art.*

And therefore out of these the Physitian may make his choice of such Medicaments as are most fit and convenient for every several and particular Constitution. For the body by how much the more moist it is, by so much doth it require Medicaments that are less drying and Abstersive: and on the Contrary, the Body when it is more dry, it then requireth the stronger sort of drying Medicaments.

And so likewise in the colder times and seasons of the yeer, we are to use those Medicaments that are somwhat Warmer; but in the hotter seasons of the year, the Medicaments that we make use of may be less hot. For if we apply Medicaments that are weaker then is fitting, then there will be great store of *Sanies* (the thinner sort of Corruption) gathered together in the Ulcer, and the Flesh that is generated wil be soft and flaggy. But if they be overstrong and overdrying, the Ulcer wil then be rendred dry, and the Lips thereof will become very red, the flesh will be consumed and sometimes the Excrements of the Ulcer will be bloody, and a certain kind of mordication or biting wil be perceived in the part. But if the part be rendered exulcerated and dry (as naturally it is wont to be) and that neither *Sanies* nor *Pus* flow forth of the Ulcer, and that there appear a good colour in the Flesh, it is then a Sign of a fit and convenient Sarcotick Medicament.

And here likewise the very form of the Mediment it self ought to be regarded. For they are wont to be applied either liquid or humid, or Dry. In bodies hard and dry, and when a harder flesh is to be generated the Sarcotick Pouders that are to be sprinkled upon the Ulcer are most fit. As,

Take *Frankincense halfe an ounce*, *Dragons Blood*, *Colophony*, *of each two Drams*, *and make a Pouder.* Or,

Take *Frankincense half an ounce*, *Aloes two drams*, *Dragons Blood*, *and Sarcocol*, *of each one dram*; *make a Pouder.*

But if the Bodies be softer, we use those Medicaments that are moist. And yet nevertheless, touching the preparation of Liniments and Unguents, it is to be observed that they be not too soft. For such as these are melted by the heat of the part, and so easily flow about and spread all abroad. And therefore if the Ulcers be not very deep (for in such those Medicaments are required that can penetrate even unto it) but that they stick in the Superficies of the Body, we must then make use of those Medicaments that are endued with a thicker Consistence. Moreover, Unguents that are overmoist, by reason of their Oyly Nature do mollefie, and generate a flesh that is too loose, and unlike unto that lying under it, especially in dry Bodies.

When the ulcer shal be filled up with flesh, it is to be closed with a Cicatrice, a Skin, or in stead thereof a Cicatrice is to be generated, and by the benefit thereof the Continuity that was dissolved is again to be united. But as in the generating of flesh it is Nature that doth the work, and the Blood that supplieth the matter; so likewise the very same happeneth in the generating of the Skin: the Physitian by the Medicaments only removeth the Impediments. But that which is commonly told us, that the matter out of which the Cicatrice is generated is flesh, which by the assistance of the Medicaments is so to be altered, and by the use of Dryers and Astringents is so to be condensed, that it may become like unto the Skin (if it be understood of the principal Agent) is altogether false. For as the Sarcopoietick (or flesh-causing) faculty in the flesh doth only generate flesh, and restoreth that which is lost; even so the Cutifick faculty (as I may so cal it) or Skin-making power, in the Skin doth only generate Skin. Whence it is, that never yet by the use of any Epulotick Medicament, or only by the use of Sarcoticks, hath there been known any Cicatrice to be produced in the midst of an ulcer; but it beginneth to arise alwaies from the Skin lying neer unto it, about the lips of the ulcer, and so by degrees is sensibly extended, until that at length the flesh become wholly covered over with the Cicatrice. And hence it is also that oftentimes the ulcers are brought unto a Cicatrice, without any use at al of Epuloticks. And yet we acknowledge that Nature by the use of the said Epuloticks may be much furthered and holpen in her operation. For if this Action be left wholly unto Nature, the Cicatrice will be generated but very slowly; not (as *Fallopius* thinketh) becaufe that the flesh out of which the Cicatrice

is to be generated is so moist that it cannot be dried by the Nature of the cutaneous or skinny part; but it is becaufe the Cutifick faculty in the Skin that is neer unto it cannot (but very flowly) change and convert into Skin, (which to wit, is a dry fubftance) that blood that floweth in unto it, the faid blood being moift: which it wil more eafily perform, if it be affifted by Epulotick Medicaments that have in them a drying power. But of what quality thefe Epulotick Medicaments are, and what kind of Faculties they have in them, *Galen* teacheth us in his third Book of the Method of Phyfick, Chap. 4. &5. and in his fourth Book of the Compofition of Medicaments according to the kinds of them, Chap. 1. And we have likewife already fpoken touching this very thing, in the fifth Book of our Inftitutions, Part 1. Sect. 1. Chap. 9. To wit, by how much the Skin is more dry than the flefh; by fo much likewife ought the Epulotick Medicaments to be dryer than the Sarcotick. But in thofe that are Active the Medicaments may be as wel hot as cold; or both of them, if there be occafion.

But now thefe Epuloticks are likewife of three forts, to wit, Mild, Mean, and more ftrong. The Milder kind are, Cadmia waſhed, the Rind of Frankincenfe, Aloes, the Roots of fweet Cypereſs (which fome term Engliſh Galangal) Lead burnt and waſhed. The Compounds thefe; Unguent of Litharge, of Minium (or Vermilion) of Ceruſs or white Lead, of Diapompholyx, and he Cerote of Vermilion. The mean and middle fort of Medicaments are thefe; Flowers of red Rofes, Pomegranate Flowers, unripe Gals, the Rind of the Pomegranate Tree, Bole-Armenick, Terra Lemnia or Sealed Earth of Lemnos, Myrobalans, Dragons blood, Vermilion, Lead. Of the Compounds; Unguent of Tutia, Unguent Diapompholyx, Emplaſtrum Diapalma, Emplaſtrum Gryſeum, and the Emplaſter of Lapis Calaminaris. The ſtrongeſt ſort are; Chalcitis, Sarcocol, Allum, Braſs burnt, the off-ſcouring of Braſs. Of the ſtronger Compounds are theſe; Unguent of Tutty, and the Cerote of Bole-Armenick. But now in the choyce of them we are to conſider both the Conſtitution of the ulcer, and the Nature of the body. For it ſomtimes happeneth that the ulcers which when they were ſordid and foul felt no mordacity or ſharp biting (as it were) from the Medicaments, do yet perceive and feel the ſame from them, after ſuch time as they are purged and made clean. Wherefore even then when the ulcer is at the pureſt, we muſt from the ſtronger ſort of Abſterſive Medicaments have recourſe unto thoſe that are more mild and moderate; like as again in ſordid ulcers we are to betake our ſelves unto ſuch as are more abſterſive; unleſs the ulcers were made ſordid by the ſaid mordication. For now and then this very thing lieth upon the Phyſitian, as a thing altogether neceſſary to be done, to wit, that he betake himſelf unto the moſt ſtrong and forcible Abſterſive; upon which the ulcer again appeareth corroded and ſordid, the fleſh that is diſſolved and (as it were) melted by the Medicament, defiling and fouling the ſame; for the colliquated or diſſolved fleſh degenerateth into a filthy and noyſom *Sanies*. And there it behoveth us carefully and diligently to conſider, whether or no the ulcer (the fleſh lying under it being eaten through and diſſolved) be not become ſordid and foul, becauſe that when it required a Medicament apt and fit to take away its filth and naſtineſs, there was yet neverthelefs no ſuch Medicament applied and laid on. But now, when the ulcer is rendered more ſordid and filthy by the acrimony of the Medicament, this is evidently manifeſted by the Cavity that is made in the ulcer, which wil be the greater; as likewiſe the orifice thereof wil be the more red and hot. And then again in the next place, we ought carefully to conſider, whether the conſtitution of the body be ſoft and moiſt, or elſe dry: for unto the ſoft the more mild, but unto the dryer bodies the more ſtrong and prevalent Medicaments are to be applied.

But the Epuloticks are then to be made uſe of (as *Galen* inſtructeth us, in his thirteenth Book of the Method of Phyſick, and Chap. 5.) when the ulcer is not altogether filled up with fleſh, but that there is yet a little thereof wanting. For in regard that Nature is never idle, but that even likewiſe then when it beginneth to produce the Cicatrice, the fleſh likewiſe withal at the ſame time receiveth yet ſome further increment and growth; if then at the laſt Epuloticks ſhould be adminiſtred when the ulcer is already altogether filled up with fleſh, we might wel fear, leſt that before ever the Cicatrice ſhould be compleated and fully finiſhed, in the interim the fleſh ſhould receive yet a further growth and encreaſe, and ſo the Cicatrice ſhould thereby be raiſed the higher. For in regard that the Skin is a Nervous ſubſtance, it cannot therefore be ſo generated anew as the fleſh, but in place and ſtead thereof there is ſomthing generated that is like unto the skin, and this we cal a Cicatrice.

This is likewiſe to be taken notice of, That Epulotick Medicaments ought to be endued (both actually and potentially) with a drying faculty; and that therefore (for the producing and cauſing the Cicatrice) Emplaſters are moſt fitly and commodiouſly adminiſtred and applied.

Gabriel Fallopius in his Book of Ulcers, Chap. 13. propoundeth this Unguent, which he termeth *de Tutia Magiſtrale*; and he there writeth, that of al that he had ever ſeen this is abſolutely the beſt. Viz.

Take *Oyl of Roſes, and Oyl Omphacine, of each ſix ounces; Oyl of Myrtle, and the Unguent Populeon, of each three ounces; Plantane Leaves, and Garden Nightſhade, of each two handfuls. Let the Herbs be cut very ſmal, and*

let

let them be mingled altogether for the ſpace of eight daies, ſhaking and ſtirring them wel together every of thoſe daies. Then ſtrain them, and to the ſtraining add, of Wax four ounces; mingle it with the reſt upon the fire, until that they be al melted: after this mingle them better with a Wooden Spatter, and while it is yet blood-warm, add of the Litharge of Gold or Silver ſix ounces; Ceruß two ounces, Tutty prepared two drams, burnt Lead ſix drams, Braſs burnt unto a redneſs three drams, Camphire one dram and half: ſtir them wel about in a Mortar, by the ſpace of two hours.

An Epulotick Pouder.

Take *the Roots of Tormentil, Biſtort, Round Ariſtolochy, Acorn Cups, Egg-ſhels burnt, Frankincenſe, Dragons blood, of each half an ounce; Lapis Calaminaris one dram, Litharge two drams, and make a Pouder.*

This following Emplaſter is likewiſe very uſeful; the which I have oftentimes made trial of, and that with very good ſucceſs. Viz.

Take *of the Unguent Diapompholyx, the Emplaſter Diapalma, and the Emplaſtrum Gryſeum, of each one ounce; Gum Elemi two drams, Sugar of Saturn one ſcruple, Wax as much as wil ſuffice, and make an Emplaſter.*

Chap. 3. *Of an Ulcer with a Diſtemper.*

BUt it many times ſo happeneth, that the ulcer is not ſolitary and alone, and pure, but that other preternatural Affects are conjoyned therewith; whereupon alſo the Cure is varied. And therefore we intend in the next place to treat of theſe ulcers in ſpecial.

An ulcer with a Diſtemper.

And firſt of al, there is indeed oftentimes a diſtemper conjoyned with an ulcer; which when it happeneth the Cure of the ulcer is then much hindered. For in regard that the Nature of the part is the Efficient cauſe of the Cure of the ulcer, and that the blood is the matter: if the part be intemperate, neither of theſe can be in that right temper that they ought to be, neither can the ulcer be filled up with fleſh, nor cloſed with a Cicatrice, unleſs the fleſh lying underneath it be in its natural temper; as *Galen* tels us in his third Book of the Method of Phyſick, Chap. 8.

But what the differences of the Diſtempers are, we have already acquainted you in the ſecond Book of our Inſtitutions, Part 1. Chap. 3. which here alſo have their place; and there may concur together with the ulcer a diſtemper that is hot, or cold, moiſt, or dry; a diſtemper hot and moiſt; hot and dry; or cold and moiſt, cold and dry: and indeed the diſtemper may be either with or without matter. But of the diſtemper with matter we ſhal ſpeak in the following Chapters. Here therefore in this Chapter we ſhal treat only of a Diſtemper without matter.

The Cauſes.

Now ſuch a Diſtemper as this, either it was preſent before the riſe and appearance of the ulcer; or elſe it was excited even in the very time of the ulceration. But for the Cauſes of theſe Diſtempers, what they are, we have likewiſe told you in the place before alleadged. Which that we may apply unto ulcers, a hot diſtemper in ulcers is excited by a hot Air, by too many Swathbands and bindings, and by Medicaments that are over hot. And on the contrary, a cold diſtemper is cauſed by the cold Air, from the not ſufficiently fencing and guarding the ulcer with Swathbands and warm Rowlers againſt the coldneſs and injuries of the external Air; as likewiſe it is excited by cold Medicaments. The moiſt diſtemper is produced by the moiſt Ambient Air (and hence it is that in ſome places the Air is greatly hurtful unto ulcers) and by the afflux of humors; touching which more in the Chapter following. A dry diſtemper is cauſed by a dry Air, by Medicaments that are over drying, and by the want or ſcarcity of Aliment. Of Compound Diſtempers the Cauſes are likewiſe compound.

Signs Diagnoſtick.

The ſigns of a hot Diſtemper are, that heating Cauſes went before; and alſo, that not only the Lips, but even the very fleſh it ſelf of the ulcer appeareth more red than uſual; and the ſick perſon himſelf perceiveth a great heat in the ulcer, which for the moſt part a pain followeth: Cold Medicaments being thereunto applied do exceedingly refreſh and delight, and withal do greatly benefit the Patient; and on the contrary hot Medicaments are greatly hurtful; the excrements of the ulcer are ſharp and biting.

A cold diſtemper cooling Cauſes went before it; in it the Lips of the ulcer decline unto a whiteneſs, or unto a wan leaden color, and they are ſoft; and hot things are helpful and agreeable unto the ulcer, but cold Medicaments are on the contrary very hurtful. If the Diſtemper be moiſt then moiſtening Cauſes had their precedence, the fleſh is ſoft, and appeareth lank and flaggy, and ſomtimes it groweth forth overmuch; the excrements of the ulcer are many; ſuch things as are drying do benefit, and thoſe Medicaments that moiſten do greatly hurt.

And laſtly, A dry diſtemper is known by this, That drying Cauſes went before, the Lips of the ulcer appear dry, and ſquallid, and hard; the excrements of the ulcer are but few, or none at al. Moiſteners are profitable; but drying Medicaments cauſe much hurt unto the ſick perſon.

Prognosticks.

1. Whereas (as *Galen* tels us in his fourth Book of the Method of Physick, Chap. 1.) for the healing and curing of ulcers the flesh that lieth underneath them ought to be altogether temperate, therefore it is that these ulcers become hardly curable by reason of the distemper in the part lying next under it.

2. Ulcers with a distemper either hot, or cold, or moist, are cured without any great difficulty. For with one and the same pains, and at the same time, and with the very same Medicaments we may both remove the distemper, and cure the ulcer.

3. But those ulcers that are attended with a dry distemper, are the hardest of al to be cured; because that the cure of the ulcer being for a while neglected and laid aside, it behoveth the Physitian to be altogether intent and busied in the removal of the distemper.

The Cure.

A Distemper sheweth that the alteration ought to be by the contraries. Yet nevertheless the Cure ought so to be ordained, that the ulcer (as far forth as may be) may not be neglected. If yet nevertheless we cannot be helpful unto both of them at once, and together, then in this case it behoveth us to be most intent about that that is most urgent. But since that the distemper hath in it the nature of a cause, and that it being present the ulcer cannot be cured; the distemper is therefore first of al to be removed, unless it be so that with one labor and pains both the distemper may be removed, and the ulcer cured. If the distemper be with matter, there wil then likewise be need of universals; of which we shal speak further in the following Chapter.

The Cure of a hot distemper.

But as for the distemper that is without any matter at al (of which we treat here in this Chapter) and withal hot, this hot distemper indicateth and pointeth at cooling Remedies, which ought to be milder, or stronger, according unto the excess of the heat. And albeit the ulcer requireth drying Medicaments, yet nevertheless in regard that the very heat it self by consuming the humors doth render the ulcer more dry, we must therefore make use of the milder and gentler sort of dryers: but yet notwithstanding these ought withal to be such as are likewise endued with an astringent power; that so the flux (which the heat is wont easily to excite) may be inhibited and restrained. Moreover, since that the heat is wont to produce pain, let the Medicaments therefore be such as have in them a power withal of mitigating pain, or at least such as are altogether free from any such faculty of exciting pain; and therefore let them be such as want the drying and abstersive power. Wherefore those Medicaments are useful and proper that are made of the Juyce and Water of Roses, of Plantane, Endive, Vinegar, Saunders, Bole-armenick, Nightshade, burnt Lead, Cadmia, Sugar of Saturn, Oyl of Roses, Turpentine, Plantane Water often washed. Or else let there be administred, the Unguent of Roses, the cooling Unguent of *Galen*, the Unguent of Cerus, of Nightshade, the Santaline Unguent, and the white Unguent. As for instance:

Take *Oyl of Roses, Turpentine, Rose water, or Plantane water often washed, of each one ounce, Barly meal as much as wil suffice; and make a Liniment.* Or,

Take *Lead burnt, and Pompholyx (both of them washed) of each one dram and half, Oyl of Roses, and Violets, of each one ounce and half, Wax a sufficient quantity; make herewith an Unguent.*

The Cooling Medicaments may not only be imposed upon the very Ulcer it self, but likewise upon the parts that lie nigh unto it, and round about it. And therefore we may not only anoynt those parts with the aforesaid Unguents, but we may likewise impose the said Unguents upon them with a Swath-band that hath been first wet in the Juyce of Plantane, Lettice, or Nightshade, or the Decoction made of Myrtles, of Pomegranate rindes, Pomegranate flowers, Saunders, Plantane, Bolearmenick, and the like, adding unto the Decoction a sufficient quantity of sharp and sowr Wine.

The hot Distemper being removed, the Ulcer (as it is wont to be done) is to be cured with Sarcoticks: which yet notwithstanding ought to be less hot and dry, lest that the hot distemper be called back again.

The Cure of a cold distemper.

The Cold Distemper of the Ulcer requireth heating Remedies; such as are the Oyl of *St.* Johns wort, Oyl of Spiknard, of the Flowerdeluce, of Camomile, of Rue, of Dill, the Sirup and Honey of Roses, Rosin of the Fir Tree, of the Larch Tree, the Spirit of Wine, the Cerote of Betony. And indeed Liniments and Unguents made out of these are imposed upon the Ulcer it self. But externally, and upon the neer adjoyning parts there are to be imposed Fomentations, made and prepared (together with a strong and generous Wine) of the Decoction of Sage, Hyssop, Wormwood, Organy, Rue, Mints, Bay Leaves, and Camomile flowers; or else let the said parts be anoynted al over with those hot Remedies even now mentioned; or else let the Cerote of Betony be laid thereon.

The Cure of a dry Distemper.

A dry Distemper requireth moysteners. And here water a little warm is of good use, if with it the Ulcer, or rather the parts neer unto the ulcer, be besprinkled or fomented. For albeit *Hippocrates* in his Book of ulcers teacheth us,

us, that we ought not to moisten universal ulcers, unless it be with Wine; and further addeth, that what is dry cometh neer unto that that is sound, and that that is moist cometh not nigh unto it; and although *Galen* in his third Book of the Method of Physick, and Chap. 4. and in his first Book of the Composit. of Medicaments according to the kinds, and Chap. 6. writeth, that no moistening Medicament is fit and convenient in the Cure of ulcers, and least of all Water: yet nevertheless, these things are altogether to be understood of an ulcer, as an ulcer; for the which Moisteners are no waies useful and proper. But if there be conjoyned with the ulcer a dry Distemper that hindereth the Cure thereof, then (the Cure of the ulcer being as it were left for a while) we ought to apply Remedies unto the dry Distemper, until such time that we find that the part affected hath recovered its pristine due temper.

The Cure of a moist Distemper.

And lastly, a Moist Distemper sheweth us that drying Remedies must be made use of. And because that an ulcer doth otherwise require drying Medicaments, therefore the Sarcoticks that we here make use of ought to be stronger than in a simple ulcer: and such are, the Roots of sweet *Cyperus* (or English Galangal) Horehound, the Spume or froth of Silver, burnt Lead, Chalcitis, the drosse scales of Iron and Brass, and such like; out of which Medicaments are to be provided fitting and proportionable unto the greatness of the distemper of every ulcer. For by how much the moister the ulcer is, by so much the more forcibly and strongly drying ought the Remedies (that are required) to be. And on the Contrary, if the ulcer be but little or nothing moist, then the Remedies that we administer ought to be more mildly and gently drying; which is done by adding unto the stronger sort of them, Oyl, Rosin, and Wax. For by how much the more there is of these added unto the former drying Medicaments, by so much the more is their drying faculty and power abated and weakned; and by how much the less, by so much the more strong and entire doth their drying faculty remain. The ulcer may first of all be washed (for the cleansing away the filth and nastiness thereof) with Wine, or *Posca*, in which Astringents and Dryers (such as are sweet Cyperus Root, St. Johns wort, Wormwood, Roses, Betony, and Sage) have been boyled: after this some of the aforesaid Medicaments may be strewed thereon; or else an unguent may be made thereof with Oyl and Wax, that without any warming at all may be extended and spread upon the Liniment (the Greeks call it *Emmoton*) and at last upon this we may likewise impose and lay on some hard Plaister, or Cerote. These Compounds and Emplasters are by *Galen* recounted in his first Book of the Composit. of Medicaments, and Chap. 13. Now as for the manner and measure of this humectation or moistening, let it be until the part begin to be lifted up, and to appear very red, and no longer; for we must then desist from any further washing and besprinkling it. For if we continue thus doing any longer, then that that hath been attracted wil be dissipated. Now as for the manner how this warm Water is to be applied unto the part, it is threefold; and it is performed either by fomentation, or pouring it on, or by bathing therein. The Fomentation is performed with a Spunge, a Cloth, Hurds, or Cotton: and this Fomentation is the most commodious and convenient way of moistening the part affected. As for pouring the warm Water thereon, or bathing in it, we conceive not that it is any way so fit and proper. And it wil be yet far better, if the part be fomented with Oyl and Water together blood-warm, rather then with Water alone, especially in the Winter time. For although warm Water may heat the part with an actual warmth; yet nevertheless, after the fomentation is past, it cooleth the part, and withal scattereth the heat; which is prevented by mingling Oyl therewith, for by this means the Pores of the Skin are obstructed. After the fomentation, let some Cataplasm that hath in it a Moistening faculty be laid on. As for example.

Take *the Leaves of Mallows boyled to a softness, half an ounce; Barley meal, and Wheat flour, of each two drams; sweet Almonds bruised one dram and half; Honey boyled one dram, Saffron half a scruple, Swines fat as much as will suffice, Mingle them wel together in a Mortar, and make a Cataplasm.*

Or else let the laid part be fomented with Oyl. Or else let an Unguent be made for it, of the Juyce of Mallows one part, sweet Oyl two parts, white Wax as much as wil suffice.

But if the Ulcer be dry, and the part lie under an Atrophy, so that the pouring of Water upon it wil not suffice, we must then (in the first place) do our endeavor in taking care that the sick Person may be nourished with meats that afford much good Juice, and which are easily distributed; that so there may be abundance of aliment administred unto the part affected; and moreover, if need require, it may be drawn unto the part, by the use likewise of those Oyntments we cal *Dropaces*, or by any other wáies and means.

The Distemper being removed, we are then to make use of Sarcoticks (and these indeed must be such as dry but little), lest that otherwise the part affected should again relapse into its dry Distemper, as *Galen* wel cautioneth us, in the fourth Book of his Meth. of Physick, and Chap. 1. and therefore together with these Sarcotick Powders there ought to be added certain Fats and Oyls, and Wax. As,

Take *Frankincense, and Mastick, of each one dram; Turpentine one ounce, Oyl of Roses one*

ounce and half, Wax as much as will suffice, and make a soft Unguent.

Chap. 4. *Of an Ulcer with the afflux of humors.*

But very rare it is, that a Distemper happeneth alone unto an Ulcer; but for the most part, the Distemper is accompanied with matter, and the afflux of humors.

But now how many Causes there are of the afflux of humors, we have already told you, in the first Part, Chap. 1. touching Tumors in general. To wit, unto the exulcerated part there flow humors, either from the whole body, or else from some one particular part generating vitious humors; whilest Nature instigated and stird on either by the abundant store, or by the quality of the humor, expelleth and driveth them forth, and heapeth them up in the exulcerated part; or else when the part (by reason of pain, or heat) attracteth the humors; or when the humors do of their own accord flow down unto the part that is situated in a lower place; or else when they are any otherwise moved unto a weak and ignoble part: all which in what manner and by what means they may happen, we have acquainted you in the place before alleadged.

There is great variety of Excrements that cometh from the afflux of the Humors unto the exulcerated part. *Galen* in his Book of the times of the whol Disease, divideth these Excrements into *Sanies* and *Pus*. *Celsus* likewise in his fifth Book, and Chap. 26. besides the blood that is known unto al, determineth that likewise *Sanies* and *Pus* do issue forth from wounds and ulcers; and there he thus writeth: That *Sanies is thinner than Blood, and yet variously thick also, and glutinous, and colored.* Pus *is most thick, and most white, more glutinous than Blood and Sanies. There issueth forth blood* (saith he) *from a wound that is recent and new made, or else that hath been of some continuance, and is now upon its healing.* The Sanies *is betwixt both these times.* Pus *out of an Ulcer that is now upon the very point of healing. Again, both* Sanies *and* Pus *have certain species or kinds distinguished by their Greek names. For there is a certain kind of* Sanies, *which is termed either* Ichor, *or* Meliceria. *And there is a* Pus *that is called* Elaiodes. Ichor *is thin, somthing white, and it issueth forth of a bad and naughty Ulcer, and especially when a Nerve being hurt, an Inflammation followeth thereupon.* Meliceria *is thicker and more glutinous, somwhat whitish, and not much unlike unto white Honey: This likewise issueth out of evil Ulcers, when the Nerves neer about the Joynts are hurt; and of al these places it especially floweth forth of the Knees.* Elaiodes *(which is thin, somwhat white, as it were anointed with a kind of fatneß, and not much unlike unto white Oyl) appeareth in great Ulcers, that are upon the point of healing.* Yet notwithstanding others there are that do otherwise use these names. Yet nevertheless, if we wil speak properly, *Pus*, with the Greeks *Puon*, is that excrement of the ulcer that hath its original from Blood, or from the flesh bruised and dissolved, and it appeareth in ulcers that are void of al other excrements, or such as have been just now cleansed from other excrements. Al the rest of the excrements that proceed from other humors, although they may be comprehended under the name of *Ichor* or *Sanies*; yet nevertheless the most do distinguish between *Sanies* and *Sordes*, and they cal the thin and watery excrements by the name of *Sanies* (which some do cal *Virus* or Venom) but the thicker excrements they cal *Sordes*; so that from the thin excrement the ulcer is rendered moist, and from the thick it is made sordid and foul.

Signs Diagnostick.

Ulcers with the afflux of humors are known, First, by the Tumor or Swelling that appeareth not only in the lips, but likewise in the neer adjoyning parts. And then (next of all) from the pain, which is very grievous and troublesome unto the sick Person, especially if the Nervous parts be affected. Thirdly, from the great store of excrements, which is far greater than what it was wont to be, proportionably according to the magnitude or bigness of the Ulcer. And lastly, albeit there be likewise adminiſtred all things that are necessarily required unto the Cure thereof, yet we find the Cure of them very difficult; in regard that the flowing humors hinder the Cure.

Prognosticks.

1. All Ulcers (as we said but now) with an afflux of the humors are very hard to cure; in regard that from the afflux of the humors the Ulcer is rendered moist, gains growth and increase thereby, swelleth up, and the pain is likewise hereby xci ted.

2. But by how much the afflux of the humor is the greater, and by how much also the humor that floweth thereto is the worse, by so much the more difficult will it be to Cure the Ulcer.

The Cure.

First of all therefore, in regard that the Ulcer cannot be cured unless the Flux be removed, therefore the Flux it self, with all its Causes, is to be taken away; and thereupon, whether in the whole body, or else by the default and something far amiss in the Liver, or the Spleen, the vitious humor be generated, the generating of it is to be hindered and prevented, and so much thereof as is already flown in is in a convenient manner to be prepared

prepared and evacuated; touching which very thing we have already elſwhere ſpoken at large. Moreover, leſt that the humor ſhould flow unto the affected part, it is to be drawn back, intercepted, and driven back. Among the Revulſive Aids and Remedies, in the firſt place we eſteem and account of Iſſues that are made in the contrary part; becauſe that the Humor that floweth unto the part affected, they evacuate and empty it forth by ſome other place. And theſe Iſſues are indeed oftentimes very neceſſary in old inveterate Ulcers. For when Nature hath been now of a long time accuſtomed to evacuate the vitious humors by the exulcerated part, if the ulcer be altogether cloſed, and that there be any of the vitious humors heaped up there, it may eaſily then come to paſs that theſe humors regurgitate and flow back again into the Veins, and ſo ruſh into ſome more noble part; but al this may be prevented by a Fonticle or Iſſue.

But the aforeſaid Defenſives do intercept; which are to be impoſed above the exulcerated part, in the ſound part, toward the root of the Veſſels, in thoſe places where the Veins being bigger do appear more conſpicuouſly; which ſaid Veſſels (through which the humor floweth) they ſtrengthen and ſhut up, and withal drive back the humor. And they are formed out of thoſe Medicaments that are dry and aſtringent; ſuch as are, Bole-armenick, Dragons blood, Flowers of Red Roſes, Pomegranate flowers, the Rinds of Pomegranates, Myrtle, Allum with the white of an Egg, Oyl of Myrtle, Oyl of Roſes, auſtere or ſharp Wine, aſtringent Waters: Out of which Cataplaſms or other Medicaments are prepared.

But then unto the part affected it ſelf Repellers are to be applied, that ſo the Humors that do as yet fluctuate in the Veſſels of the affected part may be repelled. And therefore the exulcerated part, or the parts neer unto it, are to be waſhed with Allum Water, the Water or Decoction of Plantane, of Roſes, of Pomegranate flowers, the Roots of ſweet Cyperus, Cinquefoyl, and the like: but the neer adjacent parts are to be anointed with the unguent of Bole. And in the middle of the Ulcer there is a drying Pouder to be laid on, of Litharge, Tutty, Lead, Corals, Bole-armenick, Chalcitis, the white unguent of *Rhaſis*, and unguent Diapompholyx. In a word, the Sarcoticks ought here to be ſtronger than in the ſimple ulcer that is not peſtered with this flux, that ſo they may throughly dry up the humor that ſticketh in the pores of the parts; and yet nevertheleſs they muſt be ſuch as are without any mordacity at al, that ſo there may be no pain excited. As,

Take *Turpentine one ounce, the Suet of a Bull half an ounce, burnt Lead an ounce, Tutty prepared half an ounce: Mingle them, &c.*

But yet nevertheleſs, if the matter be crude and biting, ſome Frankincenſe is to be added, to further the Concoction of the humor.

Touching the form of the Medicaments this is to be obſerved, that they be not of a moiſt conſiſtence, not Oyly and fat, in regard that they do more looſen and moiſten the part, as *Galen* tels us in his firſt Book of the Compoſition of Medicaments, Chap. 6. and in his fourth Book of the Compoſition of Medicaments, Chap. 1. & 13. And yet nevertheleſs, we are not alwaies to perſiſt in one and the ſame kind of Medicaments. For it oftentimes ſo happeneth that what did once or twice do good, may afterwards (the humor being any waies dried up) prove prejudicial and hurtful, by exciting a mordication or biting; and there the Medicament is then to be changed, and one more gentle to be adminiſtred in the place thereof.

After that the ulcer is filled up with fleſh, the Cicatrice is at length to be brought over it by Epuloticks.

Guido in his Tract. 4. Doct. 1. Chap. 2. upon ſuch ulcers as theſe, adviſeth us to lay on a thin Leaden Plate with a hole bored through it. For Lead being thus beaten into a thin Plate cooleth, and therefore is of ſpecial uſe in ſuch like ulcers, if a fitting Ligature be added; in regard that it preſſeth forth the humor out of the part affected, and hindereth the influx thereof into the part exulcerated.

Chap. 5. *Of the ſordid, putrid, and corroding Ulcer.*

THe moiſt ulcers that are accompanied with an afflux of Humors are for the moſt part thereby made ſordid and foul (ſuch as the Greeks cal *Rupara*) to wit, if that thick and fnotty excrement (which in ſpecial they cal *Sordes*) flow forth; and putrid, if the ſaid excrement breath forth a grievous and noyſom ſmel, like unto that of a dead Carkaſs. For ſordid and putrid ulcers (as *Guido* in his Tract. 4. Doct. 1. Chap. 3. telleth us) differ only in degrees, viz. in this, That the one is ſuch in a greater, the other in a leſs degree. For if the excrements of the ulcer be ſimply thick and ſordid, then we cal it a ſordid ulcer; but if they likewiſe receive a putridneſs, inſomuch that they putrefie and corrupt the fleſh that lieth under it, and alſo the ſofter parts, ſo that there breath forth from thence a noyſom and unſavory vapor, then it is called a putrid ulcer.

The Cauſes.

The nigheſt Cauſes of this ulcer are depraved humors, malignant, and ſuch as receive an extraneous and moiſt heat and putridneſs. And indeed theſe humors either they flow unto the part affected from ſome other place, or elſe they become ſuch in the very part it ſelf, by reaſon of ſome diſtemper or debility in the ſaid part, or by reaſon

reason of the unseasonable use of moist, and unctuous, and Emplastick Medicaments; or by reason of the administring thereto those Medicaments that were too weak in drying, and omitting those Dryers that were required. And on the contrary, likewise, the same ulcers are made sordid, by reason of overstrong Abstersives, that even melt and dissolve the sound flesh.

And sometimes the humor acquireth so great an acrimony, that it corrodeth not only the exulcerated part, but likewise the sound part lying neer unto it, and from day to day creepeth wider and broader; and these ulcers are termed Corrosive, Creeping, and Devouring Ulcers.

Signs Diagnostick.

Sordid ulcers are easily known by the sight; when there appear in them in great abundance certain Impurities that are viscid and clammy; when the flesh is become flaggy and soft, and oftentimes groweth forth too far. If also there be added a putridness, and if there be perceived a grievous stinking smel, and such as is like unto that of a dead Carkass. If the ulcer be corrosive and creeping, if an itching and pain be felt; and if the ulcer doth continually grow greater.

As for what belongeth unto the signs of the Causes; if the humors flow either from the whol body, or from any one part thereof, this wil appear by those signs that we have already propounded in the precedent Chapter. If the part be weak, and distempered, this may likewise be known by signs of its own; and there wil then be no appearance at al of any fresh and lively color in the part. If the Ulcer hath been made sordid and foul by the weakness of any Medicament, then the ulcer appeareth whitish, and that whiteness encompasseth about the whol ulcer, like unto a kind of Web. On the contrary, if the ulcer hath been made sordid by a too strong abstersive Medicament, then the ulcer is made hollow, and afterward from day to day it becometh more red; and there floweth forth a subtile *Pus* that is not much in quantity, but very hot.

Prognosticks.

1. If by reason of the great store, and the thickness of these *Sordes* or impurities the transpiration be hindered, then there followeth the corruption of the part; and so of a sordid ulcer it afterward becometh a putrid and depascent or devouring ulcer.

2. If putridness be encreased in the ulcer, at the length a Gangrene and a Sphacelus follow.

The Cure.

In sordid and putrid ulcers there is first of al great care to be had in the course of Diet; and the body is to be purged from al bad and vitious humors. But upon them there is to be put Abstersive and cleansing Medicaments; such as are Mulsa, Salt Water, and those things that are made of the juyce of Smallage, of Wormwood, Barley meal, of the bitter Vetch Orobus, Myrrh, and Honey of Roses. But more especially the Spirit of Wine doth exceedingly benefit in the purging and cleansing of al putrid ulcers; which is therefore to be mingled together with the other Medicaments. As,

Take *Lignum Guajacum, and the Rinds of the same, of each one ounce; the Root of long Aristolochy, the lesser Centaury, Wormwood, and Agrimony, of each one handful; the Rind of the Frankincense tree, Myrrh, of each half an ounce: boyl them al in a sufficient quantity of Wine; unto the straining add of Honey scummed four ounces, the Spirit of Wine one ounce: mingle them, &c.* Or,

Take *the Root of long Aristolochy one ounce; Wormwood, Centaury the less, Agrimony, of each half a handful; boyl them in Wine. Unto the straining add the flour of the bitter Vetch Orobus half an ounce; the pouder of Mirrh two drams; Honey of Roses two ounces; Spirit of Wine one ounce; Turpentine as much as wil suffice to make a Liniment.*

If the ulcer be become sordid by the alone use of Unctuous and Oyly Medicaments, and if that there be no other more grievous cause of the foulness and nastiness thereof, then the milder and gentler sort of Abstersive Medicaments may suffice: for the drier sort of Medicaments being administred, the ulcer is easily cleansed.

But if the ulcer be become sordid and foul from the use of Medicaments that were overstrong, then the milder are to be imposed; such as are the unguent Diapompholyx; the stronger sort of them are, unguent Apostolorum, and the Ægyptiack unguent. Or,

Take *the Decoction of Barley one pint; Honey of Roses two ounces, mingle, &c.* Or,

Take *Turpentine and Honey of Roses, of each half an ounce; Meal of Barley, and of the bitter Vetch Orobus, and Mirrh, of each one dram; Pouder of Flowerdeluce root half a dram.* Or,

Take *the Juyce of Smallage, and Wormwood, of each one ounce; of the meal of Barley, of the bitter Vetch Orobus, of each one dram; Turpentine one ounce; Mirrh two drams; Honey one ounce, and mingle them, &c.* Or,

Take *Agrimony, Centaury the less, of each half a handful; boyl them in Wine: unto the straining add the juyce of Smallage two ounces; Honey of Roses one ounce; the meal of Barley, and of the bitter Vetch Orobus, of each one dram and half; Turpentine washed in the Spirit of Wine, two ounces; mingle them: and make a Liniment.*

If the ulcer be putrid, it is to be washed with Oxycrate, Ley, Brine; and upon them there are

to

to be impoſed Medicaments made of the meal of the bitter Vetch Orobus, the root of long Ariſtolochy, Squils boyled in Wine, and mingled with Honey.

But the hollow Ulcer that is ſordid and putrid, is to be anoynted with the Unguent of Bolearmenick, or ſome other Cooler, leſt that there be an afflux of humors excited from the uſe and biting quality of hot Medicaments.

If the putridneſs be greater, ſo that there be cauſe to fear leſt that the part it ſelf may be corrupted, then we are to make uſe of the ſtronger ſort of them, which ſhall be hereafter declared and ſet down in the Chapter of the Gangrene and a *Sphacelus*.

And laſtly, if the Ulcer be Corroſive, and that the ſound parts be likewiſe corroded; then that that is corrupted ought to be taken quite away, either by inciſion, or by Cautery (whether actual or potential, it matters not much) until that at length we come to the ſound fleſh, and that the ſound and quick fleſh be ſeparated from that which is corrupt and dead. But as touching theſe things we ſhal ſpeak further hereafter in that that followeth touching *Phagedæna*, and a *Gangrene*, and *Sphacelus*.

Chap. 6. *Of an Ulcer with Tumors.*

FRom the afflux of humors unto the ulcerated part there is not only a Diſtemper generated, but there oftentimes likewiſe happen Tumors.

The Cauſes.

Now the truth is, that there is no other Cauſe of theſe Tumors then what hath been before expreſſed and explained, *touching an Ulcer with the afflux of humors*, and above in the firſt part of Tumors. But now according to the diverſity of the flowing humors, ſuch is likewiſe the diverſity and variety of the Tumors that are excited, to wit, an *Inflammation*, an *Eryſipelas*, *Oedema*, and *Cancer*. But what humors they are that excite thoſe Tumors hath been above declared, where we ſpake of Tumors.

Signs.

What kind of Tumor this is, and what danger it produceth and threateneth, appeareth likewiſe ſufficiently from the places alleadged; neither is there any need at all that we repeat any thing here of what was there ſaid.

The Cure.

The way, Means, and Method of Curing it was there likewiſe declared; which is yet nevertheleſs here in ſuch manner to be inſtituted, that the Ulcer may not in the leaſt be neglected. If therefore either the Blood offend in its quantity and overgreat abundance, or elſe if vitious humors abound in the body, theſe are firſt of all to be evacuated. In the next place regard is to be had to the very part affected. After this, Medicaments are to be applied unto the place affected, which may either diſcuſs the humor that is the Cauſe of the Tumor, or elſe convert it into *Pus*.

And therefore in an Inflammation there ought to be applied a Cataplaſm made of Quinces boyled with the Pouder of Myrtle, or of boyled Lentiles, with the Meal or flour of Barly, Pomegranate rinds, and red Roſes. In the augmentation of the Ulcer there muſt be added Camomile flowers, and Bean meal. In the State, Mallows, Marſhmallows, the meal of Linſeed, and of Fenugreek. As,

Take *Barley meal two ounces, the pouder of Camomile flowers one ounce, the meal of Linſeed and of Fenugreek, of each ſix drams; and make a Cataplaſm.*

If the Tumor tend toward a Suppuration, the Suppuration is then to be holpen on with a Cataplaſm of Mallows, Maſhmallows, Linſeed, Fenugreek, and Wheat, and other ſuch like Ripeners. As,

Take *Mallows, Marſhmallows, of each one handful; boyl them in Water until they be ſoft, and then bruiſe them well: When they are bruiſed, then add of the flour of Linſeed, and Fenugreek, of each one ounce; Wheat flour half an ounce, Swines fat and Oyl of Roſes, of each one ounce, and Mingle them.*

If an *Eryſipelas* be joyned together therewith, externally, and in the neer adjacent places, thoſe Medicaments are to be impoſed that we have above propounded, in the firſt Part, and Chap. 7. touching an *Eryſipelas*. There is here very uſefully impoſed upon the external parts the water of Elder flowers, and Nightſhade. We add this only, that ſomtimes it ſo happeneth, that (as in an *Eryſipelas*) if it be not rightly Cured, and if ſuch things ſhal be raſhly and unadviſedly adminiſtred that obſtruct the Pores, ſo that the humor can by no means paſs forth, nor be diſſipated, or that there be cauſed an overgreat afflux of humors, Puſtules oftentimes, yea and greater bliſters and bladders are excited in the affected part; out of which when they are broken, there iſſueth forth a watry *Sanies*, and the part is afterward exulcerated; and unleſs it be rightly handled, the Affect ſoon degenerateth into long continuing and malignant Ulcers (eſpecially in the Thighs) yea and oftentimes into a very Gangrene it ſelf. Which if it ſhould chance ſo to happen, it wil then be very requiſite to make uſe of Coolers, Driers, and Aſtringents together. As,

Take *Plantane Leaves one handful, flowers of red Roſes half a handful, boyl them to a ſoftneſs, and then let them be bruiſed; when they are bruiſed and paſſed through a Hair-ſieve, add of*

Barley

Barley meal one ounce and half, the pouder of Pomegranate flowers half an ounce, with the oyl of Roses make a Cataplasm.

That that is here especially useful and profitable is the Unguent *Diapompholyx*; unto which (if you please) you may yet further add some Sugar of Saturn.

If the Tumor be cold, then such a like Cataplasm as this may be imposed.

Take *the Leaves of Mallows, Marshmallows, of each one handful; and boyl them in Ley unto a softness, and then bruise them wel; then add the pouder of Marshmallow root one ounce and half, Camomile flowers ten drams, Oyl of white Lillies as much as wil suffice, and so make a Cataplasm.*

If a *Cancer* be joyned with the Ulcer, there can then be no other Cure more fit and proper then that we have already propounded, touching an ulcerated *Cancer*.

The rest of what might here be spoken touching these may be seen, if they be sought for in the first part, touching Tumors.

Chap. 7. *Of proud flesh growing forth in Ulcers.*

IT happeneth oftentimes, that in Ulcers there is found proud flesh, and such as groweth forth further then what is fitting; which Malady the Greeks term *Hypersarcosis*; which whensoever it happeneth, it hindereth that the Ulcer cannot possibly be shut up with a Cicatrice.

The Causes.

Now this happeneth either from the abundance of blood that floweth unto the part affected; or else by reason that the Sarcotick Medicaments that had been administred were overweak, and less drying then what was fit. If the former of these be the Cause, then the flesh it self wil be in a right temper, only there wil be too much thereof. If overmuch flesh proceed from the latter of the two Causes, then the flesh wil not be sound and solid, but loose and Spungy.

The Cure.

As for what concerneth the Cure, if the first happen, fasting and spareness of Diet is then to be enjoyned unto the sick Person, and dry Medicaments are to be imposed. But if the flesh begin to grow proud by reason of the use of Sarcotick and detersive Medicaments that were in their own Nature overweak, then we ought to make use of the stronger sort of Detersives, and such as produce a Cicatrice; and if there be occasion, even septick Medicaments likewise. And such are, a Spunge burnt, dry Liniments imposed, the rind of Frankincense, Galls, Aloes, Tutty, and burnt Alum.

And indeed in the Toes, when by reason of the compression of the excrescent Nails the flesh beginneth to be luxuriant, so that a man can neither put on his Shoes, nor go without pain, then burnt Alum alone sprinkled thereon wil take away the said flesh. The stronger Medicaments, are, the rust and scouring of Brass, Chalcitis, Mercury precipitate, Mercury sublimate. And therefore whensoever there is need but of litttle drying, then let there be imposed dry Liniments, or else such as have been soaked and wel wet in this following Decoction.

Take *Galls, the rinds of Frankincense, and Mastick, of each one dram; Flowers of red Roses, Pomegranate flowers, and Rue, of each half a handful, Alum two drams; boyl them al in Wine.* Or,

Take *Galls, Pomegranate rinds, a Spunge burnt, of each alike; and make a Pouder to be strewed thereon.*

There is more especially useful this green water following, which being besprinkled upon the luxuriant flesh, or else imposed thereon by Liniments, it taketh away the said flesh without any pain at all, and generateth a Cicatrice.

The Green Water.

Take *Alum Crude, and Green, of each two drams, boyl them in eighteen ounces of Wine, until a fourth part be wasted; then strain it; and then take Camphyre one dram: dissolve it in one ounce of the Spirit of Wine, and add it unto the former.*

The stronger are these:

Take *Plantane water, and Rose water, of each five ounces, Mercury sublimate one dram, let them boyl, and then strain them through a thick Linen Cloth. In the straining let the Liniments (being cut into divers pieces) be laid to soak, or the Linen Cloth; and let it be again throughly dryed, and reserved for use.* Or,

Take *Galls, Pomegranate flowers, of each one dram; Dragons blood, Ceruss, the rust of Brass, of each half a dram; burnt Alum, Frankincense and Myrrh, of each one dram; Make hereof a Pouder.*

Chap. 8. *Of an Ulcer that is wan, and Callous.*

IT sometimes so happeneth that the lips of the Ulcer are made hard, wan, and Callous. Now this is caused by those things that dry overmuch, or by the cooling of the externall Air, or by the afflux of hot humors.

But from what cause soever it happen, the Ulcer cannot be cured, neither can it be closed up with a Cicatrice, unless that hardness be first taken away, and the exulcerated part be reduced unto its natural state. And therefore if the hardness be less, then Emollients and Discussives are to be made use of, such as are of the Mucilage of Linseed,

of

of Fenugreek, Oyl of ſweet Almonds, Oyl of Earth-worms, the fat of a Hen, and the fat of Ducks, &c. As,

Take *the Mucilage of the ſeed of Marſh-mallows, of Fenugreek, of each two drams; Turpentine one ounce; Oyl of ſweet Almonds, and of white Lilies, of each three drams; Wax as much as wil ſuffice, and make a ſoft Unguent.*

The ſimple Diachylon Emplaſter is likewiſe here very good, and of ſingular uſe.

But now if the hardneſs be greater, and that it yield not, neither give way unto Emollient and Diſcuſſive Medicaments, after what manner ſuch a like ulcer ought then to be cured, *Galen* teacheth us, when in the fourth Book of his Method of Phyſick, and Chap. 2. he thus writeth: *When the lips of the Ulcer* (ſaith he) *are only ſomwhat diſcolored, or made a little harder than ordinary, they are then to be cut out even unto the ſound fleſh. But whenas this Affect hath made a further progreſs, then it falleth under deliberation, whether al that which is ſeen to appear preternaturally be to be cut forth, or elſe rather in time, and as ſoon as may be to be cured. And it is without doubt, that in this caſe the wil and mind of the Patient is to be conſulted and followed. For ſome of them had rather be cured without being cut, though it be a long time firſt: Others again there be that wil be content to undergo any pain or hardſhip, ſo that they may be ſoon and ſuddenly cured.* For ſuch like ulcers are moſt ſpeedily (yea and moſt commodiouſly likewiſe, and fitly) cured, if the hard and wan fleſh be cut forth (even unto the ſound) with a fit and convenient Inſtrument. For both the pain is ſhorter, neither is there any bad and hurtful quality introduced into the part, as there is by corroding Medicaments. For the hardneſs thereof is likewiſe very fitly waſted and removed by an actual Cautery.

But if the ſick perſon wil endure neither inciſion, nor burning, the hard fleſh is then to be waſted away, and conſumed by ſuch like corroding Medicaments as we have elſwhere propounded. The green Water that we deſcribed in the foregoing Chapter is likewiſe of ſingular benefit; and ſo is the Pouder alſo there mentioned. The Oyl of Vitriol is one of the ſtronger Remedies.

Yet nevertheleſs, we muſt be very cautious how we uſe the ſtronger ſort of Medicaments in the Nervous parts: and Defenſive Medicaments are to be applied unto the neer parts, leſt that there be a pain excited, and a new afflux of humors cauſed.

If the lips of the ulcer be leaden colored, wan, and black, they are then to be ſcarified, and the vitious blood is to be drawn forth: afterward a dry Spunge is to be laid thereon; and at length drying Medicaments, as the green Water, or the Pouder deſcribed in the precedent Chapter, or the like Medicament.

Chap. 9. *Of Ulcers that are hollowed and furrowed.*

IF *Pus* and *Sanies* be long contained in the Apoſtem, or Impoſtume, and ſhal in its own nature be ſharp, or elſe ſhal become ſuch by its long continuance there, it then maketh (as it were) Conney-burroughs, and formeth a hollow nook, by the Greeks called *Colpas*. But touching theſe nooks and furrows (in regard that we have already ſpoken thereof above, in Part 1. Chap. 6.) it wil be altogether needleſs here to add any thing more unto what hath been there delivered. Only we ſhal yet here acquaint you with ſome few things by way of Advertiſement. The firſt is this, That hollow and furrowed Ulcers may not only be ſo bred, but the ſinuous and nooky ulcers may oftentimes likewiſe ſucceed wounds; which eſpecially happeneth by the negligence of the Chirurgeons, and this very frequently chanceth in the Thighs. For if ſuch like places where the Muſcles are larger the wound be not ſo ordered that the *Pus* may be expelled forth by the orifice of the wound, it then by its weight deſcendeth according to the guidance of the Muſcles, and there raiſeth furrows and Conney-burrows (as the Latine Phyſicians term them) and more eſpecially if it hath been long detained, and be thereby become ſharp and corroding. And in ſuch a like ulcer, ſince that al the *Pus* can hardly be expelled forth by the Ligature that is toward the upper Orifice, it wil therefore be neceſſary to open a *Sinus* or nook in the lower part; which being done, and a way and paſſage made for the iſſuing forth of the *Pus*, ſuch wounds are afterward eaſily cured.

And therfore in the ſecond place it is to be noted, That we are to uſe ſuch an expreſſive Ligature (leſt that, whether in Wounds or in Ulcers Fiſtula's be generated) to wit, which beginneth from the very bottom of the wound or ulcer, and endeth in the orifice thereof; this notwithſtanding alwaies provided, That by how much the neerer it approacheth unto the Orifice, by ſo much the looſer ought it to be.

Thirdly, You are to be hereof admoniſhed, That in regard ſuch like ſinuous ulcers become ſordid and foul, for the moſt part, that therefore the Spirit of Wine is very fitly mingled together with other Medicaments, becauſe it hath in it an excellent property and vertue to cleanſe and purifie ſuch like ulcers as theſe. *Franciſcus Valeriola* hath a ſingular and happy way of Curing this dangerous nooked or furrowed ulcer, in the fifth Book of his Obſervations, Obſerv. 1. and another in the ſame place, Obſerv. 7. where they may both be ſeen. But yet nevertheleſs I hold it

not amiss here to acquaint you with those Medicaments he there maketh use of; for as for Section (or cutting) he would not for many reasons by any means allow of, or appoint it. *First of all* (saith he) *after Universals, and a special regard had unto the whol body, we coming unto the cure of an Ulcer in one that was extreamly afflicted therewith, found (in regard that it was sordid and foul, and hollow, and sinuous) that it wanted cleansing and filling up. But in regard that the Cavity could not be filled up, without first cleansing the Ulcer, therefore the Ulcer was first of al to be cleansed and purified: for an Ulcer can neither be filled up, nor agglutinated, unless it be pure and clean, as* Galen *tels us. And therefore to cleanse away the thin Ichorous excrements and impurities (with which the Ulcer was extreamly pestered) we proceeded in the use of many several Remedies, stil proceeding from the weaker unto the stronger.*

Take *the Decoction of whol Barley one quart; Honey of Roses six ounces; mingle them, and make an injection thereof into the inside of the Ulcer with a straight Syringe or injection pipe; this without any mordacity at al cleanseth and washeth away the filth and pollutions of those thin ichorous excrements of any Ulcer. But when we had discovered that there was present much both thick and sordid* Sanies, *we then found that there was great need of a stronger cleansing. And thereupon we made use of this other stronger and more prevalent Remedy, to wit, mingling therewith the aforesaid* Ægyptiack Unguent, *and withal mingling a smal proportion of* Aqua vitæ, *viz. Two ounces. Somtimes, and after some certain daies when we had made use of this second Decoction, and yet had not sufficiently gained our desire as touching the detersion and cleansing of the Ulcer, we then thought good to make use of this notable and effectual Injection.*

Take *Lignum Sanctum poudered very smal, and the bark of the same Wood, of each two ounces; long Aristolochy, Centaury the less, Wormwood, Agrimony, Horstail, Olive Leaves, Myrtle Leaves, Pimpernel, and the greater consound, of each one handful; the rinds of Frankincense, Myrrh, and Sarcocol, of each half an ounce; sweet scented red Wine three pints; Honey scummed four ounces; let there be a decoction of them al; of the straining make an injection within the Ulcer, at the very time of injection add thereto one ounce of the best* Aqua vitæ *for every dose, or as oft as you administer the Decoction. Where by the way this is worthy your taking notice of, and we then found it by observation, that the* Aqua vitæ *(together with the aforesaid Decoction) is most powerful, and most efficacious in cleansing sordid Ulcers that are without biting, and in throughly drying of them, and in promoting the agglutination and sodering thereof. But if together with the aforesaid Decoction you add of the best* Aqua vitæ *one quart, and so destil them in a Glass Alembick, in* Balneo Mariæ, *there is from thence a most admirable Liquor to be extracted and drawn forth, both for the cleansing of al sordid and hollow Ulcers, as also for the agglutinating and closing of them up: which we at that time frequently found by experience. For truly great and admirable is the power and efficacy of* Aqua vitæ *in the cleansing and glewing together again (as it were) of Ulcers, and especially those of the Nervous parts (as we then discovered by dayly experience and observation) so that we know nothing that is better for that purpose. But when the time was come that we thought fit to restore in the Ulcer the flesh that was lost, we then made use of this other injection; the virtue and faculty whereof is, both moderately to cleanse, and to fill up the Cavity with flesh; whereupon it may deservedly be stiled a Sarcotick Remedy.*

Take *Plantane Leaves two handfuls; Agrimony, Herb Robert, Cinquefoyl Leaves, of each one handful; the tops of Wormwood, in number three; of both the Consounds, Horstail, Ceterach (or Spleenwort) St. Johns wort, of each half a handful; Betony one handful; make a Decoction in water: in the end of the Decoction add, of red astringent Wine one quart, the Leaves of red Roses, and Myrtle Leaves, whol Barley, of each two pugils or smal handfuls; take of the straining two quarts: unto which add, Beanmeal one ounce, of the bitter Vetch Orobus half an ounce, Frankincense, Mastich, Sarcocol, Rosin of the Pine-tree, of each one ounce; Myrrh, round Aristolochy, of each six drams; Florentine Flowerdeluce half an ounce, Honey of Roses four ounces: mingle them, and of this Liquor make an injection within the Ulcer; for it fitly cleanseth and generateth flesh, as we may perceive by the Nature of the Ingredients; and so the event taught us. After the injection within the Ulcer, we then very commodiously made use of this following Unguent, with tents, Spleen-like long Plaisters, &c.*

Take *Juyce of Plantane four ounces; Agrimony two ounces; Wormwood one ounce; red Wine four ounces, Oyl Omphacine of Roses one pint: boyl them together unto the consumption of the Wine and the Juyces; in the end thereof adding of Bean meal two ounces and an half, of the bitter Vetch Orobus one ounce and half, of Frankincense, Mastick, Sarcocol, Rosin of the Pine-tree, of each one ounce; Choyce Myrrh, Flowerdeluce of Florence, and round Aristolochy, of each half an ounce. Turpentine washed in white Wine three ounces, Honey scummed four ounces; Wax as much as wil suffice: make an Unguent; with the which after that we had caused Liniments to be filled, we then ordered and appointed them to be imposed upon the part affected.*

After

After the cleansing of the Ulcer was perfectly finished, we then with very good success made use of this Sarcotick Pouder likewise within the Ulcer:

Take *Elect and choyce Aloes two drams; Frankincense, the Rinds of the same, Myrrh, and Sarcocol, of each one dram; Roots of the Florentine Flowerdeluce four scruples: make of al these a most smal and fine Pouder, and apply it unto the hollow Ulcer, to fill up the Cavity thereof.*

But we likewise (after those aforesaid Remedies) thought good to make use of a drying Fomentation, fitted for the Ulcer, and such as was very requisite and proper for the producing of the Cicatrice.

Take *the Leaves of Plantane two handfuls, Wormwood half a handful, the Leaves of the Olive, of the Mastick or Lentisk Tree, the tops of the Bramble bush, of each one handful, the Leaves of Betony half a handful; the Flowers of Camomile, Melilote, St. Johns-wort, Stichados, Cassidony or French Lavender, red Roses, Rosemary flowers, the Leaves and Grains of Myrtle, of each one handful; boyl al these in a sufficient quantity of Water; and add in the end of red astringent Wine one pottle: make a Fomentation herewith for the part affected, and apply it twice a day. But when as this had first of all appeared plainly to be less effectual than was expected, and not to be sufficiently helpful; we then made use of this other that followeth.* Viz.

Take *Centaury the less-one handful; red Roses one pugil and an half; Myrrh grosly poudered three drams; Roch Allum one ounce; boyl them all together in thick red Wine for a fomentation; and then let them be filtered, and hard pressed, according to the usual manner.*

An Astringent and Epulotick Injection followed upon this Fomentation.

Take *the Leaves of Plantane, of new Ivy, the Flowers of red Roses, of each one pugil; the grains of Myrtle shaken wel together one pugil and half; the Leaves and Flowers of Centaury the less, of each one pugil; Roch Allum one ounce; Pomegranate Rinds one ounce and half; let them boyl all together in red Wine, and then strain them. Of the straining we ordered them (with a straight Syringe, Squirt, or Injection pipe) to cast into the Ulcer, the Ulcer being first of all throughly cleansed and purified: which cleansing was indeed wholly effected and wrought by the fore-ordained Injections, but more especially likewise (and most speedily) with this following Unguent; for it hath an admirable and excellent virtue in the cleansing of Ulcers from all their thin Ichorous excrements and impurities: the Ingredients that it consisteth of are these that follow:*

Take *Juyce of Smallage half a pint (this is admirable in cleansing of Ulcers) the best Honey four ounces; Barley meal two ounces; of the bitter Vetch Orobus half an ounce; Choyce Myrrh two drams; Turpentine one ounce and half; let them be boyled al together, and make an Unguent; in which let Linen Rags be wel wet, and then put into the Cavities of the Ulcer; it purgeth Ulcers most excellently, and without any biting at al.*

For the filling up of the Ulcer with flesh, we made use of this following Emplaster:

Take *Litharge of Gold six ounces; Oyl of Roses Omphacine one pint and half; Vinegar of Roses half a pint; boyl them together with a gentle fire (continually stirring them about with a Spatter) until they shal have gotten a blackish color, and the consistence or thickness of soft Bituminous Clay, and a Cerot. Make a long Roller-like Emplaster, of which make an Emplaster fit for the Ulcer, and lay it upon the Ulcer. But in the end and conclusion of the Cure, we made use of the Emplaster Diachalcitis with the Emplaster of Diapompholyx: in the curing of which so great and hollow an Ulcer (after the throughly cleansing of the same) we found by good experience, that there was nothing could be better and more available then the applying of pillows or bolsters (a little thicker than ordinary) round about the said Ulcer; and so binding these bolsters on very hard strongly to press down into the flesh lying underneath that other flesh that lay gaping far disjoyned from it: for (as Experience then taught us) this (if there be any thing that will do it) doth most especially procure agglutination and sodering together.*

Chap. 10. *Of Fistula's.*

Fistula's differ from a Sinuous and furrowed Ulcer only in this, to wit, That they are moreover callous and hard; and therefore here after sinuous Ulcers we think it fit to treat of Fistula's. If the *Sinus* or nook be not speedily cured, the *Pus* wil moreover cause furrows, such as we usually term Coney-burrows; and the part wil contract a callousness, or thick insensible brawniness; and it wil become so hard that it can by no manner of means be agglutinated and united again unto the parts lying underneath; which Malady is after this called a Fistula. For a Fistula is a *Sinus* (nook, or furrow) narrow and long, or a Sinuous ulcer, that is (for the most part) narrow and callous; and thereupon such as wil hardly admit of any Cure.

The Causes.

But now these Fistula's for the most part have their original from Impostumes. For these (either by reason of the impurity of the body, or the too great abundance of naughty humors) if they

be permitted long to continue; or else if by the unskilfulness of the Physitian they shal be over long delayed, and not wel cured, the *Pus* then causing the aforesaid Coney-furrows, they wil at length become very deep, and withal callous, and of an insensible brawny hardness.

The Differences.

There is moreover of Fistula's very great variety and diversity. For of these some are profound and deep, others of them straight, and others lie transversly, and overthwart the flesh: again, some of them are simple, single, and alone, but others of them taking their rise and beginning from one and the same orifice are double, or even likewise threefold, or oftentimes they have very many *Sinu's*, or hollow nooks: and lastly, some of them tend unto and terminate in a Bone, others tend unto a Nervous part; and a third sort of them even unto the Veins or Arteries.

Signs Diagnostick.

But now these Fistula's (in the general) are known especially by the Probe or Instrument that is conveyed into the *Sinus* (to discover the depth thereof) which how it tendeth and passeth along, and how deeply it penetrateth is easily seen and discerned. And withal when the searching Instrument is drawn forth, we may then easily learn, whether the Fistula be moist, or whether it be dry. But if it be oblique, so that the Instrument cannot pass along in a direct and straight manner, we then are wont to put in a little long plummet of Lead, or rather (which is much the better) a Wax Candle, that may be turned about any way. And moreover, that flesh that lieth round the Fistula appeareth to be white, dry, hard, and without pain; or else if there be any pain, it is very little and moderate, unless haply it be neer unto a Nerve; and the *Pus* that issueth forth is crude and raw, and somtimes likewise very stinking & loathsom. But now whether or no there be one, or more of these *Sinus's*, this is altogether to be discovered by the Probe or searching Instrument; which the *Pus* likewise that is now and then sent forth wil sufficiently evidence. For if there flow forth more *Pus* then what probably can be contained and generated in one only *Sinus*, or hollow Nook; or if when the sick Person removeth and changeth his seat, that *Pus* that before was stopped shal begin again to flow forth; this may be a sure and certain sign and token that there are here present more then one of the *Sinus's* and that the Fistula penetrateth very deep. But if there are more orifices of the Fistula, then we cannot so easily discover by the Instrument, whether there be one only Fistula, or more: but then by a Syringe, Pipe, or Squirt, liquor is to be injected by one orifice; the which liquor if it flow forth again by all the orifices then it is al but one Fistula: but if it issueth not forth at all the orifices, then there are more Fistula's then one. And this is likewise discovered by the colour of that that issueth forth: for if that humidity that floweth forth by all the orifices be of one and the same colour, it is then a sign that the Fistula is but one; but if it be of a different colour, it is then an argument that there are more Fistula's then one. But how far the Fistula's reach, and in what part they end, it may thus be known. If that which is touched by the Instrument be soft, and the *Pus* that floweth forth be white, and in great abundance, it then sheweth that the Fistula sticketh in the Skin alone. But if it penetrate and reach even unto the Nerve, then there wil be great pain perceived when the depth of the *Sinus* is searcht unto; and the *Pus* that is evacuated is indeed white, but then it is very thin, and in less plenty; and the action of that Member unto which the Nerve tendeth, is rendred more difficult. If it penetrate unto a Bone, there is then present a pain in the very time of making the tryal and discovery; and that unto which the lowest end of the searching Instrument reacheth is hard, and maketh resistance. And the Bone is then indeed found and perceived to be equal and smooth, if it be not as yet become rotten and corrupted; but if putridness hath seized even upon the Bone it self also, it then appeareth rough and unequal unto the touch; and the *Pus* flowing forth waxeth black, and is of a very ill favor. But if the *Sinus* reach unto a Vein, or an Artery, and this Vein or Artery be not indeed corroded and eaten through, then there is somthing issuing forth that is like unto Feces or Dreggs. For the Blood sweating through by the Pores of a Vein, or an Artery, is mingled together with the humidity of the Ulcer; and thence it is, that what floweth forth appeareth feculent, or dreggy. But if the Vein or the Artery be eaten through, then sometimes there wil blood break out, and flow forth: and this wil be very red, and with a kind of leaping or dancing motion, and with a tickling, if it come from an Artery; but more thick and dark, if it issue forth from a Vein.

Prognosticks.

1. Simple or single Fistula's that are yet but new begun, which are in the fleshy parts alone, not deep, in young vigorous bodies, and such as are of a good Constitution, are easily cured; but more difficultly those wherein many parts are corroded, and eaten quite through, such as are old and inveterate, without any sense and feeling, deep, ful of turnings, and having divers and different hollow Nooks; such as are neerly situate unto noble and principal Members; and when they are in old and decaied bodies, and such as abound with ill humors.

2. And so are those (in like manner) very dangerous, and hardly cured (or rather indeed altogether

altogether incurable) that reach even unto the heads of the Muscles, unto the Veins, unto the Arteries, unto the Nerves, the Bones, the Joynts, and the very Vertebræ of the Back; that reach and extend unto the Cavities of the Bellies, as the Thorax, or the Abdomen or Paunch; or even such as penetrate likewise unto the very Bowels themselves, as the Lungs, Womb, Intestines, and also unto the very Bladder it self. For why, such like Fistula's as these, either they wil not bear nor admit of any Medicaments, or it may happen likewise that the Medicaments cannot possibly attain and reach unto them.

3. Yea some certain Fistula's there are that indeed ought not to be cured; to wit, such as are old and inveterate, as having been of long continuance, and such as are removed from the noble parts, and such as by the superfluous and vitious humors have now of a long time been accustomed to be purged and emptied forth. For such like Fistula's as these (in regard that they preserve men from divers Diseases) are by no means to be closed up; because that when they are shut up they cause and procure very many Diseases; as *Hippocrates* hath it, in his sixth Book of Epidem. Comment. 3. Text 39. But on the Contrary, if they shal at any time chance to be closed and shut up, they are then again to be opened.

The Cure.

Now the Cure of these Fistula's is twofold; one the true and perfect Cure; the other only palliative (as they call it) or imperfect, to wit, such as wherein the Fistula is dryed up within, and consolidated without, the *Sinus* nevertheless stil remaining. Which kind of Cure *Galen* seemeth to hint unto us in his Book of Tumors, Chap. 4. where he hath these words. *Yet nevertheless* (saith he) *the* Sinus *is streightned and closed together, as being throughly dryed by the Medicaments; insomuch that the part may seem to have attained unto a soundness no way to be found fault with. For evermore indeed, if any one continually using an exact and accurate Diet cometh by this means to have his Body very healthful and sound, and very free from superfluities, the* Sinus *then remaineth restrained and kept in. But so soon as any superfluity is collected, and gotten together, it is again filled up; and so there appeareth to be again the same Impostume that there was from the very first; and so again it is evacuated (as is fitting) with Medicaments, and then it is dried, and by these means it is restrained and kept in; and all this is evermore done with much more ease unto the sick Party, then in those that have the Impostume newly begun in them. For neither do the parts that are so far divided and separated, yet feel, or are in the least sensible of pain: for now although they are far distant one from another, yet nevertheless they are very speedily filled up, the* Sinus *easily and soon receiving that that floweth unto it.* And the truth is, *Hieronymus Fabricius ab Aquapendente* is of Opinion, that this kind of Cure is not altogether to be despised, and contemned; For sometimes (as he writeth) this succeeded wel unto him, although not alwaies. Now the Cure is performed, the body being first of all purged, and a fitting Course of Diet ordained; and afterwards the Tents and Fistula being taken away, and a new Spunge throughly soaked in a liquor that is strongly drying being applied and fast bound upon the place; such as is the water of hot Baths, Ley, Lime-water, and the like. For by this means the mouth of the Fistula shutteth again together, so that the Fistula may seem whol and sound; which indeed somtimes by the benefit only and operation of the Native heat doth altogether coalesce and grow together again; but for the most part it remaineth closed up only so long as there are no superfluous humors collected and gotten together in the body, for after that there is any humor again gotten together in the *Sinus*, the Fistula is likewise again opened.

But now the true and genuine Cure of a Fistula is thus accomplished. Universals in the first place are not to be omitted, but a Diet is rightly to be instituted, and the body throughly purged from all superfluous humors; and especial care is to be taken, that there may no more of the humor flow in unto the part affected. Which being done, before we descend unto Topical Remedies, there be some that administer certain Potions that may dry the Interior parts, and strengthen them, and that may prepare the Fistula for Consolidation, and may throughly purge it. Of such like Potions *Tragaultius* hath described two: the former whereof is this.

Take *Agrimony three parts, Plantane two parts, Olive Leaves one part; Cut them smal, and bruise them wel, and then boyl them in white Wine*; let the sick Person drink hereof a small Cup full (three or four ounces) every day. Or,

Take *Osmund (or Water-Fern) three parts, Gentian two parts, Centaury one part; boyl them in the same manner (as aforesaid) in white Wine; which Potion expelleth and driveth forth likewise Bones that are corrupted.* Others there are that commend this Potion.

Take *Sanicle (i. e. Bears Ears, or French Cowslips) Mugwort, Speedwel, Saracen Consound, Winter-green, of each one ounce; Savine one ounce and half, Horse-tail half an ounce; boyl them in white Wine, and make a Potion*; which if we wil at any time make stronger and more operative, we may then (in the drinkng of it) unto each Dose add and mingle therewith half a scruple of *Oculus Cancri* (or the Crabs Eye) prepared.

For Savine, and Crabs Eyes, are of singular use

and

and benefit in the expelling and driving forth of corrupted Bones, *Pus*, putrified Veins, and the like. Or,

Take *Saracen Consound, Sanicle, Speedwel, of each one ounce*; *Tormentil Root half an ounce*; *Avens, and Carduus Benedictus, of each an ounce and an half*; *boyl them in Wine.*

Afterward, before any thing else be done, we must do the utmost of our endeavor that the callous hardness and brawnishness may be removed. But now whenas the narrowness of the orifice of the Fistula doth for the most part hinder the application of those Medicaments that are to be administred for the removal of the callous hardness, it is therefore to be dilated: which may be done either by fire, or by an Iron Instrument; or else more commodiously, and without pain likewise, by long sharp tents that are made of Sea-Spunge, the pithy substance of the Elder-tree, the Roots of Gentian, Aristolochy, Briony, or even likewise of the wild Rape throughly dried. For these things being formed into a Pyramidal figure, and put into the Fistula the sharp-pointed end downward, they soak up the humidity of the Fistula, and by this means they are rendered the thicker, and so by little and little they dilate and widen the orifice, without any pain at al. Which things are somtimes likewise soaked and anointed over with such Medicaments as are in their own nature fit to take away the callous hardness, when the callus hindereth the dilatation. For there ariseth a callousness (especially in the external orifice of the Fistula) to wit, in the very skin it self, it being such as easily becometh hard, and such as is made thicker than the flesh, that is softer, and easily receiveth in the excrements, and the humors that flow thereunto. Yet nevertheless the very flesh it self somtimes likewise getteth a callous hardness in the cavity of the Fistula. The callousness that is in the orifice of the Fistula is sufficiently apparent both unto the touch, and to the sight. But now whether there be any callousness likewise in the *Sinus* it self, this may be discovered by the searching Instrument. For when the Instrument is put into it, there is then perceived very little or no pain, and there is no blood at al issueth forth, but there is a certain hardness perceived, if a *Callus* be present. Which if it be absent then there is a great pain excited, the blood floweth forth, and there is no hardness at all perceived.

But now wheresoever this *Callus* is, it is to be removed; which is done, either by Medicaments, or by Cutting, or by the Fire. But then likewise Medicaments are to be administred, somtimes such as are mild and moderate (and such are Emollients and Digestives) and somtimes again those that are stronger, and such are Detersives or Cleansers: and lastly, now and then also, the strongest sort of al, and such are Caustick. In those that are but young, and in their youthful age, and that have their flesh soft and tender, here Emollients and Digestives only are sufficient, which do dissipate the said *Callus*, and the matter that is impacted and stuffed into the part that constituteth and causeth the *Callus*; unto which we may likewise (if there be occasion) add and mingle therewithal some of the Abstersive and Cleansing Remedies. And such are the ashes of Figs mingled with the fat of a Goose; the Decoction of Fern Root, of Agrimony, of Olive leaves, the great Diachylon, and the Unguent Apostolorum. But for the most part there wil be need of the stronger and more forcible Remedies, which by cleansing, or likewise by burning do waste and consume the aforesaid *Callus*. The stronger sort of Medicaments are, the Root of *Spondylium* (we usually cal it Cow-parsnep, or Meadow-parsnep) peeled and pared round about, Asphodel Root, Snakeweed, Briony, the Decoction of Lupines, and especially (above al) the lesser Centaury. There are some likewise that make use of the Root of black Hellebor; and this they put for three daies into the Fistula. But *Antonius Chalmeteus* pre-admonisheth us touching this Root, and he tels us that it is a very unsafe and dangerous Remedy, and especially if the Fistula be in any part of the *Thorax* or Chest. For when on a time he himself (as he saith) had once, and but once, filled with Hellebor a Fistula that was in the *Spina Dorsi*, neer unto the Region of the Heart, the sick person very often fel into fainting and swounding fits. Those things that are yet stronger, are, the Ægyptiack Unguent, Vitriol burnt, Vitriol precipitate, the Oyl of Sulphur, Trochisques of Minium, Chalcitis, and that which by the Apothecaries is called *Misy*, and *Sory*; out of which there may be made Compositions for the present use. *Celsus* in his fifth Book writeth that this following is found by good trial and experience to be of singular use; and *Paulus Ægineta* doth the like also in his fourth Book, and Chap. 49. in which place we may see more hereof.

Take *of the Rust and soil of Brass twelve drams*; *Ammoniacum two drams*; *Let the Ammoniacum be dissolved in Vinegar, and the aforesaid Soil of Brass therewith mingled.* Or,

Take *strong Ley four ounces*; *the Decoction of Lupines one ounce*; *Honey of Roses strained one ounce and half*; *Allum half an ounce*; *and mingle them.* If we mind to add any further virtue and strength thereto, to make it the more operative, we may then add half a dram of Precipitate Mercury. Or,

Take *the best Wine Vinegar three parts*; *of the oldest Oyl two parts*; *Litharge one part*; *let the Litharge be bruised in a Mortar with Vinegar*: *and afterward let them boyl al together, until they have gotten both the color and consistence of Pitch*;

Pitch; of which we are then to form long sharp Tents, for the present purpose. Or,

Take *Litharge half a pound; boyl it in Vinegar and Rose water; and then strain and filtrate it.* Afterward,

Take *Calcined Tartar as much as wil suffice; dissolve it in destilled Vinegar: Mingle the Waters, and make thereof that they term* Lac Virgineum, *or Virgins Milk.* Or,

Take *of the Egyptiack Unguent half an ounce; Sublimate half a dram; Ley one ounce; Rose-water two ounces; Plantane Water four ounces; and then let them boyl a little.*

The green Water above mentioned and described is likewise very useful.

But yet nevertheless, if the narrowness and depth of the Fistula hinder the fit application of these Medicaments (as for the most part it so falleth out) then the said Fistula is either wholly to be opened, or else the Medicaments are to be injected even unto the very bottom thereof. When you have a mind to open the Fistula, then let the searching Instrument be first of al conveyed thereinto, and so let it be opened upon the said Instrument. But if it be not thought fit to open the whol Fistula, then Medicaments are to be injected, and these must be either liquid or dry. The liquid are injected by a Funnel or Squirt; and they are to be washed with Ley, Mulsum, Sea-water, Lime-water, the Water of hot Baths, Aqua vitæ, or the Spirit of Wine; of which last this is by the way to be observed, that if it be mingled together with other convenient Medicaments, it is then of singular use and benefit in the cleansing and drying of sordid Ulcers; as we may see in *Valeriola* his fourth Book, Observat. 10. and in his fifth Book, Observ. 1, 7, 8.

But the dry are made into a Pouder, and blown into the Ulcer by a Quil put into the mouth of the Fistula; especially if the Fistula be but short and within the flesh: but if it be long, it may likewise be opened on the opposite part, that so on both sides the Medicament may be injected. Where this is not to be passed over in silence (touching which we likewise gave you notice before, in the Cure of *Sinus*) that we use our utmost endeavor, that the orifice of the Fistula may be open downward toward the Inferior parts, that so the Humors may the more freely flow forth; or if it be not open, then in that very place the Fistula is to be opened, unless there be some great and weighty impediment to hinder the same.

The opening of a Fistula.

But when notwithstanding al the Medicaments the Fistula yieldeth not, neither giveth place at al unto the most prevalent Remedies that have or can be administred; and that somtimes in this case the operation of the hands bringeth more assistance, help, and benefit, we are somtimes likewise to betake our selves unto the Iron Incision Knife, and the fire it self. To wit, the whol *Sinus* is to be opened; which yet nevertheless it wil not be safe for us to attempt in those Fistula's that reach unto the great Arteries, or the Nerves, or the Tendons, or the Membrane that girdeth in the Ribs, or any other parts that are of the like Nature with these. But whensoever this opening shal be judged fit and feasible, the *Sinus* being then first of al searched by the Probe, or by some Liquor cast into it, the whol (such as it is) may be opened. The Fistula being opened, the callous hardness ought either with Medicaments, or the edg of a Pen-knife, or a Razor, to be drawn forth, even so far until we come unto the good and sound flesh; which may be perceived, not only by the color, but even likewise from the blood, and the sense of pain. The same kind of *Callus* (if it be extraordinary hard) may most chiefly be taken away with a red-hot Iron; this being done as with most speed, so with the least sense and feeling of pain. But nevertheless the fire doth so terrifie and affright people, that few or none wil admit of this Remedy. But yet in the mean time while these things are in doing (whether it be by Caustick Medicaments, or by the fire-hot Iron, or by the fire it self) the part is al the while to be wel guarded round about, with some one or other Defensive Cooler and Repeller, lest that upon the exciting of pain an Inflammation should be raised.

The Fistula being thus throughly dried, and burnt, we are then to make use of some mitigating Medicament, and such as may loosen and cast off the crustiness thereof. But if the Fistula reach unto, and end in a bone, this so soon as it is discovered by the Section, we must with al care and diligence pare and scrape away whatsoever we find to be corrupted and black in the said bone: and this indeed must be but only in the very superficies of the bone: for if the rottenness hath further corrupted the said bone, then the scaly corrupted part thereof is to be cut forth with a Wimble, unless it fal forth of its own accord; but if the rottenness shal have penetrated even unto the marrow of the bone, then that that is corrupted is to be taken out with the Cizers that are for that purpose. But lastly, if the Bone be wholly corrupted, then al the whol bone is to be taken forth; which may indeed be done in smal bones; but it cannot be so done in others. The bone being now purged, those things are afterward to be administred that are called Incarnatives, viz. Such Medicaments as generate and breed flesh. Unto which if the Fistula give not place, it is then a sure sign that as yet al that that was corrupted is not wholly taken away. The Fistula is thereupon to be opened deeper, and the bone to be scraped with al the utmost diligence and care that may be, and then it must be further cleansed. But if the Fistula wil not yet after al this be cured, we may without al doubt conclude, that it hath penetra-

ted

ted so deep into the body, that it is altogether impossible to find out the end & bottom thereof. And therefore the whol business is then to be committed and left unto Nature: which yet nevertheless we may likewise assist and help with Medicaments; for which end and purpose *Nicholaus* the Florentine prescribeth this following, which (as he saith) wil both draw forth the bones that are broken and corrupted, eat through the naughty putrefied flesh, and heal the Fistula.

Take *Salt torrefied by the fire, Tartar, and Agarick; let them be made into a very fine Pouder; and then this Pouder being tempered together with Honey, let it be imposed upon the Fistula.*

The Callus being now removed and quite taken away, if there be any thing sordid and foul yet left remaining, we must then make use of Detersive and Sarcotick Medicaments. For which end, Pimpernel, Golden Rod, Centaury the less, the Root of Aristolochy, and the like, are to be administred.

Take *Turpentine washed in the Spirit of Wine three ounces; the Juyce of Smallage three drams; Pimpernel half an ounce; Honey of Roses strained, one ounce and half; let them boyl until welnigh the one half of the Juyces be wasted away. Afterwards, add of round Aristolochy one dram; the meal or flour of Lupines three drams; Myrrh one dram: mingle, &c.*

Which said Medicament, either the Tents may be dipped in it; or else it may in some other manner be administred unto the Fistula.

There is extant in St. *Augustines* 22. Book of the City of God, and Chap. 8. a most miraculous Cure (and such as is wel worth the reading) of a Fistula by devout Prayers.

Chap. 11. *Of an Ulcer, with Vermine, or Worms breeding therein.*

AND sometimes likewise Worms are generated in Ulcers. But now what the cause is of the breeding of these Worms, we have already told you in the second Book of our Institutions, Chap. 9. and in the third Book of our Practice, Part 2. Sect. 1. Chap. 5. What was there spoken hath here place likewise: for Worms are generated in Ulcers that are sordid and foul, and which were not cleansed as they ought to have been, neither purged from their *Pus* and *Sanies*; and this especially if it be in the Summer time, and the Air being hot and moist.

Signs Diagnostick.

If the Ulcer be open, then the Worms appear unto the sight; but if by reason of the streightness and narrowness of the Ulcer the Worms cannot be seen, they may yet be known by other signs; by a certain biting, both of pricking and pain, and by the sense of motion. And there is most commonly likewise a certain stink perceived in those Ulcers.

The Cure.

The whol business and substance of the Cure consisteth in this, to wit, that the Worms be taken away, and the putridness of the Ulcer be hindered and prevented. If therefore the Worms lie open, and may be discerned, they are then to be drawn forth with Instruments fitted for the same purpose: but if they lie hid, or stick so close and fast unto the part that they cannot be drawn forth, they are then to be killed with Medicaments that may likewise withal take away the putridness, and the overgreat humidity of the part; and this is done by Medicaments made of Wormwood, Horehound, Dittany, Fern, Scordium or Water Germander, Featherfew, Centaury the less, the Leaves of Peaches, Lupines, Gentian, the Gall of a Bull, Aloes, and Myrrh. As,

Take *Wormwood, Centaury the less, Horehound, of each half a handful; boyl them in ordinary Spring Water, and strain them: Take of the straining half a pint; Honey two ounces; Aloes two drams; Mingle them, &c.* Or,

Take *Gentian Root half an ounce; white Hellebore two drams; Dittany of Candy, Wormwood, Centaury the less, of each half a handful; boyl them in a sufficient quantity of Water; then take of the straining six ounces; the Elixir of Propriety two drams; Mingle, &c.* Or,

Take *Unslaked Lime a sufficient quantity; extinguish it with Wine Vinegar; and afterward let it be stirred wel about with Oyl of Roses, that so a Cataplasm may be made hereof.* Or,

Take *Aloes two drams; Myrrh poudered one dram; the meal of Lupines two drams; Bulls Gall half an ounce; Flour of Bras one dram, Honey as much as wil suffice, and make a Liniment.* Or,

Take *Meal or flour of Lupines three drams; Elixir propriet. two drams, Buls Gal three drams, Honey a sufficient quantity, and make hereof a Liniment.*

Chap. 12. *Of a Varicose Ulcer.*

TOuching *Varices* we have indeed spoken above, in the first part, Chap. 44. yet notwithstanding it sometimes so happeneth, that an Ulcer may be joyned with, and accompany these *Varices*; and this Ulcer they cal a varicose Ulcer. Which Malady is easily known from the signs of a *Varix*, and from Ulcers.

Now this varicose Ulcer cannot be healed, unless the *Varices* be first of all healed, as *Galen* teacheth

teacheth us, in his fourth Book of the Method of Phyſick, Chap. 2. And therefore whenſoever at any time we are minded to take in hand the Cure of ſuch an Ulcer; in the firſt place the Cure muſt be directed unto, and look toward the ſaid Varices; which how it may be accompliſhed, we have told you in the place before alleadged. Now there is extant (in *Gulielmus Fabricius* his fourth Century, and Obſervat. 85.) a Hiſtory of this varicoſe Ulcer, how it was cured: the Hiſtory he relateth in theſe very words. *In the yeer* 1589. (ſaith he) *when I returned home unto my Fathers Houſe out of* France, *I was called unto a certain Patient here in the Neighborhood, a man about fourty yeers old, very ſtrong and able of Body, and of the beſt Conſtitution,* Adolphus auff dem Bruch *by name. This man was ſorely troubled with a malignant and inveterate Ulcer in his left Leg, together with a Varix of an extraordinary great bigneſs: for it was as thick as my Arm neer unto the Hand-wriſt, and almoſt a ſpan long. But it began in his Ham, and thence deſcending downward toward the Feet it fetcht a ring, and made two circumvolutions. But it was notable to obſerve, that ſo ſoon as ever he lifted up his Leg on high, the blood immediately retired; but the Leg being ſet again upon the ground the blood again deſcendeth, and that in a very moment; and (that I may tel you in a word) the blood ebbed and flowed, no otherwiſe then as if in ſome hollow Pipe or Conduit it had been caſt, firſt into this, and then into that part thereof.*

The Hiſtory of a monſtrous Ulcer

Moreover, it being ſo that varicoſe Ulcers can by no means be conſolidated unleſs the Varix be firſt cut forth, I therefore thus ſet upon the Cure. Having appointed my Patient a good and wholſom Courſe of Dyet, and now and then alſo throughly purging his Body, and opening the Arm-Vein of the ſame ſide, and putting the ſick Perſon upon a Bench, I then eaſily and gently ſeparated the Skin in the Ham from the Vein it ſelf. And then with a Thread twice doubled (which I conveyed in by a Needle that I crooked on purpoſe) I laid hold on the Varix; and in the lower part of the Varix I proceeded in the very ſame manner. But before ever I would draw the Thread cloſe, and tie the knot, I commanded that his Leg ſhould be again ſet upon the ground from off the Bench; and this I did to this end, that the blood might in manner as aforeſaid flow downward: for I much feared leſt that the Blood by reaſon of its ebbing and flowing being made very thin and ſubtile, ſhould here cauſe ſome inconvenience, or other, &c. See what further followeth in this Hiſtory, in the firſt part of this fifth Book, Chap. 44. in the Concluſion of the ſaid Chapter, in which we treat of *Varices*.

Chap. 13. *Of an Ulcer with the rottenneſs of a Bone.*

IT happeneth likewiſe ſomtimes that a rotten and corrupted bone lieth under the Ulcer. Now Bones are corrupted, and contract a rottenneſs, either from internal Cauſes, to wit, the long afflux of the excrementitious humors unto the bones, or elſe the venemous quality and acrimony of the *Sanies*, or elſe by ſome hidden propriety; like as it often happeneth in the French Diſeaſe, that the very bones become rotten, the Skin in the mean time remaining whol and ſound. The external cauſes are, the Ambient Air, eſpecially that that is cold, a contuſion or bruiſe, an Inciſion, and tart or ſharp Medicaments.

Signs Diagnoſtick.

If the Bone be in the open view, the corruption thereof doth then eaſily appear, becauſe (as *Celſus* writeth in his eighth Book, and Chap. 2.) that that is vitiated at the firſt appeareth almoſt as if it were fat, and afterward, either black, or rotten. But although the Bone lie hid, and do not in the leaſt appear, yet nevertheleſs its Corruption diſcovereth it ſelf by certain Signs. And if a Fiſtula went before, or that there were an Ulcer of a long continuance, then the Bone is corrupted by the touch of the *Pus* and the *Sanies*; touching which *Hippocrates* thus writeth, in the ſixth of his Aphoriſms, Aphoriſm 45. *If the Ulcers* (ſaith he) *be Annual, and ſuch as return yeer after yeer, or if likewiſe they be of a long continuance, then there will neceſſarily follow an Impoſtumating and putrefying of the Bone, and the making of hollow Cicatrices.* Moreover, he ſaith that ſuch like Ulcers are indeed ſometimes brought unto a Cicatrice, but that they are ſoon after again renewed, the Cicatrice being broken. For the humor and the *Sanies* that ſweateth out of the corrupted Bone eateth through the Cicatrice, and reneweth the Ulcer. And therefore if there be any Ulcer often renewed, it evermore giveth us great cauſe to ſuſpect that there is one or more Bones corrupted, as *Galen* tels us in his Comment. upon the ſixth Book of the Aphoriſm. Aphor. 45. and *Paulus Ægineta* in his fourth Book, and Chap. 10. And this is oftentimes to be ſeen in the rottenneſs of the Teeth, out of which there ſtilleth forth a *Sanies* through the holes of the Cheek or Jaw-bone, and there in the external part of the Jaw it exciteth and cauſeth an Ulcer: which although it may be, and oftentimes is healed, yet notwithſtanding after a very ſhort time the Cicatrix is again broken. If ſuch an Ulcer therefore appear in the Cheek, and be there often renewed, the Teeth are then to be looked into, and if there be any one of them rotten, it is forthwith to be drawn. For the Ulcer cannot poſſibly be per-

fectly and wholly healed, before the Tooth that supplieth the material cause unto the Ulcer, be drawn forth. Thirdly, the flesh that lieth above upon the Ulcer is soft and flaggy; for it is made thus soft by the *Sanies* that sweateth as it were out from the Bone: and sometimes likewise it becometh wan and Leaden-coloured by reason of the vitious humor that floweth forth from the Bone; in the seventh Book of the Aphorisms, Aphor. 2. Fourthly, the *Sanies* that floweth forth of the Ulcer is more abundant then what is usual, considering the bigness of the Ulcer; it is likewise thin, stinking, and of very ill consequence, as *Galen* tels us in his third Book of Fractures, Tit. 18. And if there be a dry Liniment put into the Ulcer, so that it may reach even unto the very bone; and the next day drawn forth again, it will stink loathsomly. And lastly, if the Probe or searching Instrument be conveyed into the Ulcer, even unto the very bone, then the said Ulcer is not found to be smooth and slippery, and hard, but unequal, rough, and soft.

But whether this rottenness be deep, or only superficial, *Celsus* in his eighth Book, and Chap. 2. teacheth us how we may discover it in this manner. *If* (saith he) *a slender and smal Probe be thrust into the hole of the Ulcer, it will by its more or less entring thereinto give us sufficient notice, whether the rottenness be in the top and superficies only, or whether it hath descended deeper. The blackness likewise of this* Sanies *and rottenness may rightly be gathered from the pain, and from the Fever; which if they be mild and moderate, it is then an Argument that the said rottenness hath not descended very deep: but when the aforesaid Symptoms are great, then the rottenness hath gotten down very low and deep; but it will appear yet more manifestly, by turning about the Wimble in it. For there is then an end of what was amiss, when there ceaseth to come forth any more of the black scurfiness.* Thus *Celsus.*

Prognosticks.

1. All rottenness in the bones hindereth the Cure of the Ulcer; neither can any Ulcer be perfectly healed, under which there lieth a bone that is corrupted.

2. If by reason of the diseased and rotten bone the flesh be become blackish, and of a Leaden colour, it then betokeneth much evill; 7. Sect. Aphor. 2. For as *Galen* Comments upon the aforesaid Aphorism, it signifieth no mean and smal distemper of the bones, but an extraordinary corruption of them.

3. If the rottenness of the bones be neer unto the Nervous parts, as in the Hands, or Feet, or else in the Joynts, and heads of the greater bones; or otherwise about the heads of the Muscles, and the Nerves, and the Tendons; it is not in any of these cases easily cured; in regard that we cannot with any safety make use of, or appoint any Chirurgical operations.

4. The Cure (in like manner) is altogether as difficult, if the rottenness be about the great Arteries, and the Veins.

The Cure.

Besides the Indications that the Ulcer affordeth us, the rottenness of the bone sheweth us likewise that what is corrupted must be wholly taken away: for neither can that that is dead be by any means corrected, and amended. For that which is in the flesh and soft parts, we call it *Sphacelus*; but if it be in the bone, it is then rottenness.

But now that the corrupted bone may be taken away, it is first of all to be cleansed, and then made bare (if it be covered with flesh) the Ulcer being cut off. But nevertheless (as we told you erewhile) there cannot oftentimes any Section or Cutting be administred, by reason of the Nerves, Muscles, Tendons, Arteries, and the greater Veins. The bone is therefore then (as much as may be) to be cleansed with a Gentian, or Rape root, tenderly conveyed into the Ulcer. The flesh likewise that lieth at the top of the bone may be consumed by a Caustick Medicament, or by any potential Cautery, and so the bone may be bared in the same manner as Issues are wont to be excited.

The corrupted bone when it is made bare, it is then to be taken away either by Chirurgery, or by Medicaments. We must of necessity make use of Chirurgery, when the Corruption of the bone is more deep, and not in the Superficies; or when we desire a quick and speedy Cure, as in the bones of the Thorax. For Nature doth but very slowly separate the corrupted bones, and scarcely (now and then) in the space of thirty five, or fourty daies. And therefore this separation of the corrupted bone from the sound may otherwise be assaied by Medicaments.

Now those Medicaments that separate the corrupt bone from the sound ought to be very drying, that so they may consume the superfluous humidities in the corrupted bone, and that they may likewise dry even the very bone that is sound, that so the Expulsive faculty may separate from it that that is vitious in it; and that the ossifique or bone-breeding faculty may generate a bone, or at least a *Callus*, that may thrust forth the bone that is corrupted.

Medicaments, in case the Bone be corrupted

The milder sort of Remedies (for this purpose) are the Root of Sow-fennel, white Briony or white wild Vine, Flowerdeluce, Myrrh, Aloes, Alum. The stronger sort, are, the Root of round Aristolochy, of Water-dragons, the Rind of Allheal, of the Pine Tree, the Pumice stone burnt, the dross and refuse of Brass, the Mineral Chrysocol, and the Spirit of Wine. The strongest

ſtrongeſt of al; Euphorbium, than which *Fallopius* writeth that he himſelf never found any more excellent, and that would ſooner take away the corrupted bone; burnt Copperas, the aſhes of the Fig-tree, Lime, Aqua fortis, the Oyl of Vitriol, and the Oyl of Sulphur.

Of thoſe Medicaments there are Compounds to be made, which are to be applied either in the form of a Pouder; or elſe mingled with Honey, Roſin, Wax, Unguent Ægyptiack, or ſome other ſuch like Unguent, and ſo applied in the form of an Unguent.

This following Pouder is very efficacious: Viz.

Take Root of round Ariſtolochy, Flowerdeluce, Myrrh, Aloes, the Rind of Alheal, the refuſe of Braſs, the rinds of the Pine-tree, equal parts of al: let them be al mingled together, and made up with Honey into the form of an Unguent.

This Pouder following is likewiſe very much approved of.

Take Mummy, and Sarcocol, of each half a dram, Euphorbium one dram, and make a Pouder. Or,

Take the Root of round Ariſtolochy, of Sow-fennel, of each half an ounce; the rinds of the Pine-tree two drams; white Agarick, Earthworms prepared, of each one dram and half; Euphorbium one dram; make a Pouder, or an Unguent with Honey of Roſes; as likewiſe this Oyl:

Take Citrine Sulphur one pound; put it neer unto a gentle fire that it may melt; unto which add, of burnt Tartar made into Pouder half a pound; mingle them with continual ſtirring until they are cold. Afterward let them be pulveriſed, and ſet in a moiſt place upon a ſtone until they melt; and with this Oyl let the corroded bones be anointed. Or,

Take the Root of long Ariſtolochy, Briony, Sow-fennel, Flowerdeluce of Florence, of each one dram, Euphorbium one ſcruple; make a Pouder, and ſtrew it upon the bone. Or,

Take Pouder of the Root of Sow-fennel, of round Ariſtolochy, of Opoponax, and Euphorbium, of each half a dram; Turpentine an ounce and half, Wax half an ounce; boyl them to the conſiſtence of a Cerote. Or,

Take the Roots of both Ariſtolochies, of Briony, of Sow-fennel, of Florentine Flowerdeluce, of each half an ounce; Centaury the leſs, the Rind of the Pine-tree, of each three drams; Aloes two drams, flour of Braſs a dram and half: unto al the aforeſaid pour of the Spirit of Wine as much as wil ſuffice, and extract the Tincture.

But if the corruption of the Bone be ſo great that it cannot be wholly taken away by Medicaments, then there wil be need of Chirurgery; and the corrupted bone is to be taken away, either by ſhaving and paring off, or elſe by burning. Now for the abraſion or paring it away, there are here two Inſtruments that are made uſe of; the ſcraping Iron Inſtrument, and the Wimble or Auger. The former of theſe taketh place, when the bone is not ſo deeply corrupted; but the Wimble is to be uſed when the rottenneſs hath penetrated very deep into the bone. Of ſhaving or paring, *Celſus* in his eighth Book, and Chap. 2. thus writeth: *He that ſhaveth theſe rotten Bones* (ſaith he) *muſt with al boldneſs and courage make an impreſſion with his Iron Inſtrument, that ſo he may do ſomwhat, and may the ſooner make an end. The end is then, when we come either unto a bone that is white, or unto a bone that is ſolid: for it is manifeſt by the whiteneſs of the bone that the fault in regard of the blackneſs is cured; and by that ſame ſolidity it is likewiſe manifeſt that what was amiſs in the bone in regard of the rottenneſs, is in like manner ended. We alſo told you before that unto the ſound and whol bone there wil be ſome ſmal acceſs of Roſie freſh-colored blood. But if at any time it deſcend deeper, we may wel queſtion both of them, as very doubtful: as for the rottenneſs, our knowledg is indeed therein ſomwhat quicker. A ſmal and ſlender Probe is put down into the hole, which by its entering more or leſs, ſheweth unto us whether the rottenneſs lie in the top, or whether it be deſcended deeper. The blackneſs may likewiſe indeed be gueſſed at (if not certainly known) from the pain, and from the Feaver; which if they be mild and moderate, then we may conclude that the ſaid blackneſs is not deſcended very deep; but yet nevertheleſs it is made more manifeſt when we come to make uſe of the wimble; for there is then an end of what was amiſs, when there ceaſeth to come forth any black duſt. And therefore if the rottenneſs hath deſcended deep, we ought then to make many holes (with the wimble) as deep as that that is amiſs in the bone: and then into thoſe holes burning hot Irons are to be let down, until at length by this means the bone be wholly dried. For withal (after this) both whatſoever is vitiated and corrupted wil be looſened from the lower bone, and that hollow nook wil be filled up with fleſh: and the humor that afterward iſſueth forth wil be either none at al, or certainly very little. But if there be any blackneſs, or if the rottenneſs be likewiſe paſſed over unto ſome other part of the bone, it then ought to be cut out; and this ſame may likewiſe be done in the rottenneſs penetrating into ſome other part of the bone: but that which is altogether vitiated muſt be wholly taken forth: if the inferior part be whol and ſound, then only ſo far as there is any corrupted, it ought to be cut forth. And alſo whether the Breaſt-bone, or whether it be a Rib that is rotten, it is rendered by this fault unuſeful, and therefore there is a neceſſity of cutting it forth.* Thus *Celſus*.

By al which it appeareth, That the Ancients after the paring and ſhaving of the bone were wont likewiſe to burn it, this burning being the

chiefest remedy for the consuming of al the excrementitious humidity. But then notwithstanding in the applying of a Cautery we must alwaies beware, lest that the flesh that lieth neer be likewise burnt together with the corrupted bone: and therefore the Cauteries are to be applied through Iron pipes, by which the flesh is to be defended and safeguarded; of which Iron pipes we ought to have many in readiness, that so after one is grown hot, another that is cold may be applied; or if we think good to make use of one only, then as oft as it is hot we may put it into cold water to cool it. And whatsoever of the humor sweat forth out of that bone, it is to be cleansed and wiped away with a Spunge or a Linen cloth, lest that otherwise it corrupt the neerly scituated parts. After the burning, we are then in the first place to apply Rose-water with the white of an Egg, for the preventing of the Inflammation, and the moderating of the pain; afterward we are to administer the Oyl of Roses with the Yelk of an Egg; and then after this, Butter with Honey of Roses. But unto the bone that is burnt, the Pouder of the Root of Sow-fennel, of Aristolochy, Euphorbium (or some other of the forementioned Remedies) is to be imposed and laid upon the corrupted bone, until the said bone be separated, and parted.

After the taking forth of the corrupted bone, some drying Pouder (and such as are called Cephalick Pouders) is to be strewed upon the place. After this the Ulcer is to be filled up with flesh; and at length to be closed and shut up with a Cicatrice.

Chap. 14. Of *Ulcers hard to be cured, commonly called* Cacoethe, Telephium, *and* Chironium.

THere are Ulcers likewise that are here and there in the Writings of Physitians termed *Dysepulote* Ulcers, *Cacoethe*, *Telephia*, *Chironia*, and *Phagedæna*; which what they are, we shal in this and the following Chapter explain unto you. And in general, al those Ulcers may be called *Dysepulote* (or hardly healed) that are not to be cured without much difficulty, and such as are not closed up with a Cicatrice without much ado. Touching the right curing of which *Galen* wrote both the fourth Book of his Method of Healing, and his fourth Book of the Composition of Medicaments according to their kinds. And this indeed happeneth for four causes, as *Galen* tels us in his fourth Book of the Method of Healing, Chap. 1. For of those Ulcers that are hardly cured and rebellious, some of them are made such by reason of the distemper in the ulcerated part, and others of them become such by means of the humor flowing in unto them. But now this very distemper may again be said to be twofold, since that the subjected flesh is somtimes such as hath exceeded the bounds of Nature, in the quality only; but somtimes likewise with a certain necessary Tumor or swelling. And in like manner, the afflux of humors admitteth of a twofold division; to wit, into, First the bad and depraved quality, and secondly, the excessive quantity of the humor or juyce that floweth in. But in the mean while, either some, or else al the aforesaid *Affects* are alike and indifferently mingled together. Yet nevertheless, the same *Galen* in the sixth of the Aphorisms, Aphor. 45. addeth a fifth cause; where he writeth, That Ulcers remain a long time, not only because of the afflux of humors, or by reason of any disposition in the Member contracted from the humors flowing in; but also (thirdly) by reason of some passion of the bone that is corrupted in that place. For although Ulcers that have a corrupted bone lying underneath them may somtimes be cured and covered over with a Cicatrice: yet notwithstanding that soundness is not firm, and of any continuance, but the Ulcer is afterward again renewed; and this happeneth so long as the rotten bone remaineth unhealed.

And yet nevertheless, *Galen* in his first Book of the Composition of Medicaments according to their kinds, Chap. 18. distinguisheth between these *Dysepulote* Ulcers, that is to say, such as are hardly brought to a Cicatrice, and the Ulcers *Cacoethe* or Malignant: and he calleth such of them *Dysepulote*, that arise from the conflux of either many or sharp humors; without this, that the part affected hath already such a disposition, that although that that floweth in should be good, yet notwithstanding it corrupteth it: now those Ulcers that have already gotten this aforesaid disposition, he calleth *Cacoethe*, or malignant. So that al those Ulcers that are hardly cured (from what cause soever it be) may in general be called *Dysepulote* Ulcers; and now in special likewise those that are so made, without any depraved disposition of the part affected. But in regard that al the differences and causes of Ulcers hardly cured have hitherto been explained, there is no need that we add any thing more concerning them.

Malignant ulcers.

And yet nevertheless, there is one cause of those Ulcers that are hardly curable that I have somtimes observed, which I think it not fit here altogether to pass over in silence. It happeneth very often, that in long continued Ulcers the skin is extenuated, and the fleshy panicle and fat is wasted: which if it happen, we may conclude that the Ulcer is not healed, since that the skin can by no means be agglutinated unto the flesh lying underneath it: for when the Capillary Veins tending to the skin are eaten asunder, they cannot then convey unto the skin that blood that is necessary for consolidation.

This

Ulcers Chironia.

This is known, becauſe that the skin is not only by the touch perceived to be extenuated; but the color is likewiſe changed, and becometh wan and dark, and the skin (as it were) withereth away.

There is in this caſe little or nothing to be performed by Medicaments; but the skin is either to be corroded by ſome Cauſtick Medicament; or elſe (as I have ſomtimes cauſed it to be done) the Ulcer is to be opened longwaies with the Iron; and this may very eaſily be done.

As touching the Ulcers *Chironia* and *Telephia*, the Chironian Ulcer hath its name from the Centaure *Chiron*: though ſome there are notwithſtanding that render another reaſon of the ſaid appellation. *Zenodotus* (as *Eraſmus* of *Rotterdam* relateth in Chil. 2. Cent. 8. Prov. 21.) thought that *Chiron* received from *Hercules* a Wound in his Foor, and that the ſaid Wound being altogether incurable, he periſhed thereof; ſo that incurable Ulcers are hence called *Chironian* Ulcers: But *Pliny* in his twenty fifth Book, Chap. 6. and *Ovid* in the fifth Book of his *Faſti*, are of opinion that *Chiron* was not wounded by *Hercules* (who was his friend) but that *Chiron* being entertained by *Hercules*, *Chiron* his Arrow fel accidentally upon the Foot of *Hercules*, and cauſed therein a moſt dangerous and envenomed Wound; and that *Chiron* himſelf healed this Wound with Centaury, which Plant was therefore by thoſe that came after called *Chironium*; and that this *Chiron* was the firſt Inventor of the ancient Chirurgery, being a part of Phyſick; and that from Hands, and the operation of thoſe hands it received its name. So that any contumacious and malignant Ulcer, that by reaſon of its contumacy hath need of ſome *Chiron* to cure it, and which was at the firſt cured by the ſaid *Chiron*, may be called a *Chironian* Ulcer.

Celſus in his ſixth Book, and Chap. 28. defineth a *Chironium* Ulcer in this manner: *It is* (ſaith he) *great, and hath lips that are hard, callous, and ſwelling. The Sanies that iſſueth out of it is not much, but thin; there is no unſavory and ſtinking ſmel, neither in the Ulcer, nor in its Tumor. There is no Inflammation, the pain is but little and moderate; nothing creepeth therein; and therefore it bringeth along with it no great danger; yet however it is not eaſily cured. There is ſomtimes a thin Cicatrice brought all over it, but this is again ſoon broken, and the Ulcer renewed. It happeneth moſt eſpecially in the Feet, and in the Thighs.*

The ſame *Celſus*, ſeeing that he maketh no mention of *Telephian* Ulcers, it is not to be doubted but that he thought them to be the ſame with the *Chironia*: as likewiſe *Paulus Æginetæ* doth when in his fourth Book, and 26. Chap. he thus writeth: *Inveterate Ulcers* (ſaith he) *and ſuch as hardly admit of a Cicatrice, ſome cal them Chironia, as though they needed a* Chiron *himſelf to heal them; others there are that cal them* Telephia, *becauſe that* Telephus *continued long troubled with ſuch a like Ulcer.* Thoſe that think that both the *Chironium* and the *Telephium* Ulcers conſiſt not ſo much in their corroſion as in this, that they are both of them malignant and contumacious, ſo that they are wont to continue with the ſick perſons even unto their old age, theſe diſſent from *Galen*, who (in the ſecond Book of the Method of Healing, Chap. 2. and 14. of the ſaid Method. Chap. 17.) thinketh that *Phagedæna* conſiſteth in eroſion; and that *Chironium* and *Telephium* are a ſpecies hereof. Where we muſt know (as *Galen* acquaints us in his Commentary upon the ſixth of the Aphoriſms, Aphor. 45.) that al Ulcers that become greater and worſe, the Ancients called al theſe Ulcers *Phagedænæ*; and if in this manner we take *Phagedæna*, then *Chironia* and *Telephia* may be called a Species or kind of *Phagedæna*. But there are ſome certain of the latter Writers that have endeavored to diſtinguiſh them, giving unto each of them a proper and peculiar appellation; and ſome of theſe they cal *Chironia*, others of them they term *Telephia*, and a third ſort *Phagedænæ*. So that *Phagedæna* being taken for a corroding Ulcer, is one while the *Genus* of *Chironium* and *Telephium* Ulcers; and another while a certain determinate Species of a corroding Ulcer, differing from *Chironium* and *Telephium*; which (to wit) beſides the skin, eateth through the fleſh it ſelf; and yet nevertheleſs is not altogether ſo malignant as *Chironium*, or *Telephium*, or the *Cancer*.

To wit, *Telephian* Ulcers are the ſame with *Chironia*, ſo called from *Telephus*, who was a long time afflicted with ſuch an ulcer. And what *Galen* (in the fourth Book of the Compoſition of Medicaments according to their kinds, Chap. 4.) hath written touching *Chironia*, to wit, *They cal* (ſaith he) *thoſe* Chironian *Ulcers that are not meanly and indifferently malignant or contumacious, but ſuch as are ſo in the higheſt degree*; The ſame is likewiſe to be taken and underſtood of the ulcers *Telephia*.

The Cauſes.

Now ſuch like Ulcers have their original from a Melancholy humor, having ſome (though not much) black Choler mingled together with it.

Signs Diagnoſtick.

Such like Ulcers are known, in that they have their lips il colored, and for the moſt part they are red, and itching; and although the Ulcer be never ſo lightly and gently handled or wiped, yet there is a pain perceived; the parts lying round about it ſwel up, and the Ulcer is from day to day dilated; and not only the skin, but the fleſh likewiſe that lieth under it is eaten through.

Progno-

Prognosticks.

Every sort of these Ulcers is Contumacious, and hard to be cured, as we told you before.

The Cure.

As touching the Cure, Universals being premised, and the body emptied of the vitious humor, and a fit course of Diet prescribed, there are to be applied unto the Ulcer Medicaments that are compounded of such things as are cold and dry, astringent, and withall Discussive: and such are Plantane, Nightshade, the tops of the Black-berry or Dog-berry bush, the Flowers of Roses, Cypress Nuts, Pomegranate flowers and rinds, Mastick, the bark of Frankincense, burnt Lead, Litharge, and the like.

And therefore in the first place, let the Ulcer be washed and fomented with this or the like Decoction.

Take *Plantane one handful, Flowers of red Roses, Pomegranate flowers, and Cypress Nuts, of each half an ounce; Myrtle berries, Pomegranate rinds, Sumach, of each three drams; Alum burnt half an ounce; boyl them in Water and wash the Ulcer wel therewith.* Or,

Take *the Juyce of the Bramble, Plantane, Nightshade, Shepherds-staff, of each four ounces; the whites of six Eggs, Alum four ounces; destil them in a Leaden Alembick:* Let the Ulcer be washed and fomented with this Water: and let the parts likewise that lie neer unto it be anoynted over with some Defensive.

After the Ulcer is thus washed, let the Unguent Diapompholyx be laid thereon; as also the white Camphorate Unguent, and the Unguent *de Minio.* Or,

Take *Tutty prepared half an ounce, burnt Lead, Ceruss washed, of each an ounce; let them be wel mingled together in a Leaden Mortar, pouring in unto them by little and little the Juyce or water of Plantane, and make hereof a Mass: afterwards add of Bolearmenick three drams; Oyl of Roses and Wax of each as much as will suffice, and make an Unguent.*

More of these like Medicaments shal be declared in the Chapter following.

Chap. 15. *Of the Ulcer* Phagedæna.

Phagedæna what it is. AND because (as we have told you) there is likewise mention made of *Phagedæna* among the Ulcers; we shal therefore here in this Chapter explain it, and shew you what it is. It is so called from the Greek word *Phagein*, from its *Eating*; and this (whether Tumor or Ulcer) hath received its name from eating through and corroding, because it eateth through the parts lying neer unto it. And indeed it is properly an Ulcer. But yet nevertheless, in regard that the Lips of the Ulcer strutting forth with black Choler are lifted up into a Tumor, it is therefore by some referred unto Tumors; and there is mention hereof made by *Galen* in his Book of Tumors, Chap. 14. But we wil treat here of it among Ulcers. But yet nevertheless, as touching its name, this is to be noted, that it is not alwaies taken in one and the same signification. For somtimes (as *Galen* tels us, in Epidem. 6. Comment. 3. Text 37.) *Phagedæna* signifieth an appetite unto, and eating of much meat, and hence (by the Author of the Medicinal Definitions) it is defined to be, a Constitution in which Persons having an appetite unto much Food, and devouring much thereof are not able to retein and keep it; but when they have cast it up, they again desire more; and in this manner it is also defined by *Aurelianus*, in the third Book of his Chronic. Chap. 3. So that *Phagedæna* being taken in this manner, and in this sence, is nothing else but that we cal the Dog-like appetite. And therefore *Pliny*, in his Book 20. Chap. 5. 13. and in his Book 30. Chap. 9. and Book 35. Chap. 13.) for distinction sake (when he speaketh of an Ulcer) is wont to add the name of Ulcers, and to cal them *Phagedænæ* of the Ulcers. And furthermore the name of a *Phagedæna* doth sometimes signifie a certain kind of destruction that befalleth unto Bees; of which *Columella* writeth in his tenth Book, and Chap. 13. But here in this place we take *Phagedæna* as it is only an Ulcer; touching which *Galen* in his Book of Tumors, and Chap. 14. thus writeth; *Whatsoever of the Ulcers there be that eat and devour, and reach unto the Bodies lying round about them, and continually eating through that that is sound, all these Ulcers are by the Greeks called* Phagedænica: *but those that are compounded of both (to wit, of an Ulcer, and a Tumor, surrounding the flesh) these are called Phagedænæ.* Thus *Galen.* Moreover also *Herpes* feedeth upon, and eateth up the parts lying neer round about; but the exulceration is in the Skin alone: but the *Phagedæna* (together with the Skin) reacheth even unto those parts that lie underneath.

Nome. *Nome* is likewise a different Affect, so called from the Greek word, signifying to *feed*; because that it is wont to move forward (stil feeding the Disease) from the sick and unsound parts unto those that are whole and sound, and of these sound particles it is wont alwaies to add somthing thereof unto the unsound; so that it hath its Appellation not from the substance of the thing declared and shewn; but from something that is Accessary, which is to feed; as *Galen* tels us in his fifth Book of the Method of Healing, Chap. 4. For *Nome* signifieth an eating or devouring putridness, albeit that the Ulcer creep but slowly. But *Phagedæna* is from humors that are sharp and corroding, even without any putridness.

But

What Phagedæna is.

But what a *Phagedæna* is, we are now to declare unto you. Now a *Phagedæna* in ſpecial, and properly ſo called, is an Ulcer that feedeth upon and eateth through the fleſh lying underneath it, and thoſe things that are about it; and then preying upon ſomewhat belonging unto the ſound parts, which it addeth unto thoſe that are diſeaſed and unſound; as we may ſee from the ſixth Book of the Aphor. Aphor. 46, and in *Galen* his Book of Tumors, Chap. 12. To wit, the *Phagedæna* which the more ignorant Phyſitians call the Ambulative or walking Ulcer, is an Ulcer that is tumid and profound, eating through the parts lying neer, and the fleſh that lieth underneath.

Its difference from Nome.

For it hath a Tumor about its lips, by which it is diſtinguiſhed from *Nome*, which likewiſe eateth thorow the adjacent parts, but then it is without any Tumor. Although that it be likewiſe otherwiſe diſtinguiſhed from *Nome*, becauſe that in *Phagedæna* the Corroſion is only from a Malignant quality, and the acrimony of the humor; wheras in *Nome* there is likewiſe a putridneſs conjoyned. And it is alſo a deep and profound Ulcer, and ſuch as doth not only eat through the Skin, but even through the fleſh alſo; in which reſpect it differeth from the *Herpes*, that corrodeth and eateth through the Skin only.

The Cauſes.

This Malady hath its original from an aduſt or burnt humor, and Cholerick, and ſuch as almoſt degenerateth into the Nature of black Choler or Melancholly; or elſe from yellow Choler with ſalt Flegm, and a ſerous or wheyiſh humor therewithall mingled: which humor is not ſo thin as that that cauſeth the *Herpes*; nor yet ſo thick as that which produceth the *Cancer*. But now theſe humors proceed, either from ſome principal Member affected with a hot and dry Diſtemper; or elſe they are burnt in the very part that is affected, that lieth under ſome hot and dry preternatural Diſtemper.

Signs Diagnoſtick.

The Signs are already declared and explained; and they may be collected out of this, and the foregoing Chapter.

Prognoſticks.

1. Theſe Ulcers are hard to cure; whereupon they are likewiſe in the general called *Cacoethe*.

2. Yet nowithſtanding ſome are more malignant then others: for which cauſe there is a neceſſity that we have in a readineſs divers Medicaments, differing in ſtrength and virtue. For we never yet heard of any one that with one only Medicament eaſily cured al ſuch like Ulcers as theſe.

3. Eating Ulcers, with a hot and dry diſtemper of the Liver, or elſe conjoyned with the foul Diſeaſe (which we commonly cal the French Pox, or the Neapolitane Diſeaſe) are not to be cured without much difficulty.

4. Eating and devouring Ulcers unleſs they be rightly and ſpeedily healed, they often degenerate into an exulcerated *Cancer*.

The Cure.

About the Cure of this Ulcer it is to be noted (as elſewhere likewiſe we have often ſaid) that in it nothing wil any whit profit or avail (as it is alſo in other Diſeaſes) whileſt that the Cauſe ſtil remaineth. And therefore in the firſt place, ſuch a Courſe of Diet is to be preſcribed that will not only not generate ſuch like aduſt humors, but likewiſe qualifie and correct their acrimony: and afterwards theſe bad humors are to be evacuated out of the body.

And moreover this alſo is to be obſerved, which *Galen* likewiſe taketh notice of (in the place betore alleadged, *Viz.* in the fourth Chapter of his Book of the Compoſit. of Medicam. according to the kinds of them; upon the Medicament of *Aſclepiades*) where he hath theſe words; *Rightly* (ſaith he) *hath* Aſclepiades *added theſe words unto the end of his preſcribed Medicament*; Viz. *and looſen this every third day, and mitigate the pain with fomentations; and ſoften the ſame Emplaſter when you have waſhed it, and again lay it on: for unleſs the Medicament ſhal ſtick ſomwhat long unto the Skin, it effecteth but little or nothing: which moſt Phyſitians are ignorant of, who think that if thrice a day they wipe away the* Sanies *from the Ulcer, they then do better then thoſe that do it but twice a day.* And the truth is, there is moſt commonly a great error committed in this very point; whileſt moſt men think that they take the beſt courſe with the Patient, if they waſh ſuch a like Ulcer three or four times a day. But ſince that the Medicament doth not at all act any thing unleſs by the Native heat it be drawn forth into act, and in regard that in malignant and long continued Ulcers the heat of the affected part is very weak, it needeth much time therefore to excite and draw forth the ſtrength and virtue of the Medicament. Wherefore the ſame Medicament ought to be kept ſticking upon the part affected a long while; neither is its action to be diſturbed, when the virtue and ſtrength thereof is ſcarcely yet drawn forth by the heat of the place affected (ſo that it now but beginneth to act) and a new Medicament to be applied. In which caſe notwithſtanding the condition of the humor exciting the Ulcer is to be conſidered. For if it be very ſharp, it is the oftner to be wiped away, leſt that ſticking in the ulcerated part it more corrupt the ſame.

CHAP.

Chap. 16. *Of an Ulcer with pain.*

BUt now the Causes do not only cherish and encrease the Ulcers, and there are likewise certain Diseases therewith joyned to accompany them, but there happeneth likewise oftentimes a pain unto these Ulcers, which is therefore immediately to be mitigated; in regard that pain attracteth, augmenteth the Ulcer, and causeth Inflammations and the *Erysipelas* to arise. Now as touching pain in general, we have already spoken in the first Book of our Practice, Part 3. Sect. 1. Chap. 2. So that we are here only to treat of the pain of Ulcers. This pain therefore in ulcers ariseth for the most part from a sharp and corroding humor. But now whereas the pain is to be taken away, either by taking away the cause, or properly by mitigating the pain, or by taking away the sense thereof (as we have shewn you in the fifth Book of our Institutions, Part 2. Sect. 3. Chap. 8. and likewise in the place alleadged) the last of these waies is not so safe, because that it cannot be administred without great detriment unto the part; and therefore it is not to be put in practice but only in case of urgent necessity. For this reason it is most safe to take away the cause of the pain; or if this cannot be done but in a long time, and that there be cause to fear that in the mean time the Ulcer may be encreased and made worse, then in this case Anodynes are to be made use of: which what they be, we have shewn in the place alleadged. Those things that here much benefit, are, the Yelks of Eggs, Saffron, Turpentine, Oyl of Roses, Rosin of the Fir-tree, out of which mingled together Liniments may be made, to be imposed upon the ulcer. But upon the Compass or Circuit of the ulcer, the Fat of a Hen, of a Goose, of a Duck, the Mucilage of Linseed, of Fenugreek, of Marsh-mallows, the Oyl of sweet Almonds, of Camomile, of Dil, and of Violets, are to be imposed. Or,

Take *Mallows, Marsh-mallows, of each one handful; boyl them to a softness, and then bruise them wel; when they are bruised and passed through a hair sieve, add of Barley meal one ounce; Linseed and Fenugreek, of each one ounce; Oyl of Roses two ounces; Oyl of Camomile and white Lillies, of each one ounce; the Mucilage of Marsh-mallow seeds, the extracted Water of the Elder flowers an ounce and half; Saffron one scruple; the Yelks of two Eggs: Make a Cataplasm.* Or,

Take *Crumbs of white Bread two ounces; soften them in Milk; and then add of Barley Meal, and Linseed, of each one ounce; the pouder of Camomile flowers half an ounce; Oyl of Roses an ounce and half; Water-lilly half an ounce; the Yelk of one Egg, Saffron one scruple: mingle them and make a Cataplasm.*

But if at any time we have a mind to fit the Medicaments unto the cause, in regard that most commonly in ulcers the pain ariseth from hot and sharp humors; therefore to take away this pain we may administer the juyce or the destilled water of Nightshade, Plantane, Henbane, Sengreen, Oyl of Roses, Whites of Eggs, with Rose water: of this those Cataplasms that are made of Mallows, Plantane, Nightshade, and Oyl of Roses, are to be laid on; or else an Unguent of the white of an Egg, Oyl of Roses, and Litharge, wel bruised and mingled together in a Leaden Mortar, and afterwards boyled with the Juyce of Sengreen, until al the juyce be consumed; or a whol Egg carefully mingled together with the Oyl of Roses, and Turpentine, in a Leaden Mortar; or else the white Camphorate Unguent.

If necessity drive us unto Narcoticks, then the Oyl of Poppy, of Henbane, of Mandrake, of Frogs, or the juyce of Henbane, al or any of these may be applied with Milk.

Chap. 17. *Of the Ulcers of the Legs, and other particular Ulcers.*

AND these things we thought fit (in a compendious way) to speak of Ulcers in the general; which any one may easily apply unto the ulcers of particular parts. Neither do we conceive it to be at al needful, that we should speak any thing more of the ulcers of al the particular parts, since that we have already treated of them in our former Books, as we shal by and by tel you. And therefore in this Chapter we wil speak only of the ulcers of the Legs in special. For it oftentimes happeneth that bad and depraved Humors, especially the Melancholly, as wel by their own weight tending unto the Thighs, as by nature thrust and driven down thither (as unto the external parts) do excite ulcers; and this especially happeneth after *Erysipelas's* that very frequently infest the skin; and chiefly in Women, where without doubt there is a concurrence of somthing amiss in the Womb: and I know that in some certain Families such ulcers are so familiar, that al the Women therein (although they seem to be otherwise very wel) have of these long continued ulcers in their Thighs. And therefore by al means possible we are timely to meet with, and prevent these ulcers. For unless they be speedily healed, Nature wil accustom her self to send away al the vitious humors that are bred and heaped up in the whol body unto these parts, which afterwards, if the ulcer be closed up, and the body be not diligently and often purged, wil excite other more grievous Diseases, especially in those that are aged: for if they be neglected, they are wont likewise to gain growth and encrease, to corrupt the parts that lie neer, and to become callous; so that if some speedy

The ulcers of the Legs.

dy course be not taken for the healing of them, they afterwards become altogether incurable.

Now that these ulcers may be rightly cured, first of al the body is to be throughly purged from the vitious humor; and the fault of the Spleen (which for the most part is here present) is to be corrected, and a Purgation oftentimes to be repeated.

And afterward the Unguent Diapompholyx is to be imposed (which I have ever found to be most efficacious in this kind of ulcer) so long as until there appear a *Pus* good and white: and then this Emplaster:

Take *of the Unguent Diapompholyx, the Emplaster Diapalma, the Emplaster Gryseum, of each one ounce; Gum Elemi two drams; Sugar of Saturn one scruple: mingle them wel in a Leaden Mortar.*

With which two Medicaments I have oftentimes happily and successfully cured the long continued ulcers of the Thighs. Or,

Take *Cerus two ounces, Litharge one ounce, Oyl of Roses one pint, Wax two ounces; let them be carefully mingled in a Leaden Mortar: afterwards add of Tutty prepared with the Water of Nightshade, of Frankincense, and Lead burnt, of each one ounce; and let them be again stirred about in the Mortar, and then make an Unguent.* Or,

Take *Wax, Rosin, of each one ounce; the Suet of a gelt Pig two ounces; Ship Pitch, Oyl, of each three ounces; Mastick, Frankincense, and Myrrh, of each three drams; Litharge one ounce and half, Cerus half an ounce. Let the Oyl, Rosin, Wax, and Suet, melt together, and then let them be boyled unto a just consistence: and after let the rest of the Ingredients be added.* Or,

Take *White Wax, Turpentine, Rosin, of each one ounce; Frankincense, and Mastick, of each two drams; Styrax Calamite three drams; Gum Elemi six drams; round Aristolochy two drams; the juyce of Milfoyl, and Betony, of each half an ounce; Oyl of Roses as much as wil suffice, and make an Unguent.*

But let the Wax, Rosin, Turpentime, and Oyls, be first of al dissolved together; after this let the Juyces be poured unto them; and when they begin to grow cool, add the Pouders. Or,

Take *Oyl of Roses twelve ounces; Cerus three ounces; Litharge four ounces and half; Frankincense, and Mastick, of each half a dram; Dragons blood half an ounce; Myrrh, and Sarcocol, of each two drams: boyl them a little, until they be red; after remove them from the fire, and then dip therein an old Linen cloth; which when it is throughly soaked in the matter of the Emplaster may be taken forth and spread abroad to make a Sparadrape.*

Touching the ulcers of the rest of the parts, we have already treated of them in the former Books of this our Practice. To wit, in the first Book, Part 3. Sect. 2. Chap. 18. of the ulcers of the *Adnata* and *Cornea* Tunicles of the Eye: *ibid.* Sect. 3. Chap. 3. of the ulcers of the Ears: *ibid.* Sect. 4. Chap. 1. of the ulcers of the Nostrils: In the second Book, part 1. Chap. 3. of the ulcers of the Lips: *ibid.* Chap. 16. of the ulcers of the Gums: *ibid.* Chap. 21. of the exulceration of the Throat-pipe: *ibid.* Chap. 22. of the ulcers of the Tonsils: Part 2. Chap. 1. of the ulcers of the *Aspera Arteria* or rough Artery: *ibid.* Chap. 12. of the ulcers of the Lungs: *ibid.* Chap. 18. of the Fistula's of the Thorax: Part 4. Chap. 3. of the ulcers of the Heart: Book 3. Part. 1. Sect. 1. Chap. 1. of the ulcers of the *Oesophagus*: *ibid.* Chap. 17. of the ulcers of the Stomach: Part 2. Sect. 1. Chap. 9, & 10. of the ulcers of the Intestines: Part 3. Chap. 5. of the impostumes and ulcers of the Mesentery: *ibid.* Chap. 7. of the ulcers of the Pancreas: *ibid.* Chap. 8. of the Caul: Part 4. Chap. 8. of the Spleen: *ibid.* Part 6. Chap. 8. of the Liver: Part 7. Chap. 11. of the Reins: Part 9. Sect. 1. Chap. 6. of the Bladder: *ibid.* Chap. 9. of the Urinary Passage: Part 8. Chap. 5. of the Testicles: *ibid.* Chap. 6. of the Cods: *ibid.* Chap. 8. & 10. of the Yard: Part 10. Chap. 5. of the Navel: *ibid.* Chap. 7. 11. of the Abdomen: Book 4. Part 1. Sect. 1. Chap. 48. of the Neck of the Womb: *ibid.* Chap. 10. of the Fistula's of the Neck of the Womb: *ibid.* Chap. 11. of the Cancer of the Womb: *ibid.* Chap. 12. of the Gangrene and Sphacelus of the Womb: Sect. 2. Chap. 14. of the Cancer of the Womb: *ibid.* Chap. 19. of the ulcers of the Womb: *ibid.* Chap. 20. of the Testicles in Women: Part 3. Sect. 1. Chap. 7. of the Cancer of the Breasts: Chap. 8. of the ulcers and Fistula's of the Breasts: *ibid.* Chap. 11. of the ulcers of the Teats.

Chap. 18. *Of Burnings.*

WE may not unfitly unto Ulcers subjoyn Burnings, which do likewise excite and raise ulcers. For oftentimes it happeneth, that by some mischance and unfortunate accident the Members may be scalded, either with water, or with hot boyling Oyl, or melted Metal; or else one may chance to fal into the Fire, into the Water, or into scalding hot Oyl; which whensoever it happeneth, then pain, blisters, and exulcerations are excited.

The Differences.

Now of such things as are burnt there are three degrees or Differences. For somtimes there is only a heat and pain excited in the part affected by the said burning; and unless that Remedies be forthwith administred, the Scarf-Skin wil be separated

parated from the true Skin, and blisters wil be raised, in the which there wil be a certain cleer water contained: and oftentimes likewise suddenly and in a moment the blister or bladder is lifted up, and the very Skin it self is burnt, dried up, scorched, and contracted together; and yet notwithstanding, there is al this while no Crust or Eschar produced: but at other times the very Skin it self, yea and oftentimes the flesh that lieth under it is burnt, dried up, and an Eschar produced, and the Skin becometh black, loseth somwhat of its sense and feeling; and after that the Eschar is fallen off there is left behind an ulcer sufficiently deep. For fire dissolveth the continuity, and exciteth a pain: and because the moist parts in the Skin are resolved by the force of the fire, and endeavor to exspire and breathe forth, but are stil kept in by the thickness of the Scarf-skin, they lift it up, and raise the bladder or blister. But somtimes again there is by the force of the fire some kind of humidity left remaining in the part, from whence the Skin is contracted and drawn together: but somtimes also the moisture of the part is altogether dissipated and dried up, and an Eschar is produced: and this happeneth according to the variety of the things that burn. For Water burneth less than the other; and this Water likewise more or less, according as it is more or less hot. For stubble, straw, flax, and the like, cause no great and vehement burning, unless the burning be long continued. But Oyl burneth more, and so do Fats, Varnish, Pitch, Honey, Wax. And the greatest and most vehement of al burners, are Lead and Tin melted, Iron and other Metals made red hot by the fire, as likewise the very actual Fire it self, Gun-powder, and Lightening. And so likewise by how much the thicker the subject matter of the Fire is, and the more its force and strength is augmented by the concurrence of its many Atomes, and the more it is condensed; and lastly, by how much the longer the action of the Fire is continued, by so much the greater the burning must needs be. But if the fire be in a subject more thin, and so its Atomes be the more dispersed, and but little united, and if its action likewise continue but a short time, then the burning is so much the less.

Prognosticks.

Touching the Diagnostick Signs there is no need that we speak any thing at al; since that the burning wil sufficiently manifest it self. Its Degrees likewise, and how far it hath gone, wil sufficiently appear by what was said a little before.

As for the Prognosticks: 1. By how much the lighter the Burning is, by so much the more easily it is cured, and so much the less is the evil that it bringeth along with it: but by how much the burning is greater, by so much the harder it is to cure, and so much the more grievous the evils that it bringeth along with it. For oftentimes an Inflammation of the part, yea even a *Necrosis* or Mortification (the Radical humidity being consumed, and the Native heat dissipated) ariseth from thence, ulcers hard to cure are likewise from thence excited, the motion of the part is abolished, and there are filthy and deformed Cicatrices left remaining.

2. Burning by Lightening is likewise very dangerous, and for the most part deadly.

3. By how much the purer the Body is, by so much the more easily is the burning cured. But if the Body be either Plethorick, or Cacochymical, then from the pain and heat there is very easily caused an afflux of the humors; and from thence Inflammations, putrid ulcers, and other evils are excited.

4. The Burning is likewise somtimes more, and somtimes less dangerous, according to the Nature and condition of the parts affected. For if there be but only one part burnt, there is then less danger than if many parts, or the whol body be burnt. For when many parts, or the whol body be burnt, it is very rare that the persons thus burnt should ever be perfectly wel and sound; but most commonly they die miserably by the very vehemency of the Symptoms.

5. If the burning be so deep that it reach even unto the greater Veins, Arteries, and Nerves, it is then dangerous. For when the exsiccated Vessels are contracted and shut up, the blood and the spirit cannot then flow unto the affected part; from whence there is caused an Atrophy; a Gangrene, and a deprivation of sense and motion.

6. The burnings of the Abdomen are not cured without much difficulty: for the Skin is there softer; and those Muscles by reason of their various motions are variously extended and contracted.

7. If the burning reach even unto the Intestines, it is then deadly.

8. The burning likewise of the Groyns is very dangerous, since that those places are moist, and therefore the more fit to receive the afflux of humors.

9. The burnings of the Eyes are also dangerous. For although they be but light; yet notwithstanding they may produce either a stark blindness, or a deprivation of the sight, or at least a diminution thereof.

10. If the hairy parts be ever a whit grievously burnt, they alwaies continue smooth and slick: for hairs are never generated in that hard Cicatrice that is brought over the affected part.

The Cure.

Indeed some there are that from the ordinary and wel known Axiom of Physitians (viz. That Contraries are the Remedies of Contraries) are of opinion, that such Members as are burnt ought so be cooled; and therefore they think that unto those

thoſe parts that are burnt there muſt Coolers be immediately applied. But this their opinion hath its original from that vulgar but falſe Conceit, viz. That the burning is only an alteration, and the introducing of a hot quality; whenas notwithſtanding the very fire it ſelf, and likewiſe its Atomes, are communicated unto the part that is burnt, and an *Empyreuma* (as al of them are forced to confeſs) is produced: for what, indeed, elſe is this *Empyreuma* (which al of them tel us ought to be called forth) then the ſmal parts or particles of the very fire, that have penetrated themſelves into the burnt part: and Experience it ſelf teacheth us, That cold things wil not cure burnings; but that (on the contrary) by the ſaid Coolers (the fiery particles being thereby thruſt down much lower) the pain is wonderfully augmented, and inflammations, yea and the Gangrene it ſelf, and the Sphacelus excited: but that ſuch things as are hot, and that cal forth the *Empyreuma*, are very helpful: from whence likewiſe it is (as we al wel know) that the burnt parts are not to be plunged into cold water, but rather to be put ſomwhat neer unto the fire. Which although that *Platerus* ſeem to find fault therewith, yet uſe hath taught even the very vulgar the truth of this; and *Ariſtotle* long ſince took notice hereof, as appeareth in his Sect. 2. Problem. 56. Neither are thoſe things that are applied hot, applied in the nature of Anodynes, ſince that al Anodynes wil not do it, as by and by in the Cure it wil appear: but only thoſe of them which have virtue and power in them of calling forth the *Empyreuma*. But now ſimilitude and likeneſs begetteth attraction; and the external fire calleth forth the intrinſecal fire, that is to ſay, that very fire that it ſelf conveyed into the burnt part; as *Ambroſe Parry* tels us very truly, in his Book 11. Chap. 9.

In the Cure therefore of Burnings, let the firſt care be to cal forth the *Empyreuma*: to wit, in the ſame manner, like as we have told you in Part 1. Chap. 15. touching Kibes, that the cooled parts are not rightly cured if they be put neer unto the fire, or plunged into hot water; ſince that hence the pain becometh ſo much the more intenſe and vehement; yea and that oftentimes a Gangrene and Sphacelus are excited; but if they be firſt rubbed with Snow, or dipt into cold water, then the cold is drawn forth: ſo if the *Empyreuma* be called forth by thoſe things that are hot (which is done by means of the ſimilitude or likeneſs) then this Malady is ſoon taken away. Which that it may be rightly done, the Cure is to be inſtituted and ordered according to the degrees of the Burning above propounded.

The Cure of a light burning.

Firſt of al therefore, if the Burning be but light, we muſt prevent what we can the breeding and ariſing of Puſtules or bliſters: for if this be done, the ſick perſon is then already freed from al the evil of the burning. But now this is to be ſpeedily done; and therefore whatſoever Medicament we have ready at hand, we muſt forthwith make uſe thereof: and therefore the Member (if the nature and condition thereof wil ſo bear it) is to be put a little neer unto the fire, or elſe deeply plunged into hot water; or elſe fomented with a Spunge, or a Linen cloth doubled, and then wel ſoaked in warm water, that ſo the *Empyreuma* by reaſon of the likeneſs may be extracted; or elſe immediately a Linen cloth dyed in Varniſh is to be impoſed upon the burnt Member; or a Linen cloth wel wetted in the Ley or water in which unſlaked Lime hath been extinguiſhed. And then preſently Onions bruiſed in a Mortar with Salt are to be laid upon the burnt part: or elſe this Unguent. Viz.

Take *of a raw Onion one ounce and half; Salt, Venice Sope, of each half an ounce: mingle them in a Mortar, pouring in unto them as much of the Oyl of Roſes as wil ſuffice, and make an Unguent.* Or,

Take *Venice Sope three ounces; raw Onion one ounce; Salt ſix drams; the Oyl of Eggs half an ounce; Oyl of Roſes and ſweet Almonds, of each one ounce and half; the Mucilage of Quince ſeeds one ounce: mingle them, and make an Unguent.* Or,

Take *the green Rind of the Elder tree, or the firſt ſhoots of the Elder; let them be wel bruiſed, and then boyled in Butter that is new and unſalted, and then ſtrain them.* Or,

Take *Unſlaked Lime often waſhed in Roſe-water, and with the Oyl of Roſes make a Liniment.* Or,

Take *Oyl of Lin-ſeed, Oyl of Olives, of each one ounce and half; Salt half an ounce; the Whites of two Eggs: Mingle them, &c.*
Or,

Take *May Butter unſalted, Venice Sope, and Varniſh, of each a like quantity: Mingle them, &c.* Or,

Take *Oyl of Roſes three ounces, Camphire three drams, the Whites of three Eggs, and mingle them.* Or,

Take *the Juyce of Onions three ounces; Oyl of Roſes, freſh Butter, the fat of a Hog, of each one ounce; Lime waſhed in Roſe water half an ounce; the Mucillage of Quince ſeeds extracted with Roſe-water one ounce; a little Turpentine, and make a Liniment.* Or,

Take *the middle Rind of green Elder one ounce and half; the juyce of the firſt ſhoots of Elder one ounce; Oyl of Linſeed and Roſes, of each ſix drams; Varniſh, and Hogs Fat, of each one ounce; Wax, one ounce and half; Frankincenſe pulverized one ounce; boyl them a little while in Water; and when they be cooled, gather the fat together, and make uſe thereof inſtead of an Unguent.*

Of Lime often (even twelve times) washed, and the former water alwaies thrown away, there may be made many Unguents very good against Burnings: for either it is mingled with fresh Butter, or Oyl of Roses, or Oyl of St. Johns wort: and sometimes there are other things added, as the Mucilage of Quince Seeds, of Fleawort, the white of an Egg, and white Wax. These things are likewise very good.

Take *the Juyce of the middle rind of the Elder one ounce and half, Cream of Milk one pint; boyl them to a Just consistence; and then add of the Mucilage of Quince Seeds, the extracted water of Nightshade, unsalted Butter, and Ceruss, of each half an ounce, mingle them, and make an Unguent.* Or,

Take *Oyl of Linseed four ounces, new Wax two ounces, whites of Eggs as much as wil suffice; mingle them over the fire, and make an Unguent.*

For the healing of all kind of Burnings, this is likewise very prevalent.

Take *Oyl Olive one part, whites of Eggs two parts; let them be shaken together with all exactness and care, and throughly mingled together, that so a white Unguent may be made thereof*; with the which the burnt place is oftentimes every day to be anoynted with a Capons Feather, even until the Crust shal fal off of its own accord; neither is there here any External ligature to be made use of.

Ambrose Parry (in his *Parisian Nosocomium*) writeth, that this following hath been made use of with very good success:

Take *Lard small shred one pound, let it melt in Rose water, and then let it be strained through a thin Linen Cloth: let it be washed four times in Plantane water, or some other convenient water: and afterward add the Yelks of three new-laid Eggs, and so make an Unguent.* Or,

Take *Crawfish as many as you please: bruise them to pieces alive in a Mortar; and afterwards take new fresh Butter, make it boyling hot and then scum it: whilest it is yet hot, cast in the mashed Crawfish and boyl them until they wax a little red; afterward strain it, and let this Unguent be kept for use, for it is singularly good.*

Omnibonus Ferrarius in his fourth Book of the Art of Curing Infants, and Chap. 25. commendeth this that followeth as a rare secret, and such as he himself had oftentimes made tiral of with very good and happy success, although the Pustules were already raised. *Viz.*

Take *the whites of two Eggs, Oyl of Roses two ounces, Rose water one ounce, Mingle them together exactly.*

Afterwards let a white linen Cloth, or silk (that is very thin woven) being first throughly wet and soaked in that Liniment be laid upon the burnt part, and not at all taken off untill the Malady be healed; but only let the Linen Cloth be again anoynted over and wel wet with the said Liniment, twice or thrice every day. After the fourth day is past, in the place of the Whites of Eggs take the Yelks of the same; and continue the use hereof untill there be seen to appear the breeding of a new Scarf-skin: and then with a pair of Cizers let the little Cloth be from day to day cut off by some and some, where it shall appear that this new Scarf-skin is generated, until at length the whole Cloth be cut away; which when it is wholly taken away, there will appear no sign or mark at all of any hurt or burning. Or,

Take *the middle rind of the Elder as much as you wil; boyl it in the Oyl of Olives; when it is strained, add of Ceruss two parts, burnt Lead, and Litharge, of each one part; Mingle them exactly in a Leaden Mortar.*

And yet nevertheless this is to be observed touching al Unguents, that they ought to be so ordered, that they may not stick over stifly and too close unto the part, but so that they may easily be cleansed and removed. Neither indeed wil these kind of Ulcers admit of a strong and exact cleansing; but they must only be wiped clean by putting a fine thin and soft Linen Cloth upon the part, and so cleansing it from its filth and purulency. But if the Unguents stick too close, they then cause much pain unto the Party, and much trouble to the Physitian in his cleansing away of the filth and impurities.

If the Blisters or Pustules be elevated, and yet notwithstanding the Malady never a whit more grievous than before, they are not then immediately to be opened: for if they be presently opened, by reason of the Skins being made naked and bare, there wil a pain be excited, and the Cure wil be the longer ere it be wrought. But at length on the third day, when the new Scarf-skin beginneth to be formed and bred, then they are to be opened: but this opening must not be long in doing, lest that the humor within conteined be made the sharper, and so it corrode and eat through the Skin.

Burning by Gun-powder

Unto this first degree there belongeth (for the most part, for if there be greater store of the Gun-powder, the hurt wil be so much the more vehement) that burning that happeneth by means of Gun-powder; which oftentimes hath this peculiar unto it, that some Corns of the said Powder wil remain and stick fast in the Skin of the Face, and there cause a great deformity. Which if it so chance (for otherwise if the part be only hurt by the flame of the said Powder, and that there be no Corns thereof driven into and fixed in the Skin, it is then to be healed and cured like as other Burnings) forthwith the Corns of Powder are to be drawn forth with a Needle, or some other Instrument fit for the purpose: but if they cannot be al of them presently drawn forth; we must then permit

permit the Pustules to be lift up; for so by this means some of these grains of Powder may be the more easily drawn forth. But if the Chirurgeon be not presently called at the very beginning, and if after the burning is quite healed there remain still some blemishes, then there is to be laid on a Vesicatory of Cantharides and Leven; and the Bladders or Blisters that are excited are to be cut with a pair of Cizers, the Powder to be taken forth, and the place (the like hereunto is to be done likewise at other times in such like burnings) is carefully to be washed from its blackness with the Decoction of Fenugreek and Camomil flowers. And afterward this or the like Liniment is to be made use of. *Viz.*

Take *Gum Elemi one dram; Dissolve it in the Oyl of Eggs, of Roses, and of white Lilies, of each two drams; Unguent Basilicon three drams; unsalted Butter one ounce; and mingle them.*

Gulielmus Fabricius in his Book of Burnings, Chap. 6. maketh use also of the Powder of Precipitate.

But *Paræus* doth rightly inform us, that this Gun-powder doth sometimes so penetrate into the Skin and the Flesh (these notwithstanding being not greatly hurt) that it cannot by any Remedies be taken or drawn forth, neither by Phænigms, nor by Vesicatories, nor by Scarification, nor by Cupping-glasses, so that oftentimes there remain some certain foocsteps and prints thereof; as experience it self testifieth.

But for the moderating of the pain, let the parts that lie neer be anoynted over with this Unguent.

Take *Oyl of Sweet Almonds, of Roses, of white Wax, of each one ounce; let them melt over the fire; and then ad of Camphyr one scruple, and a little of the Mucilage of Quince seeds; Mingle them, &c.*

Burning from Lightening.

And hither belongs that Burning that happeneth from Lightening. But now in regard that Lightening hath Joyned therewith a Malignant & poysonous quality (which manifestly appeareth from the stinking smel it carrieth along with it, and that great power it hath to hurt the body, yea oftentimes to Kill; as also by this, that even the Dogs wil not touch the flesh or Carkasses of those Creatures that have been destroyed by Lightening:) therefore when any one hath been blasted and burnt with Lightening, then the Party is immediately to be put into a Swear, by giving of him some of the Pouder of Bezoar, or Treacle, or Bezoar Water. The Arteries also, the Lips, the Tongue, and the Nosethrils, are to be anoynted with Wine in the which Treacle hath been dissolved; and unto the Hand-wrists and the Heart there ought to be applied Cordial Epithems: but unto the burnt place there are to be applied Unguents made of Onions, the Leaves of Rew, and Treacle: there are likewise to be administred Cordiall Syrups, Conserves, and Pouders.

If there be an Eschar drawn over it, it is speedily to be removed with a Penknife; and then such a like Unguent as this is to be applied.

Take *of the Pouder of the Root of Swallow-wort, of Angelica, of each half an ounce, the Leaves of Rew, and Water-Germander, of each one dram; Treacle two drams; Treacle Spirit three drams; Honey of Roses two ounces, mingle, &c.*

The Ulcer being cleansed, this sarcotick Pouder is to be strewed thereon for the breeding of flesh.

Take *Roots of Angelica, and Swallow-wort of each one ounce; Myrrh, Mastick, Frankincense, the Leaves of Water Germander, of each half an ounce; Aloes succotrine two drams; make a Pouder, which may be sprinkled with the Juice of the true and right Nicotian or Tobacco and Sanicle; and hereof Trochisques are to be made, which must be dried in the shade, and (when there is occasion) again reduced into a Pouder.*

But then if there be likewise any bones broken, then we are not to make use of those extraordinary and common Astringent Cataplasms (lest that the evaporation of the poyson should be hindered) but some other, of Bean meal, Barly meal, of Lupines, of Angelica root, of Swallow-wort, of Rew leaves, Leaves of Water Germander, and Treacle: and this is to be renewed day by day, untill such time as the strength of the poyson be overcome and discussed. And upon the place there is a Defensive to be put, lest that the poysonous vapours through the vessels ascend up unto the Heart.

The Cure of Burnings of the second degree.

But if the Burning be so great and vehement, that there be not only bladders or Blisters raised, but that the Skin be likewise burnt, overdried, and drawn together, then those Medicaments that only draw forth the *Empyreuma* wil not suffice, neither are they alone to be applied; but such are likewise to be administred that mollifie and soften the Skin that is so much dried. And therefore all the Pustules are forthwith to be cut and opened, that so the hot and sharp humor may flow forth; and then such a like Unguent is presently to be laid on upon the place affected,

Take *of the Basilick Unguent one ounce, Oyl of Roses, of Almonds, of white Lilies, of each three drams; Yelks of two Eggs; Mingle them &c. Or,*

Take *of new fresh Butter, the new and fresh fat of a Hen, of each one ounce; new Wax, and Oyl of white Lilies, of each half an ounce; let them melt upon the fire, and then mingle therwith of Saffron one scruple, Mucilage of Quince seeds one ounce; Mingle them, &c.*

Or

Or else this of *Fabricius*:

Take *New fresh Butter washed in Rose-water three ounces*; *Oyl of Violets, of the Yelks of Egs, of sweet Almonds, of each half an ounce*; *Barley Meal one ounce and half*; *Saffron one scruple*; *Mucilage of Quince seeds one ounce*; *Wax as much as wil suffice, and make an Unguent.* Or else another of those things that were before mentioned. Or,

Take *Litharge, Ceruß or Vermilion, as much as you please*; *let them boyl in Vinegar*; *the Vinegar being passed through the filtring bag, add of the Oyl of Violets, or Oyl of Eggs, a sufficient quantity*; *and let them be carefully mingled together*: And afterward,

Take *the Pulp of sweet Apples rosted under the Embers two ounces*; *Barley Meal, and Fenugreek seed, of each half an ounce*; *and with Milk make a Cataplasm*; *unto which add of Saffron half a scruple*: *mingle, &c.*

But upon the burnt place such a Defensive is to be laid on.

Take *the Pouder of Bole-armenick, Dragons Blood, Pomegranate flowers, Flowers of red Roses, of each half an ounce*; *Oyl of Roses three ounces*; *Wax one ounce and half, a little Vinegar, and make an Unguent.*

And then the Member it self is afterward to be bound about with a Swathband that hath been wel wet in *Oxycrate*, or else a Linen cloth throughly moistened in the said Oxycrate is to be imposed upon it, that both the pain may be mitigated, and the influx of the Humors hindered and prevented. They commonly make use of that tart Brine or pickle in which the Cabbage is kept and preserved.

Cure of Burning of the third degree.

If (lastly) the Skin be not only somwhat dried, but that al the Radical humidity thereof be wholly consumed, and the Native heat altogether scattered; yea and the very flesh it self, and the Veins, and the Arteries, and the Nerves be burnt (so that there be cause to fear that the part may Gangrenate) in the first place, then the Pustules and al the blisters are to be cut, and the water contained in them to be dried up. And then afterward we must do our endeavor that the Eschar may forthwith the first or second day be separated; or if this may not be done, it is then to be cut in divers places with a Pen-knife, that so there may be a passage and way made for the issuing forth of the humor, and the admission of the Medicaments unto the part affected: and therefore instantly the Liniment of *Gulielmus Fabricius* (that is anon to be described) ought to be laid on. Or else,

Take *unsalted Butter washed in Rose-water three ounces*; *the Basilique Unguent one ounce*; *the Mucillage of Quince seeds extracted with Rose-water, Oyl of sweet Almonds, and white Lilies, of each half an ounce*; *the Yelk of one Egg*: *Mingle, &c.* Or,

Take *fresh Butter, Oyl of Roses, Hogs Fat, of each one ounce*; *the Yelks of two Eggs*: *mingle, &c.* Or,

Take *the Mucillage of Quince seeds extracted with the water of Parietary or common Pellitory of the wall two ounces*; *Oyl of white Lilies one ounce*, *the Yelk of one Egg*, *Wax as much as wil suffice to make a soft Unguent.*

But upon the Linen cloth there must be laid on a little of the following Emulsion:

Take *Gourd seed hulled two ounces*; *Quince seed two drams*; *Fenugreek seed one dram*; *pure Water three quarts*; *make an Emulsion*: *adding hereunto of white Venice Sope half an ounce*; *Camphyre half a scruple*: *Mingle them, &c.*

Defensives are not here so fit and convenient, (especially if the part begin already to swel up, and most of al if there be danger of a Gangrene to follow) in regard that they hinder Transpiration.

If there be a Gangrene already begun, then the Cure is to be ordered and ordained, as we shal further shew you in the following Chapter: and if there be any thing that is quite burnt, it is timely to be separated, lest that the putridness corrupt the found parts.

When by the Eschar that which was burnt shal be separated, the ulcer is then to be cleansed, filled with flesh, and closed up with a Cicatrice; as we have hitherunto told you in the Cure of ulcers, and as we shal further shew you in the following Chapter. But yet let not those things that you administer to produce the Cicatrice be over dry, lest the Cicatrice be made foul, unsightly, and rugged.

Gulielmus Fabricius (to cause the Cicatrice in the burnt places) made use of these things following:

Take *Emplast. Palmei two ounces*; *Hens Fat, and Goose Fat, of each half an ounce*; *let them melt together*: *and then mingle therewith of burnt Allum, Calcined Lead, Litharge of Gold, Lapis Calaminaris, of each one dram*: *let them be bruised together in a Leaden Mortar, adding thereto of the Mucillage of Quince seeds, and Fenugreek, of each a sufficient quantity, and make an Unguent.*

He likewise in this case very often made use of the Alabastrine Unguent (and that with singular benefit) of which this is the Description:

Take *of the Alabaster stone calcined one ounce and half*; *of the white Pumice stone calcined half an ounce*; *burnt Allum two drams*; *make of them al a very smal and fine Pouder*: And afterwards,

Take *white Wax, Goats Suet, the Oyl of sweet Almonds, and white Lilies, of each one ounce*; *Oyl of the Yelks of Eggs half an ounce*: *make an Unguent that mollifieth, and asswageth pain, and draweth over the part a fair Cicatrice.*

If

If the Veins, and the Arteries, and the Nerves likewise be burnt (left that the part should be surprised with an Atrophy by reason of the want of Aliment, but that the Vessels that were streightly shut up may be opened) they are to be anointed over with this following Unguent.

Take *the juyce of Earthworms two ounces; Mans Fat, Hens Fat, Bears Fat, of each one ounce; Spirit of Wine two drams: Mingle them, &c.*

If the parts that are naturally severed and disjoyned be burnt, as the Eye-lids, the Lips, the Fingers, (left that they should grow together) dry Liniments, or most thin little plates of Lead are to be put betwixt. And then at length there is likewise a special regard to be had unto the parts affected, in the choyce of the Medicaments. For it wil be altogether unfit and improper to apply unto the burnt face those Medicaments that are made of Onions, liquid Sope, as also Varnish, in regard that the Eyes may hereby be easily hurt. And therefore upon the Face we must lay on the Unguent of *Omnibonus Ferrarius* (before mentioned) or some other of Sope, that is made thicker, that so it may not flow and run abroad. As,

Take *Oyl of Roses, and of sweet Almonds, of each half an ounce; Venice Sope one ounce: Mingle them, &c.*

The burning of the Eyes. If the Eyes be hurt, then let there instantly be dropped into them Womans Breast-milk, or any other Milk blood warm: Or let such a like Collyrie be administred:

Take *Rose-water three ounces; Plantane Water one ounce; of Quince seeds, and Fenugreek, of each one dram: let them stand a while in a hot place, and then let them be strained.*

If the burning be vehement, & a crust be excited, we must then be very careful that the Eye-lids be not drawn back, which wil cause a great deformity: and therefore a Fomentation by Emollients is to be ordained. As,

Take *Roots of Marsh-mallows, of common Mallows, of each six drams; the Leaves of Marsh-mallows, and common Mallows, the flowers of Melilote, and of the Elder tree, of each half a handful; seeds of Fenugreek, and Linseed, and Quince seed, of each half an ounce; boyl them, and let the Eye-lids be fomented with the Decoction.*

Afterwards let them be anointed with this Unguent:

Take *of the Mucillage of Quince seeds, and Fenugreek, of each two drams; Oyl of sweet Almonds, Mans Fat, of each one ounce; Gum Elemi one dram: let them melt over the fire, and then let them be strained.* Or,

Take *Oyl of white Lilies, Oyl of Eggs, of each half an ounce; Mans Fat six drams; Gum Elemi two drams; new Wax one ounce; Saffron one scruple; let an Unguent be made hereof.*

But then likewise let the Skin be oftentimes extended with both the Hands.

The Burning of the Joynts. If the Joynts be burnt (in regard that they are parts almost bare and void of flesh, nervous, and endued with an exquisite sense) lest there should be caused an afflux of humors, and so a more grievous Malady should thereupon follow, Universal Evacuations are not to be omitted. But let not the Topical Remedies be over sharp, as are those of Onions, Sope, and the like; but let them be mild and Anodyne: and great care must be taken to prevent the contraction of the Nerves, and the incurvation or crooking of the Joynt. As,

Take *Oyl of white Lilies, and of sweet Almonds, and of Earthworms, of each one ounce; the Fat of a Hen, and Mans Fat, of each half an ounce; Unguent Dialthæa six drams; Gum Elemi two drams: Mingle them and make an Unguent.*

Ferula's likewise, or other Instruments, are gently, and without causing any pain, to be fitted unto the Member, to prevent the contraction of the same. But if the Nerves shal chance to be contracted, and the joynts incurvated, then (generals being first premised) the part affected must first of al be fomented with an Emollient Decoction, made of the Root of Marsh-mallows, Briony Roots, white Lily Roots, the Leaves of Marsh-mallows, and common Mallows, Ground-pine or Herb Ivy, Flowers of Camomile, of St. Johnsworr, Linseed, and Fenugreek seed.

Afterward let it be anointed with this following Unguent.

Take *of the Unguent Dialthæa one ounce; Mans Fat, Hens Fat, and Goose Fat, of each half an ounce; the Juyce of Earthworms one ounce: and mingle them.*

And upon the part there is to be imposed the Emplaster Diachylon simplex, and the Emplaster de Melilot. or the Melilote Plaister.

And withal likewise the contracted Member is with fit and convenient Instruments sensibly and by degrees to be extended; such Instruments as these we speak of are to be found lively set forth and delineated in the Chirurgery of *Gualtherus Ryff*, and in *Gulielmus Fabricius* his Tract of Cumbustions; and thither we refer you for the sight of them.

The burning of the Groyns. If the Groins be burnt, (in regard that those places are moist, loose, and very apt to receive fluxions; and because that thither the humors do very easily flow by reason of the vicinity of the Glandules, and that thereupon a Gangrene is there soon excited) let the Medicaments be there more dry than in other parts. And therefore

fore if there shal break forth no Pustules, then the Medicaments that are made of Sope, Onions, and Lime, are very usefull. But if the Pustules be already raised up on high, then let them be timely and speedily opened: and afterward let this Unguent be imposed.

Take *Unguent of Roses one ounce, Unguent Basilique six drams, Oyl of the Yelks of Eggs, and white Lilies, of each half an ounce; Myrrh and Aloes, of each one dram; Mingle them, &c.*

Upon the Unguent let the whol part be covered with such a like Cataplasm;

Take *Barley meal, Bean meal, and that of the Bitter Vetch Orobus, of each one ounce, Pouder of Roses half an ounce; with Honey of Roses, or Oxymel simple, make a Cataplasm.*

But if the burning be great, so that there be fear of a Gangrene, then those Medicaments are to be made use of that shal be prescribed in the Chapter following touching a Gangrene.

Cicatrices how they are to be prevented.

There are likewise oftentimes very unsightly and deformed Cicatrices left remaining after the burning, by reason of the extraordinary drying caused by the Fire. If this be feared it is then to be prevented by applying of Emollients during all the time of the Cure. But those Remedies that are wel enough known to be over drying we ought not to make use of them for the producing of the Cicatrice: to wit, the part is to be fomented with that Decoction that was but even now propounded, as touching the Contraction of the Members. And afterwards the part is to be anoynted with this Liniment:

Take *Oyl of Roses, and white Lilies, of each half an ounce; Mans fat, Hens fat, the fat of the Fish Thymallus, of each three drams; Oyl of Myrrh half a dram, the Juyce of Earth-worms half an ounce; Mingle them.*

The Diet.

And withall let there be a good and right Course of Diet appointed unto the Patient. Let his Diet therefore be such as is Cooling and moistening; and let the sick Person eat Brothes, in which Endive, Sorrel, Lettice, and Borrage were boyled: and on the Contrary let him abstain from those things that are hot, sharp, and salt: let him drink no Wine, but Barley Water, or smal Beer. If need require, there may likewise be appointed the opening of a Vein, and the Purgation of the Body.

Chap. 19. *Of a Gangrene and Sphacelus.*

INdeed a *Gangrene* and a *Sphacelus* are neither Tumors nor Ulcers: neither (to say truth) is Sphacelus so much as a Disease; but only the very Mortification and deadning of the part; but then the Gangrene is a notable and extraordinary Distemper, tending unto the aforesaid Mortification; which may likewise invade the Party without any Tumor at all; yet notwithstanding becaus that most frequently it followeth Tumors, and especially Inflammations, there are some therefore that among Tumors do treat of the Gangrene, and the Sphacelus. But there are others, who (becaus that when the part is Gangrenated an Ulcer necessarily followeth thereupon; and in regard that after the Sphacelus there is an Ulcer left remaining) treat of the Gangrene and Sphacelus among the Ulcers: and these we chuse to follow, and therefore it is that in the end of this Tract touching Ulcers, we thought fit to say somthing of the Gangrene, and the Sphacelus.

A Gangrene what it is.

Now the Gangrene (which they call the Fire of *Marcellus* or St. Anthonies Fire) is an imperfect Mortification or Corruption of a part, tending unto a *Necrosis*, that is to say, a deadness or Mortification; unto which unless there be speedy and fit Remedies administred for the Curing thereof, the Member becometh altogether dead, loseth all sense and life, and feeleth nothing at all, whether it be Cut or burnt: which *Necrosis* being already thus far perfected is by the Latines termed *Syderatio*, and by the Greeks *Sphacelus*; so that these two Maladies differ not but only in their greatness. For in a *Sphacelus* the part is wholly deprived of all sense and life, and is altogether dead: but in a Gangrene there is not as yet present a perfect Corruption of the part. And in regard that in a Gangrene there is not as yet so great a Corruption, neither a perfect and absolute Mortificacion, therefore it only invadeth the softer parts: but now the *Sphacelus* (in regard that it is a perfect, entire and absolute Corruption of the part) doth not only invade the softer parts, to wit, the Skin, the flesh, the Veins, the Arteries, and the Nerves; but it likewise corrupteth and spoyleth even the very bones themselves. And yet nevertheless we acknowledg, that in the *Sphacelus* likewise the softer parts are at first only corrupted, and that not the bones, but the Veins also, and the Arteries, and the Nerves, remain and continue safe and sound; but yet if the putrid part be not speedily separated, it cannot possibly be avoided but that the more solid parts must likewise be infected with this putridness.

The difference between a Gangrene & Sphacelus.

The

The Causes.

Whenas therefore in the Gangrene and Sphacelus there is caused a Mortification of the Member; in the Gangrene indeed one that is but only beginning; but in the Sphacelus a perfect and absolute Mortification; and that the mortification of the part dependeth upon the destruction of the innate and natural heat (as on the contrary, the life of the part dependeth upon the preservation and safety of the said Native heat) we conclude that whatsoever destroyeth the Native heat of the part, that same may likewise be accounted a cause of the Gangrene and Sphacelus. Now the Native heat is destroyed, when by its contrary it is either corrupted or suffocated, or dissipated, or altogether extinguished for want of Aliment. It is destroyed by its contrary, either acting by a manifest quality, and cold; or else by a secret and hidden quality, as by poyson. It is suffocated, when the transpiration is hindered: It is dissipated by a greater heat: It is extinguished, if necessary food and sustenance be denied: so that there are (as you see) five causes of the Generation of a Gangrene and Sphacelus: to wit, overmuch cold, a poysonous quality, the hinderance of transpiration, a vehement external heat, and a defect of Aliment, and the heat flowing in.

For first of al we see that oftentimes (in the Winter) those that take Journeys in the Snow and Ice have the extream parts of their feet, and of their hands, their Ears, and their nostrils almost dead with cold, by reason of the vehemency thereof: and thus it happeneth somtimes also, that by reason of Medicaments over cooling in a Phlegmone, or an Erysipelas, carelessly and incautеously administred, the part is taken and surprised with a Gangrene, or a Sphacelus: although I had rather refer this case unto transpiration hindered.

There is also a very great power of destroying the innate heat in those things that are poysonous, and such things as destroy our Bodies by a secret and hidden quality. For somtimes the humors in our bodies do so degenerate, and acquire so great a malignity, that they bring a *Necrosis* or deadness unto those parts whither they are by Nature thrust, as we see it done in a Carbuncle. And so in like manner the biting and stingings of poysonful Creatures do corrupt and putrefie the parts. And the same also is done by the Septick Medicaments, which if they be not wisely and carefully administred have in them a power of corrupting the flesh; especially in places that are hot and moist, as in the Emunctories, the privy parts, and the other places that are like unto these.

Thirdly, Transpiration hindered exciteth likewise a Gangrene. For whereas our heat standeth in need of perpetual ventilation and cooling, if this be denied, it is suffocated by the abundance of Vapors. And for this very cause in great Inflammations, and especially in the moist parts, there very frequently happeneth a Gangrene, the Native heat being extinguished; as otherwise likewise we see that a little flame is extinguished and put out by casting thereon good store of water; and that the flame is stifled if it be put under a Cupping-glass that hath no hole or vent in it, or any other Vessel whatsoever that is kept covered, which is preserved in a Cupping-glass that is perforated, or any other Vessel that is open. And this chiefly happeneth, if in Feavers (especially if they be malignant) the humors be with violence either thrust forth, or that of their own accord they rush unto any one part. And so I remember that here a certain Citizen that was taken with a malignant Feaver, from the humors that were thrust down unto the *Scrotum*, had the said *Scrotum* al of it so inflamed and mortified with a Sphacelus, that there was a necessity of cutting off the whol *Scrotum* or Cods, so that the stones hung down altogether naked and bare; which yet notwithstanding (the Gangrene being cured) became afterwards covered again with flesh that grew out of the Groyns. That Inflammation likewise which the Gangrene followeth is sometimes caused by Wounds, and these not alwaies great, but oftentimes also very smal and sleight Wounds, that seem inconsiderable, and of no moment. So *Henricus ab Heer* relateth in the first Book of his rare Physical Observations, Obser. 12. That he was present and saw a man fifty nine yeers of Age, who having pared the Nails of his Toes, and cut them to the quick, was presently surprized with a Gangrene, and within a very short space died thereof. And he telleth us likewise of two other eminent persons, who being desirous to have the hard and callous brawnines of their feet pared away, were both of them taken with a Gangrene that within a short time caused their deaths. And this may likewise be done by Emplastick Medicaments, in great Inflammations, and especially if they be unseasonably applied in moist places, which frequently produce there a suffocation of the Native heat.

Fourthly, A preternatural heat likewise, and such as is extraneous and from without produceth the Gangrene, by wasting the Radical moisture, and the Native heat: and so many times a Gangrene followeth after great burnings.

And lastly, A Gangrene ariseth from the defect of Aliment, to wit, the blood, and the spirit flowing in, that is altogether necessary and requisite for the cherishing of the Natural heat implanted within. For whereas the innate heat standeth in need of continual Nutriment (as the flame doth of Oyl) if this be denied, it languisheth and is extinguished; like as is the flame when the Oyl in the Lamp faileth. And in this manner a Gangrene happeneth unto the external parts of the body, somtimes in an Atrophy, Consumption, and the like Chronical and long continued Diseases

that extenuate the body. And for this very cause it is that when the greater Joynts are put out of Joynt, if they be not again wel and rightly set, then the disjoynted bone presseth together the vessels that lie neer, and hindereth the influx of the blood, and of the Spirits into those parts that lie underneath; from whence there followeth a leanness and consumption of the said parts, and in process of time very frequently a Gangrene also. And so it is found by experience, that from a hard Tumor about the *Vena Cava* (where parting several waies it descendeth into the Thighs) pressing the same together, and hindering the descent of the blood into the Thigh, a Gangrene very often ariseth. And in this manner a Gangrene likewise happeneth, if any part be too hard and long bound about with Ligatures and bands; or else if Medicaments that are over astringent shal be imposed upon any part.

Signs Diagnostick.

It is no hard matter to know the Gangrene. For the color of the part beginneth to be changed and turned unto black, the flesh to grow loose and flaggy, the pulse and sense to be diminished, and the heat to be abolished. Which said Symptoms the more the Gangrene tendeth unto a perfect corruption and a Sphacelus, by so much the more are they increased and made more evident. For in a perfect and absolute corruption and Sphacelus the life and sense of the part are wholly abolished; there is no pulse at al to be perceived; the part, whether you cut or burn it, is insensible of pain; the flesh appeareth to be cold, is made soft and flaggy, so that it yieldeth unto the touch when it is pressed by the fingers; which yet nevertheless, after it is throughly dried, becometh black, wan, and altogether deadned, and it yieldeth a noysom and stinking savor like that of a dead Carkass; and the skin if it be taken up with the fingers seemeth to be separated from the flesh lying underneath it. And here *Ambrose Parry* adviseth every Physitian, that when he hath discovered by these signs that there is a Gangrene, and a Sphacelus, he no longer defer the doing of what is to be done, neither suffer himself to be deceived by the motion; some whereof is oftentimes stil left remaining even in a mortified and dead Member. For in a Sphacelus the corrupted parts are moved, not by the motion of the whol and entire Muscle, but because the Head (and no more) of the Muscle is yet whol; the which while it is moved, it doth together with it draw the Tendon that is inseparable from it, and the tayl likewise thereof, although it be now wholly dead, and without any true and proper motion.

And these signs (that appear in a perfect corruption and Sphacelus) are stil the same in every one of them; whatsoever the cause be that it draweth its original from; whether it be from cold, or from a poysonous quality, or from transpiration hindered, or from an extraneous heat, or lastly, from the defect of Aliment; unless it be in this only that such like Symptoms in a Sphacelus that hath its original from an occult cause and such as is poysonous (as for example, the *Delirium* or dotage, the *Syncope*, and the like) are greater and more grievous. But in a Gangrene and mortification that is but yet now beginning, there is observed a diversity of the signs and symptoms, according as the Gangrene hath its original from divers and different causes. For in a Gangrene that ariseth from cold there suddenly appeareth an acute and pricking pain, and a redness in the part, which soon after is changed into a black color; and the heat that was in the part is extinguished; and there is perceived a coldness and stupidity (with a certain kind of horror) as it useth to be in Quartan Agues. And moreover, in a Gangrene that proceedeth from a poysonous and malignant humor in the body, which Nature thrusteth forth unto the external parts, there is present a continual Feaver, and a strong conflict of Nature with the Disease; from whence the *Syncope*, Dotage, and the like, have their original; and such a Gangrene as this ariseth for the most part in the external Members, and the extream parts thereof, (as for instance, the great Toe of the Foot) with a certain Pustule or Bladder, (under which there is present a black spot) which oftentimes is suddenly derived into the whol Leg and Thigh.

But that Gangrene that followeth upon great and extraordinary Inflammations (that proceed most usually from the hinderance of Transpiration) is known by this, That the fresh and flourishing color that is wont to appear in Inflammations is turned into that which is pale and wan; that beating pain which before did infest now ceaseth, the sense is become dul, and there arise very great Pustules that are ful of a thin ichorous excrement, like unto that that cometh from the washing of raw flesh. Which appear almost the same, when the Gangrene hath its original from an extraneous heat. If lastly, the Gangrene seize upon the part by reason of the want of Aliment, or through a dry distemper, then there is present neither pain nor inflammation, nor swelling, but rather a leanness, and the body is immediately cooled; and this Gangrene happeneth for the most part in those places of the body that are the utmost and extream, as for instance, the Ankles and Toes. But when at length the Pustules arise, and the part becometh pale and wan, then the pains likewise appear, and the Feaver is excited. But if the Gangrene happen by reason of hard tying and Ligatures, then the part swelleth and is distended, and there arise greater Pustules, ful of a thin excrement, resembling the washing of raw flesh: but the evident Causes we may easily learn and understand from the sick person himself.

Progno-

Prognosticks.

1. That the Gangrene is a Malady very dangerous is sufficiently manifest unto every one. For unless it be speedily cured, it degenerateth in a very short time into a Sphacelus, and the part becometh altogether dead. For this cause therefore there is not any the least delay to be made; but help is to be afforded with al possible speed: which may be done with less difficulty in a body that is as yet young, strong and vigorous, where the vital spirits are as yet entire, and especially where the Muscles and Nerves are as yet unhurt.

2. But that Gangrene which is with an afflux of poysonous humors, and an occult quality, is more difficult to be cured than that which is without any such afflux: for there are but very few that recover of such Gangrenes.

3. There are Gangrenes that are yet more dangerous, and these are they that begin in the moist parts: for the innate heat is sooner suffocated in such parts by the great store of humors abounding therein.

4. And for this cause it is that the Gangrene that ariseth in Hydropical persons is likewise very seldom cured, but most usually it degenerateth into a Sphacelus; and that which ariseth from the Antecedent Cause is likewise ever more dangerous than that which hath its original from the primitive Cause; in regard that in the former the Bowels are more affected.

5. But a Sphacelus is yet far the more dangerous Malady. For the part that is taken with the Sphacelus can no way be restored and made sound again; but it is forthwith to be cut off, and separated from the part that hath life: which if it be not speedily done, then the sound parts that lie neer wil likewise be infected, and the putridness wil at length creep into the rest of the body, from whence there wil be extream danger of present death; before which there usually precede Dotings, Watchings, the *Syncope*, Convulsions, Ructures and Belchings, Sobbings, and a cold Sweat breaking forth over all the Body: and some of them die while they are yet speaking, and others of them die being as it were oppressed with sleep.

The Cure.

The Cure of the Gangrene that it may be rightly proceeded in, first of al regard is to be had unto the Dyet (and the Antecedent Cause, if it be present in the body) before ever we come to Topicks. Most Physitians prescribe and command a Diet that is cool and drying: which albeit that it be most true of that Gangrene that is accompanied with an afflux of Humors, and followeth great Inflammations: yet nevertheless the Diet is sometimes also to be varied according to the variety of the Causes; as anon in the species or several kinds of Cure we shal further shew you.

And so also the Evacuation of the blood, and the preparation and purgation of the vitious humors ought to be enjoyned, according to the Nature of the peccant humors. This in the general is to be pre-cautioned, that regard be had unto the Heart, that it be wel and safe guarded against al the malignant vapors that exhale from the putrifying part. And therefore we must here administer for the comforting and strengthening of the Heart, Medicaments of Borrage, Bugloss, Carduus Benedictus, the smallest Sorrel, Bole-armenick, Terra sigillata, Bezoar stone, Citrons, Treacle, Mithridate, Species of Diamargarit. frigid. Electuarium de Gemmis, Confection of Hyacinth, Alkermes, and the like. Or,

Take *the Water of Scabious, Sorrel, Borrage, Roses, and Carduus Benedictus, of each one ounce and half; Syrup of Sorrel, Citrons, and Pomegranates, of each one ounce; the species of Diamargarit. frigid. Bole-armenick, and Terra sigillata, of each one scruple; Mingle them, and make a Potion.* Or,

Take *Conserve of Roses two ounces; of Sorrel, of Borrage, and of Gilliflower, of each one ounce; Citron rind candied, Rob de Ribes, of each half an ounce; prepared Margarites, Bole-armenick, Terra sigillata, the temperate Cordial Species, of each one scruple; Syrup of Sorrel, and of Citrons, as much as wil suffice, and mingle them.*

Let the Heart be likewise guarded externally with Topicks: As,

Take *the Water of Roses two ounces; of Borrage and Sorrel one ounce and half; of Carduus Benedictus one ounce; Vinegar of Water-Germander six drams; Spirit of Roses one scruple; Mace, Lign-aloes, Rinds of the Citron, of each half a dram; Saffron half a scruple, Camphire six grains: Mingle them, and make an Epithem,* which must be applied unto the Region of the Heart, for its defence and preservation.

In a Gangrene likewise for the most part the sound part ought to be fenced and guarded; and we must be alwaies doing our endeavor, that the said part receive none of the putridness. And for this end the above mentioned Defensives of Bole-armenick, and Terra sigillata must be administred; unto which (by reason of the malignity) Water Germander may be added, and mingled therewith. As,

Take *Bole-armenick one ounce; Terra sigillata half an ounce, Harts-horn burnt and prepared one dram, Camphire half a dram, Wax six drams; Oyl of Roses four ounces, Rose Vinegar one ounce, the juyce of Water Germander half an ounce, the white of one Egg: mingle them and make an Unguent.* As,

Take *Bole-armenick, and Terra sigillata (or sealed Earth of Lemnos) of each half an ounce: Mingle them with Vinegar of Water Germander.*

Gulielmus Fabricius frequently made use of this that followeth.

Take *Barley meal four ounces; Bolearmenick two drams, Galls, Cypress Nuts, Pomegranate rinds, of each one dram and half; with a sufficient quantity of Oxymel simplex make a Cataplasm.*

A Gangrene from overmuch cooling.

But now that we may come unto the more special Cure, we will in the first place declare unto you, in what manner the Gangrene that hath its originall from an overgreat cooling ought to be Cured. But now that it may be wel known, how and in what manner al those are to be dealt withal that have been over cooled (whether it be so that the Gangrene be already present and in being, or that it be only neer at hand) we wil from the very beginning briefly pursue and declare the truth of the thing.

The Cure of such as are overcooled.

If therefore there be any one over cooled, yet notwithstanding that as yet there is no Gangrene present; neither is the part as yet become wan, pale, and cold, but that there is rather a redness in the part, together with a vehement and burning pain; then in this case the man is not instantly to be moved neer unto the Fire, but he is rather to be placed somewhat more remote from it, that so by degrees the heat may recover and recollect it self. But if it be so that the part be not altogether stiff and stifled with cold, so that there be no longer any blood left therein, then it is forthwith to be wel chafed, and rubbed with Snow; or the overcooled members are likewise to be throughly washed with cold water, upon which they wil begin by little and little to wax warm, and to recover their former heat. Which the Inhabitants of the Northern Climates have much in use; who are wont when any Travellers are overcold, stiff, and almost dead therewith, first of all to plunge them deep into cold water; and before ever they give them any entertainment, to wash and rub their Hands, Feet, Noses, and other Members, with Snow. And that from the inward parts the heat may the more strongly diffuse it self unto the external parts, and that all the cold may be expelled, it wil be requisite to administer suppings made of Wine, and to drink Wine and Treacle mingled together. The aforesaid People of the Septentrional Regions use to give their Guests (when they are almost dead with cold) Hydromel, with the Pouder of Cinamom, Cloves, and Ginger, and the like Spices; after which they put them to bed, and cause them there to Sweat. For which purpose there be some that outwardly apply likewise unto the body Flagons or Stone Pots ful of hot water. Afterward when the pain and the coldness are something mitigated, gentle rubbings with the hands anoynted with the Oyl of Camomile, sweet Almonds, and Dil, are to be administred; and the parts are to be fomented with sweet Milk, in the which there may also be boyled the Leaves and Berries of the Lawrel, Rosemary, Camomile, Sage, Organy, French Lavender, and the like. The Decoction of Rape roots is likewise singularly useful; and commonly unto those members that are pained with overcoldness they use to apply the Decoction of Rape roots that have been first frozen with cold.

After this we must betake our selves unto those things that are hotter, such as the Oyl of Lilies, of Turpentine, of Wax, Nettle seed, Cresses. But if there be not only a fear of a Gangrene, but that there also be one already present, and that the Member already begin to die, we must then use our utmost endeavor that the heat may be preserved in the part, and that from other parts it may be again called back unto it: and therefore here is little or no benefit to be expected from Defensives, but Scarifications are rather to be administred, and the parts to be fomented with those hot Medicaments that were but even now mentioned; unto which we may add Scabious water, Germander, the Root of *Asclepias* or Swallow-wort, and the like. Unto the parts there may be administred, Treacle, Mithridate, Trochisques of the Viper, the Ley in which Water Germander hath been boyled, and Treacle Waters.

A Gangrene from the afflux of Malignant humors.

Secondly, If the Gangrene hath its original from the afflux of Malignant humors, or a malignant quality; then by appointing a Cooling and drying Diet, and by administring of Meats sauced and seasoned with Citrons, Lemmons, and Pomegranates; and likewise by evacuating and emptying forth of the peccant and depraved humors, either by opening a Vein, or by purging Medicaments (if need require, and that the nature of the Disease, and the strength of the Patient wil bear it; but we are here alwaies to take heed how we give those things that are too strong) the Malignity is to be expelled, and the depraved matter to be driven forth from the more inward unto the external parts; and such a like Cure almost is here to be instituted, as is wont to be in malignant Fevers; to wit, there are Medicaments to be administred of Citrons, Sorrel, Roses, Borrage, Water Germander, Carduus benedict. Dittany of Crete, Swallow-wort, Angelica, Treacle likewise and Mithridate. And we must do our endeavor that a Sweat may be provoked by these medicaments, and that the Poyson may be driven forth from the Noble members unto the exterior parts. Which that it may the more successfully and more eafily be done, the malignant matter is likewise by Topicks to be drawn forth unto the external parts.

Where we are also to take notice, that if poyson stick outwardly unto the body (as it happeneth oftentimes from the strokes of poysonful Creatures) then Defensives are to be administred, lest that

that the Poyson creep broader, and spread it self unto the more interior and Noble parts. But if the malignant matter be bred in the body, then Defensives are by no means to be administred; but the said Matter is only to be called forth unto the external parts; unto which end Scarifications may be administred unto the part affected, Cupping-glasses likewise and Leeches may be applied; and moreover the part also may be washed with the Decoction of those Medicaments that resist malignity and putridness; such as are Wormwood, Rue, Dittany, *Asclepias* or Swallow-wort, Angelica, and especially Water Germander, which is of a most soveraign virtue in all Gangrenes, and that that hath in it an extraordinary power to preserve from putridness. And others there are that to attract do make use of the Raddish root, the Seed of Cresses, and the like.

But if Poyson shal chance unto the body from without, and shal either by a blow, biting, or any other touch be transused into the part affected; then those Medicaments that do strongly attract the Poyson, dry it up, and consume it, are to be made use of: for which end and purpose, an actual Cautery may most fitly be administred. The part affected being either scarified, or burnt, then there are further to be applied those Medicaments that resist putridness, and prevent the *Necrosis* or Mortification, and such as do also attract and draw the offensive and depraved matter; as an Emplaster of the aforementioned Medicaments; with which we may likewise mingle Leven, and Garlick roasted in the Embers. And at length, the Gangrene being in a fair way of recovery, if there hath happened any Ulcer from the scarification or burning, it is then to be cleansed by Medicaments of the Juyce of Smallage, and Honey of Roses (unto which if need be, there may be added some Spirit of Wine) and other things are moreover to be done that are fit and convenient for the Ulcer.

A Gangrene from Inflammation

Thirdly, The Gangrene that is wont to follow upon great Inflammations, and to arise from the abundance of blood and humors that suffocate the Natural heat of the part, is cured in this manner. First of all, the Diet that is appointed ought to be slender, and such as is cooling. The blood and humors that flow overmuch into the part are to be emptied forth of the whol body, by opening of a Vein, Scarifications Cupping-glasses, Purgers, and other convenient Remedies; and lest that they should any longer flow into the affected part, they are to be drawn back, and derived unto some other place; and round about the part affected there is some kind of Defensive to be applied, as we told you above, in the first Part, Chap. 5. touching an Inflammation.

And then immediately the blood and humors that are corrupted in the part, and suffocate the Native heat, are to be evacuated out of the part affected, that so the cause may be taken away, and the former heat and vigour may be restored unto the Member.

Wherefore the part must presently (since that there is danger in delay; and the blood that hath already begun to be corrupted, by reason of its abundance and thickness can hardly be digested or dissipated by Medicaments) be scarified with many sections, and these ought to be made deep enough; and of the corrupted blood a sufficient quantity (to wit, great store and plenty thereof) is to be evacuated. And yet nevertheless, in the greatness and depth of the Incisions, we ought to have respect unto the greatness of the Affect it self; and according as the Affect is more or less nigh unto putridness, and a *Sphacelus*, so thereafter the Incisions are to be moderated. Some likewise there are that apply Leeches, or the lesser sort of Cupping-glasses, if the blood be not sufficiently and plentifully evacuated by scarifications alone. The Incision being made, the part is to be washed with salt water, or a Ley; unto which we may likewise add Lupines, or Aloes, and boyl them together; that so if any of the thicker blood continue yet sticking in the part, it may be washed off; and that the Reliques or Remainders of the putrid matter may be evacuated; and al possible resistance made against the putridness. And for this end, this Decoction following may be made use of; with the which the affected Member (as often as any new Medicaments are applied) is to be washed.: *Viz.*

Take *of the strongest Ley, and of the best Vinegar, of each one quart; of Water Germander, Lupines, Wormwood bruised, of each half a handful; of Flowerdeluce root, round Aristolochy, and Swallow-wort, of each half an ounce: let them all be boyled to the consumption of the third part; unto the streining add of Aloes and Myrrh pulverized, half an ounce; and then let them boyl once or twice again: at length add Honey of Roses one ounce, Spirit of the best Wine three ounces; Mingle them, &c.*

When the part is washed, then the Ægyptiack Unguent is to be laid on; which here is reputed the most excellent of all the rest, as being a most efficacious Remedy for the taking away of putridness, and for the separating of the dead flesh from the sound. But if the Corruption be more then ordinary, then *Gulielmus Fabricius* compoundeth such a like Remedy as this following, which likewise resisteth malignity.

Take *Rust of Brass three ounces, of the best Honey, and with the Decoction of Wormwood, and Water Germander scummed, one pint, Vinegar of Squils, six ounces, Alum, and Salt Armoniack, of each half an ounce; the Juyce of Rue, and Water Germander, of each two ounces; boyl them to a good thickness: and afterwards add of the best Treacle and Mithridate,*

of

of each half an ounce; Camphire one dram, and mingle them.

This Water is likewise very useful, if a wollen Cloth be wet therein, and so imposed upon the place affected; it hath likewise been happily and successfully administred in the Gangrene of the Cods; of which we have spoken above.

Take *Vitriol one ounce, the tops of the Oake one handful, Frankincense half an ounce, Camphyre two drams, Urine two pints and half; boyl them to the Consumption of a third part, and then strain them.*

But the Ægyptiack Unguent is not alone to be applied, but upon the Unguent that Cataplasm is also to be imposed, which resolveth, drieth, and hindreth putrefaction; such an one as *Johannes de Vigo* in his second Book, first Tract, and seventh Chapter describeth and commendeth; and which many other Physitians and Chirurgeons now a daies likewise make use of. And all these are to be applied blood-warm; and they are so long to be continued, untill the putridness be removed.

But if the Malady wil not yield unto these Remedies, then we are to have recourse unto those that are stronger, to wit, Causticks, such as those Trochisques of *Andro*, *Polyidas*, *Musa*, and *Pasio*, which dissolved in Vinegar and Wine may be imposed upon the part. Many indeed do here commend, and prefer Arsenick before all other Remedies; but *Gulielmus Fabricius* doth (and not without good Cause) reject and altogether disallow of it in the Cure of a Gangrene, as that that not only hath in it a Septick and putrefying faculty, and a quality of melting the flesh, as it were; but that likewise produceth very great and grievous Symptoms, vehement pain, Dotings, Syncope's, and the like, the malignant vapours being communicated unto the principal part. It is therefore more safe to make use of an actuall Cautery, as that which hindereth and preventeth putridness, drieth and corroborateth the part.

This is also much commended.

Take *Mercury*; *dissolve it in Aqua fortis*; *when it is dissolved, precipitate it the Oyl of Tartar*; *after it is precipitated, wash it.* Or Mercury alone dissolved and mingled with the Water of the Trinity Flowers; and wollen Cloaths wet in this Liquor may be imposed on the part.

The Crust in what manner soever it be produced is to be taken away by those Medicaments that have been above declared, in the first Part, and Chap. 13. touching a Carbuncle. Neither are we to wait so long til Nature shal altogether have separated the Corrupt from the Sound, but the highest part of the Crust is with the edge of a Knife or a Penknife to be cut even unto the found part, that so there may be a way made for the Medicaments unto the deeper parts, and the rest that are corrupted. For if we expect until the Crust shal be freed of its own accord, it may possibly hrppen, that under the Crust a new putridness may be contracted. The rest of the Cure is in the same order to be proceeded in, as is fit to be done in Ulcers.

A Gangrene from too much heat.

Fourthly, If the Gangrene happen from overmuch heat, then (a Cold Diet being prescribed, and the hot humors being duly qualified and evacuated) if the Malady take its original from an internal Cause, the Member affected is to be scarified, and then washed with such a Decoction as this.

Take *the Water of Endive, Sorrel, Lettice, Nightshade, and Vinegar, of each one pint; Syrup of Sorrel, two pound, of Lupines half an ounce, Water Germander half a handful, Salt three ounces: boyl them till a third part be consumed.*

After this the Ægyptiack Unguent, and the Cataplasm but even now mentioned, is to be imposed; and the rest which were before prescribed are speedily to follow. Where notwithstanding this is to be observed, that (unless in case of urgent necessity) we must not have recourse unto the actual Cautery, lest that hereby (to wit, by the power and force of the fire) the extraneous heat, which is the Cause of the Gangrene, be augmented.

A Gangrene by reason of an Atrophy in the part.

Fifthly and lastly, If the Gangrene arise from the defect of Aliment, and Blood, and Spirits, and chiefly in truth if it be by reason of a Drineſs, and an Atrophy (necessary Nutriment being denied unto the part) then meats that are hot and moist, easie of Digestion, and such as generate much and good blood, are to be given unto the sick Person; and outwardly the body is likewise to be moistened with Oyntments of sweet Oyl, or with Oyl of sweet Almonds; and all things are carefully to be avoided that exsiccate and dry the body. And unto the part it self that is already affected with the Gangrene the Aliment is by all manner of means to be attracted. And therefore here there is no place left for Defensives; in regard that they shut and stop up all passage of the blood and Spirits unto the part affected. And therefore we are not only to anoynt the part affected and the other members with the Juyce of Earth-worms, which is made of the said Earth-worms first washed in Water, and then in Wine, & so put into a great Vessel with good store of the Oyl of sweet Almonds & Violets, and melted by a gentle and moderate heat over hot Embers, and afterwards strained (which is a special and soveraign Remedy in the Atrophy, and extenuation of the parts) but the part affected is therwith likewise gently to be rubbed and chafed; unto which also Cupping-glasses not scarified are to be applied. But it wil be most fit and requisite, if there be already present a putridness, to

administer

adminiſter thoſe things that do alike both attract and reſiſt putridneſs; ſuch as are, Salt Water boyled with Water-Germander, Liquid Pitch, with the meal of Lupines, of the bitter Vetch Orobus, Myrrh, and the like. But if the Gangrene hath already made any progreſs, the part is then to be ſcarified, and the Ægyptiack Unguent, and that likewiſe that is compounded of Pitch, and thoſe other things a little before mentioned, are to be laid thereon.

A Gangrene from the interception of the blood & ſpirits.

Moreover, If the Gangrene happen from the interception of the Blood, and the Spirits likewiſe, (whatſoever the Cauſe then be that thus intercepteth the blood and the ſpirits) it is immediately to be taken away; as, if the ſaid interception be from the binding of the part, it is forthwith to be looſened; and withal thoſe Medicaments that reſiſt putridneſs, as likewiſe thoſe that diſcuſs that that is corrupted (ſuch as are thoſe that are made of the Meal of Beans, of the bitter Vetch Orobus, of Lupines, Aloes, Water-Germander, and the like) are to be impoſed. And if the Gangrene hath already gotten unto any heighth, the place is to be ſcarified; and thoſe other things that are required in al Gangrenes, are to be done. If an aſtringent and repelling Medicament be the Cauſe, the ſaid Medicament being removed, the heat is to be recalled by Frictions, Lotions, and Anointings. And ſo we muſt alſo proceed in the Gangrene that hath its original from other Cauſes that intercept the Spirits. For the Cure of the Gangrene it ſelf doth ſcarcely at al differ; the difference lying only in the removal of the Cauſes. But if the Malady be come to that, that the Member is now already altogether mortified and dead, and that it be ſphacelated, from whatſoever cauſe it be that the Malady hath its original, there is then one only way of curing it. For ſeeing that what is altogether dead in the body cannot poſſibly recover life again, and that it hath now altogether the nature of a thing that is preternatural, there is this one only Indication, to wit, that it is to be taken and amputated from the body. Which if (by reaſon of the unfitneſs of the place) it cannot conveniently be done, then the caſe is wholly deſperate. For ſome parts are much more fitly ſituated for amputation than others; as for inſtance, the fingers, the feet, the hands, the genitals may be cut off with leſs danger. But if the Malady be in the Thorax or Cheſt, or in the Belly, the parts cannot then be cut out, and eſpecially if there be many particles of the Member at once infected. For it ſometimes ſo falleth out, that the whol Member is not to be taken away, but only ſome part thereof. But oftentimes indeed the whol Member is wholly to be amputated and cut off, to wit, when the putridneſs hath ſeized upon and corrupted al the parts thereof round about: which in ſome may be ſpeedily done, and without any great danger, as in the *Scrotum* or Cods; but in other parts the amputation is ful of difficulty and peril; as in the Feet, Arms, and Hands. But after what manner the ſaid amputation and the taking away of that which is corrupted is to be performed, we wil now acquaint you. Now this may be done divers waies; ſome there be that having firſt applied a Defenſive upon the ſound part, they then with many ſtraight and oblique Sections ſcarifie the dead fleſh that lieth neer unto the ſound; and this they do very deep, even unto the very bone. And afterward upon the Wounds they ſtrew the pouder of Arſenick and Sublimate, that ſo the mortified part may be ſeparated from the ſound. But in this way of extirpating the corrupt fleſh, Arſenick (as we lately gave you notice) is ſuſpected; and therefore in the ſtead thereof we are to adminiſter other burning Medicaments, of the aſhes of Vine-ſprigs and unſlaked Lime. The Cruſt that is al over the part affected is to be taken away with a Pen-knife; neither muſt we expect til it be ſeparated of its own accord. Yet nevertheleſs, that the dead part may be dried, and be eaſily ſeparated from the ſound, *Fallopius* applieth this Sparadrape:

Take *Aloes, Myrrh, Acacia, Gallia Moſchata, Alipta Moſchata, al the Saunders, Lign Aloes, Cumin, Allum, of each one dram; make a Pouder:* Of which,

Take *one ounce; Ship-pitch, Roſin of the Pine-tree, Colophony, of each two ounces; Frankincenſe, Maſtick, Styrax liquid, of each one ounce and half; Gum Arabick, and Tragacanth, of each half an ounce: Let them be all melted; put a Linen cloth into the Liquor until it be throughly ſoaked in the Medicament.* And afterwards let al other things be done, as it uſeth to be in other Ulcers. There are others that with an actual Cautery burn that that is corrupted, even until there be a pain perceived in the part; and al other things are afterward to be done according to art.

But now *Fallopius* doth adviſe us (if much dead fleſh be to be taken away) not to make uſe of an actual Cautery alone, in regard that from the ſaid burning there wil be cauſed a moſt abominable loathſom ſtench. Others there are that by Section and the Razor amputate that that is corrupted; and afterwards to avoid the Hemorrhage, and to dry up and conſume the reliques, they apply likewiſe an actual Cautery, if need require. But what hath hitherto been ſpoken touching this way and method of Curing, is to be underſtood only of that Sphacelus wherein the whol Member is not corrupted, and when there is no cauſe of taking away the Bone likewiſe.

For

The cutting off the corrupted Member, when to be done.

For if the whol Member be corrupted, and therefore to be amputated; this cannot be effected either with an actual Cautery, or a Potential; neither yet with a Razor; but there is a neceſſity of cutting off the whol entire Member, the Foot, the Hand, &c. But in what manner this amputation ought to be performed, Authors differ much in their opinions concerning it. *Celſus* in his ſeventh Book, and Chap. 33. perſwadeth us to make the Section between the ſound fleſh and the dead; and rather to take away ſome of the ſound, than to leave any of the dead fleſh remaining, leſt the Malady that is left corrupt that that is ſound. Which way of curing moſt of our late Phyſicians diſapprove of, by reaſon of thoſe dangers that follow the Section in the ſound part, to wit, an immoderate profuſion of the blood, and an extraordinary great pain, and the faintings and ſwoundings that depend upon theſe. And therefore that theſe may be avoided, they adviſe us to make the Section in the corrupted part alone. *Fallopius* indeed with a Razor cutteth into the dead fleſh (even unto the bone) a fingers breadth diſtant from the ſound part; and then after this he forthwith taketh away the bone with the ſaw; and then again with Irons red hot he burneth the greater Veſſels, and the fleſh, even unto the cauſing of pain. *Hieronymus Fabricius* alſo leaveth a portion of the ſound fleſh (as much as one fingers breadth) and appointeth the Section likewiſe to be made with a Razor in the dead fleſh; and he afterwards burneth the part with fire-hot Irons (after the ſame manner) to hinder and reſtrain the Hemorrhage, and to waſte and conſume the reliques of the putrefaction.

But here in this place we are to adverтiſe you, that ſomtimes the putridneſs wil yet creep further, and infect the neer neighboring parts; but then again, that ſomtimes the putridneſs ceaſeth, neither doth it creep any further unto the parts neer adjoyning; which whenſoever it happeneth, then round about the corrupted part there appeareth a Circle that is exactly red, and of an exquiſite ſenſe. In the latter caſe indeed, that way of curing ſeemeth not altogether improper and unfit, in a part that is corrupted and dead. For by this means thoſe many dangers which accompany that Section that is made in that part that is alive, are prevented; to wit, the profuſion of blood, pain, and faintings; ſince that through the corrupted part the blood cannot paſs; and becauſe that the ſaid part hath no ſenſe at al. But if there be any of the dead fleſh left remaining, this, when the putridneſs ſhal ceaſe any longer to creep (although there ſhal not be any Cauteries adminiſtred) wil afterwards divide it ſelf of its own accord; and then it wil be ſeparated by Nature, upon the adminiſtring of fit and proper Medicaments. But if as yet the putridneſs be creeping forward, and that Nature hath not as yet of her own accord begun to ſeparate the ſound from the corrupt, then the Section cannot be inſtituted in the corrupted part alone, without preſent danger. For it oftentimes falleth out, that in the interior parts, and in the bottom of a Member, the corruption penetrateth far deeper and further than in the skin it appeareth to do. For the Muſcles and their Veſſels in the interior parts (in regard that they are there hotter than they are without) do eaſily receive the putridneſs. Wherefore if any wil yet be inſtituting the inciſion in the mortified part, ſeeing that he leaveth behind much putridneſs in the interior parts, either he wil haſten ſudden death upon the ſick perſon (by leaving the ſaid putridneſs that wil be alwaies creeping further, deeper, and broader) or elſe by reiterating and renewing of the Section he muſt needleſly and unadviſedly again excruciate and torture the Patient. Neither maketh it any thing at al to the matter that the pain is excited in the ſound part. For as *Celſus* ſaith in the place before alleadged, it is little or nothing material, whether that guard and defence be ſufficiently ſtrong and ſafe, that is but one alone. And as *Hippocrates* hath it, *Unto extream Diſeaſes the Remedies that are to be adminiſtred muſt likewiſe be extream.* But in very truth, the pain may in a manner be moderated, and the ſenſe obſcured by the faſtening on of the Ligatures, intercepting the paſſage of the Animal Spirits for a certain time, as we ſhal afterward ſhew you; and likewiſe how with a very ſharp Razor the Section ſhal be almoſt quite finiſhed, before ever the ſick Perſon ſhal perceive what it is in doing. But yet they themſelves who make the Section in the the Corrupted part cannot (notwithſtanding) hereby prevent all manner of pain. For ſo ſoon as the bone is cut aſunder with the Saw, then there happen very ſharp and moſt acute pains, becauſe of the *Perioſtium*, or that Membrane that encompaſſeth the bones; which pain if any would avoid, then of neceſſity he muſt make the Inciſion with the Saw in that part wherein the ſaid Membrane it ſelf is dead: which if he ſhould do, without all doubt even there likewiſe the bone it ſelf is corrupted, and there would be ſo great a putridneſs left remaining in the Veſſels, and in the Muſcles (which are very apt & ready to receive the ſaid putridneſs) that it cannot poſſibly be afterwards all of it extinguiſhed, no not with the Cautery it ſelf. Neither do thoſe Cauteries themſelves take away all that is corrupt without much pain; of which there ought indeed many to be applied and adminiſtred, if all the dead fleſh that there remaineth be to be taken away. And moreover, Cauteries have likewiſe in them theſe inconveniencies, that by their vehement heat they melt the fat and the humors; and they ſo vehemently heat the parts, that thereupon in thoſe parts that have their ſenſe and feeling there is an extraordinary pain excited; and the fleſh for the moſt part is ſo conſu-

consumed by the force of the Fire, and withall contracted, and wrinkled, that a great part of the bone sticks forth naked and bare, which very often requireth a new Section. The Hemorrhage likewise is not so greatly to be feared. For if the Vessels be intercepted by Ligatures (as we shall shew you) there wil not then flow forth much of the blood. And if the blood should chance to flow forth in somwhat a greater abundance then ordinary, yet this would make rather for the benefit of the sick Person, then be any waies prejudicial and hurtful unto him. For by this means the blood in the Vessels that haply hath received some putridness, is evacuated; and so by this means al the danger is taken away and prevented, lest that the putridness should creep any broader, and by spreading it self any further should again prevail and get strength.

That we may therefore briefly declare unto you after what manner the said Section ought to be performed, Universals (if the malady wil admit of any respite and delay) are not to be neglected; and especially there is a due regard to be had to the strength of the Patient. Let the sick Person therefore first of all eat a potcht Egg with a piece of Bread toasted, and throughly soaked in Wine; and let him be strengthened with Perfumes, Epithems, and other Cordial medicaments. Some there are that before they set upon the Section do prescribe some kind of Narcotick Medicament, to dull and stupefie the Sense: but *Fallopius* much blameth these; for (as he saith) gentle and sleight stupefiers benefit little or nothing; and as for those that are strong, they are very dangerous. After this, the sick Person being fitly placed, and held fast by the standers by, or (if need be) fastned by tying, and the Muscles being drawn upwards towards the sound part, upon that part in which the section ought to be made the Member is most strictly and very hard to be tied down with Ligatures. By which binding, first of all the overgreat flux of blood is prevented; secondly, the sense of the part (by the shutting up of the Animal Spirits) is somwhat dulled; and thirdly, the Muscles that are by this means drawn upwards (the Section being ended, and the bands loosned) do again devolve and move downward, that they may cover the extream and naked parts of the bones.

The place of Amputation

As concerning the place of Amputation; in the Fingers, and Toes, the Section is most fitly made in the very Joynt. For in the Joynt (if at least the Malady will admit thereof) the Amputation is made with the least danger, and likewise with the least pain. For the Nerves and the Tendons so soon as they are cut assunder they are instantly contracted upwards, and covered with flesh, neither doth there follow any Convulsion hereupon. But if in the Feet the Sphacelus transcend the Ankle, then the Leg is to be cut off a little below the Knee; so that the Patient may be the better fitted and accommodated with a wooden Leg. For which cause (in the Leg) the amputation is not alwaies to be made in that part that is neerest unto the dead part, but there is oftentimes also much of the sound part to be amputated. For if much of the Leg be left, this wil be very burdensome unto the sick Person, and a great impediment to him in his motion. But then on the Contrary, in the Arm, as little as may be of the sound part is to be amputated; but the Section ought to be instituted as neer as may be unto the corrupted part.

And therefore when we have made choyce of the most convenient place, then with a very sharp Razor the Section is to be made even unto the very Bone; and if it may be done, the very *Periostium* is likewise to be cut in sunder; and if there be any smal portion of the flesh left behind, or if there be any of the flesh hid betwixt two Bones (lest it should afterwards hinder that Section that is made with the Saw) that flesh is likewise to be cut off with a Knife that is fit for the purpose. And then instantly, and with as much speed as possibly may be, the Bone is to be amputated with the Saw, unless the Section be in the Joynt; for the nthe Member may be amputated with the Razor alone. The amputation of the Member being finished, the next thing to be done is the stopping of the flux of blood, after that it hath flown forth sufficiently. Most Practitioners burn the Vessels with a Cautery. But *Paræus* much disliketh this course; for he conceiveth it indeed to be very cruel and barbarous, in regard that it causeth an extraordinary great pain, if the Section be made (as it ought to be) in the quick and live flesh; and very bad and dangerous Symptoms happen unto the Nervous parts: unto which we may add that by the said burning very much of the sound flesh is consumed, whereupon the bones are left bare, and the flesh, together with the Cicatrice, either it is not at all brought over the naked part; or if it be, it is not without much difficulty. And therefore he Practiseth another way of stanching the Hemorrhage; to wit, with a Crows-bil he laieth hold upon the Vessels, and draweth them altogether, & then bindeth them as close as may be. The Vessels being thus straitly tied together with a Ligature; or (if you judg this more) fit shut up close with a Cautery; the bonds are then to be loosened, and the courser part of Flax or Hemp (we call it Hurds) after it hath been throughly soaked in the White of an Egg, and sufficiently besprinkled with a Pouder that hath in it a virtue and faculty of stanching the blood, is to be laid upon the Member. And yet nevertheleles for the most part, without any such Ligature or Cautery, the blood may likewise be stopped and stanched after this manner; As,

Take *the finest Flour three ounces, Dragons blood, Frankincense, Aloes, of each two drams;*

Bole,

Bole armenick, Terra Sigillata, Paraet or Plaister, of each one dram; Water Frogs prepared (though there be some that for this use and purpose do rather commend those of them that live among Trees) *one ounce; the Flix of a Hare cut very small, a thin Spunge torrefied by the Fire, of each two drams, and make a Pouder.*

Upon the Vessels likewise that pour forth blood there may very fitly be applied and laid on that Mushrom so much used by Chirurgeons to stanch blood, which they cal *Crepitus Lupi.* Others there are that make up Emplasters of Dragons blood, Bolearmenick, Terra Sigillata, and the finest Volatile flour (and the like) with Pitch. Afterwards the Trunk of the amputated Member is to be safe guarded with those Defensives, or such like, as we have above mentioned; the like unto which is this also that followeth; which is to be applied with Hurds, and Swath-bands, having been first wel and throughly soaked in Oxycrate.

Take *Bolearmenick, Terra Sigillata, Dragons blood, Mastick, Paraet, Oyl of Roses, and Oyl of Myrtle, of each one ounce; Whites of three Eggs, Vinegar as much as wil suffice, and make an Unguent.*

And this is the first dressing, or the first binding up; which is not to be loosened (in the Summer time) before the second or third day; but in the Winter, not before the fourth day at the soonest, unless in cale of urgent necessity.

And in the mean time the Member is to be placed in a direct middle posture or figure, in Pillows stuffed with the haits of Harts, or Wheaten meal. The first binding being loosened, and the first Provision taken away, again with the White of an Egg, as before, the Pouder stanching the blood is to be applied; and the extremities of the bones to be covered with a piece of the dry Liniment; and in the end the Wound to be bound up with some kind of Digestive.

And this Cure is so long to be continued, until there be now no cause of further fear that any mischief may follow upon the Hemorrhage, and that the Wound be now become Purulent. For then these Medicaments being laid aside, we are to make use of Cleansers. *Gulielmus Fabricius* commendeth this Unguent following of the Juyce of Smallage, not only for the Gangrene, but likewise for other sordid, foul, and Malignant Ulcers:

Take *the Juyce of Smallage, of Water-Germander, of Waybred or Plantane, and of Rue, of each two ounces; Honey of Roses strained one pound; boyl them to the Consistence of a Syrup: and afterwards mingle therewith the meal of Lupines, the Pouder of round Aristolochy root, of Angelica root, of Swallow-wort, and of Treacle, of each half an ounce, Aqua vitæ one ounce; make an Unguent.*

In the mean time we must do our endeavor that the Lips of the Wound may be drawn together, and afterwards that flesh may cover the bones, and may be unto them in stead of the Pillows. *Paræus* and others sew together the lips of the wound in the form of the letter X: but a Suture (which they cal the dry Suture) seemeth to be far more convenient; or else by a Glew, which is done after this manner. A Linen Cloth of a convenient figure and bigness, moistened throughly in a Glew of Astringent, Emplastick, and viscous Medicaments (such as are Bolearmenick, Dragons blood, Gum Tragacanth, Sarcocol, Mastick, the White of an Egg, and the like) is to be laid upon the place. As,

Take *Mastick, Dragons blood, Bolearmenick, Sarcocol, and the finest Volatile flour, of each half an ounce; Rosin of the Pine Tree two drams; mingle them with the White of an Egg. Of this Linen Cloth let there be made Emplasters which are to be applied unto the extremity of the Wound on both sides.*

So soon as the Emplasters are become dry, so that they begin to stick too fast unto the Skin, then we use to annex unto them little handles to hold by, of Thread twice or thrice doubled; and with them we contract the lips; and this may likewise be done in a suture that is more thin sewed.

And then at length we must do to the utmost of our endeavor, that the extremities of the bones which were hurt by the touch of the Iron and the Air may fal off. For which end, some there be that burn the utmost parts of them with a red hot Iron; yet stil taking great heed lest that the flesh, and other of the sensible parts be hurt thereby. Others make use of the Emplaster of Betony, and other Caragmatick or Fracture Medicaments. And so within thirty or fourty daies whatsoever there is of the bone corrupted wil fall off. If the flesh be luxuriant or proud (as we sometimes term it) it is then to be represled and kept under by the Pouder of Alum, and the like, and at length the Cicatrice is to be brought over it. But whereas pains do in the mean time much infest and disquiet the sick Person, and that there is cause to fear lest that Convulsions arise thereupon; the Trunk or Stump of the part that hath been cut asunder, yea and the Neck likewise, and all the Spinal Marrow is to be anoynted with those Medicaments (that are otherwise also wont to be applied unto affects of a Nervous Nature) made of Sage, Rosemary, Marjoram, Rue, Lavender, Dil, Camomile, St. Johns wort, Bayberries, the Oyl of Earth-worms, the Oyl of a Fox, Turpentine, and the like.

The Scorbutick Gangrene.

We must not here pass by in silence the Scorbutick Gangrene, touching which we have already spoken something in the third Book of our Practise, Part 5. Sect. 2. Chap. 4. Which most usually

usually beginneth about the extream part of the Foot, with black and purple spots; and a little after this there appeareth from hence a crusty and Gangrenous Ulcer, dry, and yielding forth neither the thin Excrement *Sanies*, nor yet the thicker, which we term *Pus*; and then one or other of the Toes beginneth to die, and then there appear red lines, and purple spots upon the juncture of the Foot, according to the length of the Leg. I have my self seen some examples of this Disease. But both this Gangrene and Sphacelus differ from that Gangrene and Sphacelus that are both of them wel and commonly known, and that in many things. For that Gangrene that is so wel and commonly known hath its original for the most part from Causes that are manifest and apparent; and there alwaies floweth forth of the Member that is dead in such a like Sphacelus a stinking and wateriſh humor; the Member becometh soft and putrid, and it sendeth forth from it a grievous and noysom stench, like unto that of a dead Carkas; and it creepeth much in a very short time, and most commonly it soon destroyes and kils the man that hath it. But now the Scorbutick Gangrene almost ever appeareth and invadeth the person without any manifest cause, creepeth forward but very gently and slowly, and doth not destroy the person therewith affected until after a long time: for I knew a Noble-man that lived above three months, but a certain School-Master I saw that lived above six months notwithstanding this Malady. The part affected with this Gangrene is altogether dry, so that there floweth out of it nothing at al; and when the corrupt part is taken away by the Iron, although a red flesh offer it self unto the view, yet nevertheless that same red color is withal somwhat dark and blackish; and the day following it likewise is even found to be dead also; and there is here no stink at al perceived that offendeth. And moreover, so soon as ever the Malady hath first of al seized upon one of the feet only, then presently after (without any manifest cause at al) there begin to appear in the other Leg and Foot also certain spots and blemishes of a red or purple color; and then likewise not long after this, one or other of the Toes of that Foot becometh wan and leaden colored, and in a very short time it is found to be quite dead: and at length most commonly the party (as it befel that Noble person before mentioned) being taken either with the Apoplexy, or with the Epilepsie, upon the first approach thereof dieth.

And yet notwithstanding, this Malady sometimes invadeth suddenly; to wit, when the peccant humors are by wrath, terror, or the like Cause, first disturbed, and then afterwards thrust down suddenly (and as it were in a moment) unto the Toes; and first of al to some one of them only; after the very same manner as the *Erysipelas* or *Rosa* is wont suddenly to arise: and this humor (in regard that it hath in it a very bad and destructive quality, or else hath received it from some affect of the mind) causeth that part that it seizeth upon instantly to die: and hence it is that by some this kind of Gangrene and Sphacelus is in special called *Syderatio*; whereas otherwise the Gangrene is wont in the general also to be termed *Syderatio*. Now this said humor seizeth upon the Tendons most usually; from whence there arise most terrible and intollerable pains that torment and grieve the sick person both day and night; which said Tendons, in regard that they do not so easily and soon putrefie as doth the flesh; hence it is that this Gangrene likewise creepeth on so slowly, that sometimes (unto the external view) it is a whol months space in overspreading one only joynt, and ere it seize upon another, albeit that within almost al the Tendons of the Foot are already infected: and this Malady continueth sometimes a quarter of a yeer before it kil the person, and it is seldom or never cured, in regard that this depraved humor hath insinuated it self more deep than usually into the Tendons, and therefore cannot be so easily taken away. So a certain Noble person (that had otherwise a Cacochymical and foul body, and was subject unto the *Erysipelas*) upon a fear and terror (Nature then suddenly thrusting down the vitious humors unto the little Toe) was surprised with a Gangrene, which afterwards by little and little overspread likewise al the rest of the Toes, and almost the whol Foot, with extream great pain; upon which (after the space of three months) he died.

Of this kind was that Gangrene also, with which a certain Citizen here (about thirty yeers of age) was taken in the month of *January*, 1633. He first of al complained of a pain in his left Arm, neer unto the Elbow; which he making light of, the pain descended unto his Hand; and it was presently taken with a cold Tumor or Swelling, and at length became suddenly overspread with a purple color; so that now there appeared manifest signs and tokens of mortification, and a Gangrene. Yet notwithstanding, upon the administring of fit and proper Medicaments (of which we shal speak more hereafter) his Hand had its natural color again restored unto it, and the swelling vanished away; so that there was nothing further to be seen, but only in the very tip of the little Finger the Scarf-skin appeared to be somwhat wrinkled; upon the opening of which there flowed forth a little of an humor; and the Skin underneath appeared pale, and so the very tip of the finger was taken with a Gangrene; which yet nevertheless (without any diminution of the Joynt) was cured. In the curing whereof we found this one thing wel worth our observation, that from the said finger most sharp and exquisite pains were extended into the whol Hand, insomuch that the sick person was even afraid to betake himself unto his bed; but that rest and

sleep he took was in the night time as he sate. When his finger likewise was handled by the Chirurgeons, the pains that he felt were so great, that he could not endure the least touch; the feet moreover swelled much, and his face was something more swoln than usually.

Neither indeed wil any man that is not a stranger unto what is done in the practice of Physick admire that some vitious and depraved humor by Nature her self thrust unto some Member should be able suddenly to mortifie and deaden it. Certain it is that a potential Cautery of Lye (out of which Sope is made) doth within the space of an hour, or at the utmost in two hours time, mortifie that part upon which it is imposed; whenas notwithstanding it is made only out of the Salt of Woods, and of unslaked Lime. What wonder is it therefore, that some humor of the same Nature, salt, sharp, and malignant, being now separated, & acting a part by it self from the rest, by the which it was tempered and qualified (as *Hippocrates* tels us in his Book of the Ancient Physick) should effect somewhat like unto the former.

Of all those that have been affected with the Scorbutick Gangrene (of whom I made mention before) no one ever recovered, besides that Citizen, that was taken with a Gangrene in the little Finger of his left Hand; he himself being (as I saw good cause to judg of him) a Scorbutick person. Now the Medicaments by which he was cured are these that follow.

Take *of the Apoplectick Water, and the Spirit of Juniper berries, of each two ounces; the Spirit of Wormwood, and of Cherries, of each half an ounce; Sage water, and Lavender water, of each one ounce; Mingle them.*

This Water was oftentimes prepared; with the which the affected part was washed, or else Linen Cloaths moistened therein were laid upon the part.

Take *Conserve Cochlear. two ounces and half; of Betony and Sage, of each one ounce and half; of the temperate Cordial Species, and pleres archont. of each one scruple; Rob. of Juniper two drams, Syrup of Betony one ounce, Make an Electuary.*

Take *Conser. Cochlear. three ounces, of Sage two ounces, Species Dyaxyloaloes one dram, the Candid Rinds of Citron half an ounce, Rob. Juniper, two drams; with the Syrup of Betony make an Electuary.*

Take *Oyl of Juniper berries one ounce, Oyl of Earthworms two ounces, Oyl of Flowerdeluce, one ounce; Mingle them.*

Take *the Essence of Carduus Benedictus, and of Wormwood, of each two drams; Cochlear. half an ounce, the Elixir of propriety one dram, the Spirit of Water Cresses one scruple; mingle them.*

Take *of Fennel root, and Asparagus root, of each half an ounce; Pimpernel two drams, the Herb Harts Tongue one handful; Germander, and Groundpine or Herb Ivy, and Dodder, of each half a handful; Anise and Fennel seeds, of each two drams; Juniper berries two drams and half, the Flowers of Bugloss and Liverwort, of each one pugil; Raisins cut small one ounce: boyl them in Spring Water unto seven or eight ounces: unto the straining ad of Sugar two ounces and half: And then again let it boyl once or twice, unto the Consistence of a liquid Syrup; and then add of Cinnamom water half an ounce, and mingle them.*

Take *Asparagus Roots, and Fennel Roots, of each half an ounce; Pimpernel, and Succory of each two drams and half; the Herb Maidenhair, Agrimony, Harts Tongue, Germander, of each half a handful; Anise seed, Columbines, of each two drams; Borrage, and Bugloss flowers, of each half a pugil; boyl them in a sufficient quantity of Water, unto half a pint: unto the straining add of the whitest Sugar two ounces; and again let them boyl up once or twice; and make hereof a liquid Syrup; unto which ad of Cinamom water half an ounce, and mingle them.*

Take *the Trochisques of Capars, and of Rheubarb, of each one scruple and half; Extract of Womwood, and Gentian, of each one scruple; Oyl of Cinnamom two drops; make Pils.*

Take *Trochisques of Rheubarb, Capars, Lacca, of each two scruples; Extract of Wormwood, and Gentian, of each one scruple; of Spleen-wort as much as wil suffice; and make Pills hereof.*

Take *Pills of Tartar with Scammony, and of Rheubarb, of each one scruple; Extract of the Pils Aggregative half a scruple, Oyl of Cloves one drop; with Betony water make Pils.*

Take *the Elixir of propriety, with the Juyce, one dram; Essent Cochlear. two drams, of Germander, Spleenwort, and Wormwood, of each one dram, and mingle, &c.*

Take *Lawrel leaves, Betony, Sage, and Marjoram, of each two handfuls, to wash the Hand withall.*

Take *Trochisques of Rheubarb, and Capars, of each one scruple, Extract of Succory half a dram, Centaury the less, and Carduus Benedictus, of each half a scruple; Make Pills forty five.*

Take *Leaves of Betony, Bay leaves, Marjoram, Sage, Rosemary, of each two handfuls; Flowers of Elder and Lavender, of each one handful; Stæchados of Arabia half an ounce; boyl them in Wine to foment the Hand therewith.*

Take *of the Nerve Emplaster three ounces, destilled Oyl of Sage one scruple, of Marjoram half a scruple; Mingle them, and make an Emplaster.*

Take *the Elixir of propriety two scruples, Es-*

sents

sent. Cochlear. and of Germander, of each two drams, of Elecampane, and Lign Aloes, of each half a scruple, Mingle them &c.

Take *the Leaves of Lawrel, and Betony, of each two handfuls; Marjoram, Sage, Organy, of each one handful; Flowers of the Arabian Stœchados half an ounce: boyl them in Wine for a fomentation of the Hand.*

Take *the opening Roots half an ounce, Agrimony half a handful, Leaves of the choyceſt Sene one ounce, Mechoacan half an ounce, Ginger one dram and half; boyl them in Spring water: in four ounces of the ſtraining diſſolve half an ounce of Manna, and then ſtrain it again, adding thereto one ounce of Sugar, and make a Syrup.*

This Cataplaſm was likewiſe made uſe of.

Take *Bean meal one ounce, Pouder of Water-Germander, Rue, Sage, Wormwood, of each half an ounce, and make a Cataplaſm.*

The little Finger with that next unto it (the Ring-finger) was oftentimes anoynted with the Oyl of Earthworms, which is made by putting the ſaid Earthworms waſhed into a Glaſs, & then encloſing the Glaſs in a Maſs of Dough, bake it in an Oven; and the Liquor that cometh from theſe baked Worms gather it together, and filtrate it.

But for the Curing of the Ulcer in the little Finger, after the Gangrene we uſed this Unguent.

Take *Oyl of Bays, Honey, Turpentine, of each two drams; May Butter, Gum Elemi, one dram: Mingle &c.*

Another Cure.

A certain Noble Perſon having had his Foot wrung with his ſhoe, in that very place where the hurt had bin there aroſe a black Puſtule in the ſole of the right Foor. Which he not much regarding, there inſtantly followed a Gangrene, which in that place ſeized upon the Fleſh. Which ſo ſoon as it was obſerved, the affected fleſh was preſently ſcarified; and the Puſtule being cut with a pair of Cizers, the Ægyptiack Unguent was impoſed upon the part affected. After this the Defenſive of *Vigo* was applied unto the Foot; which is in this manner prepared.

Take *Oyl of Roſes Omphacine, and Myrtles, of each three ounces; the Juyce of Plantane and Nightſhade, of each two ounces; boyl them to the Conſumption of the Juyces, and then ſtrain them.*

Add of white Wax one ounce and half, Meal of Lentiles, Bean meal, and Barley meal of each half an ounce; of all the Saunders, of each two drams and half; Bolearmenick one ounce, the Berries and Leaves of Myrtle, of each one dram; Mingle them, and make an Unguent, with the which let the part affected be anoynted.

Upon this Unguent there were impoſed Linen Cloaths wel wet in the Water following; and they were often renewed.

Take *Barbers Ley two Quarts, of Lupines groſſy beaten three handfuls; boyl them, until the Lupines become ſoft: let the Ley be ſtrained; and in the ſtraining diſſolve of Saffron two ſcruples; Mingle them.*

The Scarification of the place affected, and the laying on of the Ægyptiack Unguent (together with the Defenſive) was thrice repeated the firſt day: the Water that was likewiſe applied.

The day following the corrupt fleſh was cut forth, and the ſame helps and Remedies adminiſtred.

The third day the corrupted fleſh being wholly removed, the following Digeſtive was impoſed.

Take *of pure Honey two ounces, of Bean meal two drams, of Choice Myrrh half an ounce, the Whites of two Eggs, Saffron ſix grains; Mingle them, and make an Unguent.*

And together with the foregoing Unguent there was likewiſe adminiſtred the Emplaſter of *Vigo*, ſuch a one as this:

Take *Bean meal, the Meal of the bitter Vetch Orobus, of Lentiles, of Lupines, of each four ounces; Juyce of Wormwood, ſix drams, common Salt half an ounce, Oxymel ſimplex as much as will ſuffice; boyl them over a gentle Fire, and make an Emplaſter.* The uſe of theſe Medicaments being for ſome daies continued, the ſick perſon was thereby perfectly cured.

Hitherunto touching Ulcers in general; and particularly concerning the Gangrene and Sphacelus, both that Species of them which we term Scorbutick, as alſo thoſe other that are ſo wel and commonly known. It remaineth that in the next place we ſpeak ſomething of what is oftentimes amiſs in the Skin, Hair, and Nails.

THE

THE FIFTH BOOK, THE THIRD PART.

Of the Vices of the Skin, Hair, and Nails.

Sect. I. *Of the Vices of the Skin.*

Chap. 1. *Of the color of the Skin changed, (in general) and in special touching that blackness that is contracted from the Sun.*

NATURE being very sollicitous and careful in the preservation of the health of Mans Body doth alwaies that which is for the best; and therefore she expelleth the vitious humors that are heaped up in the body from the principal Members, and the greater Vessels unto the more external parts, and the superficies of the body; from whence there arise many kinds of Tumors, Tubercles, and Pustules, as likewise divers sorts of Ulcers; as also divers kinds of spots and blemishes, and changes of the color. Whereas therefore we have already treated (in the first and second Part) of Tumors, Tubercles, Pustules, and Ulcers, (and withal made mention there of the Measles, small Pox, and certain other spots and blemishes) as there it is to be seen; we wil now handle those things that remain in this Part; and withal we wil treat of the Vices, that is to say, whatsoever is amiss in the Hairs and Nails.

The changes of the color of the Skin.

And in the first place indeed for what concerneth the Vices and blemishes of the Skin, the changes of its color are many and various. First they are Universal, and of the whol body; as in the Cachexy, Scurvy, yellow Jaundice, the white Feaver of Virgins (commonly called the Green-sickness) touching which we have elsewhere spoken. Secondly, they are particular, and of some one part of the body; as in a *Suggillation*, *Erysipelas*, *Gutta Rosacea*, *Impetigo*, *Lichen*, *Vitiligines*; touching al which we have already spoken in our handling of Tumors; as also the blackness contracted from the burning of the Sun, those spots and blemishes appearing in the faces of Women great with child; as those they cal *Ephelides* and *Lentigines*, which are spots and blemishes of a dark and reddish color, that in their color and figure do very much resemble Lentiles. And moreover likewise those spots and blemishes which are contracted from the very birth and infancy; touching which we are now to speak. And first of al, among these blemishes we wil speak somthing of that affect which they cal *Ephelius*, that is to say, heat-wheals, or smal hard pushes in the face. Where notwithstanding we must give you to understand (as a little before wetold you likewise) that many of the Tubercles, Spots, and Blemishes of this kind, although they are now with us commonly and generally wel known; yet nevertheless by what names these like Affects were called by the Ancients is not so wel and sufficiently known. And this appeareth even out of *Celsus*, who in his sixth Book, and Chap. 5. thus writeth: *The regarding of these* Vari *or Pimples*, Lenticulæ *or Freckles, and* Ephelides, *so as to cure them, is but a meer folly and foppery* (saith he) *but yet nevertheless it is likewise a thing altogether impossible to take from Women the care they have of the beauty and handsomness of their faces. Now then, of those that we mentioned before, the* Vari *and* Lenticulæ *are commonly known; although that species be somwhat more rare which the Greeks cal* Phacos, *since that kind is a* Lenticula *somwhat more red, and more unequal. But as for the* Ephelis, *the most are generally ignorant, as not wel knowing what it is; it being indeed nothing else but a certain roughness, and an hardness of an ill color. The rest of them are to be found no where in the body, but only in the face; but the* Lenticulæ *are wont likewise to arise and appear in some other part.* And I am altogether of opinion, that even out very ordinary Women are sufficiently acquainted with these Affects; which said Affects notwithstanding, viz. *Vari*, *Lenticulæ*, and *Ephelides*, what Affects they were with the Ancients is not sufficiently manifest. If the *Ephelis* that *Galen* mentioneth in his seventh Book of the faculty of simple Medicaments be written by the Greek Letter ν, then without all doubt it hath its name from the Sun, so that they are certain spots contracted from the Sun. But *Celsus* (unless it be an error and mistake of the book) writeth the word with the Greek ε, *Ephelis*, and saith that it is a roughness and hardness of an evil color; which wel agreeth not with those spots. *Eustachius Rudius* (in his second Tract, second Book, and Chap. 4. of the Affects of the external parts) saith that the Greeks *Ephelis* is *Panus*; and that *Panus* indeed may infect any part whatsoever

soever of the body, especially the Groyns, the Abdomen, the Back, the Neck, and the middle Region of the Breast: but for the most part nevertheless (as he writeth) it defileth the very Forehead it self. But in regard that *Celsus* reckons up the *Ephelis* among those Affects that never appear but in the Face, we have therefore determined above (in the first Part, and 29. Chapter) that those broad spots that appear about the Groyns, Breast, Abdomen, Back, and Neck, and dye the said parts with a certain kind of duskishness, that is one while somwhat greenish, and another while somthing reddish, and as soon again of a color inclining to black (and which are generally wel known) are more fitly to be referred unto the *Alphus Niger* or the black *Alphus*. And he (the aforesaid *Rudius*) doth likewise ill in calling the *Ephelis* by the name of *Panus*; and his determining that *Ephelis* and *Panus* are one and the same Affect, is altogether false: since that out of *Celsus* his fifth Book, Chap. 18. *Pliny* his twenty fourth Book, Chap. 4, & 9. and likewise from other Physitians it is very cleer, that *Panus* is the Greeks *Phygethlon*; and that somtimes likewise *Phymata* are comprehended under the name of *Panus*. But there are some others also, that neglecting the Authority of the Ancients, cal those spots in the Face, especially in Women, by the name of *Pani*. *Hippocrates* in his Book of Women that bear not Children, page 245. (in *Foesius* his Book) writeth that this kind of spots is called *Ephelis*; when he saith, That *those women that are with child if they have a spot in their Face, as it were from the Suns burning, for the most part bear female Children.* Where for the most part is wel added, in regard that it is often observed also that Women great with Child, which have born Males, have had their Faces defiled with these kind of spots; so that these spots may rather be said to be a sign and token of the Conception in general, than particularly of the Sex that is conceived, whether it be Male or Female: Whence it is, that the Germans likewise cal it *Kinds flecken.*

But now, whereas there is a twofold *Ephelis*, one from causes external, another from internal Causes; of the latter of these we intend to treat in the Chapter following, but of the former we wil speak in this present Chapter. And indeed the first kind of these *Ephelides* is that wel known Affect, to wit, that blackness (which the Germans cal *Sommerbradt*) in the Face, the Hands, and those other parts that are exposed unto the Sunbeams, contracted from the heat of the Sun. And as wel men as women are subject unto this affect; but yet nevertheless more especially women, as having their Skin more tender, and chiefly in the Spring time. For whereas in the Winter the Face was not accustomed to much heat, if in the Spring it be suddenly exposed unto the Sunbeams, the Skin that before was white now beginneth to wax red with a certain kind of blackness.

Blackness from the Sun.

The Affect is of it self known from the Cause foregoing. And the Face is not only deformed with some certain spots, but the whol color thereof is changed.

Preservation from it.

But now this burning and blackness from the Sun may be prevented, if the Suns Beams be turned away from the Face by Shades and other Coverings, and the Hands kept covered with Gloves; or both the Face and Hands anointed with the white of an Egg, shaken together with Rose-water, or with the Mucilage of the Seeds of Quinces, or of Fleawort extracted with Rose-water, or Gum Tragacanth dissolved in Rose-water; or else let the face be anointed with the Emulsion of the four greater cold seeds, or let it be anointed with this Unguent.

Take *Unguent Pomatum two drams*; *Cerus dissolved in Rose-water one dram*; *Mastick half a dram*; *the Mucilage of the seeds of Fleawort one ounce*: *Make hereof a Liniment.*

And of these kind of Medicaments there is need most especially in the Spring time, when the tender Face can very hardly be sufficiently guarded from the heat of the Sun, and of the Air.

The Cure.

But if the Face be already as it were burnt, and a blackness be contracted, Nature indeed of her own accord is wont in process of time to change this deformity (when it draweth a new Scarf-skin upon the burnt place) if in the mean time the Face be covered from the Beams of the Sun. But these delaies being for the most part tedious unto women, they must in al haste have their pristine color again restored unto them by the help of Medicaments. And commonly women are wont to cleanse their Faces with the Leaves of the Cherry Tree while they are yet fresh and green. Others of them there are that use Rose-water wherein Camphyre hath been dissolved; and others of them make use likewise of the Cherry-tree Gum dissolved in Vinegar, whereunto they put a little Oat-meal.

And here likewise there is much use made of the Water of Bean flowers, of Mallows, and white Lilies: and those that are made of the four greater cold seeds destilled with Milk. Bitter Almonds are also here very useful. Or,

Take *the juyce of Plantane, and of Nightshade, of each one ounce*: *Litharge of Gold, and of Silver, of each one dram*: *burnt Lead half an ounce*: *Tutty prepared six drams*: *Camphyre half a dram*: *Oyl of Roses and Wax as much as wil suffice, and make an Unguent.*

Take *Roots of white Lilies rosted under the Embers two drams*: *the Root of the Herb Dragon-wort, and Solomons Seal, and Melons seed, of each two drams*: *the Mucilage of Fleawort seed one ounce*: *of the Citrine Unguent half an ounce, and make an Unguent according to art.*

CHAP.

Chap. 2. *Of the* Ephelides *in Women with Child.*

THere is another kind of these *Ephelides* that happeneth more especially unto Women with Child; and it hath its original from the Menstruous blood retained; which (in regard that for the most part from the said retention it contracteth a great deal of viciousness) is wont to excite in Women great with Child divers symptoms, as likewise these spots in the Face bred from a vitious humor thrust forth thither.

But now and then notwithstanding Virgins and Women that are not with Child have these kind of spots breaking forth in their Faces, if in the time of their monthly Menstruous flux they eat those kind of meats that (as they say) have in them a power of coloring; such as are the Carrot Roots, and the red Beets, and the like, which (as we are taught by Experience) do breed and bring forth these kind of Spots.

Signs Diagnostick.

These *Ephelides* in Women with Child are known, in that they are dark and duskish spots, appearing more especially in the Forehead, and deforming it, and spreading themselves both in length and breadth; and oftentimes they equal in length the palm of the hand, but they are void of al kind of roughness.

The Prognostick.

The *Ephelides* in Women are a sign of their Conception, (as we told you before out of *Hippocrates* his Tract of Women that never have Children) and they are seldom or never cured; and if haply they be taken away yet they soon return again, and with some they continue even unto the time of their Delivery, and after that they vanish, and in some they likewise continue after their Delivery; and in some others they also vanish before they are delivered (when the Child is now become strong and vigorous) like as do other symptoms that usually infest Women with Child in the beginning of their Conception.

The Cure.

Indeed it is very requisite that the depraved humors (that are the Antecedent Cause of this Affect, and are wont to nourish the same) should be evacuated; but in regard that in Women with Child we may not safely make use of those evacuations, we ought therefore to content our selves with Topical Medicaments. And here there is to be commended the use of Bayberries, if their rinds be taken off, and then they be beaten into a pouder, and so mingled with Honey, and made into the form of an Unguent, and the Face therewith anointed in a Bath. Or,

Take *Pouder of Lawrel Berries as much as you please, and with Mushrom Water make it into the form of a Pultis, with which let the Face be anointed in the Bath.* Or,

Take *Camphyre one dram; Nitre two drams; Mingle them with Honey, and let the Face be anointed with the said mixture.*

The Emulsion likewise that is made of the Seeds of Hemp is very useful.

For the spots that are in the Faces of Maidens while their Courses are upon them, and whilst they yet flow,

Take *the Juyce that is pressed forth of the root of Bugloss sliced, and with it anoint the Spots.*

Chap. 3. *Of* Lentigines, *Pimples, or Specks in the Face.*

AND hither belong likewise the *Lentigines*, which the Germans (from the color of dry Leaves) cal *Sommer strossen, Sommer flecken*, and *Lauf flecken*; and they are spots in color resembling Lentiles, with the which (in Women especially) the Face principally, and somtimes likewise the Hands, Arms, and upper part of the Thorax being exposed unto the Air is aspersed and overspread, they somtimes standing thicker, and somtimes thinner, like unto so many drops, as it were, without any pain and trouble; in some appearing indeed only in the Summer time, and vanishing again in the Winter; and in some likewise they keep their course from yeer to yeer.

The Causes.

But now they have their original from adust burnt blood seizing upon the Scarf-skin. And this happeneth more especially in ruddy bodies, that are of a Cholerick temperature, and especially in the Summer time when that vapor of the blood is more burnt. And hence it is that in the Winter for the most part these spots vanish, but then they return again and appear in the Summer. And they break forth chiefly in those parts that are exposed unto the external Ambient Air, the Face, the Neck, the Hands, and the superior part of the Thorax, because that the Scarf-skin is more burnt by the Sun, and the Ambient Air detaineth those burnt vapors in the Skin. *Platerus* is of opinion, that the Juyce that should nourish the hairs that are fixed in the Skin, being brought unto the pores of the Skin do cause these spots. For this humor (saith he) being first of al assimilated by them, and agreeing somwhat with them in color before they are put unto the Roots of them, if it be by them further dispersed any whither else into the superficies and circumference of the pores, it then produceth those kind of spots, and that dark and duskish color, somwhat (more or less) inclining unto that color of the hairs that it had gotten

gotten while it was assimilated by them. Which diffusion of this Juyce into the Pores proceedeth sometimes from the external heat overstrongly attracting it, and withall dilating the Pores, if then the Juyce nourishing the Hairs doth not only affix it self unto the roots of the Hairs, but diffusing it self further also, and there subsisting, causeth those Dusk, Dark, and Brown spots, more or less, according to the diversity of the colour of the Skin. But since that the Face wanteth Hairs, it is not credible that the Juyce ordained by Nature for the nourishing of the Hair should breed such kind of spots: but for the breeding of these like spots there sufficeth a portion of the adust blood, degenerating as it were into a Melancholly humor. *Platerus* also is of opinion that the overgreat Natural loosness of the Pores contributeth its furtherance, so that even by reason of them the said Juyce doth not only nourish the Hairs, but likewise produce these spots. But I had here rather assent with *Eustachius Rudius*, who thinketh rather that the *Lentigines* do arise from the thickness of the Skin, and therefore because that the Cheeks are more thin than other parts, therefore it is that although there come into them very many of these adust vapors, yet notwithstanding they are not detained in them, but are from thence gently evaporated; and so the *Lentigines* that are in them are but few: but because the Skin of the Fore-head is thicker, and that the vapors are not easily received in it, but being once received are the more detained there, therefore the Fore-heed doth the more abound with these *Lentigines* or Dusky spots.

Signs Diagnostick.

These *Lentigines* are easily known; because that they are Spots of the bigness a of Lentile, of a dark, brown, and dusky color, dispersed up and down in many drops as it were, standing close and thick together, and very familiar unto such as are of a red Hair; and they annoy the Face, the Neck, the Hands, and those parts that are exposed unto the Sun and the Air.

The Prognostick.

Those *Lentigines* as they have in them no danger at all, so for the most part they vanish in the Winter: but yet notwithstanding in some bodies they alwaies return again in the Summer; and in some they are Annual, and return constantly from yeer to yeer.

The Cure.

Galen for these Spots commendeth the Herb Costmary with Honey and Water, as also the seed of the Cabbage. Bitter Almonds are likewise very useful, and so is the Oyl of Eggs likewise. But most effectual is the Water of great Figwort, distilled out of that wel known Plant: as also the Water drawn out of the flowers of the spotted Satyrion; and lastly the Oyl of Tartar by draining. O,

Take *of Eldern flowers, and Bean flowers, of each a like proportion: pour in unto them Goats Milk blood-warm. Let them stand for a daies time in some cold place; and afterwards let them be destilled: and then,* Take *Bean meal as much as you think fit; let it be moistened with the said water, and in the evening let the Face be anoynted with that mixture.*

In the morning let the Face be washed with the water of Elder flowers, and Bean flowers; unto which there may be added a little Camphyre dissolved in the Spirit of Wine. Or,

Take *Honey four ounces, Oyl of sweet Almonds one ounce, Pouder of the Flowerdeluce root two drams, Borax half an ounce; make an Unguent.*

The Virgins Milk likewise (as it is called) is here very good; and it is thus prepared.

Take *of Litharge four ounces; boyl it in three pints of the best Vinegar, unto the wasting of a third part; when it is cooled, let it be strained through a filtring bag; and afterwards,*

Take *Sal Gem three drams; boyl it in cleer water unto the Consumption of a third part; then strain it: after this,*

Take *of this Water two parts, and of the former Vinegar one part; and mingle them.* Or,

Take *the Citron Unguent new made three ounces, of sweet Almonds throughly bruised, and Bean meal, of each one dram; the bone of the Sepia-fish, Harts horn, and Barley meal, of each two drams; let them be incorporated with Honey and then wel mingled together.* Or,

Take *the fresh flowers of Beans as many as you think fit; pour unto them a sufficient quantity of Goats Milk: let them stand infusing a day and a night. Afterwards let them be strained, and squeezed hard; and into the straining let new flowers be thrown in, and so let them stand infusing again for the space of a day and a night, and then let them be strained: this must be five times repeated. And then add of the soft pith of new Bread as much as wil suffice, that it may be made like unto a Pultise; and then adding thereto a little Goats Milk, destil them: With this Water let the Face be washed in the morning and evening.*

There are certain things likewise very usefull, that shall be propounded in the following Chapter.

Chap. 4. *Of Cosmetical, or Beautifying Medicaments.*

BUt yet although we have hitherto in the precedent Chapters spoken touching the taking away of divers of these Skin-spots; Women notwithstanding (that study little else but their beauty) are not herewith contented; but they

reftleſsly purſue after thoſe things that procure unto their Faces a luſtre and amiableneſs. For their ſakes therefore we wil add ſomthing alſo even of theſe Coſmetick or beautifying Medicaments. Now theſe Medicaments are of two ſorts; ſome of them do only mend the obſolete, dark, and blackiſh colour of the Face, and render the Skin ſomewhat more bright and cleer; (and theſe are by no means to be diſallowed of; ſince that they only reſtore unto Man or Woman that beauty which either by the injury of the Air, or by any other Cauſe, they have loſt and been deprived of; and withall do truly and really produce a fair and ſtable colour; and theſe are called Coſmetick or beautifying Medicaments:) but others there are that are only Palliative, and theſe we call Face-fucuſſes, becauſe that unto the Natural colour there is likewiſe added an adventitious and acquired white or red colour; and this is ſo painted on that continueth it for a while, and but for a while only, and deceiveth the Eyes of the Beholders. We ſhal ſpeak of the former ſort of Medicaments alone. But as for the latter ſort of theſe Medicaments, in regard that we judge it neither honeſt nor pious to make uſe of them, we wil therefore ſay nothing at all of them, but paſs them over in ſilence. But now as for what concerneth the former of theſe Medicaments, it ſeemeth altogether a thing unreaſonable to reject them, in regard that they bring over the Face no *Fucus*, or counterfeit painted beauty, but they only reſtore the Natural whiteneſs of the body, loſt upon any Cauſe whatſoever. And this is more eſpecially allowed unto Women; who becauſe that they are in Wiſdom, ſtrength of Body, Fortitude, and in ſome certain other things, much inferior unto Men, therefore in ſtead (of theſe as the Poet *Anacreon* tels us)

Nature on Women doth beſtow
A Comely form, and Beauteous hiew:
Inſtead of Lances, Targets, Shields,
Their Face a fair bright luſtre yields:
Which puts on Women ſuch a Grace,
That Fire and Sword to them give place.

And *Plato* (in his Phædrus) ſaith, *That of all things whatſoever Beauty is the moſt excellent and Amiable*, and there he calleth a Beautifull Face, a *Divine Face*, that is to ſay, *a Face ſhining forth by reaſon of a kind form that is put upon it.* But the other is altogether to be rejected by Women; and St. *Cyprian* writeth very truly, in theſe words of his (in his ſecond Tract, of the Habit of Virgins) *We ought not only* (ſaith he) *to admoniſh Virgins, or Widows; but I conceive, that even Married Women and all others whatſoever (in general) are to be admoniſhed, that the Handiwork and Image of God ought by no means to be adulterated, by adding thereto any yellow color, or any black Powder, or any kind of redneſs, or (in a word) any other Medicine that corrupteth the Native Lineaments.* And a little after; *They lay wicked hands* (ſaith he) *upon the Work of God, when as they go about to transfigure and reform that which he himſelf hath formed, as not knowing that all whatſoever is made and wrought is the work of God, but whatſoever is Changed is the work of the Devil.*

Now the Medicaments of the former ſort are ſuch as (almoſt all of them) do very much ſcour and cleanſe, by ſeparating from the Skin that Juyce that deformeth the ſame with this brown and duskiſh color, and by alluring thereto a new Juyce that may procure unto it a bright and beautiful color. Unto which there are ſomtimes added likewiſe certain Emollients, which have in them a power to ſoften the Skin when it is hard, thick, and rough; they alſo make it ſmoother, and more eſpecially they cauſe an extraordinary ſoftneſs in the Hands.

Milk wil ſatisfie both theſe ſcopes, and eſpecially Aſſes Milk, and Goats Milk: Which *Poppæa* the Wife of the Emperor *Nero* being not ignorant of (a Woman extreamly proud and luxurious) ſhe cauſed five hundred Milch Aſſes alwaies to attend her whitherſoever ſhe went; and in a great Tub made purpoſely for her to bathe in, ſhe waſhed her whole body in the ſaid Milk, that ſo it might be all over freed from wrinkles, made tender and delicate, and preſerved white; as *Pliny* relateth the ſtory in his eleventh Book, Chap. 41. and Book 28. Chap. 12.

Cleanſers are theſe; *the Roots of the greater Dragon-wort, Solomons Seal, great Figwort, wild Cucumber, white Lilies, the Elder, bitter Almonds, Pines, the four greater cold Seeds, French or Kidney Beans, Rice, Bean meal, the Meal of Cicers, of Lupines, Starch, the White of an Egg, Milk, Camphyre, Salt, Oyl of Tartar, Frankincenſe, Myrrh, the Crumbs of white Bread, the Oyly Nut Ben.*

Of the Roots of Dragon-wort there is a certain Gerſa made; which is nothing elſe but the Dregs or Lees thereof, as they commonly cal them.

And ſo alſo there may in the like manner be prepared ſuch a like *Fæcula* or *Gerſa*, out of the Roots of Solomons Seal, and great Figwort. And out of the Oyly Nut Ben (commonly called Balanus Myrepſica) there is an Oyl preſſed forth, that is called the Oyl of Been.

And likewiſe out of divers of theſe ſimples together that erewhile we mentioned there are made many deſtilled Waters, and divers Compoſitions. As,

Take *Root of Solomons Seal, Dragon-wort, great Figwort, of each one ounce and half; of the Flowerdeluce one ounce, of Bean flower two ounces, Maſtick one ounce, Borax two drams; let them be deſtilled.*

Take *the ſoft Crumb of White Bread three pound*

pound thereof, the Whites of Eggs wel shaken together, twelve in number; Goats Milk two quarts; let them be destilled. Or,

Take *Rice one pound, let it be steeped in the Water of Bean flowers, untill it break; afterwards add of choyce Mastick six drams, Borax two drams; and then destil them.* Or,

Take *the Pith or Crumb of White Bread one pound, Root of Solomons Seal half a pound, Goats Milk as much as wil suffice; and let them be destilled.* Or,

Take *Flowers of the Elder, and of Bean flowers, of each a like proportion; pour hereunto Goats Milk, and strain it; let them stand in a cold place for eight daies; and then destill them.* When you use the Water,

Take *of Beans hulled, beat them into a very fine Pouder, and cast the same into the said Water, and after this let the Face be washed with this Water, and permitted to dry leisurely of it self. In the end dissolve Camphyre in the Spirit of Wine, and mingle it with Eldern Water; and let the Face be washed with this Water.* Or,

Take *Whites of Eggs, in number twenty four; Cinamom two drams, Asses Milk or Goats milk, two Quarts, and destill them.*

Emulsions likewise made of the four greater Cold Seeds, bitter Almonds, and Pines, are here very useful.

There are also Decoctions made (with which the Face is to be washed) of Beans, Cicers, Lupines, Rice. Or,

Take *Roots of white Lilies, Solomons Seal, Borrage, of each one ounce, Mallows, Sope-wort, Parietary or Pellitory of the Wall, and Violets, of each two pugils; Beans hulled one handfull, Flowers of Mallows half a handful; make a Decoction, with which let the Face be washed.*

Liniments moreover and Unguents are made use of, among which are the *Pomacea* or *Pomata*, as they are commonly called. The Oyl of Talck is now adaies much in the mouths of many; and very much used in the Nurseries of great Women. But this last seemeth rather to belong unto the Face-fucusses then unto the true Cosmeticks, unless it be administred only to cleanse; and after the use thereof (when they go abroad in publick) washed off from the Face.

Medicaments that whiten the Hand.

But now the more Choice and delicate Women (that are unaccustomed to labor) do not only administer certain Medicaments unto their Faces, but unto their Hands likewise, that so they may become soft and white; and these Medicaments are made of the Crumb of White Bread, the Meal of Barley, of Cicers, of Lupines, and Honey, all which being wel wrought together with Water, or else mingled with soft Sope and Honey, they wash their Hands therewith. Or,

Take *Meal of Cicers, of Beans, of sweet Almonds, of each two ounces; the Roots of Flowerdeluce of Florence two drams; Honey and Rosewater of each as much as wil suffice; and Mingle them.*

And here likewise the Pomatum Unguent is of much use.

Or else such a Sope may be made;

Take *of Venice Sope one pound; let it be dissolved in Rose-water; add thereunto the Pouder of Flowerdeluce of Florence one ounce, the Meal of Cicers one ounce and half; and mingle them.*

There are likewise many other Medicaments (which we mentioned a little above) for the making of the Face fair and clear; and they are here also very useful.

Many other things there are of this Nature, that we may see in *Rondeletius*, in his Tract of Fucusses.

Of Mending and Beautifying foul and deformed Cicatrices.

What things they be that amend the deformed Cicatrice.

The rectifying and amending of deformed Cicatrices is not unfitly referred unto the Cosmetick or Beautifying Medicaments. For when as upon the Solution of continuity (either by reason of a Wound or an Ulcer) there is from the Juyce nourishing the Skin (for the uniting of the part) something generated that is like unto the Skin, and stiled by the name of a Cicatrice; this said Cicatrice is indeed like unto the whole skin; and yet it is oftentimes differenced from it in colour, and many times likewise in figure; because that somtimes it becometh more high and raised, and otherwhiles it is depressed & kept low, and leaveth as it were a pit, and so consequently a certain inequality or unevenness, and thereby breedeth a deformity; which in the progress of time is wont to be somewhat changed, whileſt that the Cicatrice is rendered day by day more like stil unto the Skin. Which if yet nevertheless we have a desire that it may be speedily effected, it may then be done by some certain Medicaments; such as are, first the Oyl of Myrrh, which is made if the Yelk be taken out of an Egg hard boyled, and then the Egg filled up with Myrrh, and put into a moist place, until it be all dissolved into a Liquor; and this likewise may be wrought by the destilled Oyl of Myrrh. The moisture also that sweateth forth of Eggs whiles they are in rosting is very useful for this purpose. The Oyl likewise of the Yelks of Eggs, the Fat of the Thymallus Fish, which they commonly call *Ascia*; the Oyl that is pressed forth of the Kernels of Peaches, Oyl of bitter Almonds, and Oyl of Been. Or else an Unguent may be made of Borax, Camphyre, and Mans fat, or of Litharge, and the Oyl of Roses, and the Oyl of bitter Almonds

mingled with Honey; or else an Unguent may be made of the Juyce or Root of wild Cucumber and Honey; and with this the Cicatrice may be anointed for one day, but the day following with Milk; and this by turns from day to day must for a while be continued. Or,

Take *the Mucilage of Fenugreek seed, and of Fleawort, of each two drams; Oyl of Tartar by straining half an ounce; Oyl of Roses one ounce; Cerus, and Borax, of each one dram, and mingle them.* Or,

Take *the Root of Dragon-wort, of Solomons Seal, of each two drams; Bitter Almonds, Peach Kernels, of each one dram; Egg-shels burnt half a dram; Frankincense and choyce Myrrh, of each one dram; Sugar Candy three drams; the Mucilage of Fenugreek seed one ounce; Oyl of the Yelks of Eggs, and Mans fat, of each as much as wil suffice: Mingle and make a Liniment.*

But if the Cicatrice be deep, it is not so to be amended by Medicaments that it may be made equal and even with the rest of the Skin; but the Cicatrice is by Section, or else by some corroding Medicament to be taken away; and the Cavity (as much as is requisite) is to be filled up with flesh, and afterwards a new Cicatrice is to be brought al over the part.

Cicatrices after the smal Pox and Measles.

But most of al after the smal pox and Meazles there are oftentimes very frequently left behind (in the Face) unsightly and deformed Cicatrices, that cause an exceeding great eye-sore and il-favorednes; and thereupon (that they may be amended) the help and assistance of the Physitians is oftentimes implored.

But for the taking away of these Cicatrices, those Medicaments that we a little before mentioned are very useful; and so are those likewise that have been prescribed before in this present Chapter, for the making of the Face more fair and clear. And for this (out of al these) there is more especially commended the fat of the precious Fish *Thymallus* or the *Ascia* fish.

Forestus had happy succes in the use of this that followeth:

Take *Oyl of sweet Almonds an ounce and half: of white Lilies one ounce: the Fat of a Capon, and Goats Fat, of each half an ounce: Sarcocol half a dram: the pouder of Bryony root, and Flowerdeluce, of each one scruple: Sugar thabergat one dram. Bruise what is to be bruised into a very fine pouder, and pass them through a very fine sieve, and then (if you so please) add thereto dissolved Gums, and at length let them be mingled together in a Mortar, pouring thereupon Rose-water, the Water of white Lilies, and of Beans, of each a sufficient quantity; continually stirring them, and incorporating them together; then let them by the stroking of the Hands be passed through a woollen Cloth, and there wil run forth a soft Unguent.*

Chap. 5. *Of those they cal Mother Spots, or Blemishes.*

THere is also another sort of Blemishes that is wont to defile and deform the Skin, and this is derived from the very first original, and that which the Infant hath contracted even in the Mothers Womb; and hereupon they are called Maternal, and original Blemishes, Spots, and Marks. Now these Spots are very various and different, sometimes of a red color, and as soon again of a dark and brown color, and oftentimes of neither of these two, but of some other color; and it is also of this or that shape and figure; and somtimes in this, somtimes in that part of the body.

The Causes.

There are some indeed that believe that these spots and blemishes are excited in the body from a fortuitous and accidental concourse of the humors. But the very truth is that such like things come not to pass by chance; but Experience it self teacheth us, that these spots depend upon the fancy and imagination of the Mother, and that by it the Infant is thus marked as they speak. There is no necessity for our heaping up of the several Authorities both of Philosophers and Physitians, as touching this subject; neither is it requisite here to recount even al the faults and things amiss in the conformation, that are caused by occasion of the imagination. For it is wel enough known unto al kind of Women, that Infants have now and then had some certain spots resembling Straw-berries, or Cherries; or else red spots like unto red Wine, or the Fire; whenas upon the sight of such like objects by the Mother, the Imagination maketh an Impression of these like colors upon the Child. And I my self knew a woman great with Child, who standing under a Mulberry Tree, there fel some of the Mulberries upon her back; whereupon the Infant that she went withal had as many excrescences in its back, resembling the shape and figure of Mulberries. But now, how it cometh to pass that the Imagination doth this, I have at large shewn you in my Tract touching the Consent and Agreement of the Chymists with *Aristotle* and the *Galenists*, Chap. 14. and in the fourth Book of our Practice, Part 2. Sect. 4. Chap. 7. Which here to repeat I hold it altogether needless.

Prognosticks.

1. This kind of Spots is very hard to Cure: and although it seem sometimes to be a little obscured, yet it soon breaketh forth again, in a manner as if it were raw; and some there are that relate how that those spots that are contracted by the occasion of Cherries, Strawberries, and Grapes,

(at

(at the time when theſe Fruits are wont to be ripe) wil appear, and as it were flouriſh again.

2. If yet notwithſtanding there be Medicaments adminiſtred immediately upon the birth of the Child, they are ſomtimes taken away.

The Cure.

Women do commonly make uſe of the blood of the Secundine or Afterbirth for the taking away of theſe Spots; rubbing and cleanſing the ſaid Spots therewith while it is yet hot. And others likewiſe afterward make uſe of the Menſtruous blood.

There are yet notwithſtanding other cleanſing Medicaments likewiſe (of the which we have hitherunto ſpoken, and preſcribed for the taking away of other Face-ſpots) that may here be made uſe of: others adminiſter the Mothers faſting ſpittle: and others require the often inſtilling of the Milk that is drawn out of the Mothers Breaſts upon the ſaid ſpots and deformities. Which if they ſuffice not, then we are to have recourſe unto corroding and Cauſtick Medicaments alſo, or unto the Manual operation, and the ſhaving of the Scarf-skin likewiſe. It is alſo good for the Mother in the morning (for ſome certain daies continually) to chew Muſtard ſeed, and with it to rub the ſpot. And ſome there are that preſerve that part of the Infants Navel that falleth off after the due knitting thereof, and this being dried, and afterwards moiſtened in the Water of the Herb Chriſtopher they lay it upon the Spot thrice a day, ſo long until the ſaid ſpot be wholly vaniſhed. There is here likewiſe commended the deſtilled Water of Mountain Avens, if the Infant (ſo ſoon as it cometh forth of the Womb) be waſhed therewith; and the ſpots afterwards waſhed with the ſame Water.

Chap. 6. *Of the Volatick or flitting ſpots of Infants.*

THe German Practical Books (as we may ſee in the Practice of *Gabelchomerus*, and in the Phyſical Diſpenſatory of *Wittichius*, and in others) make mention (among Childrens Diſeaſes) of a certain Affect that they cal *Denflug*, which in regard that I never ſaw it, I have therefore omitted, & not at al ſpoken of it in my Tract of Infants Diſeaſes. But becauſe there are ſome that write that they have ſeen it, we wil therefore make mention thereof here in this place. Now theſe deſcribe this Affect, that they are certain flitting ſpots, of a red or purple color, creeping up and down here and there in the Skin; which if they touch upon any orifice (as ſuppoſe, the Mouth, the Noſtrils, the Eyes, and the Ears) and penetrate ſo far as that they reach even unto them, the Malady is then mortal. And therefore that they may prevent this, they take Roſe-water, and mingle therewith a little Saffron, and with this they anoint al the ſaid Orifices (and the Spots themſelves likewiſe) round about. Only they do not anoint the body towards the Feet, that ſo by the Feet theſe ſpots may vaniſh. Which ſpots (if any ſuch there be) without al doubt they are a ſpecies of the *Eryſipelas*, and therefore we are not only to adminiſter that Liniment unto the orifices of the body, but we are likewiſe to make uſe of thoſe Expulſive Medicaments alſo that are otherwiſe wont to be uſed in the *Eryſipelas*.

Chap. 7. *Of thoſe ſpots and blemiſhes that the Germans cal Hepatick, or Liver-ſpots.*

AS I have often told you (and cannot but here again acquaint you with it) there are many kinds of Tubercles and Spots (and theſe are alſo at this day very commonly known every where in al Nations) which by what names they were called by the Greeks or Latines we know not; whenas yet notwithſtanding it is no way credible that there were no ſuch Affects as theſe among the Ancients; for there were then riſe in thoſe times the ſame cauſes as now.

The Affect Leberflecke *what it is.*

There is commonly known an Affect which the Germans cal *Leberflecke*, without al doubt, in regard they beleeve that it hath its original from the Liver, to wit, dark and browniſh ſpots, or ſuch as of yellow become ſomwhat blackiſh, as broad as the Palm of the Hand, ſeizing upon the Groyns eſpecially, and the Breaſt, and the Back, yea and ſomtimes alſo covering the whol Breaſt with a certain ſleight roughneſs of the Skin that ſendeth forth as it were ſcales, or branny ſcurf; which yet notwithſtanding do not ſtick and abide in one place alone, but are diſperſed hither and thither; and one while they vaniſh, another while they break out and appear again. *Reinerus Solenander* (of al that I can remember) doth moſt plainly and cleerly deſcribe unto us theſe ſpots, in his Sect. 5. Conſultat. 11. but yet he gives them no name. And *Platerus* likewiſe ſeemeth to make mention of theſe, when he writeth, that there are ſome certain dark, browniſh, and dun ſpots, as broad as the palm of the hand, ariſing ſomtimes in ſome certain parts of the body, and at ſome certain times only, and vaniſhing alſo at ſome certain ſeaſons. But he maketh the matter ſomwhat obſcure and doubtful, in bidding us to ſeek for the cauſe, and for the Cure in the *Lentigo*. For theſe *Lentigines*, and the ſpots we now ſpeak of are different Affects, and they have different Cauſes; as wil further appear from thoſe things that have been already ſpoken of before in the third Chapter, touching the *Lentigines*, and ſhal be more

more fully spoken of in this present Chapter. Whether these kind of spots may not be referred unto the *Vitiligo*, and the black *Alphus* (as I think that they wel may) I leave it unto the judgment of the Reader. Our purpose is here in this Chapter to explain and treat of this Subject, without either the Greek or Latine name; for the German name is of al others the best known, as are also the very spots themselves.

The Causes.

The Cause of these Spots is a humor very dry and Melancholy brought unto the Skin, together with the aliment of the parts; or else blood that is feculent, ful of dregs, and very thick; which when it cannot al of it be assimilated, that of it that is excrementitious is thrust forth unto the Skin. But although that more feculent blood may be generated from an overdry Liver; (from whence it is that by the Germans it is called *Leberflecke*, that is to say, Liver-spots:) yet nevertheless, seeing that the Liver doth its office in its sanguifying faculty, and breedeth good blood, the Spleen without doubt is not altogether free from fault. Whereupon I have observed that after those spots (if they have continued long) Quartan Feavers have arisen. An unfit kind of Diet, and such a course of life as is apt to breed a thick and feculent blood, and a Melancholy humor, maketh very much likewise for the generation of these spots; touching which we have already spoken elsewhere.

Prognosticks.

1. These very spots indeed have in themselves little or no danger; neither do they breed any kind of trouble, or any deformity visible unto the eye, when they arise in the Face and Hands, as the *Lentigines*, but in those places that are covered with Clothes.

2. And yet notwithstanding, in regard of the Cause upon which they depend, and the vitious Constitution of the Liver, and Spleen, they presage other Diseases: and very frequently Tertian and Quartan Feavers follow these Spots.

3. Although those Spots may easily be taken away (as anon we shal shew you) yet nevertheless, unless the fault and imperfection of the blood and bowels (from which the vitious blood is generated) be taken away, they again return and flourish in a short time after.

The Cure.

Since therefore these kind of Spots being taken away may again return, unless the Cause upon which they depend be likewise taken away, the vitious humor is therefore to be evacuated by Medicaments that are made of the Roots of Polypody, Succory, Borrage, Spleenwort, Dodder, Maidenhair, Egrimony, the Leaves of Sene, Rheubarb, Jalap. And this is sometimes to be repeated: and if there be occasion, a Vein may likewise be opened.

But then in regard that these Purgers do evacuate only those humors that are collected in the Veins, but do not prevent the generation of the said humors; we must therefore more especially do the utmost of our endeavor that the vitious Constitution of the Liver and Spleen (upon which the breeding of these humors doth depend) may be amended: and this may be performed by a good and wholsom dyet, by the which that dry constitution of the Liver and Spleen may by degrees be restored unto a better condition. And therfore we are to prescribe Meats of a good Juyce, such as Goats flesh, Veal, Lamb, Pullets, Eggs, and the like, Barley, Wheat, Apples throughly ripe,, Prunes, Raisins, Almonds. But the Patient must avoid meats that are thick, salt, & sharp, and generally al meats of an il juyce, such as are flesh that is smoke-dried, and the like. For the Constitution of the Bowels being by the use of good meats reduced unto a better estate and condition, the vitious humors wil no more be generated, but only a good and temperate blood.

But as for what concerneth Topicks; it wil be very good in the morning to rub those parts that are thus defiled and deformed with spots. But first of al, before the Patients going into the Bath, it wil not be amiss to take the Water, or the Syrup of Fumitory, with a little Treacle. After his sweat let the place be anointed with Mustard seed with warm water reduced into the form of a Pultis; which may be there left to continue so long, even until that a heat and a certain pricking be felt and perceived in the part; and afterward let it be washed with warm Water. Or else let it be anointed with this Mass.

Take *White Sope half a pound, let it be sliced and dried; and afterwards add of Mustard seed one dram and half; the meal of Beans and Lupines, of each two ounces; the soft Crumb of white Bread one ounce; with the juyce of Fumitory, or the sharp-pointed Dock, mingle, and use it.*

Chap. 8. *Of the Itch.*

Although that the Itch may be joyned together with many other Affects, as Scabs, the *Impetigo*, Leprosie, and the like; so that these being taken away, this very Affect is likewise removed; yet notwithstanding it sometimes singly and alone vexeth and troubleth persons; and so troublesom it is, that the party thus affected is often enforced to implore the help and assistance even of the Physitian also; and of this we intend to treat here in this Chapter.

Now the Itch is a pain that is excited from a thin and sharp excrement sticking between the Scarf-skin and the Skin it self. For albeit while the place of the Itch be scratched, there is perceived

ved a certain seeming pleasure; yet nevertheless this pleasure doth not belong to the Nature of the Itch, but it followeth only upon the scratching, whilst that the parts that were gnawn by a sharp matter do suddenly return unto their natural state, and their wonted smoothness. For like as there is a pain excited from that sudden motion unto a preternatural state; so in like manner there is a certain pleasure felt from this sudden motion and return unto their Natural state. Now the truth is, the Itch it self ceaseth after scratching, because that the matter which was the cause of the Itching is evacuated; and because also that the solution of Continuity that exciteth the pain, is again brought unto an Union and quietness, if the scratching be any thing strong.

The Causes.

The neereft cause of the Itch is a salt Excrement that is biting and sharp; to wit, either meer pure Choler, or else black Choler, commonly called Melancholy; or else a salt flegm. Which excrement albeit that it be present also in the scabby Affect, yet in the Itch it is more thin, and insinuateth it self through the least particles. But it sticks between the true skin and the scarf-skin, and thereupon by its acrimony it goadeth (as I may so say) and pricketh the sensible particles in the skin, and provoketh them unto scratching. And indeed like as the Nature of the excrement it self maketh much for the sticking of the said Excrement in the Skin (this Excrement although it be thin, yet having in it a certain kind of clamminess and glewishness, by the which it sticketh very close and pertinaciously unto the parts;) so doth likewise the thickness of the skin it self, by reason of which it cannot exhale.

But now that excrement is collected by reason of the heat and driness of the Liver, the use of sharp meats, and many Spices. And hence it is that old men (those especially of them that in their youth had a hot Liver, and such of them as then used a hot kind of Diet in their meat and drink) are in their old age so sensible of the Itch, and at length come to be troubled with scabbiness. See further hereof in *Galen* his second Book of the Causes of Symptoms, and the sixth Chapter.

The Differences.

Now according to the variety of the humor, and the nature of the places affected, there is a certain difference likewise of the Itch. For look how the matter is more or less sharp, so the Itch that is excited is more or less contumacious and troublesom. And sometimes there is felt an itching in the skin of the whol body; and sometimes in some parts only.

Prognosticks.

1. The Itch is for the most part the forerunner of Scabbiness shortly to follow. For if the Itch be of any long continuance, there is then at the length collected a greater abundance of the matter; and this receiving a putridness is rendered more sharp, and it corrodeth the Scarf-kin, and exciteth Pustules.

2. By how much the worse the humor is that exciteth the Itch, by so much the worse is the malady also. To wit, the Itch that is excited from burnt blood, or Choler, is sooner ended and gone: but that which proceedeth from salt flegm lasteth longer; and longest of al that which hath its original from burnt Melancholy.

3. The Itch in which there is great pleasure taken in the scratching thereof, is evil, because that it ariseth from a sharp Choler.

4. The Itch in old people is seldom cured, especially in those that are decrepit. For since that old age is fit for the treasuring up of these salt humors, that disposition of the body is hardly changed, and brought unto a better state. And yet notwithstanding if diligence and care be shewn, it is sometimes healed. And *Mercurialis* (in his Tract of the Diseases of the skin, Chap. 3.) relateth that *Leonellus Pius* (a man fourscore yeers old) was freed from an extraordinary great Itch by the benefit of Medicaments.

5. *Hippocrates* (in *Coacis*) writeth that the Itch in those that have Consumptions (if it succeed the suppression and binding of the Belly) is not only dangerous, but deadly. For by reason of the trouble and disquiet of the Itch, those in Consumptions can neither sleep, nor take any rest; whereupon there is little or no Concoction, and therefore they have their death hastened upon them.

The Cure.

The Itch (seeing that it is a pain) if it be extraordinary great and vehement, and cause watchfulness, thereby decaying the strength, sheweth that mitigation by Anodynes is to be procured; but the Cause that it dependeth upon calleth for evacuation. And indeed the next Cause (since that it is a sals humor sticking in the Skin) this is likewise to be evacuated from the Skin. And in regard that this said next cause is nourished by a like humor contained in the Veins, therefore this is likewise to be evacuated. And because that this humor is generated from a distemper, and vitious disposition of the Bowels, it is therefore to be anointed: and so the generating of such like humors is to be prevented.

Those Moisteners take away the Itch that mitigate the sharp matter that is the Cause of the Itch. Now those things that evacuate these excrementitious humors from the Skin, are those Medicaments that Cleanse, Mollifie, and make thin. Purgers take away the Antecedent Cause. Alterers amend the vitious disposition of the Bowels; but more especially a good course of Diet.

And

And therfore in the firſt place the Salt, Nitrous, and ſharp humor is to be prepared and evacuated. The humor is prepared by ſuch Medicaments as have in them a power of Cooling and Moiſtening; and ſuch as withall attenuate the Thick Clammy humor; ſuch as are Succory, Endive, Borrage, Bugloſs, Fumitory, Hops, Maidenhair, Aſparagus Roots, Polypody, Mother of Time, and Syrups made out of theſe; and more eſpecially that of Hops, Fumitory, Succory, the Byzantine Syrup, and the Syrup of Maidenhair.

Now the Humors are evacuated by the Leaves of Sene, Polypody, black Hellebor, Jalap, the compound Syrup of Polypody, the Electuary Diacatholicon, Confection of Hamech, Extract of black Hellebor, the Melanagoge Extract. The forms of theſe are elſewhere propounded, and ſo they are alſo in the Chapter of the Scabs.

And ſometimes alſo Veneſection (if the Age and ſtrength wil bear it) is to be inſticured: and becauſe that it often falleth out, that either the Hæmorrhoids, or the Courſes ſuppreſſed and kept it may afford matter and occaſion unto this Evil; it wil therefore not be amiſs to provoke and draw forth theſe Hæmorrhoids, or Courſes.

But for the tempering and allaying the heat of theſe Aduſt humors, as alſo of the Bowels themſelves, there is nothing that doth it ſooner then the Whey of Goats Milk; which may be given from one pint to three. But it wil be better for uſe if there be added ſome Juyce or Syrup of Fumitory. But that which more eſpecially correcteth the diſtemper of the Bowels, and maketh for the generating of good blood, is a fit and proper Courſe of Diet. Let the Air be temperate, inclining unto cold and moiſt: and the Meats of a good Juyce, of an eaſie Concoction, and that are not eaſily corrupted, theſe may be altered with Borrage, Endive, and eſpecially Lettice; which laſt procureth alſo ſleep which in this Affect is very requiſite and uſeful. But all ſuch meats as are Sharp, Salt, Bitter, Sour, Sweet, Fat, and moſt of all fried meats, are to be ſhunned and avoided.

As touching Topicks, for the mitigating, and moderating of the Itch it ſelf, and for the tempering of the humors Acrimony, and likewiſe for diſcuſſing of the humors, a Bath of ſweet Water made blood-warm is of ſingular uſe; in the which the ſick Perſon may ſit for half an hour (or a whole hour) in the morning faſting; becauſe that it doth at once temper the heat and drineſs of the Bowels, and withall rarefie the Pores. But the Medicinal Baths (to wit, thoſe of Sulphur, &c.) are more uſeful in the ſtronger diſcuſſing of the matter; and it wil not be amiſs (by turns) one while to make uſe of a Bath of ſweet blood-warm Water, and another while of that that is ſalt and ſulphury. For ſo by this means both the Itch ſhal be mitigated, the Pores looſned, and the excrements in the Skin Cleanſed away and evacuated. But for diſcuſſion we may likewiſe make uſe of either common Oyl, or Oyl of ſweet Almonds with Salt and Sulphur; as alſo *Oleum Coſtinum*, or Oyl of bitter Coſtus. Or elſe the body may be waſhed with the Decoction of Smallage, Parietary, the ſharp Dock root, the Seed of the bitter Vetch Orobus, Lupines, White Cicers, Bran. Or,

Take *Lupine meal three ounces, Sulphur two ounces; mingle them with Vinegar, and anoynt the body therewith.* Or,

Take *Litharge, Sulphur, Turpentine, of each one ounce and half; the Juyce of Mallows, and Parietary, of each one ounce; Oyl of Cinnamom as much as you think fit, and mingle them.*

But then after the uſe of ſuch like things as have been mentioned, the ſick Perſon muſt make uſe of a blood-warm Bath of ſweet Water.

More hereof may be ſeen in the firſt Part, Chap. 27. touching Scabbineſs; ſince that moſt of thoſe Medicaments that Cure the Scabs, and eſpecially the dry Scabbineſs, they are likewiſe uſeful in the Itch.

Chap. 9. *Of the ill and offenſive Smell.*

AND laſtly, among the Affects of the Skin, we muſt not paſs over in ſilence that ſtinking and offenſive ſmel that is ſometimes wont to breathe forth out of the external parts of the body through the Skin; and to be very offenſive, not only to the By-ſtanders, but unto the Perſon himſelf alſo, whoſoever he be that is troubled therewith. For the body of man, whiles it continueth in its right ſtate ſmelleth not at all, neither doth it ſend forth any ſavor that may by any one be perceived. For every living Creature (whatever it be) doth breathe forth ſome kind of Smel proper unto its own kind, as *Theophraſtus* teacheth us in his Book of Smels; and this he proveth by experience; by which we ſee that Dogs find out and follow their Maſters foot-ſteps, by the help they have from this ſmel; and wild Beaſts likewiſe do the ſame in ſeeking their Prey. But yet nevertheleſs if any ſmel ſhal be perceived to come from any one, this is a thing that is preternatural, as being beyond and beſides Natures Intent. And as for what *Plutarch* writeth (in the life of *Alexander* the Great) that the body of the ſaid *Alexander* ſent forth a ſweet and pleaſant ſmell, this is a thing very rare; unleſs haply it come more from the Cloaths, then the body.

But that ill and ſtinking ſmels do oftentimes proceed from Mans body, is a thing wel known by frequent obſervation. Now the places from whence the offenſive ſmel cometh, are the Mouth, the Arm-pits, the Privy Parts, but more eſpecial-

ly

ly the Feet. But that the Ears and the Nosethrils likewise do sometimes stink, this proceedeth from the Ulcers that are in them. Yet sometimes notwithstanding, there exhaleth forth a stinking & offensive smel even out of the whole body of him that is thus affected: as for the stink of the Mouth, we have already spoken thereof, in Book 2. Part 1. Chap. 19.

But now it is not our Intent, here (in the general) to dispute of the Nature of smels, what it is, and likewise by what means the sweet or unsavory smel is generated; in regard this may be known from Philosophical and Physical Discourses. In this place it is sufficient that we know, that this offensive smel and stink proceedeth from a superfluous humidity putrefying, and exhaling such a like vapor.

Hircus The stinking smel of the Arm-pits is called *Hircus*. *Avicen* (*Septima quinti*, Tract. 3. Chap. 23.) tels us, That there are some who assert that the Remainders of the Seed that were superfluous in Generation, and brought into this place, are the cause of this stinking and offensive smel. Which Opinion although that *Avicen* rejecteth it, and that by others the cause of this smel is said to be the astriction of the pores of the Skin in that place, by reason of which the vapors cannot freely breathe through and exhale: yet notwithstanding, this constriction or shutting up of the Pores is not sufficient; for if it were so, then this Affect should be most familiar unto old people. And this opinion albeit thus rejected by *Avicen*, doth not in any thing seem to be absurd. For we know well that this Affect is most familiar unto Virgins that are marriageable, if at any time they grow hot with motion. And that the Testicles, and the Seed have in them a full power of imprinting such an offensive and stinking smel upon the blood, we may sufficiently know it from Goats, and other living Creatures that are gelded. Yet nevertheless this feat smel is most especially familiar unto those that have very moist bodies, because that moisture is most obnoxious unto putridness. For although that all the blood do not putrefie, yet notwithstanding about the Emunctories the excrementitious vapors are apt and very ready to receive the putridness.

The offensive smel of the privy parts in some. And for the very same cause the privy parts of many yieldeth the like offensive strong smel, by reason of excrementitious humors, which from the Liver and the Veins are thrust forth unto the Emunctories that are seated in the Groyns, from which stinking vapors do exhale.

Stinking Feet. The Feet likewise of some have a very feat and strong smel, and may truly be said to stink. For whereas Nature is wont to thrust forth the excrementitious humors unto these external parts, the Feet being so covered and shod that the vapors exhaling from them cannot freely expire and breathe forth, they then and there receive a putridness, and from thence that stink is contracted. And lastly (but this is very rare) the whole body stinketh (unless this smell arise from sweat, as most frequently it doth) and that strong Feat smel (stinking you may cal it) that is sometimes ascribed unto the whol body, is properly the smel of the Arm-pits. And yet notwithstanding *Martial* (as we find it extant in his sixth Book) hath this Epigram upon *Thais*.

Thais *stinks worse than Fullers Pot ere stunk that lay*
Fur'd up to th' brim, but newly burst, in th' midst of th' way:
Worse then the lustful Goat new come from's Mate ere stank;
Worse then the Dogs skin flay'd beyond great Tibers *bank:*
Worse then th' Abortive Chick that's found in rotten Eggs;
Worse then the Tankard marr'd with Corrupt Sauce, and Dreggs.
This Cheat to damp her poysonous stink with sweet Perfumes,
Whenas she's stript, and takes the Bath, she then assumes
Psilothra, *Perfumes, Oyntments, or lies hid with Chalk,*
And thus by shifts she keeps her stink from common Talk.
When sh' hath us'd all her thousand Arts, and thinks all wel,
Yet stil she stinks, and Thais *doth like* Thais *smel.*

Prognosticks.

1. This strong and stinking smel is loathsom, and very offensive to the Standers by, and such as is very unfit for Conversing with others; and it oftentimes rendereth the Wife unacceptable and unpleasing in the Eyes of her Husband.

2. And yet notwithstanding this stinking smel is a sure sign of an overmoist Body, and a Body wherein there are many moist Excrements heaped; and this the body is very easily obnoxious unto in Fevers and other Diseases arising from putridness.

The Cure.

The Cure respecteth either the stink it self (that may be palliated and covered by a sweet smel) or the very cause of it; and this is the true Cure. And therefore the bodies of them that are thus troubled, are in a convenient manner, by Venesection (if need require) and Purgation to be evacuated, and its overgreat humidity to be dried up. And here more especially there is commend-

ed Aloes Rosate, which drieth the body, and powerfully preserveth it from putridness.

Let the Diet likewise be so ordered that it may tend toward drineſs, and resist putridness. And therefore let his Meats be sauced with Vinegar, the juyce of citrons, & oranges, Rose-water, & Rose vinegar. But there must be an abstinence from meats that are easily corrupted; such as are Cucumbers, Melons, Musk Melons, Figs, and the like. The overmuch use of Fish, especially the softer sort thereof likewise to be avoided. The Exercises of the body let them also not be neglected: neither let the sleep be excessive. Afterward we are wel to take notice from what part the stink exhaleth, and accordingly that part is to be cleansed and washed with the Decoction of Barley, Scabious, Flowerdeluce Root, Aloes, Myrrh, Guajacum wood, Citron Rind, Saunders, Asplalathus or Thorny bush; and after this a Cerote is to be imposed of Styrax Calamite, Benzoin, Cinnamom, Cloves, Myrrh, and Aloes, incorporated, and made into a mash with Rosin, and the Oyl of Lavender.

But seeing that (before such time also as the Cause be quite taken away) the said stink is troublesom and offensive unto al persons that come neer; it may therefore be obscured by sweet smels, and thereby be both depressed and palliated. The Arm-pits therefore and the Groyns (as there shal be need) may be anointed with some sweet smelling Liniment or Unguent) made of the Flowerdeluce Root of Florence, Cinnamom, Lign Aloes, Cloves, Gallia Moschata, Styrax Calamite, Oyl of Lavender, or Balsam of the Citron, Cloves, Cinnamom, or many of these mingled together, adding thereto Musk, and Ambar, if it seem good unto you so to do. Under the Arm-pits there may likewise be born sweet scented bals, or an Ambar Pomander. The said stinking and offensive smel is easily taken away, if the Feet be every day washed with Water or Ley, in which Bay Leaves, the Leaves of Organy, and Sage, the flowers of Rosemary, Roses, Camomile, and Flowerdeluce root are boyled; or else the Feet may be washed in Wine in which Allum hath been dissolved.

After the washing we may likewise administer those Remedies that the Greeks cal *Diapasmata*; which (as *Pliny* writeth in his 13. B. chap. 2.) consist of odoriferous things that are dry; and they are the sprinklings of some dry Medicament that is made into a fine pouder; with the which we are to rub the Feet, and to sprinkle some thereof betwixt the Toes. As,

Take *Bay Leaves, and Organy, of each one ounce; Flowers of red Roses, the Florentine Flowerdeluce Root, and Cypress root, of each half an ounce; Bean meal, and Lupine meal, of each two ounces; Salt dried one ounce: Make a Pouder.*

The same course is to be taken if the whol body send forth a stinking smel. And then frequent use must be made of Baths of the sweet smelling Herbs a little before mentioned. And if the said offensive stink cannot otherwise be obscured and palliated, we are then to make use of perfumed Garments, sweet Bals, Balsams, and the like. But it is better to take away the Cause of the offensive smel, than to go about by sweet scents and perfumes to obscure and palliate it; since that perfumes unless they be very strong, they mingle themselves with the stink, and are but as it were a vehicle unto it, and so cause the smel to be the more unsavory. Whereas the truth is, that he that smels of nothing at al, smels best of al.

There is extant in the Physical Epistles of that famous Physitian *Georgius Horstius*, Book 2. Sect. 10. a very memorable History of a stinking and offensive smel proceeding from the whol body: where Dr. *Sigismund Snitzerus* writeth unto Dr. *Andreas Libavius*, that a certain Augustane Virgin (seventeen yeers of age) was sent unto *Bamberg*, and there put into the Monastery of the holy Sepulchre, that so she might live as a Recluse and Nun of the said Order. And that she was no sooner entered into that Monastery, but she sent forth a stinking smel (not unlike unto that of a dead putrefying Carcass) greatly offensive and displeasing unto the rest of the Nuns; whether she kept them company in their common meeting place, or else kept her self close and mew'd up in her own Cell; for even here also they smelt her as they passed by: but a diligent enquiry and search being made into the cause thereof, he came (as he writeth) at length to understand that this stink of hers proceeded not from any thing amiss in her Mouth, Stomach, Womb, or any other particular part of the Body, but from the general habit, temper, and constitution of the whol body. Yet nevertheless *Libavius* (in his Epistle wherein he returneth an answer) doth not admit of this said proper Constitution and temperament of the whol Body; in regard that to render the reason thereof, is beyond the reach and power of any man living; but he rather thinks that something happening from without brought upon her that alteration of her substance, and so caused this offensive smel. And he conceiveth indeed, that this distemper was contracted in the Womb from the pollution of the blood, and the corrupted seed; and that it did consist and was nourished in the Womb of the Mother: or that this Maiden (being then but an *Embryo* in the Womb of the Mother, while it yet lay therein) suffered something from the nauseousness and vomiting of the Mother, and from affrightment befalling her, or from some grievous Affect that she lay under. He conceiveth moreover, that the Mother might be affrighted and terrified upon the sight of some Sepulchre, or that she happened to come in place where they were anointing some dead body; or that she took conceit, and a loathing from the putrid and stinking Excrements that

flow

flow from such as lie in child-bed; or else that she was some way or other greatly affected by these and the like accidents. You may read more hereof in the alleadged Epistle of *Libavius*.

And another Example of the stink of the whol body the same *Libavius* hath in the following Epistle, where he writeth, that he wel knew a certain yong woman, that after she was married, and living in Wedlock, (while she had her Courses) had such a stink coming from her, as never Jakes had worse; and that during this time her Husband lived very discontentedly, as one much afflicted therewith.

THE FIFTH BOOK, THE THIRD PART.

Sect. II.

Of things amiss in the Hair and Nails.

Chap. 1. *Of the Nature of the Hairs.*

AFter the faults of the Skin, we wil (and that not unfitly) subjoyn those things that are amiss in the Hair. For the Hair is fixed in the Skin; neither is it any where else to be found but in the Skin. Neither indeed are the Vices of the Hair to be passed over in silence, in regard that even these are (although ignoble, yet) parts of the body. For as no man can wel deny, That the Nails, the Hoofs, and Horns of al living Creatures, and likewise that the Feathers in Birds are parts of their body; and that none can wel say that a Peacocks Tail, and al the various Feathers in Birds that are of so many several colors; I say, as none can wel affirm that these Feathers affording so great variety are a thing meerly excrementitious, and not parts of their body: so likewise it is in no wise to be denied, that the Hairs are also a part of the body. And this we are sufficiently taught by the conformation of them, by their various figure, and their different colors. The same is likewise proved by the use of them, and so also by their diseases; touching which we shal speak hereafter; and especially that we cal *Plica Polonica*. And lastly, That very effective and conformative power that the Hair hath as wel as other parts, (as we shal by and by shew you) cleerly demonstrateth the truth of this. And the growing of the Hairs again after their being cut, doth not in the least prove that they therefore are no parts. For both the Nails, and the Hoofs, the Claws of Lobsters, and in certain bruit Beasts the Horns, after they are shed and fallen off, yet they grow forth again; and so do likewise the Teeth in Men and Women.

We are indeed vulgarly (but erroneously) taught, That Hairs are generated when from the heat of our bodies fuliginous and thick vapors are out of the third Concoction elevated in the parts of our body, and are driven unto the pores of the Skin; in the streight passages whereof whiles they stick, they are there conglutinated; until at the length the pore being filled up, other vapors coming underneath drive it forward; and these vapors are likewise followed close by other vapors, and after them by more, and so in the end they are thrust forth out of the pore, and the hair is formed; which afterward (the like vapors succeeding, and thrusting forth the hair) and agglutinating themselves unto the root thereof is thence cometh to be prolonged.

The breeding of the Hair.

But now if the Hair should be generated in this manner, a reason could not then be given why hair should not alike be bred in al parts of the body; and in those parts where they are bred, why there should be in some places more store thereof, in some less; and why some of them are alwaies growing, when others grow not at al. In the Neck and Face there grow no hairs naturally, but in the Head and Cheeks there are great abundance of them; as also in the privy Parts, in the Armpits, Eyelids, and above the Eyelids on the Eye-brows. The hair in the head and beard is ever growing, and is continually lengthened out; but those hairs that are in the Eyelids ever keep at one and the same length, and moreover they evermore remain straight. And furthermore no cause could at al be given, wherefore men only should have Beards, and that women should not likewise have them; whenas notwithstanding women have on their heads most usually the longer hair. Moreover, the hair is by *Aristotle* (in his third Book of the History of living Creatures, Chap. 12.) distinguished into that wch is bred toegther with us (such as is the hair of the head, eyelids, & eyebrows) and that that is afterwards bred, to wit, such as at length ariseth in process of time as age comes on: of which there could no cause at al be rendered, if (according to the vulgar opinion) the hairs had their original out of those vapors that break forth.

And therefore there is some other cause of the hairs original to be sought for; in the discovery of which *Galen* hath also been very curious, and taken great pains; insomuch that he here taketh occasion (which otherwise he doth but very seldom) to make mention of the wisdom, power, and goodness of Almighty God, the Author and Framer of al things; and he hath here endeavored to examine his Omnipotency and Wisdom in this particular, and to confute *Moses*, as we may see in his eleventh Book of the use of the Parts, Chap. 14.

But if we seriously weigh the matter, we cannot by any means grant that the hairs are bred only from the excrements, or the vapors exhaling out of the body, and sticking in some certain places; but we are rather to determine that they are generated from the formative (we may term it the pilifique or hair-breeding) faculty, for the causes a little before mentioned. And that the hairs are generated, not only from some kind of fuliginous vapors, but from a matter that is far more solid, and neerly allied unto the matter of the Nails, and Horns, we are taught even by this, that the hairs are not easily corrupted, but are (even after death) preserved a long while whol and entire. Touching which *Gabriel de Zerbis* relateth a History (in his Book of the Anatomy of Mans Body, in the Title of the Anatomy of the Hair, fol. 15.) in these very words: *At* Rome *we both saw and touched* (saith he) *the dead body of a Woman buried in the way called* Appia *(just opposite unto the way where* Cicero *was buried: and therefore it was the conjecture of the most, that this Carcass was the dead body of* Tulliola *the dearly beloved Daughter of the said* Cicero, *as it might be understood by the Inscription: this Carcass was taken out of the Grave, wherein by means of great store of Myrrh, and some Mummy likewise, it is believed that it had been preserved from corruption, from the time of* Cicero, *even unto the time of Pope* Sixtus *the fourth; being neer upon one thousand five hundred yeers. In this Carcass there was good store of Hair, adorned, and tied up with a Golden Fillet; as it was then the Custom to bury those of her age. This Carcass (having been also generally viewed by sundry Spectators, and almost by al the people as wel as by my self) was from thence removed and brought to* Rome, *where in three daies time (the means that preserved it being now far distant from it) it putrefied, and was soon resolved into its first principles, and became mingled with the Earthy Element wherein it lay.* And so altogether in the same manner, like as the Nails in Men and Women, the hoofs and horns in four-footed Beasts, the painted and variously colored Feathers in Birds are produced by the Formative faculty; and if they chance to fal off they are again renewed in the same manner; even so likewise the hairs are generated by the formative or pilifick faculty that is by the Creator implanted in some certain parts; and hence also it is that there oftentimes ariseth such a great variety of colors in the hair. For (as we have already said) the hair in the head and beard is from day to day augmented and lengthened; but it is not so in the hair that is in the Eyelids and Eyebrows, which for the most part evermore keepeth at one and the same length. Moreover the hairs in the Eyelids stand alwaies straight forward; and if either their length be increased, or their straightness incurvated, they then hinder the sight, and cause an inconvenience. Men have beards, Women have none: the Creator, to wit, having altogether destined these hairs unto a certain use; and therefore he hath given this pilifique or hair-breeding faculty unto some parts, and not unto other some; which said faculty formeth the hairs, for their certain quantity, figure, and color. In Man-kind and Animals there groweth no hair under the feet; the Hare alone excepted, which (as *Aristotle* testifieth in the third Book of his History of living Creatures, Chap. 12.) hath hair growing under the feet. And this moreover arguеth that the hair in Animals proceedeth from the formative faculty; to wit, for that by the strength and force of Imagination the form and color of the hair may be changed, as out of the 30. Chapter of *Genesis*, in the History of *Jacob* sufficiently appeareth.

The matter of the Hair.

The matter of the Hair (as of al other parts of the body) is the blood, as likewise *Adrianus Spigelius* (in his fift Book of the Fabrick of Mans Body, Chap. 10.) hath determined; and this also appeareth plainly in the Affect we cal *Plica Polonica*, in the which if the hairs be cut, there issueth blood out of them; but this blood is of the meaner and more ignoble sort. For Nature doth the part, and discharged the office of a good and provident Houſ-keeper, (distributing unto each particular person in the Family what properly belongeth unto him) and with the best and purest part of the blood she nourisheth the more noble and worthy parts of the body, distributing the residue unto the ignoble and less principal parts, to wit, into the Nails and Hairs in Man-kind; and in Bruits, into the Hairs, Hoofs, Horns, and Feathers: of which we have already likewise spoken, in the third Book of our Institutions, Part 1. Sect. 2. Chap. 3. But although it be true that the Hairs proceed from the more ignoble part of the blood, yet notwithstanding it is unctuous, and (if we may so speak with the Chymists) very Oyly, and Sulphureous as it were (as appeareth by the burning of them) as having I know not what kind of neer alliance with the seed; and from hence it is that such as are lustful and salacious are likewise hairy; and those on the other side that are not inclined unto Venery are smooth and without hair; and hence it is that Eunuchs

and

and effeminate Persons produce no Beard; and those that are excessive and immoderate in the use of *Venus* are soon bald; and on the contrary, Eunuchs are never bald.

The use of the Hair.

From al which we may likewise easily collect what the use of the Hair is. For certain it is that they have their peculiar and proper uses; since that the Hairs on the Head are (as it were) the Natural Covering thereof; the Hairs in the Eye-lids do after their manner conduce unto and further the sight; and when they are pulled forth or fall off of themselves, it much prejudiceth and hindereth the sight; the Hair of the Head, and the Beard, in men especially, serves as a great ornament unto Man, and they render him more venerable (as it were) in the account of others. But now in regard that the Hair under the Arm-pits, in the privy parts, and in the Thighs, is given us by Nature neither for a Covering, nor yet for an ornament, therefore we may conclude that Nature in the production of these Hairs sought some further end, and intended some other use; to wit, that hereby in the generating of these Hairs the more ignoble part of the blood may be consumed: from whence likewise it is, that in some they grow forth and appear more abundantly, and in others more sparingly; as Infants also are (in most parts of their body) altogether void of Hair; which notwithstanding are afterwards generated in them as they encrease in yeers, the matter of the Hair being more and more heaped up together.

Chap. 11. *Of things amiss in the Hair; and first, of Baldness and want of a Beard.*

AND therefore, since that the Hairs are generated from the formative or Hair-breeding faculty, they have their Natural Constitution, which consisteth in their Natural magnitude, and store, figure and color; which said Constitution when once it is lost, they are then subject unto many different Vices; which if you please to call Diseases, I wil not gainsay you. And indeed the first Vice is in the defect of them; and this is either Natural, & such as happeneth unto very many according to their age; or else it is preternatural. The first of these is termed Baldness; of the second sort, are, the Shedding or Falling off of the Hair, the *Alopecia*, and *Ophiasis*. There is indeed in all these Vices of the Hair a falling off of the Hair from the part (whatever it be) where formerly it was growing; and so (in the general) all these Vices may be comprehended under the name of *Defluvium* or falling off: but use hath so far prevailed, that the name *Defluvium* or falling off is (in special) taken for a certain Species of the shedding of the Hair, as we shal hereafter shew you.

As for Baldness, in the first place; look what *Patos* (that is to say, the falling down of the Leaves) is in Trees, the like is baldness in Animals, yea also in the very Trees themselves: whereupon *Aristotle* in his sixth Book of the generation of Animals, and Chap. 3. writeth: *Men (saith he) of all living Creatures are mostly subject unto baldness, and they evidently become so sooner then any other Creature whatsoever. Which kind of Affect is in a manner general. For of Plants likewise, some of them have allwaies green Leaves, others of them lose their Leaves. The like Affect is baldness in those men unto whom it happeneth that they should be Bald. For whenas by little and little (some now, some then) both the Leaves, and the Feathers, and the Hairs fall off; when this same Affect shal happen universally, then it receiveth these words, Baldness, falling of the Leaf, and shedding of the Feathers.* And *Columella* in his fourth Book of Husbandry, Chap. 33. saith that the young and tender Chesnut Tree that is infested by Mice and Moles, doth oftentimes become bald. Now baldness in a man,

Baldness what it is.

is a certain smoothness, or defect of Hair in the fore part of the Head, taking its original from the want of Aliment. And this most commonly chanceth naturally in the progress of yeers; but yet nevertheless unto some it happeneth preternaturally; which is thereupon to be accounted preternatural and vitious.

The Causes.

Touching the Causes of Baldness, Physitians do indeed very much differ in their Opinions. But if we wel weigh the manner how Hairs are generated in the Head, the business in Controversie wil not seem at all difficult. For whereas both the matter and the Aliment is sent and supplied unto the Hairs from the Brain more especially; therefore we say indeed, that the defect of the necessary Aliment is the neereft cause of this shedding or falling off of the Hair: yet nevertheless this Affect proceedeth oftentimes from the Constitution of the Brain; to wit, if it become more dry then is meet. *Hippocrates* tels us the same, in the sixth of his Epidem. Comment. 3. Tit. 1. where he thus writeth; *the Consumption of the Brain, and by reason thereof baldness; &c.* Where (as *Galen* tels us in his Comment. upon the place) by the Consumption of the Brain, that diminution thereof is to be understood, that happeneth unto old men from its extraordinary drineſs. For if the Brain once become extreamly dry, then there will be nothing superfluous therein remaining that may suffice for the nourishing of the Hairs. And *Aristotle* teacheth us the same, who (in his fifth Book of the Generation of living Creatures,

Chap. 3.

Chap. 3.) writeth, that baldness is caused from the scarcity of the moist heat and fatness, that is to say of the moist Aliment. For there is in old People an excrementitious humidity, that is rather too much abounding, then any want thereof. And indeed, as we have already said, baldness is natural unto the most, because that in the progress of their yeers (and as old age comes on) the Brain in every one becometh more dry then is meet: but yet unto some this baldness happeneth in their Youth and green yeers, to wit, unto those that from some preternatural or violent cause have their Brains overdried before the time; which Causes may be many. The Chief and most principal of them al is the immoderate use of *Venus*, that powerfully drieth the Brain. Whereupon it is that before the use of *Venus* none groweth bald; Neither are Eunuchs bald at all (in the sixth Sect. of the Aphorisms, Aphor. 28.) in regard they lose not, neither cast forth any Seed; and so the like may be said of Youths, and until they attain unto ripeness of yeers. Women likewise are seldom or never bald (and yet nevertheless *Albertus Magnus* testifieth that he saw two Women that were bald; in his nineteenth Book of Animals, Chap. 6.) in regard that their Constitution is naturally more moist; and therefore the Brain also in them is not so easily and soon dryed; and because that Women eject not such store of Seed as the Men do. The Brain is likewise overmuch (and oversoon) dried by too much Watching, Study, and Cares.

As for that opinion of *Altaurius*, who in the first Book of his Method, Chap. 5. assigneth overmuch humidity for the Cause of baldness, if any one hath a mind to reconcile it with the opinion of *Hippocrates*, *Galen*, and *Aristotle*, he cannot more fitly explain it, then by saying that the defect of Alimental humidity is indeed the Cause of Baldness; and yet notwithstanding that excrementitious humidity causeth that this baldness happeneth so much the sooner and more easily: after the very same manner that Leaves of Trees fal off indeed by reason of the want of necessary Aliment; and yet nevertheless they fal off sooner and faster, if any adventitious and Accidental humidity (Rain, or the like) happen.

Signs Diagnostick.

The very Truth is, that baldness of it self appeareth sufficiently unto the Eyes. But yet nevertheless in what respect it differeth from the other species of the falling away of the Hairs, we shal now explain unto you. This Baldness we now speak of differeth from the *Apolecia*, and the *Ophiasis* or *Area*, in this, that these Vices are fleeting from place to place, neither (in them) do the Hairs fal off from any certain parts of the Head; whereas baldness happeneth evermore in the fore-part of the Head. But from the falling off of the Hair, in special so called, this baldness differeth, because that in the shedding and falling of the Hair, the Hair al generally (or at least, the greater part of them, here and there, up and down throughout the whole Head) fal off; but in baldness this falling of the Hair is only in the fore part of the Head.

Prognosticks.

1. Baldness indeed in it self bringeth no danger at all (but that it causeth that the Head lieth the more open to be hurt by the externall injuries of the Air; and that it is as it were the forerunner and sign of the hastening of our Mortall Nature towards her dissolution) and yet notwithstanding it causeth a great deformity and unsightliness (especially if it happen early, in the time of Youth) and that that is resented and disliked by the most of those that behold it: and it is reported, that *Caius Julius Cæsar* the Emperor (famous both for his learning, and likewise for his warlike exploits) could so ill brook and bear the baldness wherewith he was affected, that after his making triall of very many Remedies to no purpose, it was at length granted unto him by the Senate, that he might perpetually wear the Lawrel: who if he were now at this day living, might easily cover his baldness with a Covering of Hair made of other mens Hair (we in *England* cal it a Perriwig) which is now adaies in very great and common use.

2. But that baldness that ariseth either from old age, or immaturely in the time of Youth, wil admit of no Cure; like as neither doth the shedding of the Teeth in such as have attained unto their ful growth, since that the defect of that Alimentary humidity cannot by any means be restored.

3. *Those that are Bald have not the Varices* (viz. the crooked swoln Veins in the Hipps, &c.) *very great: but those that during their baldness have these Varices coming upon them, these again recover their Hair*; as *Hippocrates* tels us in the sixth of his Aphorisms, Aphor. 34. But this Aphorism is false, as *Galen* in his Commentary, teacheth us: since that we are none of us ignorant that Baldness is an incurable Affection; and that it is likewise false, that great Varices never happen unto those that are bald; and also that upon the arising of the Varices the baldness ceaseth: unless haply (as some wil have it) he cal that *Calvitium* or baldness, that Physitians term *Madarosis*, that is, the falling off of the Hair. For this indeed in regard that it hath its Original from vitious humors (like as that we call *Ophiasis* and *Alopecia*) these very depraved humors being translated into the Thighs may cause the *Varices*, and so the man may possibly recover and receive his Hair again. For if there were at first a loss of the Hair by reason of their roots being corrupted by the said vitious humors; then good ground there is to believe that this Hair wil again now return unto its Naturall state, upon the translation of the aforesaid humors unto some other place.

The

The Cure.

But although that baldnes when it is arrived at its height can no waies be cured: yet nevertheles in regard that baldnes doth both exceedingly incommodate the health, and cause deformity; we must therefore do our endeavor al that may be, to prevent and retard it. Which can by no other means be done, than by repairing the aliment of the hair that beginneth to fail, and attracting it unto the skin of the head. And therefore we must do our utmost that the fat and hot humidity by which the hairs are nourished may be preserved and drawn unto the skin. There are some likewise that add moderate astringents, if the skin be become thin through the heat of the head. But whenas baldnes doth arise from the defect of Aliment; and whenas by reason of drines the pores and passages of the skin are closed and altogether shut up, there is no need at al of Astringents; for if they be administred, then the Aliment that floweth unto the hairs wil be altogether repressed.

Now what kind of Medicaments they are that correct the distemper of the head, and the drines of the brain, we have already shewn you in the first Book of our Practice, Part 1. Chap. 4. But that the Aliment may be attracted unto the roots of the hairs, frictions are to be first used before the Medicaments; which yet notwithstanding ought to be moderate, that they may only attract the Aliment, and not discuss it. But these Medicaments ought to be hot, and so attracting, with a moderate astriction, by which the Aliment may be drawn unto the roots of the hair, and there detained. *Dioscorides* in his first Book, Chap. 110. and *Galen* in his seventh Book of the faculty of Simples, §. *Cistus*, commend Ladanum; and yet more in case of the falling of the hair, than in baldnes: yet nevertheles very many there are that use the same likewise for baldnes, and especially the Oyl thereof, which they prepare in this manner:

Take *of the best Ladanum cut into smal pieces one pound; pour thereunto of Rose water six ounces; Oyl of sweet Almonds four ounces; boyl them together, and strain it often, until it be cléer. Or let the Ladanum be dissolved in the Oyl of Mastick, and then strained.* It is very good likewise to wash the head with the Decoction of Fenugreek. See more of these Medicaments for this use in *Galen* his first Book of the Composition of Medicaments according to the places, Chap. 1. And we shal also mention some more of them in the following Chapter.

The Dyet.

And first of al, a right Course and Order of Diet conduceth very much unto the retarding of baldnes. Let the meats therefore that the Patient eateth be of a good juyce and nourishment, (that is to say, such as affordeth a fat juyce) and of easie concoction. Let him abstain from meats that are salt, sharp, sowr, and austere (such as are most of the Summer Fruits) that yield but little aliment, and that also very fluid. Let his drink likewise be such as yieldeth a good juyce. But let him abstain from strong and old Wine, having in it a power to dry overmuch. Venery is especially hurtful in this Affect. Watchings, griefs, cares, and the anxieties of the mind are also hurtful in this Affect.

The want of a Beard.

We said before that the Beard was an Ornament unto a Man; and therefore if this be wanting in Men, it causeth a very great deformity. Now this may fail either altogether, as in Eunuchs, and certain others that are womanish and have altogether effeminate bodies: or else it breaketh forth very slowly, or groweth not so thick as it is wont. Al which happen, either from a defect of the matter, or else by reason of the thickness of the Skin out of which it is to break forth; or from such a Constitution as hindereth the appearing and growth of a Beard.

Now whereas the want of a Beard in men of that age wherein Beards are wont to bud and grow forth, doth breed some kind of unseemlines and deformity; and that such as are at their ful age (that they may hereby procure unto themselves both gravity, and respect from others) do much desire and endeavor after a Beard; it is therefore very usual upon this very account to cal in the help and assistance of the Physitian. But the truth is, the event seldom answereth the desire, or at least but very slowly, to wit, when Nature of her own accord attempteth the production thereof.

But yet nevertheles I think it not amiss here to give you a Medicament or two, for the aforesaid purpose: and more you shal have in the Chapter following.

Take *Oyl in which Southernwood hath been boyled two ounces; the ashes of Bees or Wasps one dram; Mous-tirds one scruple; Honey one ounce; Ladanum three drams; Bears fat as much as wil suffice: Make a Liniment.* Or,

Boyl Mugwort in Oyl, and let the place be anointed with the Oyl; which maketh very much for the forwarding of the slow growth of the Beard. Or,

Take *Pouder of the seed of Nightshade as much as you please, and Oyl of Eggs a sufficient quantity: mingle them, &c.*

Or let the place be often washed with the Decoction of Southernwood, Maidenhair, Golden Maidenhair, Rosemary, and the Reed root: and afterward let it be anointed with the Unguent that is made of Ladanum.

And if it be true (as some there are that think it is) that these Medicaments that even now we named,

named, and those that we shal hereafter further mention do not al of them generate hairs only by their manifest qualities, and by taking away the Causes of the falling off of the hair; but that they likewise produce hair by some occult quality that is in them; such like Medicaments are therefore especially to take place in the production of a Beard, not where there hath been a shedding or falling off of the hairs of the Beard, but where they never as yet grew.

It is also wel known, that it much conduceth unto the speedy growing of the Beard, if the first soft hairy down upon the Chin be often shaved off; by which means the Aliment is the more abundantly allured and drawn unto the Roots of the hair.

For the furthering and hastening of the Beard, these following Medicaments are likewise commended.

Take *Oyl of Dill, Oyl of Spike, of each five ounces; the tender Sprigs of Southernwood two handfuls; Squils three drams; the best Wine three ounces; let them boyl until the Wine be consumed, and then use it.* Or,

Take *Oyl of Garden Pinks, and sweet smelling Spike, of each three ounces; Oyl of Roses four ounces; of Cloves one dram; of Ladanum two drams; sweet smelling Wine two ounces. Let them boyl al of them unto the consumption of the Wine. Add of Musk one scruple, and mingle them.*

Chap. 3. *Of the shedding of the Hair.*

ALthough (as we have already said) al shedding of the Hair may be termed a *Defluvium* or falling off: yet nevertheless use and custom have so far prevailed, that the shedding of the Hair here and there in the Head (in al or most parts thereof) is in special termed a *Defluvium* or falling of the Hair; so that they fal not only in one place, but either they al fal off throughout the whol head, or at least they most of them fal away in most parts of the Head.

The Causes.

There is not one Cause alone of this *Defluvium* of the Hair, but the Causes are many; to wit, Either the want of Aliment, or the pravity of the humors corroding the roots of the hair, or the thinness of the skin, not admitting the aliment of the hair. The two former Causes have their place in those that are Phthisical; in whom if the hair fal off, this cometh to pass (as *Galen* tels us in his Comment. Aphorism 10. Sect. 5.) because there is here both the greatest defect of Aliment, and sometimes also the corruption of the humors. The same happeneth for the most part in malignant Feavers, such especially of them in which (the Brain being withal affected) the sick persons are seized on by a Delirye or Dotage. For even in these Feavers also the sick parties are greatly extenuated, and there is wanting unto the body a necessary aliment, and the depraved humors likewise lie gnawing at the roots of the hair, and eat them asunder. The hair also falleth off in those that have the French Disease, by reason of the pravity of the humors; which somtimes happeneth likewise unto those that have drunk poyson: and it is reported for a truth, That whosoever toucheth the Salamander his hairs wil shed and fal away. But somtimes also the hair fals off by reason of the thinness of the skin; and this happeneth unto Women, and especially in the Summer time. And hence it is, that those who travel out of *Germany* into *Italy*, or other hot Regions, find now and then this shedding of their hair: for by the heat of the Ambient Air the Skin is made thin; and it chanceth also that the matter out of which the hair ought to be generated doth withal transpire.

Signs Diagnostick.

The *Defluvium* or falling of the hair that is in special so called, is easily known by the continual shedding of the hair. But it is distinguished from baldness, the *Alopecia*, and *Ophiasis*, because that in Baldness the hair fals off in the fore part of the head only; but in *Alopecia* and *Ophiasis* the hair fals from al parts of the head, and the head alone; but then in this *Defluvium* (the Affect we now speak of) the hairs fal off in al parts of the body equally, one while more, and another while fewer of them. But from what cause it is that they fal off, may be known from the causes that went before. For if there went before any sickness that was in it self apt to consume the aliment of the Body, it is then credible that the shedding of the hair proceedeth from the scarcity of the Aliment. But if vitious, malignant, and depraved humors excite and cause any disease, it is then an argument that the falling of the hair proceedeth likewise from the pravity of the humors. If lastly, there went before causes rarefying the skin, it is then probable, that the said *Defluvium* of the hair proceedeth from the thinness of the Skin.

Prognosticks.

1. Among al other the species of the shedding of the hair, this *Defluvium* in special so called is most easily cured; unless the cause be such as is not to be removed. For the skin hath not as yet contracted any preternatural disposition that is difficultly cured. And therefore it is that the *Defluvium* or falling of the hair that happeneth after acute and malignant Feavers is easily cured; when the Feaver being healed, there is an Aliment again supplied unto the body; and the hair that is already fallen off is for the most part restored without

without the uſe of any Medicaments.

2. But in the Conſumption ſuch a defect of the Aliment, and ſuch a vice of the humors cannot by any means be amended. And therefore in this caſe there is not only no cure to be had for this ſhedding of the hair, but the ſick perſons die alſo. And therefore in ſuch as are in Conſumptions the falling of the hair is a ſure and certain ſign of Death approaching; as in the fifth of the Aphoriſms, Aphor. 11.

3. If the hair fal off by reaſon of the skins thinneſs, it may then by the uſe of thickners be reſtored without any great difficulty.

The Cure.

The ſhedding of the hair is cured by taking away the cauſe upon which it dependeth. If therefore the hairs fal away from the ſcarcity and want of Aliment, it ſheweth us, that we muſt uſe our endeavor that there may be ſufficient aliment bred in the body, and that that which is bred may be drawn unto the skin of the head. If this *Defluvium* be from the depraved humors, and theſe be ſupplied from al parts of the body, they are then to be evacuated; but if they lie only at the roots of the hair, they are then to be diſcuſſed. If theſe humors be of a poyſonous Nature (as in the French Diſeaſe) we ought then to meet with and oppoſe that poyſon. If the Affect proceed from the thinneſs of the skin, the skin is then to be thickened.

If therefore this *Defluvium* or falling of the hair ariſe from the want of Aliment, we ought then eſpecially to take care that by appointing a due & meet courſe of Diet there may be generated ſufficient ſtore of good blood. But for the drawing of this unto the place affected, frictions are more eſpecially to be made uſe of. Yea indeed, almoſt before the uſe of any Topicks, the frictions or rubbings of the head are to be adminiſtred, as *Galen* teacheth us in his firſt Book of the Compoſition of Medicaments according to the places, Chap. 2. For Friction doth both attract the Aliment unto the head, and alſo ſtrengthen and thicken the skin.

If this falling of the hair proceed from the pravity of the humors, then univerſal purgations (if need require) being firſt premiſed, the head is often to be rubbed, and diſcuſſives are to be adminiſtred; but yet let the Diſcuſſers be moderate (eſpecially if there be a concurrence of an abundant aliment) leſt that by the exceſſive and overmuch uſe of them the aliment be likewiſe diſſipated, and the skin rendered over thin: and therefore *Ladanum* is very fitly mingled together with the Ungueuts.

If the *Defluvium* depend wholly upon the thinneſs of the skin, then we ought to apply thoſe things that condenſe and thicken the skin. *Galen* commendeth eſpecially *Ladanum*, the Oyl of Maſtick, and the Oyl of Myrtle mingled together. Or elſe let Ladanum be diſſolved in Wine, and ſo made uſe of.

And Ladanum is alſo very fitly adminiſtred in almoſt every falling off of the hair. But in regard that it is of too thick conſiſtence in it ſelf to be anointed with, it is therefore to be diſſolved in ſomthing that is liquid (Wine or Oyl) and indeed ſuch an Oyl is to be made choyce of that may ſatisfie and anſwer the cauſe.

But ſeeing that Unguents and Oyls are troubleſom unto many, who wil not endure that their heads ſhould be anointed with Oyntments or Oyls; therefore for theſe we muſt provide Lotions for the head (that pleaſe them better) which are to be made of Southernwood, Maidenhair, Golden Maidenhair, Maſtick, Roſes, Roſemary, Ladanum.

And we muſt here again repeat what we gave you notice of about the end of the foregoing Chapter, to wit, That there are ſome who appoint (and not without good reaſon) ſuch kind of Medicaments to be made (for the recovery of the hair) that do not only by a manifeſt quality take away the cauſe of the ſhedding of the hair, but ſuch as alſo by an occult and peculiar faculty do conduce unto the breeding of hair; and ſuch as theſe are only known by experience. And theſe are, al the Capillary Herbs, Southernwood, Reed root, ſharp-dock root, the root of the greater Bur, Aſarabacca, Ladanum, Honey (and Water deſtilled from it) Bees beaten together with the Honey-combs, or the pouder and aſhes of them, as alſo of Waſps, Flyes, Moles, Mice, the Land Urchin, Bears fat, and Serpents fat. Of which there are made many Compoſitions. As for inſtance,

Take *the Rind of the Reed root burnt, Bees aſhes, of each two drams; Southernwood burnt one dram; Ladanum two drams; Honey half an ounce; Oyl of ſweet Almonds, and Bears fat, of each as much as wil ſuffice, and make a Liniment.*

For the ſhedding of the hair after ſickneſſes, this following is found to be good.

Take *Maidenhair, Southernwood, Golden Maidenhair, of each half a handful; the Leaves of Myrtle, of Roſes, and of Wormwood, of each two pugils: boyl them in a ſufficient quantity of common Oyl and red Wine, until the Wine be waſted; then ſtrain and ſqueeze them hard.*

Take *of the aforeſaid Oyl four ounces; Ladanum one ounce; Maſtick half an ounce, and mingle them according to art.* Or,

Take *Root of the Bur-dock ſix ounces; Maidenhair three handfuls; Southernwood one handful. Pour thereunto as much white Wine as wil ſuffice; and let them be deſtilled in a bladder: Unto what is thus deſtilled, if you pleaſe you may add the Water of Honey.*

Or elſe let the Roots of the Bur-dock be boyled in Ley, and the head waſhed therewith.

Chap. 4. *Of* Alopecia, *and* Ophiasis.

Alopecia: THat which is called *Alopecia* and *Ophiasis* is a peculiar kind of the falling of the Hair. *Alopecia* is so termed from Foxes; because that this kind of shedding of the Hair is familiar unto them. But *Ophiasis:* *Ophiasis* is so called from its figure, because that the bald and smooth parts, destitute of their Hair, and writhed, seem like unto Serpents. It is common unto both these Affects, that in them the Hairs fall off *areatim* (as they term it) and hence it is likewise that this Malady is in the general called *Area:* *Area.* And *Celsus* in one and the same Chapter treateth of *Area*, *Alopecia*, and *Ophiasis*. Now the name of *Area* is imposed upon this Affect from Country Garden-plats. For as there the Beds or quarters are distinct, and in certain places only; and as these Beds when they are void of Plants are Naked and bare; so it is likewise in these *Areæ*; for here in certain places the Skin appeareth smooth, bare, and slippery. These Affects differ only in their figure. For *Alopecia* hath no certain figure, but (as *Celsus* saith) *is dilated under any kind of figure.* But the *Ophiasis* creepeth up and down writhingly like unto a Serpent; and one while being extended from the hinder part of the Head it creepeth along on both sides the Head even unto the Ears, the breadth almost of two fingers; and as soon again being carried beyond the Ears it creepeth forward Serpent-like even unto the very Forehead it self. And moreover there is in the *Ophiasis* far more hurt and danger in the Cause thereof; so that not only the roots of the Hair, but even the Skin it self also is eaten and gnawn thorow, to wit, as far as the roots of the Hair reach. And so *Alopecia* and *Ophiasis* may be thus defined, that they are a falling off of the Hair after the aforesaid manner, *areatim*, having its Original from a corrupt and depraved humor gnawing assunder the roots of the Hair. *The definition of Alopecia and Ophiasis:*

The Author of the Book of Medicaments soon provided, referreth the *Alopecia* and *Ophiasis* unto those Affections that vitiate and marr the Colour of the Hair. But we are to know that this is not proper unto the said *Areal* falling off of the Hair; but that this change of Color in the Hair doth either precede the *Alopecia* and *Ophiasis* (to wit, when from a vitious Nutriment the Hair first becometh white, but afterwards they fall off) or else the colors of the Hair are changed after the *Alopecia* and *Ophiasis*. For when after the *Areæ* Hairs are again bred, they are then either white, or yellow; like as it is in Horses, after that the hair is fallen off by reason of some Ulcer caused by attrition or gauling, there is wont in the place thereof to appear and grow again white hairs; which happeneth from a vitious Nutriment, and the weakness of the Skin. And of this *Celsus* gives us notice, in his sixth Book, Chapter 1. to wit, that the *Ophiasis* is extended unto the Hair of the Head alone, but that *Alopecia* may be extended even unto the very Beard also.

The Causes.

The Cause of both these Maladies is a depraved and sharp humor of (eating assunder the roots the Hair) of whatsoever kind it be. But for the most part notwithstanding this Malady is caused by a salt flegm, adust, or putrified. Whereupon *Galen* in his Book of the differences of Symptoms, and Chap. 4. writeth, that these Vices follow a depraved Nutrition of the Skin of the Head. But that one while the *Alopecia*, & another while the *Ophiasis* is excited; and that the Hairs do sometimes constitute a strait and direct *Area*, and sometimes that that is winding and writhed, the Cause of this is the great abundance, and the quality of the matter. For if there be an extraordinary great store thereof, and it be likewise thin, then it equally and alike eateth through the Hair in the more and greater places; but if the Matter be less, and mingled with a thick humor, then there followeth an unequal and writhed *Defluvium* or shedding of the Hair; because that the humors being unequal and mingled do not flow right forward, but creeping along obliquely they gnaw assunder the hair.

The more remote Causes are the heat of the Liver and Head, and especially the fault of the first and second Concoction, by reason whereof salt and sharp humors are generated; which although it may happen in every age, yet nevertheless it happeneth more especially in Childhood and Youth; and it followeth the Affects, *Tinea*, *Achores*, and *Favi*, by reason of the Causes that we mentioned in the Diseases of Children.

And sometimes likewise External and Malignant Causes make very much for the generating of this Disease: among which *Galen* in his first Book of the Composit. of Medicam. according to the places, Chap. 2. reckoneth up Mushroms, because that they make very much for the generating of vitious and corrupt humors. And hither likewise belongeth the poyson of the French Disease, in regard that this also eateth through the roots of the hair; which other poysons may likewise do.

Signs Diagnostick.

We have already before told you in what respects this falling of the Hair differeth from baldness, and that shedding of the Hair that we call *Defluvium*. But *Alopecia* differeth and is known from

from *Ophiasis* by the very figure of the *Area*, and becauſe that in the *Alopecia* the hair only falleth off, without any hurt at all of the Skin. But in the *Ophiasis* there is not only a falling off of the hair, but likewiſe an excoriation of the Skin. And the very color of the skin is alſo changed; and in ſome it appeareth more whitiſh, in ſome more pale, and in others more black; and if it be pricked, there floweth forth a ſerous whitiſh blood. Touching the difference between *Alopecia* and *Ophiasis*, *Celſus* in his ſixth Book, and Chap. 4. hath theſe words: *That* Area (ſaith he) *that is termed* Alopecia *is dilated under all kind of Figures; and it happeneth in the hair of the Head, and in the Beard. But that which from the likeneſs of a Serpent is called* Ophiaſis, *beginneth from the binder part of the Head, and is not extended above two fingers in length; it Creepeth on both ſides the Head even unto the Ears: and in ſome unto their Forebeads alſo: the former of theſe in all Ages, but this latter only in Infants.*

But *Alopecia* and *Ophiasis* differ from *Tinea*, in this, becauſe that in *Ophiasis* the Excoriation of the Skin is ſuperficial; and when it is cured, the hair groweth again. But in *Tinea* the excoriation and Ulceration is more deep; and the skin is oftentimes ſo corrupted, that the hair never groweth again.

As for what concerneth the ſigns of the Cauſes, the Skin it ſelf ſheweth what kind of humor it is that offendeth: which that it may be the more exactly known, the hair that remaineth behind is to be ſhaven away, and the Skin to be gently rubbed: there are other ſigns alſo that wil inſtruct and teach us what kind of humor it is that aboundeth in the body. The hairs likewiſe that grow anew, by the various colour that they have (according to the Nature of the peccant humor) wil ſhew us what humor is the Cauſe of this Malady.

Prognoſticks.

1. *Alopecia* and *Ophiasis* although they bring not much danger along with them, yet nevertheleſs they cauſe a great deformity: and among the Romans thoſe Slaves that were diſfigured by the ſaid *Area*, and eſpecially by the *Alopecia*, were ſold at a far lower rate then other Slaves. And in our daies alſo, theſe *Areæ* (in regard that they cauſe a ſuſpition of the French Pox) are therfore accounted very diſgraceful unto him that is affected therewith.

2. But whether the *Ophiasis*, or the *Alopecia*, may be ſooneſt and moſt eaſily cured it is a great queſtion among Authors; and they herein much differ. *Celſus* and *Avenzoar* are of Opinion that *Ophiasis* is more eaſily cured then *Alopecia*. And on the Contrary, *Alexander* in his firſt Book, Chap. 2. and *Serapio* in his firſt Book, Chap. 1. teach us that the *Alopecia* is more eaſily cured then *Ophiasis*. But *Celſus* ſeemeth to ſpeak only of the *Alopecia* of Infants; which in the courſe of yeers and change of age is of it ſelf oftentimes cured. But if *Alopecia* and *Ophiasis* be ſuch as are grown to maturity, or likewiſe in one and the ſame age be compared the one with the other, then the *Ophiasis* ſeemeth to be altogether the more difficult to be cured, in regard that it hath its original from a matter more thick and fat worſe then the former, and ſuch as doth not only eat aſſunder the roots of the hairs, but likewiſe even the very Skin it ſelf; which is never done in the *Alopecia*.

3. Yet notwithſtanding by how much the longer either of theſe Maladies hath been and continued, by ſo much the more difficult is the Cure thereof; and by how much the leſs while they have continued, by ſo much the more eaſily are they cured.

4. If by Rubbing the place become red, there is then hope of Cure; the ſooner it is thus, the more eaſie the Cure: but if it wax not red at all, then there remaineth no hope at all of any Cure.

5. That kind of *Areæ* is alſo the worſt that hath made the Skin thick, and ſomwhat fat, and ſlick or ſlippery in all the parts affected.

6. *Alopecia* and *Ophiasis* that proceed from the Leproſie are altogether incurable; and that that hath its original from the French Diſeaſe is not to be Cured untill the Diſeaſe it ſelf be Cured.

7. There then ſhines forth ſome hope of a Cure to follow, when the extremities of the *Areæ* that are neereſt unto the remaining hairs do again begin to ſend forth other hair. For then thoſe parts that are nigh unto the ſound have the leſs receded from their Naturall State, and ſo conſequently will the ſooner again return unto their Natural State, and begin to produce hair.

The Cure.

If a Vitious humor abound in the whole body, this is firſt of all to be evacuated, for otherwiſe it wil continually cheriſh the Malady, by fomenting the matter thereof. And ſo if the French Diſeaſe be Joyned therewith, this is firſt to be cured; in regard that the *Areæ* cannot be taken away, unleſs this be firſt removed. As likewiſe the diſtemper of the Bowels upon which the breeding of the vitious humors doth very much depend, is to becorrected. And the antecedent Cauſe being taken away, the Containing Cauſe of the *Areæ* is then to be removed; which *Galen* doth by Repreſſers and Digeſtives: but we ought withal to do our endeavor, that the skin may be reſtored unto its natural temper.

And therefore in the firſt place the whol body is to be purged by fit and proper Medicaments, according to the Nature of the peccant humor. And

moreover *Galen* for the particular evacuation of the head, administreth Apophlegmatisms also, which we have elsewhere explained.

But for the matter which is yet in its flux, and in the beginning thereof, before the *Areæ* are yet made, *Galen* maketh use likewise of Repellers. And the same likewise we are taught by *Avicen*; where he telleth us that the Medicaments in the *Alopecia* ought likewise by a moderate astriction to corroborate the skin of the head; for in the seventh part of his fourth Book, Tract. 1. Chap. 6. he saith thus: *And it is requisite that there be in those Medicaments a comforting and strengthening, thereby to prevent and hinder in the head the reception of malignant matter.* But otherwise, and if the *Alopecia* and *Ophiasis* be already present, Repelling Medicaments have then no place; even as likewise they have no place in *Scabies* or Scabbiness.

But if the Areæ be already made, and the matter impacted into the skin, we ought then to use Digestives. Now these are hot, of thin parts, and not greatly drying. For if we make use of those things that dry overmuch, not only the vitious humors, but even the very aliment of the hair wil be then discussed. Yea, since that in the *Areæ* confirmed the distemper of the skin is hot and dry; therefore cold and moist Medicaments are to be mingled with the rest.

But now these Medicaments that take away the nighest cause of this Malady, are termed *Metasyncritica*; of the preparing of which *Galen* teacheth in his first Book of the Composition of Medicaments according to their places, Chap. 2. and in his fourteenth Book of the Method of Physick, Chap. 12. To wit, in the first place, if there yet remain any hairs that are corrupted, these are to be plucked out either with the *Volsella* (an Instrument purposely made to pul out hairs) or they are to be drawn forth with a *Dropacism*, or else the place may be shaven with a Razor. And then afterward let the head be washed with a Ley in which Maidenhair, Golden Maidenhair, Southernwood, and the like Plants have been boyled. After the washing, let the place be rubbed with a Linen cloth (that is not over moist, nor yet over dry) until the skin begin to be red: when this is done, then let Topicks be administred. Now such like Medicaments are, Mustard seed, Cresses, white Lily Roots, which (as it is said) wil likewise restore those hairs that burnt places have been deprived of by fire or scalding; Rocket seed, Nitre, Oyl of Bayes, liquid Pitch, Sulphur, the pouder and ashes of Southernwood, the Root of Sowbread, and Hellebor, the seed of Stavesacre, and Doves dung; and (these being the strongest and most powerful of al) Thapsia and Euphorbium. Which aforesaid Medicaments notwithstanding by how much the newer and fresher they are, by so much the sharper they are also; and the older they be, the more they lay aside their sharpness and tartness. But out of these such of them are to be made choyce of that are proper and convenient unto each of these Affects; and these are also rightly to be administred. For those Medicaments that were by us even now mentioned, they are not al of them fit for al kinds of Areæ, or at al times, or after any manner administred, or in al ages; but unto each of these there are such Medicaments as are fit and proper; and each of these Medicaments have likewise their due time and manner of use: and unto the Malady when it first begins, (and being yet but smal) the weaker sort of them are to be administred; but if the Malady be inveterate, then the stronger sort of them: and unto the softer bodies (such as are the bodies of Children and Women) the weaker Medicaments; but unto such as are at their ful age, and unto Men, the stronger sort of Medicaments are to be applied.

Galen acquaints us with divers Compositions that had been examined by long Experience, and approved of (in his first Book of the Composition of Medicaments according to the places, Chap. 1.) to wit, Those of *Heras*, *Crito*, *Orestinus*, *Ortho* the Sicilian, *Cleopatra*, *Archigenes*, *Asclepias*, *Dionysodorus*, *Soranus*, and others.

Galen himself commendeth this following:

Take *Leaves of the Greek Reed burnt half an ounce*; *the Urchin burnt one dram*; *Mouse-dung two drams*: *bruise and mingle them wel with Vinegar, and so anoint the place therewith.* Or,

Take *ashes of the burnt Reed, Goats hair burnt, Maidenhair, Bears fat, liquid Pitch, Rosin of the Cedar, of each alike*: and this he calleth the admirable Remedy. Or,

Take *House Mice burnt, a piece of linen Cloth burnt, Horse Teeth burnt, Bears Fat, the Marrow of a Hart, the rind of the Reed, equal parts of al*; *Honey as much as wil suffice*; *and make an Unguent.* Or,

Take *Euphorbium, Thapsia, Oyl of Bayes, of each two drams*; *live Sulphur, both the Hellebors, of each one dram*; *Add Wax six drams*; *which may be moistened with Oyl of Bayes, or old Oyl, or liquid Pitch, and mingle them together:* And this Medicament is of al other the strongest, and therefore most convenient for the Malady when it is become inveterate.

In the Malady that is more mild it wil be sufficient to use a Medicament made of Southernwood, or the roots of the Reed burnt, mixt and incorporated with old Oyl, Oyl of Bayes, or liquid Pitch. Or,

Take *Rocket seed, Cresses, Nitre, equal parts of them al, and let them be mingled with Oyl of Bayes, or liquid Pitch.*

This that followeth is yet more mild, and therefore fit for Women and Children.

Take *Southernwood, the ashes of the Root and Rind of the Reed, Frankincense, of each of these*

these equal parts; Bears Fat, and Oyl of bitter Almonds, of each as much as wil suffice, and make a Liniment.

But if it be needful to make it stronger, then add thereto *Spuma Maris*, live Sulphur, Bulls Gall, Rocket seed, Nitre, or even Thapsia also. Or,

Take *Mustard seed, Thapsia, the seed of Cresses, equal parts of them al; when you have beaten them into a very fine pouder, then add Oyl of Bayes, and Rosin, of each alike, as much as will suffice; and at the fire make hereof an Emplaster according to art.*

Such like Medicaments (good store of them) are likewise extant, and in divers places here and there, in the Writings of *Valescus de Taranta, Rondeletius, Vallerius, Trincavellius*, and other Practical Physitians.

And this is likewise in the use of the stronger sort of Medicaments to be observed, that in the beginning, the more liquid and softer Medicaments, and such as are tempered by the mixture of Oyls (that somwhat abate the force of the stronger Medicaments) may be administred; and after the use of the first Medicament we are to look what alteration it hath made in the part affected; and afterward (as need shal require) the strength thereof is either to be augmented or abated. Now whether or no there be any alteration made may be discovered by this especially, if we take notice, and wel observe, whether the skin after the use of the Medicament be made ever a whit the redder, or no; or whether it were made red by a light and gentle, or else by a stronger friction. For we ought to be very cautious, that the skin be not burnt through by the too often repeated use of the stronger Medicaments. And as touching the use of Compound Medicaments, you are likewise to take this advice, to wit, That if the hair be altogether shaven off, it wil be then more convenient to apply Medicaments of a more solid form, such as are Emplasters: but if the hair be not shaven away, then those Medicaments that are liquid and soft, such as are Liniments and Unguents.

But then the weaker Topical Medicaments are to be continued unto the head both day and night, that so they may exercise and put forth their strength and vertue. But if the Medicaments be of the stronger sort, they are then to be detained upon the head so long, until there appear to be some alteration in the skin caused by them, and that there begin to arise some kind of pain. And therefore in the use of the stronger, the place affected is dayly once or twice to be viewed, and if the Medicaments have strongly affected the place, we are then to return to the milder sort of them; and the place is to be anointed with Goose Fat, Oyl of Dill, or the like Anodyne Medicament. For if the stronger Medicaments be too long kept upon the skin, it wil burn the same. And *Christophorus a Vega* writeth, that he had seen very many who by the use of Medicaments that were overstrong were thereby brought unto a perpetual baldness, and continued beardless unto their dying day.

The Diet.

A good and due course of Diet maketh very much also for the curing of the said *Alopecia* and *Ophiasis*; which let it be such as that good blood may be thereby bred, and the encrease of bad humors prevented. And therefore let the Patients meat be of a good juyce, that may bring the depraved humors unto a benign and good temper. Let the Patient abstain from Wine, before his body be purged, because that Wine carrieth the bad humors that are detained in the body along with it into the Veins. But when the body shal be sufficiently purged, then the Patient may drink that Wine that is temperate and a little sweet, seeing that it nourisheth wel, and breedeth good blood. Let the Air in which he breatheth be hot.

Chap. 5. *Of* Tinea, *or Worms eating off the roots of the Hair.*

AMong those Affects in the which the Haits fal off, that Affect is by no means to be passed over in silence, in the which the hairs indeed, not whol, but in pieces (or piece-meal, as we say) fal off, being eaten through and consumed by certain Worms. There are but very few Authors that make mention of this Affect; neither (as it seems) was it known unto *Platerus* (though otherwise a most experienced Physitian) whom we find thus writing; There are some (saith he) who affirm that the hairs of the head and beard have been gnawn and eaten asunder by certain Worms so smal that they could hardly be discerned. But yet nevertheless it is an Affect that is commonly known with us; and I my self have often seen it, and it hath been offered unto me to Cure. Our Germans cal it *Haarmilben oder Milen*. And this kind of smal Worms that are scarcely visible to the Eye (and which whether they have in them any life or not, we cannot discover but only by their motion) are bred in Cheese, Honey, (if there be but a little bread added thereto) old Wax, Prunes, and dried Cherries, and divers other things besides. And without doubt this species of little Worms is of the same kind with those that (as *Aristotle* writeth) are the least sort of al Worms, and that they breed in old Wax, and in Wood; and in his fifth Book of the History of living Creatures, Chap. 32. he calleth them *Acari*. A Latine word there is none other for it, unless we think good to cal it *Tinea*; because that like as Garments are eaten by the moth; so are the hairs likewise by these Worms, being bred in the hair.

The

The Causes.

As Lice and other kind of Vermine have their certain matter out of which they are bred (all kind of Vermine being not generated from al kind of matter) which cannot possibly be known but by experience: even so likewise this kind of smal Worms is bred (as we have said) in Wax, Honey, old Cheese, Cherries, and dried Prunes; as also in the hair of the Head, and oftentimes in the Beard. But without doubt they have their original from a certain excrementitious humor, that together with the Aliment of the hair, penetrateth into the said hairs; and there being cherished by the heat of the Head it converteth into little Worms, that afterward sticking unto the hair (for from whence they are generated from thence they seek their nourishment) they corrode the same, so that they fal off piecemeal.

Signs Diagnostick.

This Affect is sufficiently manifest of it self. For the hairs are made shorter, and unequal; some of them being more, and some less Curtaild. These little Worms stick in the extremities of the said hairs; and there they from day to day corrode and decurtail them: but whether or no they stick likewise in the midst of the hairs, for this we must Consult the Sight, and take an exact view of the hairs thus affected. The color likewise of the hair (if it be black) is changed; and by reason of those little Worms sticking unto them, it becometh (in some certain places) as it were of the color of Ashes

The Prognostick.

The truth is that this Affect hath in it no danger at all; and yet nevertheless it causeth a very great deformity, and unsightlines, especially in the Beard, by making the hairs unequal; some of them being shorter, and some longer; and the Beard it self seemeth foul, sluttish, and Nasty. This Affect is also hard to be cured.

The Cure.

For the Cure hereof there will be need of those Medicaments that Cleanse away these small Worms; and that digest, and discuss the matter from whence they are generated. Neither doth it seem from the purpose, that we purge the whol body, since that these Worms arise from a vitious humor mingled together with the aliment of the hair.

Take *of Broom one ounce, Myrrh two drams, Vinegar as much as will suffice; boyl it a little; and let the hair be Cleansed with the straining.* Or,

Take *Nettle seed pulverized; let it be macerated in Vinegar, and the hairs wel wet with the same.*

The Decoction likewise of Fenugreek and Scabious made with Ley is very useful in this Case; and so are also Squils, with the Leaves of Myrtle and Sage boyled in Oyl. Or,

Take *Garlick, Centaury the less, equal parts of both; boyl them in Vinegar; and add thereto the Gall of a Bull.* Or,

Take *the greater Nettle; boyl it in Ley, and wash the Head therewith.* Or,

Take *Southernwood, Root of Avens, and Wormwood; boyl them in Vinegar and Spring Water, as much of the one as the other, and let the hair be washed with the Decoction thereof.*

Chap. 6. *Of the Cleaving of the Hair.*

And sometimes likewise the hairs on the Head, and in the Beard, are cloven and divided; so that those that before were single and but one now seem and appear to be cleft into two. Which Vice of the Hair happeneth without doubt from some sharp humor, cleaving the Hair in the ends of them. But now, since that this Vice breedeth some kind of deformity, it is therefore to be amended. Which is done, if that part which remaineth be anoynted about the ends of them with the Gall of a Bull and be afterwards again washed with the Decoction of the Capillary Herbs, Southernwood, the Reed, and the like.

Chap. 7. *Of hoarines in the Head and Beard.*

For a Man in old age to become grey and hoary in his Head and Beard, is a thing altogether Natural: but yet sometimes nevertheless it so happeneth, that immaturely, and oversoon, hoarines appeareth in some before their old age, yea indeed before they are come to be Men. And furthermore Hoarines cometh on and appeareth leisurely and by degrees.

But yet it is observed, that some persons have suddenly and all on an Instant become white and hoary. And to this purpose, *Scaliger* in his Exercitation 312. relateth a History of something that happened under *Franciscus Gonzaga*. This *Gonzaga* having committed and imprisoned a neer Kinsman of his in a strong Castle, upon suspition of treachery in him, thereby to reserve him until he were questioned and punished according to his demerits; news was brought him next morning, that his Kinsman was suddenly become all over white and hoary. And the like we read in *Lemnius* in his second Book, Chap. 2. of Complexions: and in *Hadrianus Junius*, in his Comment. upon the Hair: In *Ludovicus Vives* his *Scipio's Dream*; and in *Cœlius Rhodiginus*, in the third Book of Ancient Reading, Chap. 24. and in the thirteenth Book, Chap. 17. And *Cuspinian* relateth

lateth many Hiſtories of ſuch as ſuddenly out of fear became gray and hoary; and ſo doth *Johannes Schenkius* relate the like, in the firſt Book of his Obſervat. And of this kind of hoarineſs it is (that cometh immaturely and before its due time) that I am here in this place to treat. For this Affect (in regard that it both depriveth a man of his Natural beauty, and likewiſe betokeneth that the health is not right, and as it ought to be; it is therfore not without good cauſe made the ſubject of the Phyſitians care and pains. As for that grayneſs, whiteneſs, and hoarineſs that chanceth unto men and women in their old age, and is a Natural ornament of their old age, to endeavor to cover and hide this with fucuſſes and other artificial paintings, is altogether whoriſh, and an Argument of a light, wanton, and luxurious mind.

The Cauſes.

It is not to be doubted that natural hoarineſs doth proceed from the change and alteration of the temperament of the body, and the blood that nouriſheth the hair. But here we are to enquire how it cometh to paſs that there ſhould be ſometimes ſuch a change as this in the blood and aliment, in thoſe that are yet in their youth and green yeers. *Ariſtotle* (in his fifth Book of the Generation of living Creatures, Chap. 5.) writeth, That the Aliment that produceth theſe white and hoary hairs (when it is not concocted) doth rot and putrefie, and ſo becometh a white hoarineſs; becauſe that the filthy ſnottineſs of them being rotten is almoſt white. And ſo he deduceth this hoarineſs from the defect of Native heat; which when it cannot concoct the humors, theſe humors being deſerted by their natural heat are then the more attempted by an external and adventitious heat, and ſo they become putrefied; from which putridneſs they are made white. *Galen* ſeemeth to follow the opinion of *Ariſtotle*; when he tels us in his ſecond Book of Temperaments, Chap. 5. That the hairs are made white, becauſe that the aliment whereby they are nouriſhed is as it were the ſnot of flegm, which in ſpace of time putrefieth. And that which *Ariſtotle* calleth putridneſs he termeth *Situs*, and we cal it filth, ſnot, or ſnivel: this being ſuch a kind of affection as happeneth unto Bread in the Dog daies, which we therefore call ſinnowed or hoary Bread. And for this cauſe likewiſe it is (as he writeth) that men are more apt to grow hoary in their Temples, becauſe that the fore part of the head is (by reaſon of its drineſs) more prone to baldneſs; but the Temples, by reaſon of their humidity, and conſequently upon the generating of ſnot and filth from the putrefying of the aforeſaid humidity, are more apt and prone unto hoarineſs. The Opinion of *Galen* in this one thing only ſeemeth to differ from that of *Ariſtotle*, to wit, That *Ariſtotle* ſpeaketh only in the general, without making mention of any one particular humor; whereas *Galen* writes that hoarineſs proceedeth from the putridneſs of flegm alone. And here it is altogether more ſafe, by flegm, to underſtand any ſimple crude humor, then flegm properly ſo called; and that any crudity rather than that putridneſs only which is ſo called, may be the cauſe of hoarineſs. To wit, (that we may in a word or two propound our opinion touching this very thing in controverſie, of which others have ſo largely diſcourſed) ſeeing that the hairs (as we ſaid before) are not generated and nouriſhed from vapors, or excrements elevated in the form and likeneſs of vapors, but rather from the blood, as al other parts are, it is without al diſpute, that the blood that is generated in old age is not ſo freſh, flouriſhing, and temperate, as in youth; but that as the body is now haſtening toward death, ſo the blood alſo that is therein bred is nothing ſo good as formerly; which is cleerly ſhewn and manifeſted even by the change and decay of that freſh and lively color of the body, and that witheredneſs that befalleth men and women in their old age. And therefore we are not to wonder, that (ſeeing the blood that nouriſheth the hair is now become far worſe than before) the color of the hair ſhould likewiſe be changed; neither that the hairs (that retain their own natural conformation and nutrition even until a mans death) ſhould only from ſome filth and ſnot (that is wont to happen unto thoſe things that putrefie) ſuffer any ſuch like thing as that we now ſpeak of. But now that in *Vitiligo* and *Leuca* this color is preternaturally changed, it is doubtleſs from this, That in the ſaid Affects there is not ſupplied unto the hair ſo good an aliment, but ſuch as is full of excrements, and eſpecially flegmatick excrements. But in ſuch as are hoary before their time, in theſe no doubt there is a fault and ſomthing amiſs even in the very humors; and if not in the whol body, yet at leaſt in the head and temper of the brain. Neither is it impoſſible but that theſe who are thus hoary in their youth or middle age may come to be thus affected, and to ſuffer what we are now ſpeaking of, either by reaſon of the Seed, or ſome diſpoſition in the Teſticles; and we have already told you before, that evermore the Seed and the Teſticles do make very much in the change of the color of the hair. And again, ſince that the Paſſions and Affects of the mind (eſpecially fear and terror) may poſſibly effect ſuch notable changes in the humors, and that they may likewiſe greatly affect the brain; it is therefore no wonder that in a ſhort time hoarineſs ſhould be produced from that change that is made in the humors. For if from a ſmal Cloud, or the Air, or a hurtful Wind blowing upon Trees, the color of their Leaves may be changed, and the Leaves may thereupon wither, (the Tree it ſelf, and other parts thereof remaining ſafe and untouched; it is not impoſſible alſo, but that the color of the hairs (as of the moſt ignoble

noble parts of our body) may likewise be changed from some humor, or spirit suddenly invading and seizing upon them. And this may be also confirmed even by that which *Hollerius* (in his first *Perioche*) writeth, to wit, That the hairs have suddenly been turned white and hoary by the vapor of Hydrarge.

Signs Diagnostick.

The change of the color of the hair into whiteness or hoariness is sufficiently manifest of it self; neither is there any need of signs to discover it. And if in the declining age the hair grow hoary, it is no more than what is natural; and this change is made but slowly, as coming by degrees, as age encreaseth. But if this happen before old age, although it be but slowly, yet it is preternatural; but it is much more preternatural, if a man or woman become hoary al on a sudden.

Prognosticks.

1. That hoariness that is natural (as happening in old age) can no way be amended; as neither likewise can the witheredness in old age: yea indeed it ought not so much as to be attempted by the Physitian; since that the hoary head is rather an ornament unto those that are old, than any thing of which they should be ashamed.

2. But that which is preternatural, as it ought to be corrected (in regard that it signifieth some kind of preternatural affect and vitious disposition (in the brain more especially) so it also may be amended; since that if the said vitious disposition be amended, the color of the hair wil likewise be changed.

3. That hoariness that is from the *Vitiligo* (a kind of Leprosie) is upon the curing of the said Disease likewise amended.

The Cure.

The hoariness that is incident unto old age (as we have already told you) cannot any waies be amended; neither indeed ought it to be palliated and hid with any artificial *fucus*; and he that shal attempt any such thing may deservedly be laughed at; touching whom *Martial* (in the fifth Book of his Epigrams) thus:

Thou seemst, Lentinus, *by thy dy'd hairs young again,*
And soon art made a Crow that wast erewhile a Swan.
Thou canst not al deceive, for Proserpine *wel knows*
Thy hoary head; and wil discover thy false shews.

But that hoariness that is caused by *Vitiligo* and *Alphus* is taken away upon the removal of the said Diseases; and especially if Medicaments that prolong the hair be administred. For then new hair growing up from the good aliment, those old hoary hairs wil be soon abolished.

But if immaturely and before the due time this hoariness threaten, or suddenly invade any person (whether man or woman) the better to preserve from it, and to cure it if present, we must do our best endeavor that good blood may be produced in the whol body (and especially in the head) that may supply unto the hair a good and fit aliment; and withal the vitious humors (if there are any such present) are to be evacuated. Neither ought the particular evacuation of the head (by Sternutatories and Errhines) to be omitted. And after this we are to make use of those Medicaments that strengthen the Native heat of the body, and more especially the brain; touching which we have already spoken in their proper place.

The Arabians commend this Confection:

Take *of the black Myrobalans without their Kernels five ounces*; *Ginger, Ammi, (or Bishops-weed) of each ten drams*: *let them be throughly moistened with Butter*; *and then add Sugar of Penidies to the quantity of the one half*: give often of this Medicament one dram.

Topicks.

As for what concerneth Topicks, *Galen* indeed (in his first Book of the Composition of Medicaments according to the places, Chap. 3.) propoundeth Medicaments that are hot, and of thin parts, when he had a purpose to discuss and scatter the snotty filth, and to dry up the superfluous humidities in the skin. But unless that there afterward flow thereto such a like aliment that may again generate hair of the Natural color, such Medicaments as these wil avail but little. Others there are therefore that make use only of those Medicaments that dye and make black the hair. In doing of which notwithstanding we are well to heed and weigh what honesty wil allow of; and withal we are to take heed that by no means we bring any hurt unto the Brain. For these Medicaments that make black having most of them an astringent power, and being withal cold, are very apt to produce the Apoplexy, Epilepsie, deep and profound sleep, Catarrhs, and the like Maladies; and this *Galen* tels us he hath seen and observed to befal some certain Women in his time.

But now among these like Medicaments, *Galen* preferreth *Cadmia* or Brass Oar, before al the other; in regard that by this Medicament the hairs are made black, the rottenness and filthy snot is discussed, and the il disposition of the head amended. The Oyl of Costus is also commended, and so is the Oyl of Coloquintida, or bitter Gourd, of Nightshade, and of Mustard seed.

Some few hours after the anointing, let the head be washed with a Ley of the ashes of Beans, Nutshels, in which Litharge hath been boyled; or with a Ley in which the Pulp of Coloquintida

(so

(ſo much commended by al) hath been boyled. There is likewiſe commended the Oyl of wild Olives, Myrobalans of al the ſorts (which are ſaid to retard and hinder hoarineſs, both inwardly taken, and outwardly applied) Gals, Acacia, Fenugreek, Henbane ſeed, Ladanum, the juyce of Walnut ſhels while they are green, the Leaves of Capars, and likewiſe the Roots of them, boyled with Milk, maſhed, and then in the form of a Cataplaſm applied for a nights time; the rind of the holm root boyled unto a ſoftneſs, and impoſed; Sage, and Copperas.

Now theſe kind of Medicaments are to be continued; and albeit they appear not to do any good at once or twice uſing, yet nevertheleſs we are not to deſiſt from the uſe of them, but we are ſtil to perſevere, and continue in the ſame. Touching theſe kind of Tinctures, this is likewiſe to be taken notice of, That if you wil have them ſtable and laſting, it wil be very fit that a Lotion of the head be premiſed, that is made with ſuch a like Decoction that both giveth a beginning unto the Tincture, and that likewiſe cauſeth that it continue firm; like as Cloth-Dyers when they intend to dye a piece of black Cloth, they firſt put upon it a red color with Madder, or a Sky color with Woad. And therefore let the hairs that are to be dyed be firſt waſhed with a Ley in which Roch Alum hath been diſſolved. And in the choyce of Medicaments, we are likewiſe to endeavor, that ſuch like Medicaments may be choſen that are no waies unpleaſing in their ſmel, but rather ſuch as are ſweet and pleaſant.

This following is found to be ſure and certain, and by much uſe approved of.

Take Ley *half a pint, boyl in it Litharge of Gold four ounces:* In this Decoction let a Spunge be wel wet, and let the hoary hairs be throughly moiſtened with the ſaid Decoction, by the ſpace of a quarter of an hour in a warm place. And then let the head whiles it is wet be forthwith covered for one hour with a Linen Cloth: and afterwards let the hair and the head be waſhed with a ſimple Ley, and not with that which is overſtrong: and this is to be done twice a week.

He writeth that the Mercurial Medicament that followeth wil within one month (and often in leſs time alſo) make black al the hair.

Take *black Myrobalans one ounce, black Raiſins two ounces; aſtringent Wine three pints; boyl them in a double Veſſel by a gentle fire, to the conſumption of two thirds; then add of the juyce of green Walnut Rinds half a pound, Sumach and Acacia, of each one ounce, Cloves one ounce and half, Muſk one ſcruple: boyl them again in a double Veſſel for half a day.* Let the hairs be anointed with this Medicament about night, and then let the head be covered with a black woollen cloth: and in the morning following let it be waſhed with Wine in which black Myrobalans have been boyled. And *Aviceh* writeth that if Cloves be added unto theſe kind of Medicaments, they wil ſufficiently dye the hairs, and prevent the Brains being hurt by the Tincture. Or,

Take *Leaves of the Vine, and the Rinds of the Vine Roots, and Parietary: Boyl them in Water, and afterwards add Allum, Galls, and Vitriol; and ſo mingle them.* Or,

Take *Green Nuts in the month of* June, *and bruiſe them ſmal; and mingle therewith Allum half a pound; and in a new pot pour in unto them of Oyl three pints; and let them ſtand digeſting twenty daies; let them be afterwards ſtrained, and the head anointed with the Oyl.* Or,

Take *the Coloquintida Apple; make a hole through it, and take forth the ſeeds, and fill it up with Oyl of Bayes and the ſeed of Henbane; let them ſtand for one whol night, and then let the Oyl be preſſed forth, with the which the hair may be anointed.* Or,

Take *of Ley five meaſures, Litharge two ounces; Sage leaves two handfuls; boyl them to the conſumption of the fourth part, and make a Lotion for the head.* Or,

Take *Tartar one ounce, Litharge half an ounce, Juyce of Sage as much as wil ſuffice; mingle them in a Leaden Mortar, and make an Unguent;* with which (uſing it with a Leaden Comb) let the hairs be anointed. But here to add any more Medicaments is not worth the while, in regard that there are many more of them every where extant.

But now theſe Medicaments that make black the hair are not only made uſe of for the covering and hiding of hoarineſs; but in our *Germany* a black color of the hair is greatly deſired and endeavored after by ſome certain of our noble Virgins; either that they may ſeem to have ſomwhat Exotick, ſtrange, and forreign; or elſe that they may be differenced from the vulgar and Plebeian young Maidens, unto whom the yellow or golden color of the hair is moſt acceptable, and in moſt account. And thus every one hath ſomthing or other fair in his own eye, and high in his own account, although not ſo in anothers. And therefore theſe Virgins ſeem to me to do juſt as that Blackmoor did that lived in the Court of a certain German Prince, who often ſeeing in the Womens Ward a white Virgin, and withal a black Whelp, he would tel the Virgin that ſhe was not fair and beautiful, but rather that the black Whelp was beautiful and fair; and ſo (as *Julius Cæſar Scaliger* ſaith)

Black ſeems moſt fair
To thoſe that are.

What things they are that make the hair yellow.

But more right is the Judgment of the other Virgins, that ſeek and endeavor after a yellow or golden

color of the hair. Now this yellow color of the hair may be gained, if the hairs be washed, and likewise their Hair-laces wel wet in that Water or Ley in which the flowers of Broom, or of the yellowish Mullein, of the Citron-color'd Stæchas or Cassidony, of Camomile, Citron rind, the Cowcumber root, and the root of Gentian, have been infused. And likewise Lupines boyled in Water make the hair yellow; and so also doth the Water and Oyl of Honey. And they commonly likewise use (for the Combing of the hair) the Ley that is made of the Ashes of Vine shoots; which wil be somewhat more efficacious, if there be infused therein the Leaves of Citrine Stæchas, or of Mullein. But there are more of these like Medicaments every where to be found.

Chap. 8. *Of the Scurfineſs, and Dandriff of the Head.*

NEither are we here to pass over those Vices, which indeed happen not unto the hairs; and yet nevertheless they are about the hair and in the Skin that is covered with hair, and wherein it groweth; and of this sort are *Phthiriasis* or the Louse Evil, and *Furfuratio* Scurf and Dandriff, like unto Bran. But having already spoken touching *Phthiriasis*, in the fourth Book of the Diseases of Infants, Chap. 5. It now remaineth that we treat of the *Furfuratio*, or the Dandrif of the Head, Beard, and Eyebrows.

Scurf and Dandrif.

This *Furfuratio* (which the Greeks cal *Pityriasis*, and which is by the Latines called likewise *Porrigo*) is an Affect, wherein when there is any scratching there falleth down out of the Skin of the Head something very like unto Bran; and indeed most usually from the Skin that is under the very hairs themselves; and sometimes also from the Beard, and the Eyebrows.

The Causes.

The Cause of this Affect are humors that are serous or wheyish, and also *Ichores* or thin Excrements (not only such as are flegmatick, but such as are Cholerick also) elevated unto the Head together with that humor that yieldeth and supplieth matter unto the hairs; and hence it is that this furfuration or scurfineſs doth appear only in those places of the head that have hair upon them: for this matter seeking a passage forth through the Pores of the Skin, the thinner parts of them are discussed, but the more thick and Clammy parts stick in the Skin & about the hairs, and there they pass into a matter that is like unto Bran, or Scales. The antecedent Causes are all those that may any way generate these serous humors in the Head. But now the mater is attracted and drawn unto the Head, in those especially that have a hot Brain.

Signs Diagnostick.

The Affect it self sufficiently manifesteth and discovereth it self when the Head is Scratcht, Rub'd, or Comb'd; for then there fal down certain smal scales resembling Bran.

The Prognostick.

This Affect hath no danger at all Joyned with it; yea by some it is accounted for a very good Sign of a sound Brain, expelling and driving forth the excrements from it self; and yet nevertheleſs it causeth some kind of deformity and much trouble.

The Cure.

The vitious humors if they abound in the body are to be evacuated, and care taken that they may no more be generated.

But unto the Head it self Discussive Medicaments are to be administred. There are some likewise that therewith mingle some certain Astringents, that the part affected may be strengthened, lest that it easily receive the humor that floweth thereunto. But then it is to be feared, lest that the transpiration in the Head be hindred, and the excrements therein contained excite far worse and more grievous Maladies.

And therefore as *Galen* in his first Book of the Compositi. of Medicaments according to the places, Chap. 5. teacheth us, the Head is to be washed with the Decoction of Fenugreek, the Juyce of Beets, and Nitre. Or else it is to be Cleansed with the Decoction of Melon Seed, the meal of Cicers, Lupines, and Beans. Or else let it be washed with the Decoction of Cicers and Melons, adding thereto a little Vinegar. When the Head is washing, in stead of Soap, bitter Almonds bruised may be made use of.

If the Malady be confirmed, and wil not yield, let the Head be first washed with the Medicaments but just now mentioned; and after this let it be rub'd with a course Cloth, and then anoynted with this following Unguent.

Take *Green Hyssop, Ducks fat, of each half an ounce; the pulp of Coloquintida*, Oleum Cheirinum (*or the Oyl of Wall-flowers*) *of each one ounce; Thapsia two drams, Ladanum two ounces; and make an Unguent.*

Or else let the Head be washed with the Decoction of Beets, and the lesser Centaury, adding thereto Vinegar and Honey. Or,

Take *Marshmallow roots, the Leaves of Beets of each one handful; Pulp of Coloquintida half an ounce, Nitre two drams; boyl all in a sufficient quantity of Water, to the Consumption of the fourth part; and in the end add of Wine one pint.*

After the Washing let the Head be anoynted with the following Unguent.

Take *Copperas, and the Gall of a Bull, of each one*

one dram and half; Nitre and Sulphur, of each two drams; Oyl of Roſes two ounces; Mingle them over a gentle fire, and adding thereto a ſufficient quantity of Wax, make a ſoft Unguent.

You may ſee more of theſe Medicaments in the place before alleadged out of *Galen*, and likewiſe in *Paulus Ægineta*, and *Alexander Trallianus*.

Chap. 9. *Of Plica Polonica.*

AND laſtly, among the Vices of the hair, we muſt not in ſilence paſs over that which although indeed not known in all places, yet nevertheleſs may very wel be accounted the chief of them all. It is called *Plica*, to wit, becauſe that in it the hairs are wholly entangled one within another; and by the Polonians *Gvvodzicc*, that is, a Club; and by the *Roxolani* it is termed *Koltun*, which ſignifieth a little Stake or ſmall Poſt; whereupon it is alſo by ſome called *Helotis*. Others call it the Diſeaſe of the Locks; the Germans *Wichtelzopffe*, becauſe they ſuperſtitiouſly conceived, that ſuch like Locks of hair were entwiſted by Infants dying unbaptized (for theſe by the Ancients were called *Wichteln*) as likewiſe, *Marenflecht*, *Marenwirckung*, *Marenlocht*, *Schrotlinſzopffe*, *Indlezoppffe*, becauſe they were thought to be knit and twiſted by ſome *Incubus* in the likeneſs of a Jew.

This Diſeaſe is very familiar, and as it were Epidemical, eſpecially unto the Polonians; inſomuch that Neceſſity enforceth them to ask the advice, and to implore the aſſiſtance of the Phyſitians of *Padua*. I had rather therefore give you the Hiſtory hereof, in the very words of theſe Phyſitians, then in mine own. Now therefore thus writeth D. *Laurentius Starnigelius* (Rector of the Univerſity of *Zamoſcium*, and Profeſſor of Rhetorick) unto the Phyſitians Profeſſors of the Univerſity of *Padua*, the laſt day of October, in the yeer 1599.

Excellent and Worthy Sirs, our moſt dear and greatly to be reſpected Friends;

IN regard of that neer and Intimate acquaintance that we gained (during our Converſe and abode in the loweſt Sarmatia) with you moſt Excellent and Noble Doctors, by reaſon of that common bond and tie which the beſt of Arts had knit between us and your Excellencies; I the Rector of the lately erected Univerſity at Zamoſcium held my ſelf bound to write unto you (my Noble and ever honored Friends, famous indeed and renowned, not only by the antiquity and eminency of the moſt Noble Univerſity of Padua, but alſo far more enobled and dignified by your Learning and Practiſe. The Cauſe of this my writing unto you was given me by the Novelty of a Diſeaſe among us, and the extream difficulty of Curing thereof. My requeſt is, that you the moſt Eminent Profeſſors of the Univerſity of Padua would both pleaſe to read this my Epiſtle, according to your wonted Candor and Courteſie; and likewiſe when you have read the ſame, that you would vouchſafe friendly to write back unto me your Advice and Judgment; of what nature and quality you conceive the Diſeaſe to be, what Precepts you think fit to be given touching the ſame, & what kind of Medicaments you Judg moſt expedient for the removing of the ſame. The Caſe ſtands thus: Betwixt Hungaria and Pocutium (a Province of the Kindom of Polonia) which are diſtinguiſhed the one from the other by Mountains, out of which there break forth divers Rivers, it ſo happened, that very many both Men and Women had one or two Locks growing forth on their Heads, entwiſted and infolded within themſelves inwardly, and entangled together with the hairs nigh unto them, the Lock hereby becoming exceeding very thick: and then indeed it was nothing at all troubleſom. But now this ſame Diſeaſe hath begun to Creep further, and fleeth up and down throughout the whole Kingdom of Polonia, to the great diſquiet and torment of all ſorts of People. It infringeth the Bones; looſeneth the Limbs; infeſteth the Vertebræ of the Limbs; maketh the members round like a Globe, and writheth them back; it cauſeth them that are affected therewith to bunchout; it poureth forth Lice, and ſo filleth the Head with freſh ſupplies of theſe ſaid Lice following one after the other, that it can by no means be freed of them. If theſe Entangled Locks be ſhaven off, that humor and the poyſon thereof ſheds forth into the body, and then (as we wrote before) extreamly tortureth the perſons thus affected; it diſquieteth and troubleth the Head, Feet, Hands, all the Limbs, all the Joynts, and in a word, all the parts of the body. And it is found by experience, that ſuch as have ſhaven off theſe bundles of hairs ſo cloſely entwiſted within themſelves, that theſe have ſoon after been taken in their Eyes; or elſe have been moſt grievouſly tortured with Defluxions unto the other parts of the body. If we attempt to Cure the Party by the uſual purging Medicaments the affected Perſon is the worſe for them; and the tormenting pain rageth ſo much the more; becauſe that the ſaid purgation is not able to maſter and expel the Noxious offenſive humors, but only ſtirs them abroad, and thereby ſcattereth and diſperſeth them throughout the whole body: for (after purging) thoſe that are afflicted with this Peſt are ſo exceedingly tormented with a burning pain of all their Members, that nothing can poſſibly be added unto the ſharpneſs & bitterneſs of the Torture. Women for the moſt part are taken herewith; and likewiſe thoſe men that are inclined unto the French Diſeaſe, as alſo the Children begotten by them

them that are infected with the said Disease: and those likewise who by Repercussive Medicaments have driven back and repressed the Porrigo *of the head (which the vulgar cal* Tinea:*) and moreover, such Women as in the time of their Monthly Courses are not sufficiently purged. Of which Women some of them there have been that in their young and most vigorous age, having had no more than a shew of their Courses, but withal an extraordinary flux of blood from the Nose, these in their declining age (this flux at the Nose ceasing) have fallen into this very disease of the intangled Locks. Some there have been (though very few) who having been for some yeers tortured and afflicted with this kind of Disease, and not at al shaven their heads; and having undergone al the vexation, nastiness, and filthy deformity of this disease (not without extraordinary great trouble, and a most intollerable nauseousness) have at length recovered, upon the falling off of these virulent intangled Locks; but yet nevertheless the greatest part of them perished. Many kinds of Medicaments have been sought for, and made trial of, but as yet there hath been found none that would effect the Cure. The force likewise and nature of the Disease, and the cause thereof, have been sought for; but as yet there indeed appeareth nothing of certainty, touching what we have sought for. The Country Boors give out that they have found great relief by carrying tied about them an Urchin pulled in pieces; and for the total abolition of the said affect, they make themselves a meat of the said Urchin it self; but yet we find that even in this there is not any thing much available. They furthermore provide themselves of a Decoction made of the Leaves of Bears-breech, with the which when they wash their heads, the locks we mentioned before break forth, and withal great store of Lice. This Affect communicates with that fuliginous and sooty exhalation out of which the hairs are bred; and it seemeth to have some affinity with the affect* Tinea; *and by its excruciating and racking the bones, with the French pox; by the great abundance of Lice, with the* Phthiriasis; *by the pain of the Joynts, with the Gout* Arthritis; *and by the miserable contraction of the Members that it causeth, it seems to have some neer alliance with the Spasm. That I may add no more (most worthy and renowned Professors) your Excellencies wel skill'd, and most expert in this kind of Art, wil easily collect, how necessary this deliberation is, and with how great a benefit you shal oblige unto you the whol most vast Kingdom of* Polonia, *when by your deep Wisdoms and Skill you shal have discovered and found out a present Remedy for this kind of Pestilent Malady, with the which it is generally vexed and disquieted in a most violent manner; and when you have found out an expedient Remedy, if you then please to communicate it unto us by your Letters. Many there have been who (as the first Authors and Inventors of various Medicines) live yet even unto this very day in perpetual praise; the glory and renown of this Medicine found out by your excellent and magnifique Wisdoms, shal be properly your own, shal make you famous, and shal for ever flourish in succeeding ages. I expect from you your most friendly and courteous Answer: but if I have not sufficiently (neither yet in fit and proper words, and such as were requisite) expressed the quality and condition of this Disease, I desire of your Excellencies, that you would herein excuse me, a man wholly conversant in another kind of Art. I have presented you with a certain Adumbration of this Disease, and in a manner shadowed forth unto you this Malady; the more interior Nature and hidden parts thereof your excellent Wisdoms by the sharp and quick sight of your knowledg will easily search into, and contemplate. I bid your Excellencies heartily farewel: From* Zamoscium, *this last day of the month of* October, *in the Yeer one thousand five hundred ninety nine.*

And yet notwithstanding there are others that tel us how that this Disease is very common and familiar even in other Regions also. For in the Observations of *Schenckius* we may likewise see, that this Disease was known also unto the *Brisgoi*, and *Alsatians*. For thus *Schenckius* writeth in the first Book of his Medicinal Observations, Observat. 13. *There is* (saith he) *with us at this day to be observed a certain most horrid, uncombed, and most intricate kind of hairie Tufts, both in the head and beard, no whit strange and unusual unto ours; but altogether unknown unto the Ancient Physitians of former times, in what Age soever they lived: with which such as are affected, you may see them have hanging down (from the rest of the hair of their head and beard) even unto the shoulders, breast, and sometimes also even unto the very Navel, very long tufts and bushes of hair, wonderfully intricate, oftentimes a finger thick, exceeding dreadful to look upon, and much resembling the Gorgons head. Which tufts of hair they suffer to grow in a sloven-like and regardless fashion, for some superstitious ends inducing them thereunto; neither wil they at al suffer it to be cut, neither at any time to be parted and severed with the Comb, being altogether perswaded that the most grievous Fomenters of the diseases of the head (that is to say, the matter of the Apoplexy, Palsie, Madness, and especially the pertinacious Cephalalgie, and the like Diseases) are wholly, or at least in great part consumed in nourishing these tufts of hair. And thus being lead either by Superstition, or the long and exact observation of other men, they wil admit of any thing, rather than the kembing or cutting short of these bushy locks of hair, as a thing altogether ominous and deadly; and having*

ving made their Essayes both of Experiment, and History, they stiffly maintain their own Opinion. But those of them that would be accounted more neat and spruce hide these their deformed tufts of hair (those of their heads within their hats, but those of their beards rolled up together under somthing they purposely wear upon their breasts) that so they may not be seen. But there are likewise others of them, who (although it be even in the publique Assemblies) cannot possibly conceal these monstrous and deformed bushes of matted and intangled hair, if they would never so fain; neither would they, if they could. So that it is a thing so wel setled and resolved on (without the least doubt or scruple) in the minds both of those that wear these horrid and strange intangled locks, and likewise of al those that behold them, that even in their publick Assemblies, without any the least shame or disgrace, and as a thing altogether necessary for the sustaining of life, they expose them to open view. And some certain of them there are (as we have already told you) that during their whol life do in this manner nourish and cherish these their ugly locks, hoping that thereby they may possibly be preserved from al other dangerous and difficult diseases that continually threaten them. The vulgar likewise, if they chance to light into the company of any thus affected, they then presently suspect them to be diseased with some hidden, undiscernable, and some one or other difficult Malady of the head. In which thing whether their Superstition convince their Experience, or their Experience exceed and surpass their Superstition, I wil not at present trouble my self to judg thereof. Only this indeed I conceive fit to tel you, That as I incline very much unto the vulgar Opinion; so (that I may conceal nothing) I think also, that the Seminary of these kind of Diseases is not from thence so much argued as nourished, and that by this means it may be prevented that they invade not; as we are likewise further taught by the received Opinion of Physitians, touching the Causes of the generation of Hair, the Events, and the Cures; there accrewing also (for our further assurance) the common and constant attestation of the vulgar, and which at this day passeth (as from hand to hand) among them. I have not as yet found that this vice of the hair is sufficiently known unto other the Europeans; *neither is it known in the most parts of* Germany: *but unto al the* Brisgoi, Alsatians, Dutch, *and in many Tracts neer unto the River* Rhine, *it is in a manner Epidemical; and generally wel known likewise unto the people where I live. I my self knew here above thirty Citizens (of whom some are even yet living) that were famous and remarkable for this kind of hair. The common people cal it* Marenflechte, Maren wirkung, vnd Schrottlinszopff, *as if we should say, The contorsions or writhings of the hairs, or the locks, and hairy tufts of the* Incubi; *for they conceit that the* Incubi *and* Fauni (*as the Ancients called them*) *draw forth these hairs in the night time by sucking them. Others there are that name them* Marenlock, *that is to say, the locks and tufts of Swine, because they now and then observe some long tufts (like unto the former) growing out of the neck of these Swine, and hanging down very low.*

As for Histories, there are two that in special he reckoneth up, the one out of *Johan. Stadlerus*, a Physitian; the other out of *Moccius*; and both of them he relateth in their own words. The first is this. *Thou bringest unto my remembrance that noble person* Casparus *of* Horstein, *Brother unto the Commendator* Sigismund *in* Alsatia, *and Provincial in* Burgundy, *lately deceased; whom when the Commendator on a time sharply reprehended by reason of his uncombed, writhed, and intangled beard, which (horrid and frightful as it was) he ware before him; and withal threatning to remove him from his Table (a man of about fifty yeers of age) unless he would cut it off; he then answered, that he would more willingly be deprived of his Diet, and freely depart the Court, rather than want his intangled and altogether Gorgonean Beard. This happened in the yeer of Christ 1564. when from* Friburg *I went to* Alschusa *for fear of the Plague.* Thus much out of *Stadlerus.*

The other History is thus related: *Of late (saith Moccius) one rashly cutting off these Locks of an old woman, she died within the space of three daies. For they cry up this as a thing very fatal, even unto such oftentimes as for want of good advice have frivolously been hurt: although there are likewise some that tel us another tale. For we know the man who was wel acquainted with a certain Counteß, that having such a monstrous head of hair would often cause it to be cut, even unto the neck.* This out of *Moccius*; and thus far *Schenckius.*

I have heard from a certain Captain of Horse, that this Malady is likewise not unknown unto the *Hungarians*; and that in *Hungary* not only Men, but even the Horses also are subject unto this kind of Disease; and that he himself brought out of *Hungary* as far as *Dresda* a Horse that had such a *Plica* or intangled Lock of Hair, hanging down unto the very feet.

Unto the aforesaid Epistle of the Rector of the University of *Zamoscium*, *Hercules Saxonia* answereth in a peculiar Book, which he entituleth, *de Plica*, or, of the monstrous intangled and writhed Hair. *Johannes Thomas Minadous* hath likewise published the Consultation they had at *Padua* (touching this sad Affect) on the 15. of the Calends of *January*, in the yeer 1599. and he inscribeth it, *de Helotide.* *Rodericus a Fonseca* hath published likewise a Consultation touching this same Disease; the which

we

we find in the first Tome of his Consultations, Consult. 1. Al which are to be seen in these before mentioned Authors. But now whether or no the Polonians received any considerable benefit by these Consultations of the Italians, I leave it unto themselves to judg. I think that to be a very Ingenuous Confession, which that most eminent and famous man Dr. *Johannes Prevotius*, principal Professor of Physick in the University of *Padua* maketh in that Letter of Advice and Counsel which he wrote unto the Illustrious and most generous Lord, *Nicolaus Sapieha* chief Standard-bearer unto the great Dukedom of *Lituania*, and Earl of *Coden*, &c. (I shal anon give you the whol Letter at large) where he thus writeth: *The Nature of this poyson* (saith he) *is altogether unknown; so that (as it seems to me) it was truly spoken by that illustrious person, who said in my hearing, that the Boors inhabiting within his Territories had found out more of the original of this* Plica, *the progress and the Cure thereof, than any of those Authors that had written concerning it, of which there hath been never a one of them that as yet hath had the fortune to restore unto perfect health any one that hath been afflicted with the said* Plica. The Physick Professors of *Padua* have indeed made trial there of very many Remedies, but al to no purpose. The same aforesaid Noble person (Count of *Coden*) himself told me, that a certain *Padua* Physitian induced thereunto (as it were) by the signature & shape of the Disease (for they that are affected with the true and perfect *Plica* seem in a manner to have Serpents hanging down from their heads, and as it were the head of the Monster Gorgon) prescribed him some Vipers to eat, but without any success at al. And that another of them had provided him a Psilothrum Oyntment to use instead of the usual Ley, perswading him to condescend unto the cutting off of his hair, promising him an artificial covering for his head; but that being advised to the contrary by a German (a student in Physick) unto whom this Disease was not altogether unknown, and one who wel understood the danger that was like to follow upon the rooting out al his hair, he therefore refused it. But although I dare not arrogate unto my self a perfect knowledg of this Disease; and albeit that in no case we cannot attain unto the perfect and exact knowledg of Diseases that depend upon an occult and secret Cause; yet nevertheless what I know touching the Nature of this Disease (by means of my converse with the Noble Earl before mentioned, who was afflicted therewith) and what I conceive touching the Cause thereof, I wil here briefly acquaint you with, that in so doing I may give a further occasion and encouragement unto such as live in those Regions where this Disease is commonly and familiarly known, to publish what is come to their knowledg touching this Disease.

It seems not to me to be any new Disease. For although it hath hitherto been unknown unto the people of *Italy*, and most of the European Regions; yet nevertheless, I see no reason at al, why it should not be common and frequent in *Polonia* many Ages past as wel as now; since that the causes that produce the same at this day might then be present as wel as now; only that there were then wanting Physitians that might inquire into, and acquaint us with what they knew touching the Nature of this Disease.

Now as for the Nature of it, we are first to take notice of this; to wit, that this Disease (as for what concerns the name thereof) is known indeed from the intricateness and intangling of the hairs: yet notwithstanding that the said *Plica* is only somwhat that is Critical as it were, arising from the expulsion of the vitious matter out of the body; and that the said *Plica* bringeth no danger at al along with it unto the affected person, who oftentimes bears it about with him al his whol life, without any the least damage. But that which most of al threateneth danger unto the diseased party is that vitious humor which yet sticking fast in the body exciteth those most grievous symptoms that have been before recounted in the History of this Disease; which cease al of them afterward, so soon as the matter is thrust forth unto the hair.

And moreover, this is further to be added unto the History, That in such as are thus affected, especially if the Disease proceed unto the height, not only the hairs are vitiated, but the nails also, and more especially in the feet, but most of al in the great Toes thereof, which become rough, long, and black, like unto the horn of a Goat; and this I observed in the afore mentioned noble Lord *Nicolaus Sapieha*; and I have heard that the very same hath also befallen unto others.

But now this Vice is not without cause referred unto and reckoned among Diseases, in regard that the hairs are not wholly to be excluded out of the number of the parts. And it is to be referred unto the Diseases of Conformation, seeing that the hairs neither retain that figure that they ought naturally to have, neither do they every of them appear single and severed, as they should, but are variously complicated among themselves, and entwisted one within the other, so that of many hairs there is made one long, thick, intangled, and frightful lock. And yet notwithstanding that the Distemper of the hairs is likewise changed cannot be denied, in regard that there floweth unto them a preternatural humor, and such like hairs as these when they are cut pour forth blood.

As touching the Causes thereof, in the first place, these things that are commonly believed and by tradition pass from hand to hand, touching the paines that is taken by the *Incubi*, Infants not baptized, and other Spirits besides; in the weaving of the long, ugly and frightful Locks there

there is none but may easily perceive that they are meerly fabulous and superstitious. But that this vice of the hair, as wel as many other Diseases, may somtimes proceed from Witchcraft and Inchantment, appeareth even by the Observation of *Christophorus Rumbaumus*, Doctor and Professor of Physick, and my fellow Citizen, which *Hercules Saxonia* reporteth to be Extant in the Observations of *Johannes Schenckius* the Elder, in the seventh Book, in these very words of *Rumbaumus*. *In the yeer 1590. while I was a long time bestowing my pains (though all in vain) in the Cure of a Mans Wife (who out of the Lees of Beer artificially destilled Brandy Wine at Uratislavia) being newly brought to bed and by reason of a great and sudden affrightment upon occasion of a lamentable fire burning the next adjoyning houses, taken with an Inflammation of the Lungs, upon the retention of her Courses, Secundine, and what should afterward have come from her, and this Inflammation (through her own careleßneſs) terminating in an Impostume of the Lungs, and the Consumption: a certain Emperick (an old Woman) came unto her, and offering her pains promised present help: Which she would by no means admit of: Whereupon the Emperical old Woman growing much enraged, & uttering many threatning words, she causeth her to be shut out of doors; and then presently (as she was wont) she fals a washing and Cleansing away the filth of her Head (having first Combed, plaited, and dressed up her hair somwhat long, as her custom was) with warm ordinary Spring water. But upon the very first pouring on of the water all the Locks of one side of the Head, as it were all besmeared with Birdlime, become on a sudden so intricate and intangled, that afterward (as long as she lived) they could by no means, wit, or device, be extricated and severed as formerly; but continued thus in long entangled Locks, very frightful to behold, even unto her dying day. And this we conceive to be wrought meerly by Witchcraft.*

But I think this to be very rare; and that this Vice proceedeth from some internal Cause we are taught even by this, that in those places Bruits likewise are taken with this affect. But now what kind of humor that is, we shall find it very difficult to explain. Very many there are (and indeed the most) who refer the Cause of this malady unto a certain viscid and slimy humor. But these fal short of the truth. For in many bodies, and many Regions likewise, these viscid Clammy humors are generated, which yet notwithstanding produce no such Disease. For neither may these pains of the Limbs, Convulsions, and other Symptoms, be referred only unto a viscid humor; neither can any reason be rendered, why this matter should be thrust forth only unto the hairs, and unto no other parts. But what the Nature of this humor is, the nourishing of our body and the generating of other Diseases, may in some measure instruct us. For although all the parts are nourished by the blood; yet nevertheless, as divers Plants do from the same Earth attract (each one of them) that Aliment that is proper and familiar unto them, as *Hippocrates* testifieth, in his Book *de Natur. human.* Text. 31. even so likewise out of the same Mass of blood contained in the Veins, every one of the parts attracteth unto it self that Nutriment that is most familiar unto it. It happeneth moreover that if the blood be less pure, that excrementitious aliment is carried more unto one part then unto another. And this is plainly to be seen even in the Joynt-Gout (*Arthritis*) where that same serous wheyish matter, salt, and tartareous (or cal it how you please) is carried more unto the Joynts, then to the fleshy parts. A proof of this we have likewise from the stone *Osteocolla* (which is very fitly administred in the fractures of the Bones) where we find that the very bones themselves attract unto them the said Stone; so that it is by experience found, that from the overmuch use thereof there have grown forth Callous substances extraordinary great, and unsightly: of which see *Gulielmus Fabricius*, in his first Century, and Observat. 91. And therefore I am of Opinion, that in those places where this Disease is Epidemical, the fault is in the Genius of the place, and in the Waters, which flow down from the mountains of *Hungary* into *Polonia*; (and in *Bisgoia*, if this Disease be likewise familiar in that Region, from the *Alps*:) which supplieth unto the hair an abundant Nutriment, but unto al other parts of the body such an aliment as is altogether unuseful, and which is worse, very hurtful; which when Nature expelleth unto the hairs, the rest of the body is thereby freed from all other grief whatsoever, and the hairs alone become vitious. And I am the more confirmed in this my Opinion by what was related unto me by the aforesaid Illustrious Lord Count *Nicolaus Sapieha*; that he knew a Boor in *Polonia*, that by bathing Cured such as were troubled with this Disease: by the use of which the first seven daies the sick persons became very hairy all their body over, the hairs breaking forth in all parts; which (upon continuing the use of the same Bath for seven daies more) fell off again, and so the Diseased persons recovered their health. And indeed that some Waters have in them an extraordinary and admirable virtues will every where appear unto us in the Writers of Naturall History. So in the *Alpes*, *Styria*, and *Carinthia*, by the fault of the Water, the Tumors, *Bronchocelæ* and *Strumæ* (we cal this last, being a swelling in the Neck, the Kings Evil; the former being a swelling in the throat) are Natural and as it were bred together with the Inhabitants, the vitious matter being thrust forth unto the Glandules in the Neck, and into no other places.

And yet nevertheless, I would not have it thought that I do hereby altogether exclude the Air.

Air, which it must be confessed hath likewise a very great power in altering our bodies; and it causeth that in these, or those Regions and bodies, these or those humors are generated. Although it be likewise true that the said Air hath not this power from it self, but that it receiveth the same from those vapors that are lift up and raised from the Waters, and out of the Earth which the Water washeth upon, and passeth through. And for this reason it is, that this Malady is not general and Universal throughout the whole Kingdom of *Polonia*, but only familiar unto some certain places thereof, in regard that it alwaies spreadeth and rageth there, and yet is not from thence dispersed into any other Regions; and this Disease *Hercules Saxonia* acknowledgeth to be Endemick; but he wil by no means have it to be Epidemick; as we may see in the tenth Book of his Practice of Physick, and Chap. 7. of *Plica*. But we have already told you (in the second Book of our Institutions, Part 1. Chap. 11.) that he did not wel understand, and therefore could not rightly describe unto us the Nature of a Disease Epidemick and Endemick.

Now the said Matter is carried unto the hair, not (as some would have it) in the form of vapors, but together with the blood it self; which as it is of all other parts, so it is likewise the Nutriment of the hairs, as we told above in the tenth Chapter. Which appeareth even from hence, that the hairs in the *Plica*, if at any time they be cut, they yield forth blood. That (notwithstanding what hath been said) there are now and then some certain persons even in the neer neighboring Regions that are likewise troubled with this Disease, this may possibly proceed, either from the natural neer allied Genius of that place; or else from the Parents. For look as Arthritical persons beget the like; so also it is not impossible, but that those which are affected with the *Plica* may transfuse into their Issue a vitious disposition unto the generating of the same Disease; and Experience teacheth us the truth of this. The Son of the aforesaid Lord, Count *Sapieha*, when he was six yeers of age, had at the first some few intangled Locks of hair among the hairs on his head; and the same hath also happened unto others. I knew a Souldier (an old man) that had a *Plica* in the hinder part of his Head; who being demanded as touching the Cause of the Disease (for he was a German and born at *Thuringia*) replied, that this Disease was hereditary unto him; for his Mother (as he said) had seven of these *Plica's*, two Ells long, all her life long, even unto her dying day. The same Man related this likewise for a truth, that being a Souldier in *Hungary*, and taken prisoner by the Turks, his Master (according to the custom of that Nation) caused all his hair, and withall this *Plica* of his, to be cut off; and that he thereupon became blind: but that having by an Interpreter acquainted his Master with the Cause of this his blindness, and obtained of him that his hair might be suffered to grow forth again, he afterward recovered his sight.

Signs Diagnostick.

There is no need at all, that we add any more Signs; since that there wil appear signs sufficient from the History of this Disease before recited. But that we may in few words give you the Causes of those things that happen in this Disease; in the first place, if that said matter of this Disease (whether it be malignant, or whether it be simply unfit for the nourishing of all other the parts besides the hairs) be abundantly heaped up in the Veins, it is then by Nature (unto whom it is burthensom) thrust forth from the more Noble unto the Exterior parts; whereupon the bones are much damnified and diminished, the Joynts loosned, the Head, Feet, and Hands, and all the Limbs and Joynts infested with pain, Convulsions excited, and the Members contracted. But if Nature be so strong as to get the Mastery, she at length thrusteth forth the said matter unto the hairs, and more especially those of the Head, with the which this Matter hath a very neer alliance (as in such as are Arthritical, the Cause of the Gout *Arthritis* hath with the Joynts) whereupon Dandrif like unto Bran and Lice are abundantly generated in the Head, and from the over-great store and luxuriancy of the Matter the very hairs are Complicated and intangled within themselves, so that they cannot be separated by any Art or Labor; and being Cut they likewise pour forth Blood.

Prognosticks.

1. This very Malady, unless the matter be thrust forth unto the hair, is sufficiently dangerous; so that there are most grievous pains and Symptoms excited, almost in all the parts whereunto the matter is thrust forth, as we told you but even now.

2. But if Nature doing rightly as she should, and as it were by a *Crisis* thrust forth this matter unto the hairs, then indeed this Vice of the hair that we are treating of is excited, but the Party is altogether preserved free from other Maladies; since that Nature is wont to thrust forth unto the hair whatsoever there remaineth of this like vitious matter in the body; and many with such like Plica's live very healthfull all their life long.

3. But if such *Plica's* be at any time rashly cut off, blindness, and other most grievous Maladies are from thence excited. Neither is this a Fable; but experience it self often teacheth us the truth hereof; as the Example even of that Souldier of whom we made mention before in the Causes may sufficiently instruct us. And this happeneth not (as many conjecture) because that these Plica's being Cut, the Head is thereby exposed

unto

unto the cold Air, (for this may eaſily be prevented by a hat, or ſome other covering put upon it) but becauſe the place into which Nature was wont to thruſt forth the vitious humors is taken away, and a paſſage forth denied unto the matter, and the Evacuation thereof hindered. And the ſame happeneth here, as in old inveterate Ulcers: for theſe may not be healed without extream danger, unleſs the body be firſt wel purged and cleanſed; and like as iſſues alſo, after they have for a while been permitted to run, are not without much peril to be ſtopt.

4. If nevertheleſs there be no more of this vitious matter left remaining in the body, then after ſome time thoſe very *Plicæ* fal off of their own accord; and therefore alſo there remaining now no more of the ſaid matter in the body, which I confeſs is a thing very hard to know, it may be ſafe enough (without any danger at al) to cut off theſe *Plicæ* with the reſt of the hair.

The Cure.

I conceive that the perfect Cure of this Diſeaſe is altogether unknown. Which without doubt proceedeth from this, that in thoſe places of *Polonia* where this diſeaſe is Epidemical, there have hitherto lived but very few Phyſitians that were able to compoſe an artificial Method out of thoſe things they might come to know from the vulgar, touching this Diſeaſe, and the Cure thereof.

This in the firſt place is certain, That Purgations and letting blood avail but little in this Diſeaſe; yea, that they are oftentimes hurtful. For ſo the Rector of the Univerſity of *Zamoſcium* writeth unto the Phyſitians of *Padua*: *If we attempt* (ſaith he) *to cure this Diſeaſe with the uſual Purgations, it maketh it but ſo much the worſe, and to rage ſo much the more; in regard that the Purgation is not able to overcome and maſter the noxious humors, but only to diſperſe them throughout the whol body when they are thus moved: for thoſe that are affected with this peſtilent Diſeaſe do thereupon burn with ſo great a pain of al their Members, that nothing more ſharp can poſſibly be added unto the ſharpneſs and bitterneſs of their torments.* And the ſame is confirmed by *Herculeſ Saxonia*, who in the place alleadged, out of the Epiſtle of a certain noble Matron, a Polonian (who was troubled with this Diſeaſe) writeth, That the ſaid Matron upon the opening of a Vein in the Arm, was immediately taken with moſt extream and intollerable pains in the ſame Arm, together with an œdematous Tumor: and likewiſe that for the very ſame reaſon, a Vein being opened in the Feet, there were moſt ſharp and bitter pains excited in both her Thighs, as low as the Ankles. The ſame *Herculeſ Saxonia* in the ſame place, writeth, That a certain famous and eminent Captain, a Polonian (*Joachimus de Ociesno* by name) told him, that he had ſeen many that were blind, and ſome that were lame, and others otherwiſe affected, who having had Purgations adminiſtred unto them in the beginning, fel into theſe Affects. And the very ſame happeneth alſo in the Scurvy; the Symptoms whereof are for the moſt part exaſperated by the uſe of Purgers.

It wil therefore be the ſafeſt courſe (ſtil taking Experience for our Guide) to uſe the utmoſt of our endeavor that the ſaid vitious matter may with al poſſible ſpeed be drawn forth unto the hairs, whither it is now tending. In which it wil be likewiſe our ſafeſt courſe again to follow the guidance of Experience; by which it manifeſtly appeareth, that thoſe Lotions that are made of the Plant we commonly cal Bears-breech, is very available and ſucceſsful in this caſe.

I confeſs indeed it is altogether unknown unto me, whether the ſame may be performed by inward Medicaments. But yet the very mentioning of Bears-breech brings unto my remembrance a certain Drink (no doubt at the firſt brought thither out of *Polonia*) that was much in uſe in my Country, in the City *Uratiſlavia*, and it is made of Bears-breech: the vulgar cal it by the common Polonian name *Barſicz*, or as the Germans pronounce it *Barkſch*; which thoſe that are Feaverish, and eſpecially the great Drinkers after their exceſſive Cups the day before, uſe in their Broths, and in their ordinary Drink, to aſſwage their thirſt. Now it is made in this manner. The Leaves of Bears-breech dried are boyled in a ſufficient quantity of Water; that the Decoction may get only a yellow, and not a purple color. Unto the Decoction there is added a little Leaven, or Bread twice baked, made of the Pouder of Bears-breech, with the four Leaven of fine white Bread; and then for ſome certain daies ſet in a warm place, where it gets a boyling heat and fermentation, until ſuch time as it hath contracted a taſte ſomwhat tart and ſour. But now whether or no this kind of Drink hath a power of doing any thing toward the expulſion of the matter in this Diſeaſe, we are to conſult with Experience. And it is their part who live in thoſe places to make publick thoſe Medicaments that uſe hath taught them to be fit and profitable, that ſo al their Experiences being conferr'd together, there may at the length be compoſed a Method of Curing this Diſeaſe.

But in regard that the *Plica* hath ſome ſymptoms common with the Scurvy (ſuch as are the pains of the Limbs, Cramps, and the like) and that the aforeſaid illuſtrious Count, *Nicolaus Sapieha*, was affected with both thoſe Diſeaſes, I think it not amiſs therefore here to place the Hiſtory of his Diſeaſe; which wil add ſome light unto what we but even now ſpake touching the *Plica*; and to what we have likewiſe before, in the third Book of our Practice, written concerning the Scurvy.

The History of the Disease of that Generous and Illustrious Lord, Count Nicolaus Sapieha, *Earl of* Coden, *Chief Standard-bearer of the great Dukedom of* Lituania, *&c.*

This Illustrious Count (without doubt) contracted this his Disease of the *Plica*, in his own Country, from the same common cause from whence the vulgar have it: but as for the Scurvy, he got it from the many Errors by him committed in his Dyet, during his various & troublesom Journeys throughout almost al Europe, and from the Quartan Feaver that followed upon the same. For when in the heat of Summer (as himself related the story unto me) he had travelled over the Pyrenean Mountains, out of *France* into *Spain*; and in this his Journey had drunk good store of Wine (out of bladders) that was corrupt, and ful of Vermin, the Autumn following in *Spain* he fel into a Quartan Ague. The long continuance whereof having made him impatient, and being quite tired out with the tediousness of a Methodical Cure, he committed himself unto a certain Soldier for Cure: who took some certain Cups of the strongest Spanish Wine; and into the same he puts the pouder of al sorts of sweet Spices; and this Wine he gave him to drink, not only to satiety, but even to Ebriety, until he had made him almost drunk; by which he kindleth within him a continual Feaver, which indeed lasted not long, and quite took away the Quartan; but yet nevertheless imprinted such a Dyscrasie in his Bowels, and humors, that shortly after the Scurvy followed thereupon. With which being grievously afflicted at home in his own Country, and yet notwithstanding so that he could not wel tel what the disease was, he made a Journey unto *Padua*, and there he committed himself for Cure unto the most Eminent Physitians of that University. But yet he recovered not that health and strength that he had expected, and hoped for; and thereupon he is sent back again home into his own Countrey, with this following *Consilium*, which we may term, a Direction, Advice, or Counsel.

The Advice of that most Famous and Eminent Doctor, *Johannes Prevotius*, Chief Professor of Physick in the University of *Padua*.

TOuching the manifold Diseases that this Noble person lieth under, it is neither my purpose at large to treat of them (since that I am not ignorant that they have already been discoursed of by some of the most Eminent Physitians in their long and learned Disputes:) neither indeed wil either the state and condition of mine own health (not yet sufficiently confirmed) permit the same; nor likewise the health and safety so much desired by this illustrious person, for whom I conceive that help and assistance is far more requisite than words and tedious Discourses. I shal therefore with al brevity state and determine the whol case, and ingenuously declare unto you my Opinion touching the same; not that I may interpose my Judgment in opposition unto the Opinion of these grave and learned men; but that I may in some measure gratifie the request of this eminent person, and (if I may any waies possibly be serviceable unto him in procuring his health) that I may not in the least be wanting in the discharge of the Duty and Office of a Christian. It seemeth therefore unto me, that this illustrious Lord is disaffected with a twofold kind of Diseases; the one of them most manifest, depending upon Causes that are commonly known and confessed: the other occult and secret, the Causes whereof are as yet obscure; neither seem they hitherto to be sufficiently expressed by any. There is manifestly appearing a Catarrh of matter that is thick, tenacious, white, oftentimes insipid and tastless (and very rarely sharp and biting) flowing and falling down unto the parts of the mouth, and sometimes also unto the stomack. There is moreover an extraordinary pain of the lower belly, returning afresh after long intervals and Cessations, with an astriction and costiveness of the belly, and a certain grievous and painful sense of extension and stretching about the Region of the Navel, of the Hypochondria, especially the left, and sometimes also of the Loyns; which indeed is wont in great part to cease upon the plentiful Evacuation of the Wind, and a snotty kind of Excrement that comes from him. To these we may add the Nephritick distemper, and want of rest and sleep; this latter being indeed very familiar and frequent with him, for he usually passeth many whol nights together without sleep; and the former, to wit, the distemper of the Kidneys, hath now of a long time sorely troubled him, with a redness and heat of his Urine, and excretion of sand and gravel with his water. The causes of al which Maladies it is most manifest that they are derived from the evil constitution of the internal Bowels, and the excrements of several sorts from thence arising. For the Brain being overmoist (not without much weakness of the innate heat, contracted by reaton of a great wound he received in it at *Paris*) engendereth much flegm, there being added unto al this, in a special manner, the consent of the natural bowels; sometimes the Liver by its heat elevating many vapors; and sometimes the stomack naturally cold, and affected likewise with an Adventicious humidity, corrupting with a more crude

crude juyce the aliment of the whol body, and filling the head; and then withal the Spleen and obſtructed Meſentery ſending upwards many fumes. So that the flegm heaped up in the head, partly by its great plenty, and its own weight, maketh it ſelf a way and paſſage unto the parts lying underneath; and partly thruſt forth by the ſtrength and act of the expulſive faculty it ruſheth unto the mouth and ſtomach, looſeneth the teeth in the Gums, and beſides exciteth and cauſeth very much trouble and pain in the ſwallowing. The ſame (being much encreaſed in the ſtomach, by reaſon of its own proper diſtemper) cauſeth in him the loſs of his Appetite; and from the agitation and weakneſs of the heat it produceth extream windineſs; as alſo a pain of the Inteſtines, with a Coſtiveneſs of the belly, by reaſon eſpecially of the hindered contraction of the tranſverſe fibres diſtended by windineſs; by which ſaid Contraction the deſcent of the Dreggs is very much furthered. But the hotter habit of the aduſt blood, and both the Cholers, ariſing from the Liver and the obſtructed places, greatly diſturbeth his ſleep, eſpecially in the night time; by which it cometh to paſs that from the retiring of the Spirits and the blood unto the internal parts the Evaporations become ſo much the greater. Neither is it any wonder at al that ſomtimes likewiſe there is kindled a Feaver, not only an every day Feaver by reaſon of the vehemency of the pain, but alſo a Periodical Feaver reſembling the Nature of a ſpurious Tertian, in regard that the obſtructions being ſomtimes augmented, great ſtore of excrements (and thoſe very different one from the other) of al ſorts, mingled together one with another, are very eaſily corrupted. And moreover alſo the ſmal ſand and gravel may very wel happen to grow together from this manifold filth communicated unto the over hot Kidneys, and there retained, by the waſting of the more thin parts by the extraordinary great heat; and the Nephritick pain may likewiſe be generated by the abundant matter impacted in the Ureters, and not having an eaſie and ſpeedy motion.

But of the occult and hidden Diſeaſes, ſome of them are ſimply ſuch; touching the exiſtence whereof we may very wel doubt: and others of them are occult only in regard of their Eſſence and Nature; ſince that it is not in the leaſt to be controverted, whether or no this illuſtrious Lord be afflicted with them; a truth ſo obvious and manifeſt. Simply occult is that Witchcraft, of which this illuſtrious perſon hath very rational and probable grounds to ſuſpect that it hath been practiſed upon him; in regard that (as he relateth) there have been often found in his bed ſtrange and admirable Magical Figures, of Bones, of Wax, and of other matter; as alſo ſuch like Signs and Characters as Enchanters and Wizards are wont to abuſe in deſtroying thoſe they bewitch: and in regard likewiſe that he had moſt powerful and moſt implacable Enemies, by whom he doubteth not but that his ruine and deſtruction hath by al kinds of wiles, wicked arts, and inventions, been attempted. Since therefore it is confeſſed by al that by Witchcraft bodies may in a various manner be changed; and that thereby there often happen the very ſame effects that are wont to follow likewiſe upon the natural motions of the humor in the body ill affected; hence it is that Phyſitians can have no proper ſigns whereby they may conſtantly diſcover, and abſolutely determine whether there be any Witchcraft practiſed or not. And this is now altogether the caſe of this moſt illuſtrious perſon. For there is none (I ſuppoſe) unleſs he be either a mere Dolt, or one that hath no good opinion of Chriſtian Philoſophy, that will dare to doubt whether or no the related ſuſpicions may not frequently accompany Witchcraft; ſo that hereupon that there is in this preſent caſe no practice of Magick and Enchantment, can by no evident Argument poſſibly be convinced. But if haply any one ſhal object and ſay, That the aforeſaid doubt is altogether needleſs and impertinent, ſince that al thoſe Accidents that the Patient ſuffereth may very wel be referred unto the various, and thoſe likewiſe ſufficiently manifeſt vices of the humors; let ſuch a one know, that ſuch as are variouſly affected from a ſupernatural Cauſe, although the effects proceeding therefrom may ſeem to be natural; yet notwithſtanding they cannot by the aid and aſſiſtance of the Phyſitians ſo eaſily be corrected and kept under, as thoſe may that are vitiated, and derive their depraved power and violence from ſome Natural and ſenſible Cauſe: ſo that, albeit the knowledg of Witchcraft maketh not much for the attaining of the next and immediate Cauſe of the Diſeaſe; yet nevertheleſs it helpeth very much in foretelling the facility of the Cure, and preſaging the iſſue and event of the Diſeaſe. I would to God that this noble perſon were altogether free from this infection; which doth indeed render the Cure of the Diſeaſe moſt pertinacious in al reſpects, and moſt intricate and difficult. But there are two other occult Maladies, with the which I plainly affirm that this noble perſon is affected, to wit, the Scurvey, and the *Plica*; the Nature of which Maladies as it is abſtruſe, and hitherunto never ſufficiently demonſtrated by any, ſo the accidents therein happening are moſt manifeſt. And in very deed (that ſo for brevities ſake I may paſs over the many other notes and ſigns) al men generally acknowledg and confeſs, that the *Plica* ariſeth from the inexplicable and intangled Locks of the Hair; but yet they are altogether ignorant of the proper Cauſe thereof, although they ſpeak ſomwhat that is probable touching the common Cauſe which yet nevertheleſs cannot be ſufficient for the conſtituting of the perfect Cure of the ſaid Malady. But certain it is, that theſe hairs are conglutinated, frizled, and entwiſted from ſome dull and ſluggiſh excrement of the third Concoction of the head, ſweating through the Sutures and Pores; which being

restrained and kept in by the cutting off the hair, the Air more freely getting into the said open pores, there ensue thereupon most grievous Accidents. It is also certain that by the drinking of vitious Waters, or else from exhalations mingled together with the Air, after a long abode and continuance therein, this Malady may at length be contracted; and therefore it is that this evil is almost Epidemical unto the Inhabitants of those places that abound so much with these like Fountains and Rivers that are so wel known unto this noble person. Neither can it be doubted, that such as have weaker heads, are sooner and more grievously infected. But of what kind that excrement is, and with what poyson infected, that seemeth a thing altogether occult and hidden; as likewise for what reason it doth infest the head rather than any other parts; and why in tract of time it vanisheth of its own accord, but yet wil not in the least yield unto those Remedies that cal it forth, and such as we cal *Alexipharmaca* or Counterpoysons; and lastly, from whence it obtaineth that notable and altogether to be admired power of Conglutinating. For neither can these be referred unto the manifest qualities of any one humor (the first or second) although true it is, that according to the generating of these depraved humors more or less, the evil may possibly creep more or less, and be more or less confirmed. This may wholly be said (which is likewise usual in the explaining of al other poysons) that those Waters, and the exhalations thereof are infected with a poyson endued with this property that it is more annoying unto the head, is fixed more pertinaciously unto the root of the hairs, bindeth them together most strongly, and wonderfully writheth them, and most obstinately resisteth all kind of Remedies whatsoever, by reason that the peculiar nature and generation of this poyson is altogether unknown, insomuch that this Noble man seemed to have said but the very truth unto me, that some Boors there were within his Territories that had discovered more of the original of *Plica*, as also of the progress, and Cure thereof, than those Authors that had written concerning the same; none of which have as yet been so successful, as to restore unto perfect health any one that hath been afflicted with this *Plica*. But for the Scurvy it is to be esteemed a far more grievous Malady, in regard that it creepeth into the whol blood; and the corruption thereof prevailing and getting strength may at length cause death unto the party therewith affected; which the *Plica* if let alone without cure, and not medled withal, never yet did unto any. So that this Noble person is not without good cause very much perplexed and troubled as touching this his Malady, being in good earnest grieved, that there is hardly any regard had unto this Affect in this City; where there hath scarcely ever yet been seen (at any time) any one infected with the Scurvy. And I (for my own part) although I have seen two Hollanders and one English man (both at *Venice*, and at *Padua* also) al three of them affected with an exquisite Scurvy, yet I neither expect nor desire that any Credit should be given unto what I say; but yet notwithstanding from what I find written touching the Scurvy by *Forestus*, *Eugalenus*, and *Sennertus*, most truly, and according to what they had seen, and found attested by many Histories, I shal presume (and that very confidently) to affirm that this illustrious Lord is at present much afflicted with the Scurvy. For excepting only the swelling of the Lips, and the flagginess of the putrid Gums (the Accidents of the Scurvy confirmed) al other signs and tokens of the Scurvy are present; to wit, the much and long use in former time of salted and smoke-dried flesh, unto which the Soldiery in the Septentrional parts are extreamly addicted; add unto this the loosness of the Teeth, with some kind of itching in the Gums; the continual great lassitude and weariness of the parts, and especially of the internal; the extension of the left *Hypochondrium*, and the Mesentery; and the broad Efflorescencies, one while wan, and other whiles red, budding forth continually here and there throughout the whol body without any Feaver; which is conceived to be a Pathognomick Symptom of the Scurvy. Unto this we may add, that this illustrious person about some three yeers since was apparently affected with the Scurvy, and that the Physitian who then had him in cure (being most expert in the knowledg of the Scurvy) told him plainly and freely at his departure, that the reliques and remainders of the Scurvy were not in the least to be sleighted by him, but upon al occasions opportunely to be prevented. But perhaps the Italian Physitians do therefore sleight and but little account of the name of the Scurvy, in regard that they are of opinion that al the aforesaid accidents may be al of them referred unto those causes that are evident, and not called by unusual names, and such as in former times were not so much as ever heard of. For the redundance of the adust Melancholy which is much defiled with Ichores and thin Excrements (which said redundance of Melancholy and other the said humors, that they are at present to be found in this illustrious Lord, is manifestly shewn by the boyling heat of his Liver, the weakness of the Spleen, the familiar flux of the Hæmorrhoids, and the frequent use of meats salt and earthy) may possibly breed and produce a lassitude, and lumberness, but more especially in the internal parts, unto which the humor by its weight and heavines naturally tendeth. Unto al this it may be added that it much impaireth the strength and natural powers, enervates and weakens the body, and extenuateth the same by corrupting the Aliment; it extendeth likewise the Natural Bowels by its great plenty and thickness, and obstructeth the same by the admixture of the diffused Ichorous Excrements with the overhot blood. Neither are we at al to wonder that various spots arise, since that both by its own proper thinness that

more

more hot part of the aduſt humor is eaſily carried forth unto the outſide of the body; and that (the expulſive faculty of the internal Bowels being irritated) it is no hard matter for it to be purged forth through the looſe skin, being porous and weak. And therefore to me there ſeemeth to be no cauſe why we ſhould abuſe the new and unuſual name of the Scurvy in the explaining of things ſo wel known. But how many ſick perſons have been moſt miſerably caſt away through this kind of reaſoning, we may every where read in thoſe Authors that have written touching the Scurvy; who all of them with one conſent affirm, that never any yet being affected with the Scurvy, and having had adminiſtred unto him only theſe remedies that have acted by a manifeſt quality, and ſuch as were proper to evacuate and temper Melancholy aduſt, and to take away the obſtructions of the Bowels (although adminiſtred by the moſt able and expert Phyſicians) was thereby perfectly cured; in regard that the Melancholy blood (in this Diſeaſe) contracteth a corruption peculiar, and ſuch as cannot wel be expreſſed; which ought to be removed and taken away by thoſe Alexipharmaca that are fit and proper for it, and that otherwiſe irritate and enrage aduſt Melancholy, if we regard the manifeſt qualities. For Spoonwort, or Scurvy-graſs, Water Pimpernel, and certain kinds of the Creſſes and Water Parſley (al of them being moſt ſharp, and unto which alone the Scurvy giveth place) ſeeing that they attain unto the third degree of heat, and greatly dry, they would vehemently increaſe the vices of the aduſt Melancholy, and al the cauſes thereof, unleſs by their Alexipharmick quality they oppoſed the corruption of the Scorbutick blood. And that the ſaid effloreſcency of the ſpots in the Skin are the Concomitant of this Corruption, wil be demonſtrated even by this, That in thoſe other Meridional Regions, in the which aduſt humors do oftentimes ſway and reign, ſuch like effloreſcencies do not at al appear without a Feaver. Seeing that therefore the name of the Scurvy deſigneth and pointeth out unto us ſomthing that may be uſeful in the Cure thereof, it is by no means to be exploded, as unuſual and altogether unheard of by the Ancient Phyſicians, unto whom the name of *Plica*, of the French Diſeaſe, and the Meaſels, was alike unknown. Now if this be ſo, this illuſtrious perſon may very wel conceive ſome hope of the recovery of his health (in regard of his Catarrh, pain of his belly, and want of his reſt) from the help and aſſiſtance of the Italian Remedies: but I muſt profeſs that I underſtand not what is likely to do him any good in the Cure of *Plica* and the Scurvy wherewith he is alſo affected. The Remedy of the *Plica* is altogether unknown; and this illuſtrious perſon knoweth, that hitherto there was never any yet (either here or elſewhere) perfectly recovered of this Malady by the help of the Phyſicians though never ſo able. And what this noble perſon hath ſmal hopes to expect from Phyſicians, he may perhaps within four or five yeers attain by the benefit of Nature; ſince that it hath been obſerved, that men grown have in the fourteenth or ſeventeenth yeer been wholly freed from it, the *Plica* falling off of its own accord, and never after more appearing. But *Italy* wanteth *Alexipharmaca* for the Scurvy, into which if any chance to be brought, they wil hardly be preſerved above one yeer. What is therefore to be done in this Caſe? This alone, to wit, That (for very good reaſon) he perſiſt in the Cure as it is already begun (which may corroborate the Stomach, dry the Head, and draw forth unto the outward parts the virulent excrement of the *Plica*, by the help of a Decoction, and the external uſe of Bath-waters, as alſo by the dropping of hot Oyls upon the ſtomach) until the latter end of *April*, or the beginning of *May*, if at leaſt he be able ſo long to endure and bear the ſtrength of theſe extraordinary drying Medicaments. But then let him wholly apply himſelf unto the Cure of the Scurvy; that is to ſay, let him uſe the Decoctions of the opening Herbs, mingling therewith that quantity of the Alexipharmaca that the Phyſician wel exerciſed in this kind of Cure ſhal judg fit and convenient. But in the general, the cure of the Scurvy is more eſpecially to conſiſt in this, That thoſe things that open obſtructions (the choice whereof is to be left unto the judgment of the Phyſician that hath undertaken the Cure) are evermore to be tempered together with the Antiſcorbutick Remedies. For which cauſe I judg it fit and very requiſite that the Patient with al poſſible ſpeed make a Journey into the Northern parts, that ſo he may find the Herbs yet flouriſhing, and ful of juyce. For the general opinion is, that the Antiſcorbutick Herbs benefit more by their Juyce than by their Decoction, or any other way whatſoever. Let him have recourſe unto *Daniel Sennertus*, the moſt eminent and famous Phyſician of our Age, and one moſt exerciſed in the knowledg and Cure of the Scurvy: let him wholly commit himſelf unto his Care, and be ruled by his advice, and in ſo doing (next under God) let him expect his recovery from this moſt dangerous Malady from him alone. He liveth at *Witteberg*, where the Antidotes againſt the Scurvy are known very familiarly. Now if ſo be that before Winter he ſhal appoint him again to make uſe of the Hydrotick Decoction for the Head, (for the ſtrengthening of the head, and belly, and the drawing forth of al thick excrements whatever) this I judg to be very beneficial and conducing unto the haſtening on of the ſpontaneous and voluntary Cure of the *Plica*. His Liver though it ſeem to be extreamly hot, and to require extraordinary cooling Medicaments, yet notwithſtanding it wil be far more ſafe in the hot Summer time to uſe a cooling Diet, than any cooling Medicaments: for the Stomach being but weak and fleſhleſs by the uſe of theſe ſaid Medicaments may eaſily be deſtroyed; and it is likewiſe obſerved that the *Plica* is but the more enraged by the uſe of

refrigerating

refrigerating Medicaments. And this (most Excellent and Illustrious Doctor, and my very good Friend) is that which I thought fit to write back unto you, for the satisfying of your request. I have purposely forborn the mentioning of the Remedies, in regard that all such as were to be taken in *Italy* have already been most prudently prescribed unto the most Illustrious Patient, and to my knowledg have continually been made use of, and without any, or very little change made therein, continually practised by him: and as for such as shal henceforward be prescribed for him (in *Saxony* or elswhere) for the Cure of his Scurvy (the State and Condition in which this Illustrious Person shall then be found to be after all the toyl of his Journies being first throughly discovered, and a triall made of the Cure yet further to be continued) they are in a various manner to be accommodated unto the necessity of his body; neither may they indeed (without much arrogance) be so much as hinted unto one so expert as your self. God Almighty Grant that the Desires and Travels of this Illustrious Person may find happy Issue and success.

Thus far the Advice and Counsel of *Johannes Prevotius*, in Answer unto an Italian Doctor, on the behalf of that Noble Lord, Count *Nicholaus Sapieha*.

But the Patient returning home unto his own Country, and finding no alleviation of his Disease, but that it rather from day to day grew worse, following the advice of that eminent Physitian Dr. *Prevotius*, writeth Letters unto me from *Codma*, 28. day of *May*, in the yeer 1628. wherein he acquaints me with making a Journey unto *Witteberg* for his healths sake. But when his Kinred and Friends (by reason of so great weakness of his body disswaded him from the Journey, as thinking that he would never come hither alive, he deferred his Journey until the Autumn following. But when he perceived his Disease daily to encrease upon him, he at length provides himself for his Journey; and in the month of *November* the same yeer, being carried in a Horse-litter he took his Journey through *Polonia* and *Silesia* (about a hundred German miles) and came hitherunto me at *Witteberg*, but almost half dead. For he hung together (as it were) only by Skin and Bones; being not able to move Hand or Foot, no not so much as his Head. But I had rather relate the History of his State & Disease in the Words of his Domestick Physitian, which he had brought along with him out of *Italy* (that famous and Eminent man, Dr. *Franciscus Mistruccius*, Doctor of Physick at *Forojulium*) then mine own; who gave me an account of the Disease of this noble Lord, describing it in the manner following.

Among those many remarkable and famous things wherein Antiquity flourished, and was of old much admired for, this Custom of theirs (most excellent Doctor) was evermore held to be one of the most famous and laudable, that they made Journeys somtimes as far as unto Delphos, *that they might there receive an answer in doubtfull Cases from the Oracle of* Apollo Pythius, *an Oracle much fam'd all the World over. After the manner of these Ancients this Generous and most Illustrious Count, my* Lord Nicholaus Sapieha, *Standard-bearer General of the great Dukedom of* Lituania, *Careful as he is for his own safety & preservation after trial made of so many and so various Medicaments, after so many Answers received both in his own Country* Polonia, *& likewise in* Italy, *hath at length arrived now at this time hereat* Witteberg *(no Delphos I confess, but in very truth another* Athens*) that he may now Consult with you, I had almost said, the most wise Oracles of Physick; and expecting from yon the utmost of your assistance, which he earnestly imploreth & expecteth, and you have ever out of humanity afforded it unto any. And (since it is a task imposed upon me) I will very briefly indeed, and yet notwithstanding distinctly, relate the History of this Noble Person; his Affects and as for those few remedies that I shal cal to mind, for the removal and overmastering of this kind of Malady, I shal prescribe them with that modesty that becomes me; and yet nevertheless referring otherwise al unto your most quick apprehension, and accurate Judgment (as unto a Lydian stone) for the further polishing and adorning thereof.*

The principal Affect touching which this Noble Lord is so greatly sollicitous (as of that which hath twice or thrice threatned even Death at the door) is the long lasting and cruel pain of all the lower Belly, having its residence one while in the right, and another while in the left Hypochondrium, *and as soon again about the Navel. This is now the seventh yeer, since that these fierce and cruel pains and torments have had their recourses; which have been so pertinacious and unyielding, that (let me freely speak it) they have now almost driven both the Patient and the Physitian likewise even to desperation; so far have these torturings hitherto been from yielding unto any Medicament. There is now a yeer and a half past since that I was added unto those that had this Noble Person in Cure; in which time only I shal acquaint you what the quality of the Disease hath been, that so there may be no vain repetition of what went before, all things in a manner keeping (as it was related unto me) the very same Course and Tenour at all times. And therefore (that we may speak something of what happened in that space of time) the Case in a manner stood thus. In the month of* July *out of* Italy *we came to* Cracovia, *where this Illustrious Lord had at that very time committed himself unto the care of a certain Physitian that professed the Curing of*

the

Scurvy; who without due respect had unto the Counsel of Hippocrates *(to wit, that before the Dog-star, and during the time thereof, Purges work not kindly, but are rough and harsh) and not at all regarding, that this Noble Lord stood at that time in more need of rest and quietness (by reason of the many discommodities he underwent in his long and tedious Journey) then of any new agitation and disturbance of Medicaments, began to administer unto him those same Scorbutick Medicaments, to wit, the Syrup of Spoonwort or Scurvygraß, the Juyce of the same Herb, and other things of the same rank and order; adding thereto some certain Pouders and Potions that were purging; in which said Medicaments this Physitian persisted for six whole weeks together, without any apparent benefit at all. But at length his most Illustrious Lord seeing that he was not like to get any good from him, began to think of his departure thence; and so about the end of* Auguſt *we came to* Lublin; *whither so soon as ever we were come, those fierce and cruel torturing pains assaulted him all the lower Belly throughout, reaching even unto the Region of the Loyns; which would not admit of any the least intermission, untill after a long time, and many difficulties, and much drawing forth of the peccant humors; as likewise both upwards, by the benefit of a spontaneous Vomit; and downwards also by the frequeut use of Clysters, of a certain snotty Matter, white, insipid, somtimes thin, bitter, yellow, and sometimes duskie; and also withall great store of Wind: In which pain the Belly was so Costive, that the many Clysters that were put up, although otherwise purging, would not be brought back again without much difficulty: the Urine likewise that he made came from him red, and with much straining, and not without an extraordinary pain about the Reins; which afterward (upon the abatement of the pain) flowed forth in greater abundance, and withal he voided much red Gravel. And so (the pain being asswaged) from* Lublin *we came to* Codna, *about the latter end of* October; *this* Codna *is a City of his Lordships. But shortly after our arrival there, the Obstructions return, and the pains are renewed in their former heighth, with frequent swouning and fainting fits (like as but a little before it had befallen him in his Journey) insomuch that we wholly despaired of his life: in which his pains & fainting fits, although that by putting up of mollefying Clysters, and by the use of Evacuating Remedies given him downward, his Belly was much opened and loosned, so that (even as was said before) there were cast forth Excrements of all sorts, with some Evident alleviation and ease; yet notwithstanding the Disease returneth again with no less vehemency then before, other new Obstructions stil succeding the former; neither hitherto could the Disease be extirpated. Yea in the month of* Auguſt *last past, after the taking of a China Decoction, his Disease so far prevailed upon him for about the space of fourty daies, and so miserably was he tortured & wracked by his pains, that we could scarcely move him in his bed, he was almost speechleß, and could very hardly draw his breath. And so in his Journey, in the midst of his Coughing, his breathing was thrice so stopt and hindred, that we were altogether in fear that he would have been strangled. But you must know moreover, that besides those intollerable pains that are felt in all the parts of his Belly; there are others likewise that are sometimes extended throughout the whole Back, and unto the very utmost Joynts; but especially they pass along through unto the joynts of the Arms and Feet: yea in the journey aforesaid, such and so great were the pains that he felt about those parts (after the torturing pains of his lower Belly) that the like thereunto he had never before felt in all his life: for (even as erewhile, you might likewise have observed, most Excellent Doctor) he could scarcely take any rest, nor hardly stir Hand or Foot: unto which pains there at length followed a Palsey (not such as is indeed Usuall, and properly so called) of the Hands and Feet, with a pining away, and illfavoredneß of all the Members, as appeared unto all the beholders. And it is likewise to be observed, that those pains do now recurr more frequently then formerly in the yeers past. There is also adjoyned a Prurigineus or Itching yellowishneß, and Excrescence of the Gumms, with certain red spots, like unto Flea-bitings, appearing more especially in the Back and Thighes, which by degrees tending unto a pale and wan color at length wholly vanish. And although that the pains of the* Abdomen *do now and then intermit; yet nevertheleß his leanneß stil continueth, as also the extraordinary Lassitude of his whol body; the Palsie in like manner stil persisteth, and the pain of the joynts, with such and so great an astriction of the Belly, that he cannot (in truth) of himself void forth any the least shew of excrement: and therefore we are fain often to provoke it, and put it forward with* Aloes Rosat, *and every other day with Clysters. But if the Evacuation be but for one day omitted, then to be sure, his tormenting pains return afresh upon him. And wonderful it is to see, what abundance of Excrements of all sorts (but especially of Choler and snotty Flegm) he daily without fail voideth forth by the benefit of these Medicaments; and yet nevertheleß his Disease stil persisteth with all kind of Obstinacy. Unto those aforesaid purging Medicaments we adjoyn likewise those things that Corroborate; such as, the Rolls of the Species of* Aromaticum Rosatum, Diarrhodon Abbatis; *and adding thereunto Corals and Margarites, the Confection of Hyacinth, Alchermes, and other things of the same rank; and yet by all these means we have hither-*

to done him no good. But as for what concerneth those doubts that by your Letters you signified unto me that I should explain unto you (by loosening the knots of them) thus it is, as far as I conceive. As for that Hæmorrhage which he had some four yeers since, it proceeded not from any debility of the Bowels; for after it he did not again recover his health in that measure that for almost a yeer and half before he had enjoyed it in Italy: neither yet from the retention of the Hæmorrhoids; for together with it the Hæmorrhoids likewise had their Periods every month; which when (from the midst of the yeer only) they altogether intermitted, I was then constrained by Art to provoke them three or four several times. It remaineth therfore that the said Hæmorrhage hath its original from the acrimony & thinness of the blood, which it contracteth from the Head extreamly overheated. And as for the Plica *which he beareth about with him in his Head, it first of all manifested it self almost a yeer after the beginning of those pains; neither is it hereditary; for none of his Stock before him ever had the like Affect. And as for the destillation from his Head, it hath continually been, and as yet abideth in great abundance, even as it appeareth from those things that are continually voided out of the Head, by the Nosethrils and Palate; the greatest part whereof falleth down unto the Stomack, and from thence to the Intestines; from whence perhaps the aforementioned pains receive no small part of their fuel, and that which continually feeds and foments them. The Pulses (that otherwise are alwaies obscure, with some kind of frequency) admit of a variation, according unto the Intenseness or remissness of the pains. The order and Course of his Diet for the most part (especially in the paroxysm of his pains) hath been guided rather at the pleasure of the Assistants, then by the Advice of the Physitian; of Cullises, of Capons mashed together, new Eggs potched and supt up, and Broths aromatized with all kind of Spices. He drinketh Italian Wine, of a good substance. He hath an Appetite so dejected and weak (especially during the continuace of his pains) that even the very smel of Flesh maketh him ready to cast: He is continually thirsty, and thereupon he is very apt evermore to exceed in the drinking of Wine. He passeth whole nights (for the most part) without sleep; and if he chance at all to sleep, that sleep is altogether unquiet, and ful of Phantasms. In* Italy *how and in what manner this Noble Count hath been handled by Medicaments, you have now already seen al that can be written concerning the same. These therfore are those Symptoms that so fiercely and cruelly afflict this most Illustrious Person. From these (as far forth as it is possible) he desireth to be freed. And if ever help and assistance be to be expected for humanities sake; he in very truth (in these his so great miseries and sufferings) desireth and expecteth this assistance from none other, but from your self alone, next under God: I say from thee alone (most Excellent, and Expert* Sennertus) *whom I see to flouriſh (like as a most fragrant Rose in the most delightful Garden of Physick) among the thickest Brambles (as I may so call them) of these difficult Diseases in the aforesaid Province of* Saxony; *and for my own part (I profess) I much admire thy Abilities.* Thus far Dr. *Franciscus Mistruccius.*

And with all these Maladies was this most Illustrious Count continually afflicted. And the truth is, that which exceedingly troubled and tortured him, was the irremovable Obstruction of his Belly, which evermore continued, unless it were removed either by Clysters, or Purging Medicaments. For the moving of his Belly, and the keeping of it open, he had brought along with him out of *Italy* a great quantity of *Aloes Rosat.* But I well knowing that by the use thereof his Belly was dried much the more, diſſwaded him from continuing the Use of it. When he went to stool he then voided Flegm (Viscid, Clammy, and very Tenacious) in great abundance. And withall at that same time he was usually infested by those most grievous and intollerable pains in the Belly, which were most an end terminated in the pains of the Joynts; as for the most part these likewise again ended in those former. But if it so chanced that upon the invasion of these Belly pains he were taken with any great Vomiting (which very often happened) his pains were then the more moderate, and did the sooner remit. There was moreover present a Palsie of all the Members, as likewise of the Tongue oftentimes, so that he faltered therein, and could not speak distinctly. And yet notwithstanding, those most grievous pains of the Joynts (with a certain kind of Swelling) accompanied the Palsey, as we have already said. At certain times also (by intervals) he was infested by a Symptom that greatly terrified him, to wit, a fear of suffocation, and a certain strangling as it were (of which we have already made mention in Chap. 4. touching the Scurvy) which proceeded from a Styptick Vapor contracting the Muscles, moving the Larynx, and as it were violently pulling them together. In the Body (the Back especially) there appeared wan spots; the Teeth were loose, and indeed some of them were already faln out. There was likewise continually to be seen in the hollow of his Hands a perpetuall redness, proceeding (no doubt) from the heat and driness of the Liver; and this arose from the unseasonable use of Medicaments heating and drying. For he had not only for fourty daies together used the Decoction of China (as is beforesaid) but other Medicaments of the like Nature. He lay whole Nights (many times) without any sleep at all. There was likewise present a Fever, that observed

obſerved no courſe at al, ſuch as thoſe are wont to be that accompany the Scurvy. Such was this Patient when I firſt received him, that for the recovery of his perfect health I could give him no aſſurance at al; neither could I wel give him any certain hope of the preſerving his life from a ſudden death, which continually threatened him. But yet nevertheleſs in regard that he had come ſo far a Journey for his healths ſake, I endeavored (what I could) by my continued care and pains to effect his deſire, and to do him good; and by the good hand of the Almighty aſſiſting me I ſo wrought, that his Belly was able again to do its office; and that the excrements acquired again their natural conſiſtence; that the pains of the Belly and Joynts ceaſed; and that the Arms and the Hands had likewiſe their motion reſtored them; inſomuch that the Noble Lord could not only perform other offices with his Arms and Hands, but could likewiſe write Letters. His Belly alſo that was altogether extenuated began again to increaſe, and not only ſo, but even alſo to grow fat again.

And yet notwithſtanding there ſtil remained and pertinaciouſly perſevered the Palſey of the Feet, and their contraction; which could not be taken away by any kind of Medicaments, no not by the uſe of thoſe admirable Baths (to wit, the *Teplicenſes*) into which he was put, in the month of *June*, in the yeer 1629. and as I conceive, it wil hardly ever be wholly and perfectly cured.

Now the Medicaments that I made uſe of were directed unto theſe ends and purpoſes; to wit, that the Belly might again be made looſe and ſoluble; that the Cacochymy might by degrees be evacuated; that the vice of the humors, and the Scorbutick diſpoſition of the Bowels might be amended by Antiſcorbutick Medicaments; and that the moſt urgent Symptoms might be quite removed and taken away.

As for what concerns the matter of Phyſick; here to ſet down al the forms of thoſe Medicaments which almoſt every day were adminiſtred, it would be too tedious, and not worth the while; in regard that the ſame Indications ſtil abiding, the very ſame Medicaments (but yet nevertheleſs with often variation of the forms) are frequently to be repeated in this long laſting and contumacious Diſeaſe. We wil therefore only ſubjoyn the matter of thoſe Medicaments that anſwer unto the Indications, extracted from the forms: which yet nevertheleſs were not al of them adminiſtred in al Medicaments, but according unto the preſent condition, and the Nature of the Circumſtances, ſomtimes theſe, and then another while thoſe were adminiſtred. And yet notwithſtanding we wil here add a form or two. For the looſening of his Belly (which unleſs ſome waies irritated would ſcarcely ever have done its office) he had indeed, as I told you before, brought out of *Italy* great ſtore of Aloes Roſat. But when I perceived that by the uſe thereof his Inteſtines were but the more dried, I diſſwaded him from the uſe of it. And ſo inſtead thereof he often made uſe of Clyſters (unto the which his body had been much accuſtomed) made of the Roots of Marſh-mallows, Polypody of the Oak, the Leaves of Feverfew, of the Herb Mercury, Bears-breech, Mallows, Marſh-mallows, Centaury the leſs; the flowers of Camomile, and Elder; Dill-ſeed, Fenugreek ſeed, Lin-ſeed, Cummin-ſeed; Electuar. Diacatholic. Diacarthum. Benedict. Laxativa, Hiera ſimplex, Syrup of Roſes Solutive; Oyl of Camomile, of Elder, of white Lilies, and Yelks of Eggs.

But the Laxative Syrups were made of the Roots of Polypody of the Oak, Fern, Succory, the Rinds of Tamariſque, the Roots of Capars, Fumitory, Agrimony, Endive, Germander, Spleen-wort or Miltwaſte; the ſeeds of Carthamus, Raiſins; Leaves of Sene, Agarick, Zedoary, Galangal; the Rinds of Citron; the Cordial flowers, Manna, Cream of Tartar, and Sugar; as much of al theſe as ſhal ſuffice.

Pills of the Maſs of Pils of *Fabricius Aquapend.* with the Species of Diacarthum.

For the correcting the vice of the humors, and the amending of the Scorbutick diſpoſition, he made uſe of Antiſcorbutick and opening Medicaments. As for example,

Take *of Scorbutick Water (deſcribed in the third Book of our Practice) four ounces, of Spoonwort or Scurvygraſs, and Borrage, of each one ounce; Conſerve of Spoonwort an ounce and half; of Betony half an ounce: Let them ſtand al night, and ſtrain them in the morning; adding thereto of Tartar and Vitriol, or the ſimple mixture, of each half a dram, and mingle them together.* Alſo,

Take *the Juyce of Spoonwort newly preſſed forth, of Water Pimpernel or Brooklime, and Water-Creſſes, of each a quart; of Succory root newly Candied ſix ounces; Salt of Tartar half a dram. Let them ſtand digeſting in a cloſe Veſſel for ſome daies; and afterwards ſtrain them; unto the ſtraining add, of white Sugar four ounces; Conſerve of Borrage, Betony, and Fumitory, of each two ounces: let them ſtand again in digeſting one whol day and night; and afterward ſtrain them.* Alſo,

Take *of the ſimple Mixture one ounce and half; Rob of Juniper one ounce; Juyce of Spoonwort, Water-Creſſes, Brooklime, of each ſix ounces; Species of Diarrhod. Abbat. two drams; Syrup of Borrage, of the leſſer Gilliflower, of Acetoſit. Citri, of each one ounce and half; Cinnamom Water half an ounce; let them ſtand digeſting, and afterward pour out al thereof that is cleer.* Alſo,

Take *of the ſimple Mixture one ounce and half; Rob. Juniper two ounces; Extract. Calam. Aromat.*

Aromat. one scruple; Saffron half a scruple; Conserve of Spoonwort three ounces; Fumitery, and Sorrel, of each one ounce and half; Juyce of the Citron new drawn four ounces; Scorbutick Water six ounces; Spoonwort Water four ounces; Cinnamom Water half an ounce: Let them stand in digestion; and afterward strain them.

He made use likewise of the Pils of the Trochisques of Capars; the Extract of Succory, Spleenwort, and Gentian; and also, Cream of Tartar Vitriolat.

There were likewise Rols prescribed for him, of the Species of Aromat. Rosat. Abbat. Diarrhodon Abbat. Plires Archont. Extract of Orrace, Elecampane, Eryngus, the Pouder of Bezoar: as likewise this Pouder:

Take Species Diaireos one dram; Calam. Aromat. the seed of Cresses, Rocket, Saffron, of each one scruple, Cinnamom one dram; Cream of Tartar two drams; make a Pouder.

He used Electuaries made of the Conserve of Spoonwort, Betony, Sage, Succory, Germander, Ground-pine, Citron Rinds Candied, the Root of Vipers Grass Candied, Rob. Juniperi, Confect. Alcherm. Syrup of Borrage, Gilliflower, Acetos. Citri.

He made use also of the Wine of Spoonwort; which is made, if some handfuls of Spoonwort (while it is yet green) be bruised very smal, and a few pints of Rhenish Wine poured thereto; and then let them stand in a Cellar in a Glass Vessel, for three daies; and then afterward strain them. And this also,

Take Wormwood three pugils, Conserve of Spoonwort three ounces, Green Water-Cresses bruised one handful; the dry Rinds of Citron six drams; pour thereunto of Rhenish Wine two quarts: Let them stand in a Glass for some daies; and after this pour out that which is cleer.

And at length when I had once gotten the Spirit of Spoonwort from that most industrious Apothecary of *Gorlicum, Johan. Buttnerus*, which (like as he doth also out of most other Plants) he artificially prepareth by fermentation and distillation, that so it may still retain both the smel and the taste of the Plant; when our Patient was tired out with, and even loathed the taking down of any other Medicaments, he then most frequently, and with very much benefit, made use of this Spirit.

And likewise that we might provide for the safety of the Spleen (which at this time was very far amiss) we caused an Emplaster to be put upon the Spleen.

The pains of the Belly and the Joynts took place (as it were) by turns, and reciprocally; so that when the pains of the belly remitted, then the pains of the Joynts began; and so on the contrary, when the pain of the Joynts ceased, then those of the Belly began to disquiet the Patient: and both of them were (for the most part) much moderated, when he plentifully (which very often so happened) cast forth the tart, salt, and bitter humor, in an almost incredible abundance.

For the mitigation of the pains of his Belly, there were prescribed Clysters, of Marsh-mallows, Camomile, Fenugreek seed, Dil seed, Linseed, Oyl of sweet Almonds, Oyl of Dil, Oyl of Camomile, Honey of Roses, Oyl of Bayberries: and unto the Belly there were laid both Fomentations and Cataplasms of the same and the like Medicaments; and the Emplaster of Lawrel Berries. He used likewise the Decoction of the flowers of Camomile with Manna, and the Oyl of sweet Almonds.

For the pains of the Joynts in the Hands and Feet there were used Fomentations and Cataplasms, of the Roots of Marsh-mallows, the flowers of Camomile, and St. Johns wort, Wormwood, Betony, Water-Cresses, flour of Lin-seed, and Fenugreek seed, Earthworms, Oyl of Elder, Oyl of Camomile, and the Unguent Dialthæa.

The Wife of this Noble Lord told us that in her Country (for the moderating of such like pains as these) they had in use Cataplasms made of the Horse Raddish, bruised and boyled; and (this being grounded upon Reason) there were therefore such like Cataplasms imposed now and then, with very good success.

There were likewise used Fomentations of Elecampane Roots, Marsh-mallow Roots, Bryony Roots, Lawrel Leaves, Sage Leaves, Rosemary Leaves, Herb Ivy Leaves, Wal-flowers, Lavender flowers, Prim-roses, Arabian Stœchados, and Juniper Berries. As also Inunctions of Marsh-mallow-Roots, and Bryony Roots, and Earthworms boyled unto a softness; adding thereto the Juyce of Spoonwort and Water-Cresses, Unguent of Bdellium, and of Turpentine, Oyl of white Lilies, Oyl of Camomile, as also of the Unguent Valeriola; which we may find in the fourth Book of his Observations. And so likewise this:

Take the juyce of Brooklime, Water-Cresses, of each one ounce and half; Oyl of white Lilies two ounces: boyl them til the Juyces be consumed, and then add Oyl of Turpentine half an ounce; Oyl destilled out of Juniper Berries, and the Unguent of Bdellium, of each one ounce; Gum Elemi, and Gum Hederæ, of each three drams; Mans Fat half an ounce: Mingle them.

Also the Unguent that is made of the Root of the Florentine Orrace, the Leaves of Sage, Primrose, Tansey, Mugwort, Betony, Bayberries, Juniper Berries, Rocket seed, Lavender flowers, and Spike flowers, boyled in Wine, and the Oyl of Earthworms, the Oyl of Foxes, the Oyl of Rue, the juyce of Water-Cresses; and then strained, adding thereto the destilled Oyl of Juniper, Sagapenum, Bdellium, Styrax Calamit. Gum Elemi,

mi, the Fat of a Fox, and Mans Fat, and Wax.

My own Emplaster likewise for the Nerves was added, of which this is the Description:

Take Leaves of Lawrel, Betony, Rosemary, Ground-pine or Herb Ivy, and Prim-rose, of each one handful; flowers of Lavender half a handful; the tops of St. Johns wort one handful; Earth-worms washed in Wine three ounces; boyl them in good Wine; and being strained add thereto Oyl of Camomile three ounces; Oyl of Orrace an ounce and half; boyl them until the Wine be consumed; and then add of cleer Turpentine three ounces, Goats Suet an ounce and half; Gum Elemi two ounces, Tacamahaca dissolved, Shippitch, Rosin, of each one ounce; boyl them again; and then add, Litharge three ounces, Wax as much as wil serve the turn, and make an Emplaster; unto which in the end add Oyl of Turpentine, and of Juniper Berries, of each an ounce and half; of Rosemary, and Sage destilled, of each one dram; and mingle them.

For the Palsie of the Tongue there were made use of Mouth-Washings of Sage Water, Rosemary Water, Extract of Calamus Aromaticus, Oxymel Scillitick, the destilled Oyl of Nutmeg; and likewise Inunctions of the Tongue, of Treacle, Extract of Castoreum, of Calamus Aromaticus, Oyl of Nutmeg, of Sage, and Mustard seed. There were also Trochisques made of the same.

For the Vices of the Gums, and the loosness of the Teeth, there were prescribed Unguents of the Leaves of Columbines, of Sage, Mints, Nutmeg, flowers of red Roses, Allum, Honey; Collutions or washings for his mouth there were made of the Decoction of Fern Root, and Bistort or Snake-weed, the Leaves of Water-Cresses while they are yet green, Sage Leaves, Mints, Columbines, Frankincense, the Water of Sage, and Mints, Alum, and Honey Rosat.

And by these Medicaments indeed, although (as we told you before) that the Disease of the Scurvy was for the greatest part removed and cured, (excepting that the Palsey of the Feet remained stil firmly fixt and immovable;) yet notwithstanding the *Plica* held on its old course stil; only there was one Nail on one of his Toes that returned unto somwhat a better state and condition.

Chap. 10. *Of the Vices of the Nails.*

First of al, if the Nails have their own Natural Constitution, like as other parts of the body, they are then smooth and plain, and they have a color white and red, and a due and meet hardness and thickness: if this their Natural Constitution be changed, it fals then under the Nature of a Disease.

Nails unequal, thick, and rugged.

And first of al, indeed the Nails are somtimes unequal, and become thick and rugged. Which happeneth from the juyce by which the Nails are nourished, abundantly flowing thereunto. For then they are not only made long, but they likewise become thick, unequal, and rugged. And this happeneth from strong and hard labor, by which the Nails about the roots of them are as it were moved together, and so they attract the aliment in greater abundance.

This Vice cannot easily be amended, unless that the external Cause cease. But if the said external Cause be removed, then in process of time (those thick and unequal Nails being by degrees cut off) other that are better wil succeed in the stead of them.

The Roughness of the Nails.

Scabrities and Lepra of the Nails.

Moreover, the Nails also become rough, and ill colored, and thick; which Vice is called the *Scabrities* and *Lepra* of the Nails: in which Vice, not only the magnitude, but likewise the figure and Conformation of them is vitiated.

This Vice is generated from the vitious and excrementitious humors mingling themselves with the aliment of the Nails. Now those humors are more especially Melancholick, which is shewn even from the color it self of the Nails, they having in them something of Tartar, from whence the said hardness proceedeth.

This Vice is manifest unto the Eyes, and bringeth along with it rather a deformity, than any danger; and yet nevertheless it may hurt and hinder the laying hold upon any thing, which is wont to be done by the Nails; and it likewise sheweth withal, that there is some vitious humor lying hid and concealed in the body, that Nature thrusteth forth unto the Nails; like as we have before told you, that those who are affected with *Plica Polonica* have also this evil befalling them.

This Vice is cured, if what cannot be amended be by degrees pared away, and the excrementitious humor discussed. If the Vice be but new begun, then the Decoction of the Vetch Orobus and Lentiles wil be very convenient; or else a Cataplasm formed of their meal: or else let Sulphur with Oyl and Vinegar be laid upon them. *Pliny* writeth that Orach (or Arrach) wil take away the Nails without any Ulcer; as we find it in his 20. Book, and Chap. 20. And the lesser Celandine with Pitch doth perform the very same. Or else let an Unguent be imposed, or an Emplaster made of Pitch, Wax, Rosin, Mastick, Burgony Pitch; or else lay on Raisins with Opopanax, or Cresses with Lin-seed: stronger are the Roots and Leaves of Crowfoot. Or,

Take *Rosin half an ounce; Turpentine two drams; new Wax, and Goats Suet, of each five drams;*

drams; Mastick one dram and half; Frankincense two drams; Make an Emplaster.

See more of these in *Paulus Ægineta* his second Book, and 81. Chapter. And in *Avicen*, in the seventh part of his fourth Book, last Tract, and 14. Chapt.

The color of the Nails changed.

But sometimes only the color of the Nails is vitiated; so that they become leaden colored, yellow, and black. Which Vice happeneth not only by reason of the change of the color of the flesh lying underneath (as some have thought) but because the very aliment of the Nails is vitious, and endued with such a color. And now and then likewise the Nails are here and there marked with certain smal white spots (especially in the younger sort of people) which arising for the most part about the Roots of them, together with the growing Nail they change their place; until at the length they are pared off with the Nail; and they have their original from the thick juyce that mingleth it self with the aliment.

In Currriers also (by reason of their handling of Lime and Ley) and in Dyers (by means of their handling their Dying stuff) the Natural color of the Nails is frequently changed into another, which oftentimes lasteth and continueth long.

This Vice indeed bringeth with it no danger at al; but yet it causeth a deformity, and is very offensive and troublesom unto Men, but especially unto Women.

But now that this Vice may be taken away, the vitious humors (if they lie hid in the whol body) are to be evacuated; and then after they are to be taken away out of the Nails themselves. This may be done, if the new growing nails be very often pared, until al that is vitiated be quite taken away. And unto the Nail it self that Emplaster that ere while we mentioned (in the *Lepra* of the *Nails*) is to be applied.

But there is then a peculiar change of the color of the Nails, when by reason of a Contusion there is blood shed forth under the Nail; and when shining through the Nail it produceth a red or a blackish color, as it is wont to happen in Suffusions. Which if it chance, *Avicen* adviseth to make a hole through the same, and so to let out the blood that lieth underneath the Nail. And yet nevertheless, there is in thus doing great care to be had, lest that in the perforation the nervous skin lying underneath be hurt, and so a pain be thereby excited. The Nail having a hole made through it (or if it hath not, it maketh no matter) lay upon it Candy Dittany, with the Glue or Gelly of fish. Or the Basilick Emplaster, or the Root of Solomons Seal wel bruised. Or,

Take *Sagapenum as much as you please; mingle it in a Mortar with the Oyl of Nuts, that an Emplaster may be made and laid thereon.*

The Crooking of the Nails.

There are some likewise that make mention of the crooking of the Nails among the Vices of the Nails; and indeed it is of that crooking wherein the Nails (in their extremities) are rendered crooked, and as it were hooked (like as we see is to be in Birds) and this crooking they say proceedeth from a driness that doth overmuch contract the substance of the Nails. But this Affect is very rare; neither (when any such there is) doth it proceed from driness, but from a vitious matter; by reason of the abundant flowing of which the Nails come to grow in that vitious and uncouth manner: and this (as we have already told you) happeneth in the *Plica Polonica*. And therefore there is no other way or method of Curing of this Evil, than that of Rough and Leprous Nails.

This is not unusual (especially in the Feet) that the Nails grow forth too much at the sides, and make a hole through the skin lying underneath; upon which the flesh there in that place beginneth to grow luxuriant, and to become proud, and proveth a very great impediment, both in putting on of the shoos, and also in going. Which if it happen, we are then to sprinkle upon the place burnt Alum, which taketh away whatsoever of the flesh is superfluous; and afterwards the Nail that hath grown forth too long is to be pared off.

The Cleaving of the Nails.

And now and then likewise solution of Unity happeneth unto the Nails; so that they are cleft either longwaies, or else transversly, and as it were cut into two thin plates.

And this cometh to pass either from Causes external, as Wounds; or else from the viciousness of the Humor, which sometimes falleth out in the French Disease, and the Leprosie.

If the Cleft be from a Wound, the Wound is then to be healed: yet nevertheless the cloven Nails can no way be united; but while they grow a whol and sound Nail is wont to succeed the cloven: but care must here be taken lest that the Nail in that part where it is cloven should grow together with the skin lying under it. For if this should happen, the Nail wil never be whol as it ought to be; but wil evermore grow forth cloven and in two parts.

If this Fissure or Cleaving arise from any other Disease, and vitious humors, then that Disease is to be cured, and such like Topicks are to be administred unto the Nail as are wont to be applied in the roughness of them.

The

The Falling of the Nayls.

And at length also the Nails are wont to fal off, leaving the extream part of the Finger quite naked: which Vice may not unfitly be referred unto Diseases in the number; since that without cause the Nails are excluded from the Number of the parts, notwithstanding that they have their Natural conformity and use, and are nourished like as other parts are, and cohere (as al other parts likewise do) unto the whole. But why the Nails fal away, this first of all and principally proceedeth from the fault of the Aliment; which when it declineth into another Nature, and so indeed that the Aliment is not only become simply vitious (the same that happeneth likewise in the ruggedness and roughness of the Nails) but that it is also sharp withal, and corrodeth the roots of the Nails (in the very same manner as the roots of the hairs are wont to be gnawn asunder in the *Alopecia*, *Ophiasis*, and shedding of the hair) the Nails then fall off. And so very often after Ulcers and Wounds about the roots of the Nails, the Nails are wont to fal off, *Pus* or filthy matter gnawing asunder the roots of them. And when the roots of the Nails are eaten asunder by the said purulent matter, although the Nails do not then fal off of their own accord, yet by the Nail new growing they are thrust off. And so it is found that after pestilent and Malignant Fevers, not only the hairs have shed, but the Nails likewise have fallen off: and this hath likewise been observed to happen after the drinking of Poyson, and in the French Disease. And moreover, the very same may likewise happen from the want of Aliment; like as we have seen and found by experience, that such as have travelled in the Snow, and that have held their hands long in cold water, have had their Nails fal off, either from a Constipation of the Pores of the hands that carry the Aliment unto the Nails, or else from the extinguishing of their Native heat.

Now this Vice (which is obvious unto the sight) doth not only cause a deformity, but likewise hurteth the laying hold on any thing, for which the Nails serve: and moreover (in regard that the Nails do as it were defend the Fingers ends against external injuries) by this means the Fingers are rendered as it were defenceless, and easily obnoxious unto al kind of external injuries. And therefore this Malady doth deservedly require a Cure. And yet nevertheless all the Nails that fal off cannot be restored. For if from a depraved humor the whole root of the Nail be eaten asunder, and the Malady hath now long continued; or if by reason of the want of Aliment the Nails be fallen off, they can very hardly be restored. But if the root be not wholly eaten asunder, and the Malady be but new begun, there then remaineth some hope of a Cure: and therefore in this case we are to cover the Nails with a Cap made of Ladanum, Ammoniacum, Bdellium, and Wax.

The looseness of the Skin about the roots of the Nails.

Reduvia, or the looseness of the skin about the roots of the Nails.

And then at length, there is likewise a Vice, not of the Nails themselves, but of the Skin that is next unto the Nails; which the Latines call *Reduvia*, and the Greeks *Paronychia* because that it is neer unto the Nails. But this *Paronychia* of the Greeks is a Vice far different from the Disease that is described before (in the first Part of this fifth Book, and Chap. 14.) and is there reckoned up among the Inflammations, and by the Arabians is also called *Paronychia*. For that *Paronychia* (as we there told you) is a most grievous and dangerous Disease. But the *Paronychia* of the Greeks (of which we are now speaking) or *Reduvia* as the Latines call it, is the least and lightest of all Affects, and bringeth along with it no danger at al; and scarcely deserveth the Care and pains of a Physician; as appeareth out of *Galen*, who in his Comment. 2. touching the Nature of Man, about the end thereof, disputing whether or no that Book were written by *Hippocrates*, saith that *Sabinus* and the rest that reject that Book, do indeed take notice of a few smal faults that are therein, but they neglect and pass over without any notice taken of the faults that are far greater, and worth Consideration, after the fashion of those ill Physitians, who while they consider and take notice of the *Paronychia* of sick Persons, they then through Ignorance neglect the greater and more difficult Evils

Neither indeed is there any reason for us to think, that the *Paronychia* of the Greeks and that of the Arabians is one and the same Affect, and that *Reduvia* is a small and beginning *Paronychia* (such as the Greeks describe) either in the Swelling, or Inflammation, or any notable pain; which is in a Species of the *Rhagades*, and is described by the Greeks. But if it be already become such, it will then turn into an Inflammation, and a dangerous Impostumation, such as is described by the Arabians, and is by them named *Panaritium*. For these things do no way answer to Experience. For neither doth the *Panaritium* of the Arabians begin from such like Clefts, neither is the *Reduvia* and *Paronychia* of the Greeks ever turned into the *Panaritium*.

Reduvia what it is

Paronychia therefore, or *Reduvia*, is a certain sleight Cleft of the Skarf-skin at the Roots of the Nails.

It proceedeth from a salt humor eating through the Skin in that place.

The Vice appeareth sufficiently of it self; neither hath it any danger at all to attend it, but only that it is somewhat troublesom by reason of some light and smal pain that followeth it, whenas the Skarf-skin being cleft and divided the true Skin is left quite naked.

Now it is Cured by Purslane, the Roots and Seed of Mallows, Oyl of Violets, and Oyl of Roses.

Clefts in the Hands.

In the last place we think it not amiss, to mention also the Clefts that are oftentimes found in the Hands; which happeneth more especially about the beginning of Winter, when the Hands being tender are exposed unto the Cold, whereunto they have not as yet been accustomed; whereupon it is that they contract these Clefts, especially about the Joynts; yet nevertheless, this same happeneth somtimes likewise unto the Feet.

It may be Cured most speedily, and most conveniently by this Unguent.

Take *Litharge of Silver, Myrrh, and Ginger, of each alike parts; bruise and pouder them very small; and so with Virgins Wax, Honey, and common Oyl as much as wil suffice, make an Unguent; unto which (for the rendering it the more grateful to the smel) Musk and Ambar may be added.*

THE

THE FIFTH BOOK. THE FOURTH PART. *Of WOUNDS.*

Chap. 1. *Of the Nature, Causes, and Differences of a Wound.*

AMong the external preternatural Affects of the Body, and such as are obvious unto the senses, there remain Wounds, Fractures, and disjoyntings; of which we will now speak in order. And First of all, as touching a Wound, that it is a solution of Unity in a part, Bone, and softer *Cartilage*, is without al doubt and controversie. But yet nevertheless it is somtimes taken largely, and somtimes in a more strict sence. *Celsus* taketh it in the largest sence of all, when (in his *fifth B.* and *sixth Chap.*) he thus writeth: *That Wound* (saith he) *is far worse, and more dangerous, which is caused only by a Bruise, then that which is made by incision and dividing the part; so that it is also far better to be wounded by a sharp and keen edged Weapon, then by that that is blunt.* It is taken in a large acceptation, when it is attributed unto all kind of solution of Unity made by any sharp instrument; whether this solution be made by pricking, or by cutting; like as *Galen* (in his *Sixth B.* of the *Meth.* of *Physick*, the *first* and *following Chap.*) calleth the pricking of the Nerves the wounding of them. It is taken strictly, when it is distinguished from a pricking; that a wound is the solution of Unity in a soft part, made by a Cut from any keen and cutting instrument; but a pricking is that solution of unity that is caused in a soft part, by a prick from an instrument that is cutting. By which it appeareth, that the solution of Continuity in a soft part is wider and broader then a Wound, whether it be made by cutting, or by pricking. For Unity may also be dissolved (in a soft part) by a thing that is not sharp, but only hard and heavy; and this may be, the Skin either appearing whole, or even broken likewise, which happeneth in those Wounds that are inflicted by Bullets from Guns. Moreover also the Unity of the soft part may be dissolved by extension, which (in special) in the similary parts is called Rupture, but in the Compound, *Apospasma*; to wit, when those fibrous Ligaments and Threads (by which the parts are fastned together, the one to the other,) being broken, the parts themselves likewise become broken. By all which it appeareth, that a Wound is the solution of Unity in a soft part, caused by a cutting and sharp instrument.

A wound what it is.

But if (as *Guido* in the *Second B.* of his *Chirurgery*; and *Fernelius* in the *seventh B.* of his *Meth. of Physick*, *Chap sixth*, rightly admonish us) the Wound become sordid and foul, and that some thing be by the *Pus* or filthy corroding matter eaten away from the substance of the wounded part, then the Wound passeth into an Ulcer; or certainly we may very well say that an Ulcer is conjoyned with the said Wound. The truth indeed is, that *Rudius* (in his *B.* of *Wounds*, and *first Chap.*) doth impugn this Opinion; but al to little purpose. For neither is it absurd (as he without Reason thinketh) that one Disease should be changed into another, or that one should be added and joyned to another.

The Wound and Ulcer they are both of them the solution of Unity in the soft part; but the Wound is made by section or cutting alone, whereas the Ulcer is caused within it by Erosion; and therefore it is that in an Ulcer there is somwhat that is lost from the substance of the part. If therefore in a Wound of any part somthing shall be Eaten away and consumed from the substance of the flesh, it is then altogether to be granted, that now there is likewise present even an Ulcer also. Which nevertheless is not so to be taken, as though so soon as ever on the fourth day the *Pus* or filthy corrupt matter doth begin to appear in the Wound, that then likewise an Ulcer may be said to be present. For that said *Pus* proceedeth from the blood that is shed forth without the Veins; or some Aliment that sticketh in the Capillary Veins, and spaces of the parts; neither is there then any thing Eaten away from the substance of the part. But if there be so great an abundance of the *Pus* gathered together (whatsoever the Cause thereof be) that somthing be Eaten away from the substance of the part; then it cannot be denied but that there is an Ulcer likewise present; seeing that there are then present all things that are required unto the Essence of an Ulcer; and in this Case, the Cure is no longer to be ordered as in a single and simple Wound, but as in an Ulcer.

But since that a Wound is to be accounted in the number of Diseases, there may be enquiry made (and that upon good grounds) what actions they are that are hurt thereby. Unto which it may be rightly answered, that all the Actions of the said part, and the severall uses thereof unto which the part is destined, are hurt by the Wound, whether that part perform those actions, either as a similary, or as an instumental part. That the Organical Actions may oftentimes be hurt by a Wound, (to wit, when the part destined for motion is Wounded) cannot be denied, it being a thing so manifest; since that the wounded Member can no longer be moved in a due and right manner. As likewise the Vein that is cut assunder can no longer convey the blood unto the part, for the nourishment thereof; neither a dissected Artery the vital blood and spirits, or a Nerve the Animal Spirits.

But indeed the truth is that the temperament of the part is not next of all and immediatly hurt by the Wound; but yet nevertheless it is mediatly hurt; to wit, when the Vessels being cut assunder, and the blood poured forth, the heat of the part is withal dissipated, and the influx of the Blood, spirits, and heat flowing in (this last being so necessary and requisite unto the temperament of the part) is altogether hindred. For all which Causes, the attraction of the part, the Concoction, the Nutrition, and the expulsion, is hurt. And from hence it happeneth, that the temperament being changed, there are more Excrements generated in that part, then otherwise were wont to be. And from thence also it proceedeth, that the *Pus* is not presently generated in the very beginning of the Wound, but afterward, to wit, about the fourth day, when the heat of the part that was dissipated is again restored.

The Use is likewise hurt in the Wounded parts. The Skin being Wounded can no longer cover the parts lying underneath it; neither the dissected *Peritonæum* the Intestines; the Cornea Tunicle of the Eye can no longer contain the Humors; neither can the Arteries when they are once cut in sunder any longer contain, or convey the Blood; neither can the Nerves carry the Animal Spirits.

The Differences.

The Differences of Wounds, some of them are Essential, and others of them Accidental. The Essential are taken from the very Nature of the Wound, to wit, from the form thereof; in which respect, according to the Figure, some of them are straight, other of them oblique, and these indeed likewise of a very various Figure: in respect of their Magnitude, some of them are smal, and others great; some deep, others of them only superficial; and hither also may this be referr'd, that a wound being inflicted, either there is somwhat cut off from the substance of the part, or else there is not any thing at all cut away. Although (if we would but rightly and accurately Judg of the thing) these are no proper and Essential Differences, in regard that they are taken not from the very Essence of the Wound, but rather from some certain Accidents that happen thereto, to wit, the greatness, the figure, &c. From the part affected, (which is somtimes the Musculous Flesh, somtimes a Nerve, now and then a Ligament, and very often a Tendon) now this, or that part is affected. And indeed in one and the same part, there is great respect to be had, in what particle of the part the wound is; as for example, whether the Wound be in the beginning, or in the end, or else in the middle of the Muscle: and whether or no in the Wound of any Bowel, the *Parenchyma*, or the Vessels therein be wounded. From the Cause, because that the wound inflicted is either by cutting (which is in special called a wound:) or by pricking, which in special is called a puncture or pricking: or else together with the pricking there is likewise present an incision; or else there are present together an incision and contusion; or else all these three, incision, pricking, and Contusion, are Joyned together.

But the Accidental Differences are such as are drawn from those things that are without the Definition of the Wound. *Galen* (in the *Third B.* of his *Meth.* of *Physick*, and *last Chap.*) hath reduced them to three Chapters; and he teacheth us that they are taken either from the manner of their Generation; (to wit, that there is a total incision, or a total disruption;) or else, that there is only a part cut, or a part broken. Secondly, From the situation of the Wound, to wit, when in a wound obliquely inflicted, one part of the Wound is in sight, and another part lieth hid under the Skin. And Thirdly, From the time, that one wound is fresh, and new made, another old and inveterate.

There are likewise certain other Accidental Differences (we may rather call them improper) taken from those things that are conjoyned with the Wound; to wit, that that wound is poysonous that is inflicted by a poysoned sword; or else by the biting of some venemous beast: that there hath chanced unto the wound some inflammation, or an *Erysipelas*; or that there is a Fracture, or disjoynting Joyned therewithall: or else that there is conjoyned an Hemorrhage, Pain, or some other Symptom.

The

The Causes.

We need not say much touching the Causes of Wounds. The Causes of a Wound that is made by cutting, are al those things that have in them a power of Cutting, Swords, Glass, and the like. Of a Puncture (or pricking) the Causes are, whatsoever things are sharp-pointed, as Arrows, Needles, and the teeth of living Creatures. Of Ruptures, such things as distend the soft parts, and pul them into Contrary parts; such as the lifting or carrying of some extraordinary weight, a Fall, Blow, lowd speaking, and the like. Those things that bruise, are all things Heavy, Hard, and Blunt, as Stones, Wood, Lead, and among these Leaden Bullets shot out of Guns have in them a power of perforating.

Chap. 2. *Of the Diagnostick Signs.*

THe Truth is, that the wound it self is (of it self) sufficiently manifest unto the senses; and therefore needeth not any signs whereby it may be known. But although that place in the Skin that is wounded be obvious and open to the sense; yet nevertheless if the Wound penetrate unto the more inward parts, what parts they are, that are wounded within is oftentimes very obscure, and hidden from us. But this may be known, first from the situation of the parts; Secondly from the Action that is hurt, and the Use. Thirdly, From the supervening Symptoms; and Fourthly, from the Excrements. For if the wound of the Head be so inflicted that it be very deep, it sheweth that the Brain is wounded: and if the whole Thorax or Chest be run through with a Sword, it argueth that the Lungs are likewise wounded; and so of all the other parts. For the exact and perfect knowledg of which, the Scituation of the parts is to be learnt from Anatomy. Secondly, the Actions that are hurt do demonstrate the Wounded part. And so, after a Wound received in the Privy parts, if the Urine flow forth of its own accord, it sheweth that the Sphincter of the Bladder is hurt. But here notwithstanding, we are wisely and carefully to consider, (in case any Action be hurt) whether the hurt of the said Action be not by Consent of some other part. And therefore other Signs are to be conjoyned. If (a wound being received in the Abdomen) the Intestines fall forth, it is an Argument that the Peritonæum is cut asunder.

As for what concerneth the Excrements; If Chyle flow forth upon the receiving of a Wound, it is a sign that the Stomach is wounded, or the smal Bowels; if the Excrements of the Belly, that the greater and thicker Intestines are wounded; if Urine flow forth of the Wound, then it sheweth that the bladder is wounded; if out of the Wound of the *Thorax* (or Chest) Air pass forth, it is a sign that the Lungs are wounded. Whether it be a Vein or an Artery that is hurt and wounded, the efflux of the Blood will shew; since that, what floweth forth from an Artery cometh forth Leaping and Dancing, as it were, and is more Red then that from the Veins.

We have notice likewise given us of the part that is wounded from the supervening Accidents. And so a vehement pain suddenly happening manifesteth that some Nerve is wounded.

Chap. 3. *Of the Prognosticks, and foretelling of the Event of Wounds.*

BEfore the Physitian attempt the Cure of a Wound, he ought First to be very Sollicitous and Inquisitive touching the Prognosticks. To wit, in the first place, he ought to foreknow, wheth r the Wound be Curable, or altogether incurable. And then if it be indeed curable, whether the Cure will be easie, or difficult; and whether or no the wounded person be like to have his former perfect soundness restored unto him; or else whether or no being Cured, and his Wound healed, he be likely to undergoe and suffer the hurt Action of some one or other of his Members. For so oftentimes it happeneth, that some Tendon being cut asunder, the motion of some part is wholly lost; and that the Brain being wounded, the Memory, or Rational faculty is thereby hurt: and Moreover, whether the wound be likely to be Cured in a short, or whether it wil take up a longer time. But on the other side, if the wound be altogether incurable; whether it be Mortal, and such as is likely to hasten Death; or else whether it be not more probable that it will degenerate into some long continuing Ulcer.

And Lastly, it must be foretold likewise, whether the Changes and Alterations of the Wound will be for the better, or for the worse, and when these Changes wil be. Now in the first place, it must be diligently explained,

What Wounds are Deadly, and what Wounds are not so.

For indeed this Question is of very great Moment, and therefore most diligently and exactly to be weighed and known by the Physitian. For whereas oftentimes the lives

of some men are much hazarded and endangered, (when they are brought before the Magistrates in the publike Courts of Justice) by Reason of Wounds they gave unto others; and that oftentimes the Judges desire the Physitians Opinion touching the same; great Care and a diligent Endeavour ought to be used, that the Physitian give so true a Relation, and so distinctly deliver his Opinion touching the quality of the said Wounds, that the innocent may not be condemned, nor the Guilty acquited.

But in the first place we are to know that not every Wound which hath Death following it is to be called a Mortal wound, but that alone which in its own Nature bringeth Death. Now such like wounds are twofold. For Mortal or Deadly (as *Galen* in the 5. *B.* of the *Aphor. Aphor.* 2. and *Aph.* 18. teacheth us) is somtimes taken and understood of those wounds that are of necessity deadly and somtimes again of such Wounds as are so for the most part, as *Hippocrates* speaketh; and such as by Reason of which (as the same *Hippocrat.* maketh the limitation in the 18. *Aphorism, 6. Sect.* in *Coacis*, or his tract of Playsters) those that are wounded, almost, or for the most part die: like as *Galen* (in his 5. *B. Aphor.* 2.) writeth, that Deadly is to be taken for that that is dangerous, and is oftentimes terminated in Death. But the Question is here especially of the former kind; for that wound that hath been at any time Cured in others cannot be taken for a wound simply Mortal and Deadly. But we shall afterward tel you, when it is to be taken and accounted for Mortal, or not Mortal. And therefore, Secondly, Wounds cannot be accounted simply Mortal, whereupon the supervening of most grievous Symptoms (which said Symptoms notwithstanding do not alwaies and necessarily follow upon the reception of these like wounds) the wounded person dieth; as when in the Wounds of the Joynts, and the Nervous parts, an inflammation, Deliry, and other Symptoms happen; or that by Reason of a Cacochymy lying secretly in the Body a feaver is kindled upon occasion of the Wound. And it is altogether most true, that many things often fal out that render Wounds incurable, which in their own nature were curable. Like as neither are those to be accounted for Wounds simply Mortal, the Curing of which is long protracted, & by Reason of which it at length happeneth that the Wounded person perisheth by a slow and lingring Death: the same that happeneth when (the Lungs being Wounded) an Ulcer and the Consumption follow thereupon; or the Thorax, or Stomack being wounded; which oftentimes after a long space of time become the Causes of Death unto the wounded person. For whenas it hath been observed and known that these like Wounds have been healed in others, they cannot then be accounted for Wounds simply Mortal. But those Wounds are only to be reputed simply Mortal, which in the space of a few hours, or daies, do necessarily bring Death unto the sick person, and cannot be cured by any Art. And therefore we are to distinguish between Wounds Mortal, and Wounds incurable. For all Mortal Wounds are incurable, but all Wounds that are incurable cannot be said to be Mortal. For Wounds incurable (as we have told you) are al those that though they cannot indeed be cured, yet notwithstanding they are not suddenly the Cause of Death unto the wounded person, since that (although they cannot be healed) yet nevertheless the sick person may after this live not only many Weeks but even yeers also. And such a like Wound was that which *Matthias Cornax* (in his *Epistle Responsory unto* Dr *Ægidius Hertogh.*) and *Julius Alexandrinus* (in his *Annotations upon the sixth Book of* Galen *his Meth. of Physick, Chap.* 4.) have described unto us. For whenas a certain Bohemian Boor (as he was hunting) received a Wound in his Stomack with a broad hunting speat, it could not possibly be consolidated but yet in tract of time the lips of the wound became hardn'd by a certain Callousness growing over them, so that the wounded person survived for many yeers after; and by applying of an instrument he could at his pleasure evacuate his stomack.

And now in the next place let us see what Wounds they are that we may account to be simply Mortal, or Deadly. And now whereas Death happeneth upon the defect & extinction of the Native heat; and that the Native heat may in a twofold manner be extinguished, either sensibly and by degrees, (as it is in a Natural Death, and long continued Diseases, as the Consumption, and the like,) or else suddenly and violently: the latter way it is that Wounds are said simply and necessarily to bring Death unto the wounded person, to wit, a violent one.

Now the innate heat is extinguished, either because the vital spirits are dissipated, or because they are suffocated. And therefore all Wounds that are Mortal, and of necessity cause a sudden and violent Death, either they suddenly suffocate the vital spirits, or else they dissipate and corrupt them. But in regard that the Heart is the Store-house of the vital spirits and the Native heat, first of all therefore the Wounds of the Heart of all others do especially and most speedily bring upon the Wounded Person a violent Death.

And

And the very truth is (as *Galen* writeth in his 5. *B. of the places affected*, and 3. *Chapter*) if the Wound penetrateth unto the ventricle of the Heart, (especially the left) the wounded person of necessity dieth suddenly: but if the Wound penetrate not so far as unto the ventricle of the Heart, but that it consist in the substance thereof, the man may then indeed live for a while, but yet nevertheless he must necessarily die this violent Death.

Secondly, It is of necessity that the man die, if some Vessel be wounded in that part of the Lungs that are next unto the Heart, and that out of it store of Blood be poured forth unto the Heart, overwhelming it, and suffocating the heat thereof.

Thirdly, All the internal wounds of the greater Vessels that cannot by any art be closed up, in regard they cause (the Blood being plentifully poured forth either out of the Veins or the Arteries) that the spirits be suddenly dissipated, therefore of necessity they speedily suffocate the wounded person.

Fourthly, All those Wounds are said to be Mortal that suddenly take away the Respiration, and hinder the ventilation of the Heart, so that the Native heat of the Heart is suffocated, and so cause that the Man die even almost in the very same manner as Apoplectical persons are wont to die. And such like wounds are especially the Wounds of the Brain, but yet not all of them, since that there are many Wounds of the Brain that are not Mortal, as afterwards we shall shew you, and as we have already told you in the *first B. of our Practice, first part*, and 23. *Chapter*. But those great Wounds, and such as are the Cause that the Animal spirits be suddenly dissipated, or that the blood being poured forth of the Vessels the Orifice of the Nerves be quite stopped, and so by this means the influx of the Animal Spirits be hindered; or that from the same an inflammation of the Brain, or a feaver be excited. And this is not only done by the Wounds of the very Brain it self, but likewise by the strokes and vehement Contusions of the Head, by which the Vessels of the Brain (and those neer about it) are broken, and the Blood poured forth of them unto the beginning of the Nerves, and there subsisting hinder the influx of the Animal Spirits. And this may also happen, if the *Sinus* or hollow places of the Brain chance to be hurt, so that out of them blood be poured forth unto the Basis of the Brain; and so it is likewise in the Wounds of the Eyes, if they penetrate so deep that they open either the Vessels of the Brain, or those that are in the Basis thereof, or those that are neer about the said Basis of the Brain, and so that the Blood poured forth unto the Basis of the Brain hinder the influx of the Animal spirits by compressing the beginning of the Nerves. For although that the Blood (if it be poured forth above upon the Brain) may possibly be emptied forth by perforating and opening of the Cranium or Skul; yet nevertheless if it be poured forth unto the Basis of the Brain, it is impossible that it should ever be evacuated.

There seemeth yet (nevertheless) to be another way, whereby the Blood poured forth into the Brain, or about the Brain, bringeth Death within a very few daies, if it cannot be evacuated. For when as it is without the Vessels, it beginneth to putrefie usually about the fifth day; from whence feavers, deliries, and Convulsions are excited; so that the man dieth in the same manner almost as one in a Phrensie.

That which is done by the Wounds of the brain, the very same happeneth likewise from the spinal Marrow, if it be indeed wholly cut assunder in the superior part thereof: for then the motion of all the inferior parts (and so of the *Thorax* likewise) is abolished, and the wounded persons are suffocated. And unto one of these four waies I conceive that al kinds of Mortal Wounds may be referred. And therefore if a Wound penetrate into any interior part of the Body, so that thereupon the wounded person die within a short space of time, we are then to Judg that that Wound was Mortal; and if diligent inquiry be made, I am of Opinion that it may be referred unto some one kind or other of these Mortal Wounds: whether that Wound hurt the vital faculty it self immediatly; or else hurt it by the intervening of some other Disease, or Symptom. For, as *Nicolaus Boetius* writeth out of *Felinus* (in his 323. *Decision, Numb.* 10.) it is all one, whether a Wounded man die of his Wound, or of some infirmity caused by the same. Which yet nevertheless is so to be understood, if the Wound necessarily attract that Disease, or that Symptom which is the Cause of Death.

But as for all the other Wounds whatsoever that cannot be referred unto some one of these manners, I conceive that they cannot simply nor necessarily be accounted Mortal. The which that it may be made the more plainly to appear, we have it now in our purpose, in special to weigh and discover unto you the Wounds of all parts that are to be accounted Mortal.

What wounds accounted Mortal by Hippocrates.

Now *Hippocrates* Judgeth the wounds of seven parts to be Mortal, whilest (in his *sixth Sect. Aphor.* 18.) he thus writeth. *Whosoever hath his Bladder cut through, or his Brain, or his Heart, or his Midriff, or any of*

of his smal Guts, or his Stomack, or his Liver, that Wound is Mortal. Which *Aphorism* notwithstanding (in his *Coaca*, or his Tract of Playsters, *Aphor.* 509.) he both Limiteth and Amplifieth, when he thus saith. *From a Wound even Death it self may almost happen, if any one be wounded in his Brain, or in his spinal Marow, or in his Liver, or in his Midriff, or in his Heart, or in his Bladder, or in any one of the greater Veins. Death likewise soon followeth, if any extraordinary great Blows be inflicted upon an Artery, and upon the Lungs; so that the Lungs being wounded, the Breath that passeth out at the Mouth is less then that which issueth forth at the Wound. But they suddenly perish whosoever they are that have received a Wound in the interior Nerves, whether smal or great; if the Blow or Wound be both Transverse and great: but if the Wound be but smal and straight there are some that escape the danger. But there is neither Death nor any great danger impending from those Wounds that are inflicted on those parts of the Body in the which there are none of these, or which are as far distant as may be from these*

Indeed he limits the Aphorism, whilest that he doth not simply write that such like wounds are altogether Mortal, but *almost* and *for the most part.* He amplifyeth it, whilest that he addeth the spinal Marrow, the greater and thicker Veins, the rough Artery, and the Lungs, and the interior Nerves. And therfore we wil in order consider the wounds of these parts. For it is without doubt, that the Wounds of the rest of the Parts are not at all of themselves Mortal: and this *Hippocrates* himself teacheth us in the *above mentioned Aphorism, 509. in Coacis. Celsus* (in his 5. *B.* and 26. *Chap.*) thus rendereth the foresaid Opinion of *Hippocrates. He cannot possibly be preserved,* that hath *the Basis of his Brain, his Heart, his Stomack, the parts of his Liver, the Marrow in his Back-bone, wounded: or that person that hath either the middle of his Lungs, or the* Jejunum. (i. e. *the hungry Gout*) *or any of the smaller Guts, or the Stomack, or the Reins be wounded; or he that hath the greater Veins or Arteries about his Jaws cut assunder. And they also very hardly recover their former soundness that have any part of their Lungs, or the thick part of their Liver, or the Membrane that conteineth the Brain, or the Spleen, or the Matrice, or the Bladder, or any Inteſtine, or the Midriff, wounded These likewise are in extream great danger, in whom the Swords point hath pierced even unto the greater Veins that lie hid and concealed within, in the Arm-pits, or in the Hams. And those Wounds are also dangerous, wheresoever there are any of the greater Veins; in regard that they soon spend a man by the extraordinary effusion of Blood. And this happeneth not only in the Arm-pits, and in the Hams, but likewise in those Veins that reach even unto the Arse, and the Stones. And besides these, that Wound is also evil and dangerous that is in the Groins, or in the Thighs, or in the void places, or in the Joynts, or between the Fingers. As also whatsoever wound it be that hath hurt any Muscle, or Nerve, or Artery, or Membrane, or Bone, or Cartilage.* But now, because that *Hippocrates* what he had said (in the *sixth B.* of his *Aphorism Aphor.* 18.) to be *Mortal* and Deadly; that in his *Coaca, Aphor.* 509. he explaineth by saying that they *almost die,* let us therefore see what wounds of these parts are simply Mortal, and what not.

The wounds of the Brain.

And first of all, *Hippocrates* (in the *Sixth Book* of his *Aphorism Aphor.* 18.) reckoneth up the Wounds of the Brain among the Mortal Wounds; and yet nevertheless (in his *Coaca*) he limits it, and writes that for the most part this is so. For all the Wounds of the Brain are not Mortal. For *Galen* himself saw when such Wounds were Cured, in the 8. *B.* of the *Use of the parts,* and 10. *Chap.* and in the *sixth of the Aphor. Aph.* 18. And we have instances thereof in *Valleriola* in his 4. *B.* of *Observat.* and 10. *chap.* and in his 5. *B.* of *Observ. chap.* 9. and in his *sixth B.* of *Obser. ch.* 4. in *Gulielm. Fabricius* his 4. *Cent. Observ.* 1, 2, and 3. and he there giveth us a long Catalogue of the Physitians who had seen some Wounds of the Brain Cured. In *Johannes Andreas* a *Cruce,* in his *first B.* of *Wounds, Tract.* 2. *chap.* 14. of a *hurt* and wounded *Brain.* Yea Moreover it hath been observed, that after the loss and perishing of some smal part of the Brain, yet nevertheless the wounded person hath perfectly recovered: for the confirmation of which we have many Histories given us by Divers Physitians; *Anton. Musa Brasavolus,* in his *Comment.* upon the 18. *Aphor.* of the *sixth Sect.* of *Hippocrates, Nicolaus Missa,* in his *first B. Epist.* 11. *Fallopius* in his *Tract of the Curing of Wounds, chap.* 45. *Franciscus Arcæus, in his first B. of the Curing of Wounds,* and 6. *chap. Johannes Andreas* a *Cruce,* in his *first B. of Wounds, Tract,* 2. *chap.* 14. *Ambrosius Paræus* in his 9. *B.* and 22 *chap* and others; all which (or at least the greatest part of them) have been collected by *Schenckius,* in his first B. *Oserva.* 40. and 42. And well worth Observation also are the Histories of the most dangerous Wounds of the Brain, that are extant in *Cabrolius* his *Observat.* 16, 22. and 34. in *Henricus Petræus* his 2. *Tome* of *Harmonic. Disputat. Disput.* 36. *Quest.* 10. in *Gulielm. Fabricius,* every where very frequently in the

the *Centuries* of his *Observations*: in *Matthias Glandorpius*, in his *Speculum Chirurgic. Chap.* 22. *Observ.* 5. And I my self (together with a Chirurgeon) Cured a Carpenter, who in the left bone neer unto the Coronal Suture, had received a Wound (by a fal of the very edg of an Ax from on high) almost of a Thumbs length, that penetrated even into his Brain; so that a smal part of his Skul being presently broken forth, there appeared out a portion of his Brain, well neer as much as a Wall-Nut in quantity. And yet nevertheless he recovered, that portion of his Brain that hung forth by degrees wasting away. And (which made the wonder so much the greater) during the whole time of the Cure, he never so much as complained of any pain in his Head, nor of any other Symptom; and walk he could without any the least impediment. And of this truth there are so many examples already every where known, that to heap up more instances is a thing altogether superfluous. And on the contrary, that for the greatest part they die of these wounds of the Brain, is testified by daily experience.

And unto the Wounds of the Brain belong also those that (through the Bal of the Eye) are inflicted either upon the brain it self, or the parts neer adjoyning, and included within the Skul; as we shall afterward shew you.

But now, why the Wounds of the Brain are sometimes Mortal, and sometimes not, is well worth our inquiry. Some there be that think all those Wounds that penetrate not into the Ventricles of the Brain, not Mortal; but those that reach even unto the ventricles, these they Judg to be Mortal; and this, by reason of the suddain dissipation of the Spirits that are conteined in those ventricles. And *Galen* himself seems to be of the same Opinion, whereas he writeth (in the *sixth* of the *Aphor. Aph.* 18.) that a young Man of *Smyrna* in *Ionia* having received a Wound in one of the fore ventricles, yet scaped with life; whereas he could not indeed possibly have lived one Moment of time, if it had so chanced that the Wound had violated both the ventricles of the Brain at once. But that the ventricles of the Brain, being likewise violated, men may yet notwithstanding escape with life, we are sufficiently taught by the Histories before alleadged. Neither is their Reason good that are of the contrary Opinion. For neither are the Animal Spirits generated and conteined in the ventricles of the Brain, (as those of latter times have sufficiently demonstrated;) neither are the ventricles of the brain so separated and distinguished by Partitions, that one of them being wounded, the spirits (were they conteined in the said ventricles) may not likewise pass forth of the other.

That I may a little open this my Opinion; I account not those wounds of the Brain (although it be a noble part) to be Mortal and Deadly, only as they hurt the brain; but as, by Reason of the Wounds of the brain, violence is offered unto the Heart and the vital faculty, which is alone necessary unto life. For the brain is not the seat, and the instrument of the vital faculty, but of the Animal. From whence it is, (as *Brasavolus* testifieth, in his *Comment upon the* 18. *Aphor. Sect.* 6. and others also,) that from the Wounds of the brain the interior senses are often hurt, and a man sometimes loseth his Memory, and becometh stupid, the life al this while not much endangered, but abiding safe. But if by Reason of the Wounds of the brain the vital faculty be endangered, there is then a necessity that Death should follow. And this happeneth, when the beginning of the Nerves is shut and stopt (Whereupon *Celsus* in the *place Alleadged* saith, that simply the Wounds of the brain are not Mortal, but only when the Basis of the Brain is wounded) either by obstruction, or by compression, or else by dissection; and so a man, (the influx of the Animal spirits being denied him) dieth in the same manner as Apoplectical persons are wont to die: or otherwise the Membranes of the brain, and the Nerves being pulled and twing'd, there is a Convulsion excited. For even the very Convulsion it self (if it be vehement) exciteth most grievous Symptoms, continual pains, watchings, faintings, and swoundings, difficult breathing, and at length suffocation, upon which at last the man is Strangled and Choaked. And so in this manner such as are wounded in the Head do not indeed presently die the very first day, but afterward, when the blood that is poured forth out of its Vessels into the brain, or about the Brain, beginneth to putrefie, and so causeth an inflammation of the Bram, a Feaver, a Deliry or Dotage, and a Convulsion; and so at length destroyeth the Person.

And this is done by those Wounds that are inflicted upon the Brain, (in what manner or by what way soever it be done) to wit, whether by the Cranium or Skul, or by the hollow of the Eye, or any other way they penetrate unto the Brain. There is indeed (out of the 9. *B.* of *Paræus* his *Chirurgery*, and *Chap* 9.) a History alleadged of Henry the second, King of France, who in the yeer of our Lord 1559. (in a Tilting,) from the Trunk of a broken and disshivered Lance received a Wound upon his right Eye-brow, in the

Musculous

Musculous Skin of the fore-head, even unto the lesser Angle of the left Eye; many shivers of the same Trunk being gotten into the substance of his Eye, and yet nevertheless the bones all this while remaining whole and entire. But in regard that the hollow of his Eye was whole and sound, and that the wound of his Eye pierced not unto the brain, he could not be said to die of the wound of his Eye, but of the Commotion of his brain; which the very opening of the Skul did plainly discover. For dying the Eleventh day after the receiving of this Wound, his Skul being opened, there was found in the part opposite unto the blow, at the middle Suture of the hinder part of the Head, great store of blood poured forth between the two *Meninges* or Membranes of the brain; which putrefying and corrupting the Brain without all doubt was the Cause of the Kings Death.

And I my self lately saw here a Mortal Wound of the Eye in a certain Citisen, who received a wound (from a sharp and keen Sword) about the external Angle of his right Eye; and (the Eye still remaining safe) through the round place or hollow of the Eye, (by which the optick Nerve entereth into the Eye) penetrating very deep, even as far as the brain it self; whereupon the Vessels being here and there cut in sunder, there issued forth great store of blood into the substance of the Brain; upon which wound, this Man (after the manner of Apoplectical persons) being suddenly astonished falleth down; and about the ninth hour after he died.

The wounds of the spinal Marrow.

Secondly, As for what concerneth the wounds of the spinal Marrow, seeing that the spinal Marrow (in the parts Scituate under the Brain) discharged the Functions of the Brain, as its vicegerent, and hath a substance and Membranes in common with the Brain; in the same manner as the wounds of the Brain, so may likewise the Wounds of the spinal Marrow be Mortal; to wit, if it be wounded in its superior part; which part being hurt, the influx of the Animal spirits into the whole body may be hurt; and hereupon the sense and motion in all the parts that are under the Head, (which receive their Nerves from the spinal Marrow) may be taken away; and so, consequently, the very breathing it self may likewise be abolished. I knew a certain Butcher, who when he was to kill any Beasts, did not (according to the usual manner) knock them down with an Ax, but thrust in a little Knife into the spinal Marrow, in that very place where the Head is conjoyned unto the Vertebræ of the Neck, upon which the Beast being as it were astonied, immediatly falleth to the ground. But this is more especially done by those wounds that transversly cut assunder the whole spinal Marrow; and so hinder the influx of the Animal spirits into all the inferior parts, or else cause an Universal and Mortal Convulsion of the Body. And such like wounds are especially those that are inflicted upon the Neck, in the interior part, by which the Vertebræ are in a manner disjoyned, and not united very deeply, but for the more easie motion as it were tied together by a certain Mucous and Nervous bone; from whence it cometh to pass, that when the Neck is wounded by a vehement blow, the very Marrow it self may likewise be touched. But if the wounds be inflicted on the spinal Marrow in some lower place, they then are not necessarily Mortal; and by how much the more there are preternatural dispositions in the inferior part of the *Spina*, by so much the less hurtful are they, as *Galen* (in his *fourth B.* of the *places affected*, and *third Chap.*) teacheth us. For although even then also, pains, want of Rest, Inflammations, (and other Symptoms that have in them a power of bringing Death upon the sick person) may possibly supervene; yet notwithstanding those wounds are not to be accounted simply Mortal; since that it may so be, that such like Symptoms may not supervene.

The Wounds of the Heart.

Thirdly, The wounds of the Heart are accounted among those that are Mortal, and indeed most rightly they are so to be esteemed; since that all the wounds of the Heart necessarily or simply are mortal; in regard that they hurt the store-house and fountain of the Blood. And this (as *Galen* writeth in the *sixth of the Aphorism. Aphor.* 18.) is a truth confessed even by all. And in very deed, the wound of the Heart that is great and deep, and such as penetrateth into the ventricles thereof, suddenly killeth; but that which is but smal, and subsisteth only in the flesh of the Heart, and penetrateth not so far as its Ventricles, this likewise destroyeth the person, but not altogether so soon. For the ventricles being opened, there followeth a sudden effusion of the Arterial blood, and a dissipation of the vital spirits; and this especially upon the opening of the left ventricle. But if the Wound be in the substance of the Heart, and shal not have pierced unto the Ventricles thereof, a man may then indeed sometimes live a whol day; but yet nevertheless soon after, (as in a place most hot, and ful of blood and spirit) first an Inflammation, and then upon it a *Syncope*, and Death it self followeth. Neither was it ever found, that any one after the wounding

wounding of the Heart did long survive. For although it hath indeed been observed, that Tumors and Ulcers have been found in the Heart; yet those seeing that they arise and grow by degrees, life may sometimes for a while persist together with them; although that in the conclusion even these also bring Death unto the Party. But wounds, in regard that they suddenly disturb the very frame and Oeconomy of the Heart, the life cannot therefore long persist with these. And albeit *Galen* (in his 2. *B. of the Decrees of Plato* and *Hippocrates*, and 4. *Chap.*) relateth that sacrifices at the Altar (after the heart hath been cut forth) have been heard to cry: yet notwithstanding this lasteth so long only as the vital spirits are remayning in the Arteries; which being exhausted, soon after the Beast fals down and dieth. For as *Aristotle* writes in his *third B. of the parts of Animals*, and 4. *Chapter*) *the Heart alone of the Bowels, and of all the parts of the Body, will not admit of, or bear any great injury; and this for very good Reason. For when the very principium or principal part of all is corrupted and injured, it cannot then possibly afford any aid and assistance unto those other parts that depend thereupon.* And more especially (as hath been said) the left ventricle of the Heart (which is the storehouse and treasury of the Blood and the vital Spirit (being wounded, the wounded person immediatly perisheth. But if the right ventricle of the Heart be wounded, that the wounded person may in this case lengthen out his life for some short time is confirmed unto us by a strange (but yet true) History that we may finde written in a Table hanging up against a Wall in the Library of the University of *Groning*; and as it is described by *Gothofredus Hegenitius in Itinerario Frisic. Hollandico, Page* 16. in these very Words.

Nicholaus Mulerius, *health to the Reader.*

It hath hitherto been beleeved, that the heart being wounded no man could possibly lengthen out his life, no not for the short time of one hour. Which opinion both Reason and Experience confirm. For seeing that our life dependeth upon the safety of the spirits (whose Store-house and Fabrick is Scituated in the very Heart) the Heart being wonnded, the said treasury and fabrick that is Scituated in the same must of necessity be wounded likewise. But I thought good here to relate unto you a very Memorable History; a History (I say) of a certain Soldier, who being wounded at the Heart, yet lived above fifteen daies after; the like whereunto we meet not with in any of the observations of either Ancient or Modern Physitians. Andreas Haesevanger, *being a Soldier enrolled in the City Garison under the most Illustrious Count* William *of* Nassau, (*Chief Governour of* Frisia, Groning, Omland, &c.) *received a wound in his breast from a fellow Soldier of his, in the year* 1607. *the two and twenty day of* August, *in the evening; and he died the eighth day of* September *following, an hour after Sun-rising; it being the sixteenth day from that whereon the wound was given him. The Body of this dead Soldier by the command of the Governour of the City Garison, for the discovery of the Nature of this his wound, was opened and examined by my self and two Chirurgeons,* Gaspar *and* Luke Hulten, *there being present and looking on that valiant and most Noble* Bernhard Hoornkeus; *there looking on likewise some others both of the meaner and better sort of Soldiers. We had no sooner opened the Cavity of his Breast, and emptied forth no smal store of purulent matter that stank not much, but behold, we found to our great admiration, that the Wound had penetrated even into the right ventricle of the Heart; and that the aforesaid part of the Heart was almost all of it withered and wasted away, the left part stil abiding safe and entire; in which is conteined the Primary Store-house and treasury of the vital Spirits. And therefore by the benefit of this alone the life of this* Soldier *was preserved even unto the sixteenth day, in the morning. And lest (haply) that this relation should not be Credited by some, the most Noble and Illustrious persons before mentioned* (Bernhard Hoornkeus, *Governour of the City Garison, and* Petrus Pappus, *the Military Prætor,) have confirmed the same by their Testimony and the subscription of their Hands. And the latter of them hath likewise made an exact narration of this History, in his learned Commentaries upon the Military discipline. Done at Groninga the* 22 *day of* June, *in the year,* 1627.

I Bernhard Hoornkeus *do attest what is above written: this* 22 *of* June, 1627.

I Petrus Pappus von Tratzberk *do attest, that this History is true; and that I my self very well know it to be so.*

And therefore what is related by *Matthias Glandorpius*, in his *Speculum Chirurgicum, Chap.* 23. touching *Sanctorius* a Professor at *Padua*, that struck a Coney through the Heart with a sharp instrument, the Coney still remaining alive for many Months after; this without doubt being to be understood of the right ventricle of the Heart; it happening withal likewise, that the instrument

(out of all question) was not broad, but narrow and sharp-pointed.

VVounds of the Lungs:

Fourthly, The Wounds of the Lungs, *Hippocrates* indeed reckoneth them up in the number of those Wounds that are Mortal, in the *place before alleadged*, in *Coacis*; and yet nevertheless he doth not absolutely and simply pronounce all the wounds of the Lungs to be Mortal, but he himself addeth a Limitation; to wit, this, if the wound shall be so great, that *the Lungs being Wounded there passeth forth less of the breath by the Mouth, then there issueth forth of the Wound.* And that all the Wounds of the Lungs are not Mortal, we are oftentimes taught by experience; which evidently confirmeth it unto us, that many who have been wounded through the whole Thorax, and the Lungs, have yet notwithstanding escaped with their lives, and recovered their former health and soundness. And I my self saw an example of this in a certain Student, who in the year, 1623. in the Month of *July*, in the night received a wound, by a narrow sharp pointed Sword run through his Breast on the right side thereof, about the Third short Rib, neer unto the Arm-pit, and coming forth opposite unto it neer unto the *Spina*; so that he sent forth by the wound much Breath, with a great noise; and yet notwithstanding this man recovered, and was well again within the space of a month; and even now also, (in this year, 1634. wherein I am writing these things) he is in good health and strength. Yea, *Gulielmus Fabricius* (in his 2 *Cent. Observat.* 32.) out of a History imparted unto him by one *Abel Roscus* (which is as followeth) telleth us of the Cure of a wound in the Lungs that was far more dangerous then the former. The story is this. *There was* (saith he) *among the Delphinates, in the town of* Calmuntium, *a certain person grievously wounded in his Breast (the wound being made by the prick of a Sword) betwixt the fifth & sixth ribs of the breast, not far from the Sternum or Breast bone; in whom when the Sword by its broad point had lightly pierced through even the very Lungs, in the drawing of it forth, I know not by what ill chance it being turned round it brought forth along with it through the wound a final portion of the Lungs; whereupon immediatly all the standers by adjudged the Wounded person to be at the very point of Death. In the mean time, the Physitian (together with a Chirurgeon) being sent for, so soon as he was come, instantly commanded that the part of the Lobe of the Lungs that hung forth, (being first well washed in Wine) should again be thrust back into the Breast. But in the handling thereof, perceiving that it began to look blackish and wan, he caused it to be cut off with a red hot Iron Instrument. But as for the Rest of it, the Chirurgeon gently thrust it back again into the Breast, the Ribbs being first dilated with a Wooden wedg that was instantly provided for that very purpose. And then after this, by the Art and Medicaments prescribed by the Physitian, he was Cured; there being withal external means administred, and some certain pectoral Decoctions of Vulnerary Herbs for a few daies inwardly drunk; and so the wounded person perfectly recovered; and after this lengthened out his life for many years, his Lungs and Breast all the while continuing still very sound, and altogether free from all manner of hurt and detriment. And therefore we may conclude that the Wounds of the Lungs are not alwaies of themselves Mortal, or incurable; unless haply a deep Wound therein be affected with an Inflammation; or else when the Wound hath hurt the great Vessels, or the Lappets thereof; or that the wound reacheth neer unto the Heart.* And many other such like Histories *Schenckius* (in the 2. *B.* of his *Observat.*) relateth out of *Franciscus Valleriola* his *fourth B. Observat.* 10. *Nicolaus Massa, Franciscus Arcæus, Fallopius,* and *Foresius*: and the like are to be seen also in *Guliemus Fabricius* his 3. *Cent. Observat.* 36. and *Cent.* 1. *Epist.* 52. and others: all which here to recount would be too tedious. And the like History is related also by that excellent and expert Physitian Doctor *George Horstius*, (in his 3. *B. Observat.* 11.) in these Words. *A certain Noble youth* (saith he) Abraham *a* Schleinitz (*a Knight of* Misna) *living with us at* Giessa, *as a student, in the year, 1613. goeth to the House of a certain Citisen, upon his Birth day, which the Citisen (as it seemeth) was wont to observe in a festival manner; others in the said House by Quarrels and Threats having given an occasion of a Tumult; thither being come through a Chink of the Door he was run through his Body with a very sharp Sword, the entrance of the Wound being not far from the* Sternum, *about the Third or Fourth superiour Rib, and the Sword going forth again under the Shoulder blade, not far off from the Spina. I being called about the first hour of the Night, found that his Pulse was very weak, and that there was present a difficulty of Breathing; whereupon I had but smal hopes of him, as conceiving very great danger to be at hand, by Reason of the grievous hurt of his Lungs, and the great Vessels. But see what happened. A vomiting taking him suddenly (without any means used to procure it) all the grievous Symptoms ceused, and his strength by degrees returned; there being no purulent Spittle at all that offered to come forth; his Cough likewise and difficult breathing were not very urgent and troublesom; neither for the first Week did*

did any heat and thirst very much affect the sick person: in the interim, the wounds being handled after the Usual manner, there daily flowed forth an indifferent Quantity of well concocted pus or purulent matter. These means being continued unto the second month, and the External wounds being purified and consolidated, the sick person was suddenly taken with a most dangerous suffocation; so that he was in great peril of being strangled by an Asthma as it were; and he was likewise very much afflicted with a cough, Atrophy, and Hectick Feaver, until at length the impostbume of the Lungs brake, and with the Cough five or six pints of purulent matter were cast up at his mouth; after which, the exulceration of the Lungs being cured by fit and proper Remedies, the consumption, Fever Hectick, and all the rest of the symptoms remitted, and the Patient was restored unto his perfect health.

To wit, those Wounds of the Lungs are not mortal, in which only the substance of the Lungs is hurt, and not the great vessels; and such as are not so great that they abolish respiration, or suddenly destroy the vital faculty, either by their dissipating the sprits through some notable Hemorrhage; or else suffocating the heart, by pouring out the blood upon the Lungs, and upon the heart. On the contrary, if the wound of the Lungs be great, and that not only the substance of the Lungs, but likewise the great vessels that are therein (to wit, those notable and observable branches of the Arterial vein, and the veiny Artery, be wounded; those wounds are mortal, being such as in which the blood and vital spirit is poured forth and dissipated, or else through the overgreat abundance of the blood the Lungs and heart are oppressed, and the Patient suffocated. *Hippocrates* (in *the place alleadged* in *Coacis*,) addeth yet another cause of death; which yet nevertheless doth not bring so sudden a destruction unto any person, as those in the former case even now mentioned; where the wound being great, it is not the vessels containing the blood that are indeed hurt, but the great and rough Artery; so that by reason of the largness of the wound there is more breath that goeth forth by the wound then by the mouth; for then by reason of the sympathy the heart is affected, the vital spirits dissipated, the Lungs and heart by the ambient Air altered and offended. And indeed those wounds of the Lungs bring death likewise, in which either the substance of the Lungs beginneth to be exulcerated, (and that a Consumption is excited) or in which the blood is poured forth into the Cavity of the Thorax, where it beginneth to putrefy, and where it causeth either a feaver, or an *Empyema*. But in regard that this doth not alwaies happen, and not at all in some wounds of the Lungs; and that likewise (when it doth happen) there is no necessity that the Patient die; for this cause therefore those wounds of the Lungs are not to be accounted necessarily Mortal. For *Felix Platerus* (in his 3. B. of *Observ.* Page 690.) relateth, that a certain person that he knew, falling into a Consumption from a Wound of the Lungs, was yet nevertheless Cured and perfectly recovered. *A certain Coffermaker (sayth he) one of our Citizens, having from a servant of his received a wound very deep in the lowest part of the Thorax by a prick from the point of a knife, by the wound he voided forth a most stinking and loathsom pus or matter (by the ill savor whereof the whol neighborhood was infected and offended, and likewise some certain smal parcells of his Lungs, in which the cartilaginous branches of the rough Artery did manifestly appear: which persevering a long time, albeit that he was in a manner wholly wasted away, yet nevertheless at the length the flowing forth of the purulent matter remitting, the wound was closed, and he restored unto perfect soundness; living after this many years as a foot-post, in carrying of letters; and thus he prolonged his life for forty years safe and sound, as we say; although (as it is very probable) he wanted great part of his Lungs in one side.*

The wounds of the rough Artery,

Fifthly, That the wounds of the great rough Artery (commonly called, *Aspera Arteria*) are not mortal, but that they may be cured, even the Laryngotomy, or Cutting of the Laryinx (of which we have spoken before, in the *Second Book of our Pract. Part.* 1. *Chap.* 24.) doth evidently demonstrate: To wit, those of them are cured that are not great, and in which the membranes only (by which the rings of the rough Artery are fastened and linked together) are wounded; examples of which *Schenkius* (in the *Second Book Of his Observat.*) hath collected. And I my self also have twice seen such like wounds cured. But if those very cartilaginous rings be wounded, by reason of their hardness the part cannot again be made to grow together as formerly, as *Hippocrates* teacheth us in the sixth of his Aphorisms, Aph. 19. And in the seventh of his Aphorisms, Aph 28. and *Galen*, in Book 5. of his method of Physick, Chapt. 7. And yet notwithstanding such like Wounds do not cause a sudden death, but a slow and lingering one; while that the Lungs are either altered and weakned by that Air that violently breaketh in upon the Lungs thorow the wound; or else that a certain smal gob-

bet of flesh grow unto the wound, which by intercepting the breath at the length choaketh the Person. But those wounds alone of the rough Artery throttle the Party, in which the jugular veins and Arteries being hurt the blood violently and al at once rusheth into the Lungs, intercepteth the breathing, and so suffocateth the wounded person; which yet nevertheless happeneth not by reason of the wound of the said rough Artery, but by reason of the wound of the Jugular vein, or the soporal (*i. e.* more plainly the sleep-conveying) Artery, that is very neer unto it.

Wounds of the Diaphragm.

Sixthly, *Hippocrates* reckoneth up the Wounds of the Diaphragm among those wounds that are mortal. But *Galen* (in his Book 5. of the *Method of Physick*, *Chapt.* 9. distinguisheth between those wounds of the diaphragm that are inflicted upon the nervous part therof, & those that are made in its fleshy part; and those he wil have to be mortal, but these latter Curable. And yet nevertheless (in the *Sixth of the Aphorism. Aph.* 18.) he writeth, that the wounds of the nervous part of the Diaphragm are not alwaies mortal; but that the great wounds therein are only so. For then it is indeed that those grievous symptoms plainly appear, *viz.* a deliry or stupid dotage, difficult breathing, Feavers, Convulsions, and (as *Aristotle* hath likewise observed in his third Book *of the parts of living Creatures and tenth Chapt.*) the *Sardonian* Laughter, wherin the sick persons die laughing. For whereas the Diaphragm receiveth Nerves from the third and fourth vertebra of the Neck, and that these are mingled with those smal branches that are propagated throughout the Muscles that move the Jawbones, and the Lips; if they suffer a Convulsion in that part by which they reach even unto the Diaphragm, they then contract and draw together along with them those little branches of the Muscles of the face; by which the Jawbones, and the lips being in voluntarily moved to and fro, hither and thither, cause a resemblance and seeming appearance of laughter; which *Hippocrates* (*in the* 5 *of his Epidem.*) accounteth among those signs that are deadly, by the Example of *Tycho*, whom he bringeth in for an instance.

And yet nevertheless, neither are those very wounds that are also in the nervous part of the Diaphragm alwaies mortal, so far forth indeed that the party wounded in that place must of necessity presently die: albeit we grant it to be a thing altogether impossible that those who are thus wounded should ever be perfectly cured, or live long in that manner. A notable instance and history of this (which I have likewise before related in the second Book of my *Institutions part.* 2. *Chap.* 13. and in the second Book of my *Pract. Part.* 2. *Ch.* 15. was given me by my Father in law, Doctor *Andreas Schato*, sometimes Physick Professor in this University of *Witteberg*; which I must not here in this place pass over in silence. Take it therefore thus: *In the year* 1582, *the* 20. *of* September, *a certain Student, by name* Henricus Euscherhovius, *returning out of the lower Saxony unto* Witteberg, *and much addicted to Melancholy, before the gate ran himself through with his own sword. But yet notwithstanding within two monthes he was cured of this wound. But the yeer following, the* 28. *of* April, *he began again to be much amiss; and the days following he vomited very often, first a certain water, and whatsoever food he had eaten; then after that such things as were green; and at length, on the second of* May, *his vomitings were altogether black, and that in very great abundance; and so after the last vomit the same second day of May he died. We opened his Body, and there we found that the wound had penetrated thorow the Lungs, and the Diaphragm; and (as it seemed to us) the Diaphragm was run thorow in the Nervous circle. We found very little or nothing of his Lungs on the left side that was run thorow, but only a very smal portion thereof which stuck above unto the short Ribs; the rest of it (no doubt) had gone forth thorow the wound together with the purulent matter. The whole stomack was ascended into the left side of the Thorax; and it had driven the Heart (with its Case,) out of its proper place into the right side; where while he was yet alive, and after the wound was restored unto a good degree of health, he would wish us to observe the motion of his heart by putting our hands there.* An instance not much unlike unto this we have in *Ambrosius Paræus* his ninth Book, and *Chapt.* 30. Of a certain Captain that was (by a bullet shot out of an hand-gun) wounded and shot quit thorow the *Diaphragm*, but it was in the fleshy part thereof; who dying eight months after this wound received, we found in his dead body (when we had opened it) that a very great part of the Gut Colon, being puffed and swoln up with much wind, had thorow the wound of the Diaphragm gotten up into his Thorax.

Wounds of the Stomack

Seventhly, As for the wounds of the Stomack, for the most part they are not to be recounted in the number of the wounds simply Mortal, and which suddenly strangle and destroy a man; since that we have every where exstant examples of wounds in the stomack that have been cured. That History is generally wel knowen which is related both by *Juli-*

us Alexandrius, in the fourth chapter of his sixth Book of *Galen* his *Therapeutick method*; and likewise by *Matthias Cornax* in his *Epist. in answer unto* Dr. *Ægid. Hertogh*; of a certain Bohemian Boor, who received a wound in his stomack, (and that from a broad hunting spear) and yet notwithstanding lived a long while after: this story we told you a little before, and therefore shall say no more of it here. Neither is that other history unknown, of a certain Boor in Bohemia; which as others have related it, so we find it likewise mentioned by *Crollius*, in the preface to his *Basilica Chimica*; *in these very words. In the year* 1602. *at* Prague, *in the new Town, we saw a certain Bohemian Boor (by name* Matthæus*) about thirty six years old: who for two years together (by an admirable and unheard of dexterity that he had in his throat) would oftentimes in the company of his drunken companions hide in his wide throat (as it were in a sheath) an Iron knife of a fit size, First of al thrusting in the horn haft thereof, with the wonted sleight of a Jugler; drinking upon it a large draught of beer that they gave him for this purpose; and afterward he would pul it back again by the point thereof, at his pleasure, by a singular art and dexterity that he had: but at length (the morrow after Easter) I know not by what unhappy and mad rashness of his he had swallowed it so far down, that it wholly descended into his stomack, and could no more by al his art and cunning be from thence drawn back. And after that (half dead in a manner with the apprehension of death undoubtedly and suddenly to follow) he had lodged in his stomack the said knife seven whol weeks, and two days, by the use and help of attractive emplasters of the Loadstone, and other the like, the point of the knife by a natural impulse began to make its way forth neer unto the orifice of the stomack: which was no sooner perceived by the patient, but he instantly and earnestly requested of the Chirurgeons (who notwithstanding dissuaded him from it, by reason of the extream hazard of his life thereby) that it might by cutting be drawn forth. Which at the length upon his continual importunate desires (and yet not untill such time as he was come unto a most desperate Condition, both in respect of his poverty and weakness) was yielded unto; and the business undertaken by the principal Chirurgeon both of the kingdom, and that City,* Florianus Matthias *by name, a Brandeburger, on the thursday after the feast of Pentecost, at seven of the clock in the morning; and by him (with Gods assistance) it was happily effected. The colour of the knife after he had cut it forth (it being as long as nine thumbs in breadth) was so changed in his stomack, as if it had layn all that while in the fire, and was immediatly laid up among the Rarities of the Emperour, having been first shewn (a thing most strange, incredible, and miraculous) unto many men, as well Courtiers, as Citizens. And thus this Boor in the space of a few weeks (by the use of fit and convenient remedies, administred unto him by that most expert Chirurgeon) without any further sickness and trouble, alwaies eating wel, and drinking, and sleeping (as somtimes he told me himself) by the blessing of God, and the liberal Charity of many people toward him in his low and poor condition, (contrary unto the determinate assertion of Physical Aphorisms) fully recovered his wonted perfect health and soundness; and not long after he married a Wife.* But those wounds of the Stomack are especially mortal that are inflicted upon the superiour orifice thereof; in regard that it hath those considerable Nerves that arise from the sixth Conjugation of the Brain, and thereby obteineth a very neer consent with the Brain and Heart; so that it being wounded, most grievous Symptoms may very eatily be excited. And *Benivenius* (in his *tenth B. of the hidden Causes of Diseases that are curable Chap.* 110.) reporteth, that a certain Fuller with one blow of his fist upon the Stomack of a young Man, smote him so violently, that he immediatly died thereof.

The wounds of the smal Guts.

Eightly, The Wounds of the smaller Guts are by *Hippocrates* accounted and reckoned up among those that are Mortal. And more especially, the wounds of the *Jejunum* or hungry Gut (among al the wounds of the Intestines) are especially Mortal, by Reason of the greatness of the Vessels, and the almost Nervous substance of the Tunicle of that Gut; from whence for the most part there follow great torments and pains of the Intestines, Sobbings, and Faintings; as is to be seen in the Histories related by *Valleriola*, in his 2 *B. Observat.* 8. *and* 9. And indeed the wounds of the smaller Guts are then most especially incurable, when the said Guts are wholly cut assunder in a transverse manner; since that the Lips thereof standing wide one from the other cannot possibly by any means be Joyned, and made to grow together.

But now the wounds of the thicker Guts are less dangerous, and especially if they be not great: and that oftentimes such like wounds have been Cured, appeareth from the many extant Observations of Physitians: which *Schenckius* (in his *Observations*) *hath Collected.*

Ninthly, *Hippocrates* likewise accounteth the wounds of the Li-

Wounds of the Liver.

ver

ver in the number of such as are Mortal; which yet nevertheless wanteth a limitation. For *Ægineta* hath truly told us (in his 6. *B.* and 28. *Chap.*) that the Liver having been wounded, and a part thereof cut away, yet that the wounded person may be preserved. And *Gemma* relateth (in the *first B. of his Cosmocrit.* and 6. *Chap.*) that a Spanish youth a great part of whose Liver brake forth by the wound of the right Gut, was yet notwithstanding Cured. And *Bertinus* also (in his 13. *B.* and 7. *Chap.*) writeth, that a Noble person after a wound inflicted neer about the Region of his Liver, and a smal part of the substance thereof drawn forth and cut off, yet escaped, and became sound again. And the same hath likewise been observed by others. *Guilhelmus Fabricius* (in his 2 *Cent. Observ.* 34.) relateth that a certain *Helvetian*, thirty years old, in a Duel, was with an Helvetian Sword hurt in that part that is opposite unto the Liver; and that he received a very great wound one spanlong and that hereupon there was taken from him a good big piece of his Liver. And yet nevertheless this Man (notwithstanding the supervening of most grievous and violent Symptoms) by the blessing of God was perfectly recovered. And *Matthias Glandorpius* (in his *Speculum Chirurgic. Observ.* 34. *Page* 166.) hath a History of a youth dangerously wounded in his Liver, who yet nevertheless recovered perfect soundness. And yet notwithstanding we say, that they only recover, who have the superficies alone, or the substance of their Liver only wounded, without any hurt at all of the great Vessels. For if there be wounded any one of the greater Vessels, the wounded person cannot possibly escape; and by reason of the large effusion of the Blood, the Man (before that the wound can be Sodered and Agglutinated) dieth. And of these some indeed for a very short time have their life protracted; but others of them die in an instant, or at least, in a very short space. For (as *Hippocrates* in his 5. *Epidem.* telleth the story,) a certain person having had a dart thrust into his Liver immediatly the colour of a dead Carcass was dispersed all his Body over; his Eyes sunk in his Head, a difficulty of breathing (together with an æstuation or sudden vehement passions) followed after this; and the same day he died. Another Boy being strucken upon his Liver by a Mule, died the fourth day after; and before his Death he was troubled with a short and thick breathing; neither understood he any thing; but all the while (until he died,) lay under a feaver.

Wounds of the Spleen. Tenthly, The Wounds of the Spleen are almost of the same Nature, and alike dangerous as those of the Liver. For, if only the *Parenchyma* of the Spleen be wounded without any hurt of the Vessels, the wounded person may possibly escape. But if the Vessels of the Spleen be wounded, such like wounds are not only dangerous, but also deadly and Mortal. For seeing that the Spleen hath store of Veins, and especially of Arteries, these being wounded, by Reason of the great effusion of Blood, and Dissipation of the Spirits, the wounded person must of necessity perish.

Wounds of the Bladder. Eleventhly, The Wounds of the Bladder are likewise found in *Hippocrates* his Catalogue of Mortal Wounds. But yet nevertheless here also a distinction is requisite. For a smal wound is soon sodered together by the intervening of flesh, as *Galen* (in the 6. of the *Aphorism. Aph.* 18.) and Experience teach us. But if the whole Bladder chance to be cut quite through (which wound *Hippocrates* calleth *Diacope*) the Wound is then yet more dangerous. And indeed that is most especially perillous which is inflicted at the very bottom of the Bladder, and the Nervous part thereof: for by Reason of the sharpness and extremity of the pain, the inflammation following thereupon, and the continual feaver, the party dyeth soon after. But as for these Wounds that are inflicted at the Neck of the Bladder (which is fleshy) they are Curable; as we are taught even by the Cutting of the Stone. And yet nevertheless it hath been observed, that the Bladder wounded even in the very bottom thereof hath likewise been Cured; the truth of which we have confirmed unto us by those examples we meet with in the *Observations* of *Schenckius*. For the whole Bladder is not altogether Nervous, but the Exterior Membrance thereof is more fleshy; whereupon *Hieronymus Fabricius ab Aquapendente*, and *Spigelius*, account the said Membrane for the Muscle that shutteth the Bladder. But it is very rare that such a like wound of the Bladder is perfectly Cured, albeit that the wounded person die not thereof; but a Callousness being brought over it, the Pipe still remaineth, by which the Urine is voided forth. But yet nevertheless it is not long that a man can continue to live with such a like wound and therefore we say here again as we said also before, that there is a difference to be made between a wound Mortal, and a wound incurable. But yet notwithstanding, touching al the Wounds of the bowels hitherto mentioned, this is to be observed; that albeit there have been observed some examples of such like wounds that have been Cured; yet that this hath happened very rarely; and that among these, those are to be numbered, touching which *Averrhoes* saith,

saith, that in the Cure of Diseases there are sometimes Miracles wrought. For when fit and proper Medicaments cannot be applied unto internal wounds, but that the whole work must be committed unto Nature; if in this Case Nature be not very strong and Vigorous, the wounded person is very hardly Cured; but for the most part an inflammation, Convulsions, Faintings and Swoundings, and other the like Symptoms supervening, the party dieth. And therefore *Hippocrates* saith rightly (in the *sixth* of his *Aphorisms*. *Aphor.* 18.) that such wounds are Mortal; and (in his *Coaca*) that most commonly and for the most part, men die of such Wounds. And therefore if upon the receiving of such a wound, the sick person die within a short time after, the Cause of his Death ought to be imputed unto the Wound; since that much help is not to be hoped for from the Physitian, as we shal also anon shew you.

Wounds of the great Veins.

And Lastly, *Hippocrates* reckoneth up the Wounds of the greater Veins among those that are Mortal, and indeed rightly. But now by the word *Phlebæ* he understandeth both the Veins and Arteries; and by *Pacheis* he meaneth great, and lying hid within; which elsewhere he termeth *Aimorrhous*, that is to say, *pouring forth Blood*; such as are, the great hollow Vein, and the great Artery, and the great branches of these. For such veins and arteries, seeing that they cannot be shut close by any ligature whatsoever, (the blood and the spirits plentifully flowing forth of them) the strength and powers of the Body are soon dejected; or else the blood that is fallen forth without its own proper Vessels, if it hath no passage forth, but that it be still detained in the Body, it Clotteth together and putrefieth, and getteth unto it self a very evil, corrupt, and Malignant Nature, causeth a Gangreen, and exciteth most grievous Symptoms, and at length bringeth even death it self upon the party. And indeed this danger is most grievous and formidable in the Arteries, when the Blood and vital spirits being poured forth the powers of the Body are dejected, and the mans life endangered; neither can the Arteries be easily brought to close, by Reason of their continual motion, and hard substance. And these are the Wounds that (as *Hippocrates* rightly saith) are Mortal. Of which notwithstanding (as I told you before) some are simply or altogether Mortal: which *Prosper Farinaceus* (*Tit. de Homicidis, Quest.* 125. *Part* 3.) defineth, that they are such that require not the Care and advice of Physitians, but are such of which the Wounded person dyeth, that is, by Reason of which (although they be Cured by all the Art and industry of the most skilful Physician,) yet nevertheless the Wounded person instantly dieth thereof. And others of them are not altogether Mortal, and certain in their causing of death; which the same *Prosper Farinacius* defineth to be such, of which the Wounded party dieth not suddenly; and of which sometimes he dieth not at all.

But what Wounds of the latter sort are Mortal, that is, of which although some are now and then cured, and recover their perfect health and strength, yet nevertheless this or that particular person may truly be said to have died of them; will indeed plainly appear from what we said before touching the Mortal Wounds of each single and particular part. And yet nevertheless this is likewise to be added; that we are especially to judg by the Event, whether any such Wound be actually Mortal, or not. For although some strong and lusty Boor, or a Man otherwise exactly sound and healthful shall recover of some such wound; yet Nevertheless it will not necessarily follow, that therefore an old person, a Child, a Woman, or any other that is but of a weak constitution, must recover of the like wound; but albeit the former of these was cured of the like wound, yet this latter may necessarily die of the same. But now whether or no such dangerous Wounds be Mortal in this or that particular person, *Nicolaus Boerius* (in his 323. *Decision, Num.* 11.) teacheth us how we may discover it, by six Conjectures. The first whereof is, the shortness of the time; to wit, if the sick person die very suddenly after the Wound: of which space of time, (albeit there be very many opinions touching it) yet notwithstanding he saith that the principal is this, if the wounded person shall die within three daies after the wound received. But yet however there are some that extend this space of time unto the fifth, or even also unto the eighth day. But others notwithstanding extend this term even unto the eighth month, or a whole year; and this seemeth unto me most probable. And unto this space of time the Mosaical Law (*Exod. Chap.* 21.) seemeth to have respect. The Second Conjecture is, the persevering of the vomiting, and feaver, and other Symptoms that from the very first signifyed and threatened death. And this is a right Conjecture, and according to the Opinion of all Physitians, yea even of *Galen*, and *Hippocrates* himself. For those great and mortal Wounds have their Decretory and Critical daies, like as Acute Diseases have; as *Hippocrates* tels us (2 *Prorrhet.*) in the which good or evil Symptoms are wont to happen. And therefore, if grievous Symp-

to

toms (such as are Convulsions, Vomitings, sobbings, Dotages, Syncopes, and the like; which otherwhiles also are wont to presage Death in such as are wounded) presently and even from the very first invade the wounded person; or else appear upon him on the Critical day, and after continually persevere, they then signifie, that they were necessarily brought upon the Party by the Wound, and therefore that the Wound is altogether mortal. The third Conjecture is, the breadth and depth of the Wound. For a Wound that is very great and dangerous in it self may yet although it be great, yet not be dangerous, if by it no Noble part be hurt. The fourth Conjecture is, the quality of the instrument with which the Wound is given, and by which the person inflicting the Wound is convinced that he had a will and purpose to kil the party Wounded. But this conjecture concerneth rather the Court of Justice, then the Colledg of Physitians; who inquire not so much after the will and intention of the person wounding, as simply and solely after the quality of the Wound it self. The fifth and sixth, is, the Continual pain, from whence the Convulsion is brought upon the wounded person. But these conjectures belong unto the Second. And thus, whether or no any one die of a dangerous Wound, and of that kind of them which almost alwaies are Mortal, the Physitian out of those six aforesaid Conjectures, maketh use of two of them especially, whereby he Concludeth that that wound (touching which the inquiry is made) was in it self Mortal and deadly. First, from the shortness of the time that the wounded party lived after his Wound. And then next of all, from the State and Condition of the wounded person, who alwaies (after his Wound) falleth from bad to worse, until his Death; and those grievous and deadly Symptoms, which either presently, or on the Critical day, followed upon the wound, and continually afflicted the sick wounded person. And unto the two former we may not unfitly add likewise a third; to wit, if nothing hath been either committed, or omitted, that might render the Wound Mortal. For from these we may Collect, both that the Condition of the Wound was such, that it might bring death unto the Party; and that the wounded person had such a disposition that was not able to master the Wound. And these in all the aforesaid particular parts are those Wounds that are deservedly to be accounted Mortal.

As for the wounds of the rest of the parts, *Hippocrates* rightly pronounceth them not mortal; & indeed experience teacheth us, that sometimes the greatest and most dangerous wounds have been cured; of which there are divers Histories recited by *Valleriola*, in his fourth Book, *Observat.* 10. And there are every where the like extant, in the observat. of *Guilhel. Fabricius*, and the writings of other Physitians. But yet notwithstanding it oftentimes so happeneth that those very wounds of which some have recovered have proved mortal unto some others; and that very many also die of most sleight and inconsiderable wounds. And *Hippocrates* (*in* 2. *Prorrhet.*) writeth, that a man may chance to die of any kind of wounds. Of which we meet with examples almost in every Author. Touching the Child of *Philias*, *Hippocrates* (*in the seventh Book of his epidem.*) writeth, that he died of only the making bare of the forehead bone, a feaver supervening for one day, and a certain wan leaden color contracted in the sad bone. And the same *Hippocrates* likewise relateth that the Child of one *Theodorus*, upon the making bare of a bone, (almost of no moment) died the 23. day after. And that a certain person, Master of a great ship, having hurt and bruised his fore-finger on the right hand, and his mouth, with an Anchor, (an inflammation and convulsion supervening) on the thirteenth day following died thereof. And that *Telephanes* also the son of *Harpalus* by his free woman received a blow in the great toe of one of his feet; upon which an inflammation, & a vehement pain followed; which remitting, the sick person fell into a convulsion, and died the third day. And so *Pliny* writeth (*in the seventh Book of his Natur. Hist. Chapt* 53.) That *Æmilius Lepidus*, Crushing but his thumb against the bedpost, breathed his last. And that *Caius Aufidius* going into the Senate house, only hurting his foot, died of the same ere he could be carried home to his own house. *Petrus Forestus* (*in the sixth Book of his Chirurgical observat. Observat.* 50.) reporteth that a certain Consul (*Alcmarianus* by name) washing his feet as he was wont to do and endeavoring to cut and pare away the thick Callous skin in the sole of his foot, wounded himself, and that a spasm following upon it, he died immediatly. And oftentimes likewise a Gangreen followeth upon the wounds, and make them deadly. And so *Petrus Forestus* (*in the sixth Book of his Chirurgic. observations, Obser.* 49.) telleth us of a certain person that hurt his Leg by hitting of it against something that was hard, and that upon this bruise and wound of his Leg a Gangrene soon after following took his life from him. And *Guilhel Fabricius* (*in the fifth Cent. of his observat.*

observat. Obser. 2.) mentioneth two examples. One of a certain Labourour, who prickt his foot with a thorn; and the other of a woman that with a thorn likewise wounded the very tip of her right forefinger; both which upon the supervening of a Gangrene died. And *Johannes Matthæus* (*in his Physick Quæst, quæst.* 27.) writeth that at *Freudenberg*, a town of the Dominion of Nassaw, receiving but a sleight wound in one of his shoulders, died thereof. And that another in the County of *Oldenburg*, being but very sleightly wounded with a knife in the middle of his Thigh, died immediatly. And that at *Lemgovia* a certain Citizens son, being but sleightly hurt in his Arm by the sword of a Student, (Contrary unto the expectation of all that saw him) died within one hour after. And *Horatius Augenius* (*in the first Tome of his Epist. Book* 9. *Epist.* 2.) relateth very many histories of them that have perished upon sleight and inconsiderable wounds. And examples to confirm this truth we very frequently meet with in the reading of Authors, and more especially those before mentioned. Now this happeneth for divers Causes, which *Hippocrates* likewise (*in* 2. *Prorrhet.*) toucheth upon in these words. *Whosoever* (*saith he*) *would know, concerning wounds, in what manner they shal end, each of them Particularly; in the first place he ought indeed to make a narrow search & strict inquiry into the several kinds of men, which of them are better able to bear out a wound, and which of them are worse able to undergo the same. He ought moreover to know the several ages in which every particular is difficult to be cured; and to be wel acquainted likewise with the several parts and places in all kind of bodyes, how far forth they differ each from other. He ought also to know even these other things that happen in each of them, of what nature and quality they are, and whether they be good, or evil. For if any one shall know and wel understand all these things, he may indeed then likewise know the several events of each particular wound. But he that shall be ignorant of these things can never know what shall be the ends and events of Wounds. I shall reckon them up in this order following.*

Wounds Curable from what causes they are made Mortal.

For First of all, if the Sword, dart, (or whatsoever it be that inflicteth the Wound) be poysoned, a Wound then that seemeth but sleight in it self may yet bring death.

Secondly, The *Idæa of Men* (as *Hippocrates* speaketh) ought heedfully to be attended; for such as are of a Robust strong body, and sound, these likewise bear and undergoe the most grievous Wounds; and they are oftentimes cured of them without any great adoe: and although that many times very grievous Symptoms may supervene, insomuch that you would judg them even ready to die; yet notwithstanding beyond all hope and expectation they escape, and recover again. And hitherto appertaineth the vitious disposition of the body, and the present Cacochymy. For if any Wound shall befall unto such a like Body, Nature being irritated and stirred up is wont to thrust forth those vitious humors unto the Wound; whereupon other diseases and symptoms happening, that wound which in a found and pure body was Curable, here becometh Mortal; concerning which *Galen* thus speaketh (*in his sixth Book of the Places affected, Chapt.* 2.) suppose, saith he that one came unto us that had only his skin pricked with a Needle; this Man (if he be one whose wounds are wont to be easily healed) although without any medicament administred, with his Member naked and bare, you send him to his accustomed labour and imployment, will yet take no hurt, nor feel no evil: whereas those whose Wounds are not cured without much difficulty, and that are either Plethorical, or oppressed with vitious Juyces; these in the first place feel indeed a certain pain in the Wound; and afterward a part thereof will be infested both with a beating pulse, as also with a *Phlegmone*: and it is found, that of such like smal and sleight wounds oftentimes Convulsions, inflammations, a Gangrene, yea death it self hath followed.

Thirdly, The Age is wel to be considered; in regard of which also there may be a very various Event of Wounds. For those Wounds that are grievous and difficult, yea Mortal, in an old man or a Child, these in a man that is young and strong, are not mortal yea are somtimes accounted very slight & inconsiderable.

Fourthly, A Wound that otherwise is curable may yet become Mortal, by reason that either the Surgeon is wanting; or if he come he chance to prove either negligent, or unskilful: and so by reason of the hemorrhage (in the want of a Chirurgeon) whose part it was to stanch and stop it by ligatures, and otherwise, a man may often run a great hazard of his life, although the wound were not otherwise Mortal. And so, if the Wounds of the brain, of the Nerves, of the Joynts, be unskilfully and negligently handled, (an inflammation, Convulsion, Gangrene, and the like evils befalling the Party) the man may miscarry and perish, notwithstanding that the Wound (had it been rightly handled) were in it self Curable.

Fifthly, Sometimes there happen grievous symptoms so suddenly that although both the Physitian and the Chirurgeon bestir themselves

selves with al possible diligence, before these can be calmed and quieted, other diseases and symptoms happen, by which the man is quite destroyed. And therefore oftentimes the very pain in the part wounded (it being of a very exquisite sense) causeth an afflux of humors, the afflux of humors an inflammation, the inflammation a Fever, a Gangrene, and then death. And this indeed happeneth the more easily, if the wound be in a part that is in it self indeed ignoble, but yet such as can very easily draw a part that is Noble into a consent with it.

Sixthly, Both the Constitution of the Air, and the propriety of the place, have here a peculiar power. So the Wounds in the Head that in many (yea the most) places are not Mortal, in other places are Mortal; which yet nevertheless some there are that reckon them up otherwise. *Vidus Vidius* (*in his sixth Book of the Cure of diseases Chap.* 10. *Page* 249.) writeth, that at *Florence* the Wounds of the head are Mortal to most men; and he ascribeth the cause unto the cold thin Air; but that at *Pisa* and *Lions* very few die of them, in regard the Air is there thicker and warmer. *Amatus Lusitanus* (*in his sixth Cent. Curat.* 100.) Writeth that at *Florence* and *Bononia* the Wounds of the head are extremely dangerous, but not so at *Ragusum*. And *Ambrosius Paræus* testifieth, that wounds of the head are far more difficult to cure at *Paris*, then they are at *Avignion*.

Seventhly, An ill course of Diet may render those wounds deadly that in themselves are not very dangerous: to wit, if the wounded party either eat meats of an ill Juice, be much moved with anger, terrified with fear, Laugh immoderately, and use venery. Examples of this truth, as we meet with them in others, so especially *Guilhem. Fabricius* (*in the first Cent. of his observat, Obser.* 22. *and in his* 5 *Cent. Observ.* 75. and in the 1 *Cent. of his Epist. n.* 1.) reciteth certain of them; as they are there to be seen.

And unto this kind of cause, and in special to a sudden fear and affrightment, or vehement wrath, those wounds are to be referred, that being in themselves but sleight & scarcely considerable, yet notwithstanding many have been known to die of them within the space of a very few hours. For although that the Nerves being pricked and a Convulsion excited, a man may suddenly die; yet nevertheless, in regard that in these there is happening neither any Convulsion, nor yet any other such like grievous symptom appearing; it is therefore credible, that they died by reason of the vehemency of the Passions of Wrath and fear; in regard that these Affects of the Minde have in them a very great power of affecting the Body. Of which thing we have every where examples extant. *Suidas* writeth, that a certain person naturally timerous and fearful, hearing but the bare report of *Hercules* his coming hid himself for fear in a private place; from whence now and then looking forth, and at length seeing *Hercules* by chance passing by, he fell down dead with fear. And so *Julia* the Wife of *Pompey* died suddenly, upon the sight only of her husbands Garment spotted with blood. And as *Plutarch* testifieth, *Lentulus* also hearing unexpectedly of the death of *Pompey* fel down dead suddenly. And some there are that upon the sight of their own blood in venesection, or when they have received any Wound have presently swounded and sunk away. And *Manlius* (in his *Common places, Sub.* 5. *Præcept.*) relateth this history. *A Fool or Natural* (*saith he*) *for some fault by him committed was brought forth unto a pretended and feigned, but not really intended punishment; as if he should have been beheaded. The Headsman cometh, and shews him the sword indeed, thereby only to terrify and feare him, and withal lightly striketh him on the neck with a little wand, and thereby makes the Man* (*fearful and faint-hearted fool as he was*) *to fall down dead, to the admiration and astonishment of al the Beholders.* And *Johannes Matthæus*, (in his *Physical Quest. Quest.* 27.) *telleth us this story. When* (*saith he*) *in the Court of the most illustrious Prince* Ernestus Fredericus Marquess of Bada, *his Highnesses Chief Gentleman of his Chamber* Johan. Beckber *a Plethorick young man, was but lightly touched in his lower eyelid with a blunt-pointed sword* (*such as they were wont altogether to exercise themselves with in their fencing schools*) *from the hand of a young beardless youth, possessed with rage and indignation, and taking it most heynously thus to be foyld by a boy, and his own scholar, fell suddenly into a most grievous Epileptick Convulsion, which in the space of four or five hours ended his life.* And I my self also remember a certain Student (stout hearted enough otherwise) Who being by a Chirurgeon to be let blood (in my presence, and at my command) as the Surgeon was about according to the custom to bind his Arm, and began but to move his Instrument toward the vein, he fainted away, and fell from the seat wherein he was sitting, before ever the Lancet was put neer unto his Arm, whenas Nevertheless he had neither fever, nor any other Disease that might any waies cause and occasion this swounding of his.

Eightly, and Lastly, an Inflammation following upon a Wound may render that Wound Mortal, if it be internal. For indeed an Inflammation doth not necessarily accompany Wounds: yet notwithstanding because

cause that in internal Wounds those Medicaments cannot possibly be administred that were wont to be applied in external, if any internal part (especially if it be more Nervous, and of an exquisite sense) shall chance to be wounded, then a pain is excited, and thereupon an afflux of Humors, and from thence an Inflammation, a feaver, a Gangrene, and other Evils do arise, that destroy the Wounded person within a very few daies. And from hence it is, that the Vulgar do likewise in Wounds observe the seventh and the nineth day; because that within these daies those Symptoms are wont to supervene, and in these daies to bring the greatest danger unto the sick Party.

Some there are that add yet another Cause, to wit, the influence of the Stars. And so *Franciscus Vallesius* (in *his Comment. upon the* 95. *Text. B.* 4. of *Hippocr. his Epidem.*) saith that the Malignant Aspect of the Stars and Constellations is the Cause why light and very sleight Wounds are oftentimes likewise rendered Mortal. And the very same *Quercetan* also tels us (in his *Third Chap. Touching Wounds made by Guns*) and that for this very Cause the Wounds of the Head are for the most part wont to be Mortal, at *Ferraria*, and *Florence*. But this Cause is not to be admitted of; neither can there any Reason be easily rendered, why at *Ferraria* the wounds of the Head should be mortal, and not so in the neer neighbouring *Rhodigium*, or *Bononia*.

And from these Fundamentals no doubt it is that Civilians likewise take upon them to pronounce what Wounds are of themselves and in their own Nature Mortal, and what not. *Nicolaus Boerius* (in the *place alleadged*, N. 18.) propoundeth six Conjectures, from which it may be Collected, that the Wound was not Mortal of it self, but that it was made such by Reason of some accident happening thereupon. The first is, if the Wounded person died not until a longer time after then wounded persons are wont precisely to prolong their Lives. The Second is this, if there were present no dangerous Symptoms in the beginning of the Wound; or if there were any present, and remained for a while, the sick person notwithstanding was not much the worse for them, but that he was able to perform all kind of Actions in such a manner as they are not able to do that are mortally wounded. For if he shall appear to be in a fair way of Recovery, and then afterward die, it is to be beleeved that he died upon some other Cause, and not from his Wound. All which notwithstanding are to be understood only of a Wound that is not of it self Mortal. The third Conjecture is, if the sick person (in the Course of his life) were not so ordered as wounded persons ought to be; but that he exposed himself unto the cold Air, addicted himself unto excessive drinking, were often distempered with passions of the mind, immoderate Anger, frequent affrightments; and overmuch addicted to Venery. The fourth, if the Physitians were of opinion, and that they adjudged the Wound not mortal; who as men experienced in their Art ought to be beleeved. The fifth is, if the wounded person had no Physitian with him; or if any were sent for unto him, he was one altogether ignorant and unskilful; which is al one as if he had had none at all. Which yet nevertheless (as hath been said) is only to be understood of a Wound not simply mortal in it self. For if a Wound be in it self mortal, albeit there were no Physician sent for, yet nevertheless we are not thence to collect, that the wounded person might have been cured. The sixth and last Conjecture is, if the wounded person be of a strong Nature. For in this Case, if due care be taken in the preserving of the said Natural strength and vigour, the sick person very seldom miscarrieth. But if the Wound being not mortal, the wounded person die, and that in a short time, we ought to collect that he died not of his wound, but that he died from some other Cause, as we said before.

And this is the Judgment of all Physitians in general touching Wounds, both mortal, and not mortal. But yet there ariseth another Question among the civil Lawyers, to wit, whether the person that inflicteth the Wound may be found guilty, and condemned of Homicide. For these do not only (as Physitians) weigh and consider the quality and Nature of the wound, but the minde and intention also of the party wounding, and other Circumstances likewise; touching which we may see more in the Books of these Civilians.

The Rest of the Prognosticks.

Now although that out of what hath hitherto been said may easily appear what is to be foreknown and foretold touching the event of wounds; yet nevertheless we think it not amiss here to add somwhat more as touching the premises. For although that other Wounds (besides those we have already spoken of) do not indeed suddenly destroy and kil the person; yet nevertheless some of them are far more dangerous then other; and even of these some are more easie, some more difficult to Cure. And this in the first place is to be learnt from the very substance of the part. For the fleshy parts of all other are most ea-

fitly brought together and fodered again; the reſt, as the Veins, Arteries, Nerves, Tendons, and Membranes, with more difficulty. They may be united, and made to grow together again, but it will be more ſlowly. *Galen* (in his 1. *B. of the Seed, and* 13. *Chap.*) tels us, that himſelf ſaw the Veins in the Head (and thoſe both many of them, and great ones alſo) grow again; and (in his 5. *B. of the Meth. of Phyſick Chap.* 7.) that he ſaw an Artery alſo united. Secondly, from the Action and Uſe of the part. For the more Noble the part is in regard of its more neceſſary Uſe, and the Action that it performeth for the good of the whole Body, ſo much the more dangerous are the Wounds of that part. And thoſe parts likewiſe that are in continual motion will not be brought to grow together again but with much difficulty. And the more exquiſite likewiſe the ſenſe of the part wounded is, the more eaſily upon its being Wounded there happeneth unto it a pain, an Inflammation, a Deliry, a Convulſion, and other Symptoms. Thirdly, From the very greatneſs of the Wound. And Fourthly, From thoſe things that uſually happen and befal the Wound. To wit,

Prognoſtick. 1. The more Noble the part affected is, or which may likewiſe draw a more Noble part into Conſent with it, by ſo much the more dangerous is the Wound.

2. Thoſe Wounds that are in the muſcles, far from the Joynts, and the Temples, are more eaſily Cured then thoſe that are in the Nerves, Tendons, Membranous parts, and the Joynts. For the wounds of the Nerves and of the nervous parts are for the moſt part dangerous; in regard that by Reaſon of the pain, and inflammations, a Convulſion and other grievous Symptoms do eaſily happen: and therefore they require a very expert and diligent Chirurgeon.

3. All the Wounds of the internal parts are more dangerous then the Wounds of the external parts.

4. Great Wounds are more dangerous then ſmal ones, all things elſe being anſwerable.

5. *Moreover* (ſaith *Celſus*, in his 5. *B* and 26. *Chap.*) *that which may much conduce hereunto, is, the Age, and the Body, and the order and Courſe of life, and the time of the yeer: for ſooner is Cured a Child, Youth, or young man; then one that is Ancient, and in years: and one that is of a ſtrong Conſtitution is more eaſily and ſooner Cured then he that is of a weak and infirm Body; and one that is not over fat, nor over lean ſooner then if he were one of theſe; and he that is of an intire and ſound habit, then that man that hath an unſound and Corrupt habit of Body. And ſooner likewiſe is that perſon to be Cured that is given to exerciſe, then the ſlothful and ſluggiſh perſon; the ſober and temperate, then one addicted to Wine and Venery.*

6. Wounds are more eaſily Cured in the ſpring time, then in the Winter, or the hot Summer.

7. That Wound likewiſe that hath a Contuſion Joyned with it, is the more dangerous. And therefore it is of the two better to be wounded with a ſharp-pointed or ſharp edged, then with a blunt and dull Weapon.

8. Thoſe Wounds are moſt ſafe, and moſt eaſie to Cure, that are made in a ſtraight and direct line; but thoſe with more difficulty, that are oblique; and thoſe moſt difficultly of all that are round and orbicular.

9. If a Nerve, or a Vein, or an Artery, ſhall be wholly Cut, there is leſs danger impending, then if it be cut but only in part: alwaies provided, that they are none of the more notable Veins and Arteries, and Scituate in the deeper parts of the Body. For if a Nerve be wholly cut aſſunder, there is then no danger of a Convulſion; which we may well fear is night at hand if the Nerve be cut but only in part. And ſo, if a principal Vein and Artery be wholly Cut; the danger of the Hemorrhage is then wholly taken away, when the Veſſel is Contracted, and drawn together: but if a Vein or an Artery be only wounded, and not wholly cut aſſunder, very dangerous Hemorrhages do their oftentimes ariſe. And yet nevertheleſs, if it be one of the moſt Notable and Obſervable either of the Veins or Arteries that is cut aſſunder, then that part unto which this befalleth is deprived of its wonted Native and neceſſary heat; and is ſomtimes likewiſe taken with an Atrophy.

10. Thoſe wounds that have paſſed beyond the laſt and utmoſt term of Acute Diſeaſes, and eſpecially the fourteth day, are not in themſelves Mortal: but if the ſick perſon die, this may proceed either from an ill diſpoſition of the Body, or elſe by Reaſon of Errors committed in the Diet of the ſick perſon, or the Phyſitians Errors in the curing thereof. Yet nevertheleſs ſuch like wounds are not Cured without much difficulty; in regard that they indicate, that there is preſent ſome grievous Cauſe, which hindereth the Conglutination of the wound.

11. That wound is alwaies evil, by which there is ſomthing cut off, and by which the fleſh that is cut off from one part hangeth upon ſome other.

12. *Such as together with their Ulcers are troubled*

troubled with Conspicuous and apparent Tumors, these are not subject unto any dangerous Convulsion, or Madness: but those in whom they presently vanish and disappear, if this indeed be done in the hinder part, then Convulsions and Cramps follow: but if in the forepart, then there happeneth Madness, an Acute pain of the side, an Empyema, and Dysentery; if the Tumors be more red then ordinary, in the 5. of the Aphor. Aph. 65. And ibid. Aphor. 66. If the Wounds being great, and depraved, there appear no Tumor, this betokeneth much evil; which Celsus *(in his 5. B. and 26. Chap.) thus rendereth. But for a Wound overmuch to swel up is somwhat dangerous; but not at all to swel up is far more dangerous, Yea most of all perillous. The former is an evidence of a great Inflammation; and the latter a token of a dead and mortified Body.*

13. That an Inflammation should supervene upon a great Wound is no wonder at all; and therefore it ought not in the least to terrifie us, if it do not long continue. But for an Inflammation to follow upon a smal wound, and for it long to Continue, this indeed is very dangerous, being such as is wont to excite a Convulsion, and Deliries, or Dotings.

14. *When the fifth day is now come, how great the Inflamnation is like to be, it will then shew it self. On which said day the Wound being again uncovered, the color thereof ought well to be considered. Which if it be Pale and Wan, Leaden-colored, of a various colour, or black, we are then to know for a truth, that this wound is evil and dangerous; and this whensoever we well consider it, cannot much terrifie and affrighten us;* Cornel. Celsus Lib. 5. *Chap.* 26.

15. *A Convulsion in a Wound is very pernitious;* Hippocrat. Sect. 5. Aphorism. 2.

16. A Vomiting also of Choler that is neither voluntary, nor yet accustomed unto, even presently so soon as ever a man is wounded, or while the Inflammation remaineth, this is an ill sign; because it betokeneth that the Nervous parts are wounded.

17. If the wound in the Arm, Hand, or other part, be so great, that by Reason of the Veins and Arteries cut asunder it can no longer possibly receive any influx from the Liver and the heart, the extream part then dieth; and therefore lest that the Gangrene should be communicated unto the sound part it is maturely even with all speed to be cut off.

18. Those wounds that happen unto Cachectical and Hydropical persons are very hardly Cured; because that (as *Hippocrates* speaks of *Ulcers*) *Whatsoever is dry cometh neerer unto that that is sound; and whatsoever is moist approacheth very neer unto that that is vitiated.*

19. The greater the Wound is, the more time (all things else being answerable) is required for the curing thereof; and the less it is, the less time it requireth for its Cure; so that some wounds indeed are cured in twenty four hours time, but others require the space of many daies for their perfect Cure.

20. That wound that is not purged and cleansed but with much difficulty is likewise hard to Cure, and slow in the Curing; in regard that that which is an impediment unto the Curing thereof is not taken away without much difficulty.

21. A wound in that part that is apt and ready to receive the influx of the Humors is very hardly Cured.

22. All wounds that have any other affects complicated and interwoven with them, are the more difficultly cured. For the more the Affects are, the more Nature is hurt; and it is easier for her to take away and correct one only affect, then many; and in very deed, the more the affect that is conjoyned doth hurt the temperament of the part, so much the more difficult will the wound be to Cure.

23. All things extraneous, and that coming from without stick fast in the wound, if at the very first they cannot be drawn forth, they much retard the Cure.

24. Wounds have likewise their Critical daies; touching which *Hippocrat.* (in *Coacis Prænot.*) saith; *That for a feave, (in the wounds of the Head) to begin the fourth day, or the seventh, or the eleventh, is very fatal and dangerous: but that for the most part it is to be Judged of if it begin on the fourth day of the wound, and so continue unto the eleventh; or that it begin on the seventh day, & continue unto the fourteenth or seventeenth; or if it begin on the eleventh, and continue unto the twentieth.* And in his *B. of the Wounds of the Head*, he saith, that when any Error is committed in the Cure of a wound, that then for the most part (if it be in the winter) a Feaver cometh upon it before the fourteenth day; but if it be in the Summer, after the seventh day: and there he also asserteth, that some perish either (in the Summer time) before the seventh or (in the winter) before the fourteenth. And in his 4. *B. de Popular.* he there relateth, that unto the Son of *Metrophantus* being wounded in his Head there happened unto him a Feaver on the twelfth day, and that he died about the twenty fourth day; And in the 5. *Popular.* he reporteth that *Antonomius* of a wound in his head died the sixteenth day;

day; and a servant Maid in *Omylum* on the fourteenth day, unto whom a Feaver had befaln on the eighth day: and that the Daughter of *Nereus* by a friend of hers being in sport and merriment struck on the forepart of her Head, at that very time affected with the *Vertigo*, presently became breathless; and as soon as she was come home she was forthwith taken with a vehement Feaver, and with a pain in her head, and a redness about her face; and that she died on the nineth day, when on the seventh day about her right ear there proceeded forth a great quantity (more then a Porringer ful) of filthy stinking *Pus* or Mattier, being somwhat red, but very offensive. And that the Son of *Phile* after a wound in his head had a Feaver surprizing him on the ninth day, and upon this he soon after dyed. And that *Aristippus* receiving a violent and grievous blow (by the stroke of an Arrow) upon the upper part of his Belly, died in seven daies after. And all along in *Hippocrates* we shall find, that he also in wounds did observe the Critical daies. The truth is that wounds (as wounds) have no Critical daies; since that a wound is a Disease without matter. But as there may happen unto it some certain matter (that ought to be Concocted) or some kind of disturbance of the Humors upon occasion of the wound, in this regard it may likewise have some Crisis. For even Nature her self, upon some certain fixed and set daies, both concocteth that that ought to be concocted, and calmeth the disturbance of the Humors. And therefore, whensoever on the Critical daies there is no change nor alteration for the worse, but that all things proceed in a right manner, and that the Symptoms which before were present are now quieted and Calmed, it then affords great hopes of a happy Cure to ensue. But if (on the Contrary) in these daies there supervene any evil, as pain, Inflammation, or Feaver; or if those Symptoms that were before present are not lessened, but are rather become more intense and greater then before, it then betokeneth either Death, or a very difficult Cure. And it is altogether a very rare thing, that any such kind of motion in wounds ever bode any good unto the party; since that it declareth that Nature is not able to quiet and Calm that Motion of the Humors that happeneth in a wound; but that being stird up and set on work she endeavoureth the expulsion of these Humors either unto the wounded part, or some other principal part. And therefore, when any such motion as this is taken notice of in a wound, rather much evil then any good at all is from thence to be presaged. And therefore it will be to very good purpose to observe those Critical daies in wounds; that so by them we may come to know the useful actions of Nature, and that so we may not hinder them. We are likewise on these daies to abstain from all those things that may excite any motion of the Humors on the said Critical daies.

Chap. 4. *Of the Cure of Wounds, and First of all, touching the Indications.*

The first and Common indication of the solution of unity is the uniting thereof; or, unity dissolved sheweth, that the parts that are separated and disjoyned should again be united and brought together, so far forth indeed as the wound is a simple affect. But if there be conjoyned other Affects, whether they be causes, or diseases, or symptoms, there are then so many indications given us as those several things are that are conjoyned with the Wound, and so constitute a compound Affect; and these may be very many For somtimes the weapon or some other body sticketh in the Wound; which because that it is extraneous it hath the nature of a cause; and (as those things that are from internal causes, and in their whol kind preternatural) indicateth its removal.

If there be any of the substance of the flesh lost, there is then a double indication given; to wit, that which is divided is again to be united; and that which is wanting, again to be renewed. If the flesh and the skin be bruised, that that is bruised is to be converted into *Pus*, that so it may separate and fall off. And so likewise of al other affects that are conjoined with the Wound, the case is one and the same.

Now we will first of all treat of a simple Wound, and the solution of continuity that is caused by a weapon; upon which there hath as yet followed no other evil: but yet because that somtimes the Weapon, or some other strange body inflicted with the wound sticketh therein, we wil therefore together and at once treat of the removal of them.

But now, (as we said before) the common indication of a simple wound is union, as *Galen* teacheth us in his *Art. Medic. Chap.* 90. And (as the same *Galen* hath it in his *third Book of the Meth. of Physick, Chapt.* 4.) a simple Wound only requireth agglutination. Now this Agglutination and union is the work of Nature alone; and by her operation only the wounded parts, as likewise those parts that are broken and disjoyned, do again grow together, and are conglutinated. But then since that there is required for this purpose a certain medium, and a glew as it were; nature for this purpose maketh use

of

of that very matter by which the parts are nourished, to wit, the blood. For this blood being attracted unto the part for nutrition, and sticking in the pores of the sides and the lips of the wound, is converted into a substance like unto the wounded part, to wit, flesh; and so by the benefit thereof, what was disjoined now groweth together again, and so of two becometh one. And this in the flesh the *Sarcopoietick* faculty performeth; in the skin, the cutifique or skin-breeding faculty: and so in every part, Nature generateth a Medium of the same kind, for the Agglutinating of that which was disjoyned. And this inded albeit that it be solely Natures work; yet the Physitian in the furtherance of this work is a Servant unto Nature; and the truth is, that unless the Physitian strike in for Natures assistance, she is in many things frustrated of her end; neither can she effect the intended Conglutination.

But now those things that in this case are to be done by the Physitian, are reduced by *Galen* (in *Art. Medic. Ch.* 90) unto four heads. *Nature her self (saith he) causeth to unite and grow together again those things that stood at distance one from the other, and she it is that restoreth the pristine Unity: but now it is our part and work actually to apply and put together the extreams of the distant parts, and being thus brought together into one, so to keep and preserve them; and thirdly to beware of this, that nothing fall into the Lips of the wound; and fourthly, our work it is to preserve safe and unhurt the substance it self of the part.* And so in the Cure of Wounds, there are especially four offices belonging to the Physitian specified by *Galen* in the *place alleadged*. First of all, the Physitian is to see and take care, that nothing fal into the part affected, which may hinder the Conglutination. Secondly, That the Extreams in Unity dissolved may again be rightly conjoyned, and put together in a due and fit manner the one to the other; and the extreams thus joyned together are so to be kept, until Nature hath done her work. Thirdly, That so the temperament and the innate heat of the part it self may the better be preserved, he is during the time of Agglutination to afford unto Nature all the necessary help and assistance that he can by the best of his skill and diligence. Unto which we may not unfitly add a fourth, to wit, that those Symptoms which may, and are wont to supervene, may be prevented and corrected, and all those things taken away which may be any the least impediment to Nature in the Conglutinating of the Wound.

But now in regard that there may be a very great difference in the solution of Unity, these Scopes are not alwaies to be performed alike in one and the same manner in all parts. And first of all, for what concerneth the wounds we are now treating of, if there be any thing extraneous (as Clods of Blood, or Haires, or any thing of the Nature of any sort of Weapons, or smal pieces of bones, or any thing else whatsoever from without) shall chance to stick in the Wound, that is to be taken forth, and extracted. For they cannot possibly become one, between which somthing lieth that is of a different kind. And indeed we are not only to draw forth of the wound (at the very first) all things that are extraneous, but we must likewise afterward take great Care, lest that any thing from without fal into the wound.

When once all extraneous things (if any such there were) are drawn forth, the lips of the Wound are then to be brought together, and joyned close the one to the other; the which how it ought to be performed, we shal by and by shew you.

The parts that stood at distance being thus Conjoyned, all the rest of the work (to wit, that they may be united, and grow together in one,) is the work of Nature alone. For it is she only that Conglutinateth these parts when they are disjoyned. But seeing that Nature in this Agglutination maketh use both of the temper of the part, and the innate heat thereof; we must therefore do our endeavour that the temper and innate heat of the part may be preserved, or if it hath been by any means weakned, that it may be again restored. And seeing likewise that the matter of the flesh (by which the parts are Conjoyned) is the Blood; we must therefore take especial care, and use the very utmost of our endeavours, that the Blood that floweth unto the part affected may not offend either in quantity, or quality. For if the Blood be vitious, it cannot generate good flesh. And again, if there be too great abundance thereof, the flesh then becometh over Luxuriant and proud; and there are many Excrements generated: if there be less thereof then is requisite, it doth not then generate and make a supply of sufficient matter. And whereas the wounded part is made much the weaker both by the pain, and by the wound; therefore in the wounded part of necessity there must be produced store of Excrements, and corrupt filthy mattier: and if the *Sanies* and Excrements intervene in the midst of the Lips when they are drawn together; or if that also there shall be any middle place between, which though it be indeed void of filth and Excrements, yet is ful of Air, such a like Ulcer (I say) cannot possibly be Conglutinated by the sole Conjunction of the disjoyned and distant parts; but that it may unite and

grow

grow together again, there is a neceſſity that it be firſt filled up with fleſh. And therefore in ſuch like caſe as this there wil be need of a ſarcotick Medicament. And ſo, in the performing of the cure of Wounds, our firſt office and work is,

1. To endeavor, that nothing extraneous and coming from without may ſtick in the wound, and betwixt the Lips thereof; and that nothing be left remaining therein.

2. That the Gaping parts of the wound may be again conjoyned.

3. That being conjoyned they may be ſo kept.

4. That they ſodder and grow together again, each to other.

5. The performing of which ſeeing that it is the work of nature, it is eſpecially requiſite, that the temper and ſtrength of the wounded part be by all manner of means preſerved.

6. That all the ſymptoms, and whatſoever may poſſibly hinder the uniting and Coalition of the part, may be taken away, and removed. And thus, although that a wound, only conſidered as a wound, is one ſimple Affect, and ſeemeth to indicate and require one only uniting; yet nevertheleſs, the very truth is, that there are herein couched very many indications, as before we told you.

Chap. 5. *Of things extraneous, and from without, that are to be taken forth of the Wound.*

IN the firſt place therefore we muſt uſe our endeavour, that there may be nothing extraneous in the wound that may hinder the union and glutination thereof. And therefore firſt of all, the blood is not inſtantly to be ſuppreſſed; and we muſt permit whatſoever we find ſticking in the leſſer veines cut aſſunder freely to flow forth. For ſo by this means there will both a leſs quantity of *Pus* be generated, and all the danger of putrefaction and inflammation be prevented. Which is likewiſe very well known by him who out of ſimple wounds is wont either to extract the blood, by ſucking it forth with his mouth, or to ſqueez it out by the compreſſion of the wounded part with his finger. Moreover, when there are any hayres neer about the wound they are to be ſhaven away, leſt that they fall within the lips of the wound. Thirdly, if ſand or earth, or any ſuch like thing ſtick within the lips of the wound, it is to be cleanſed away with wine. Fourthly, if there ſhal be any Clods of blood in the wound (ſeeing that they may hinder the uniting, excite pain, and putrefying may cauſe a fever) they are therefore to be wiped away with a piece of a ſoft Linen Cloth, or a lock of wool; or if need require, they may likewiſe and muſt be taken forth with an iron inſtrument. In which action notwithſtanding we muſt uſe no manner of violence at the firſt ſetting upon the cure; neither is all the Clotted blood at once to be taken forth, and eſpecially if a Hemorrhage be feared; ſince that the clods of blood may ſtop the orifices of the veins, and the veſſells may grow together under them: but this is to be deferred until the ſecond or third dreſſing; when we have afterward nature her ſelf (which beginneth to expel whatſoever is extraneous) helping and aſſiſting. Fifthly, the little broken bones likewiſe (if any ſuch be in the Wound) are to be taken forth. In the firſt dreſſing nevertheleſs only thoſe things are to be taken forth that are altogether free and looſe, ſo that they may be taken out of the Wound without offering any violence thereunto: but as for ſuch ſmal pieces as yet ſtick faſt unto other bones, in theſe Natures endeavour is to be expected, and ſo it wil ſoon be ſeen whether ſhe intend to unite theſe fragments that are broken with the reſt of the bone, or elſe whether ſhe purpoſe to make a ſeparation. Sixthly, if Glaſs be broken in the wound, it is to be taken forth; and this is alſo to be done, if any other kind of Weapon, or Arms wherewith the wound is inflicted, ſtick in the Wound. But before we aſſay the extraction of the ſaid weapons we are to look and conſider, whether or no the wounded perſon be likely to live after the drawing forth of thoſe things aforeſaid. For if there be no hopes of life remaining, there is no ſuch taking forth of any thing to be attempted, no not of the weapon it ſelf; leſt that the Chirurgeon ſhould be thought to have haſtened on the parties death and leſt the wounded perſon dye under the very hands of the Chirurgeon; which happeneth ſometimes in the wounds of the Heart, of the Brain, (the baſis thereof eſpecially) the *Vena Cava* (or great hollow vein) or the great Artery. For it hath been obſerved, that ſuch wounded perſons though the weapon hath been left in the wound, have yet lived for the ſpace of a whole day; but that upon the drawing forth of the weapon (by reaſon of the Hemorrhage following thereupon) they have inſtantly died. But where there is any hope that the ſick perſon may be recovered of his wound, we ought then to labour that firſt of al the weapon be drawn forth. For the weapons, as likewiſe leaden bullets, although they may ſomtimes ſtick very long in the body: yet notwithſtanding it is a very rare thing, that a

wound

wound should be perfectly cured, the weapon stil secretly abiding in the body.

The drawing forth of the weapons

But now to draw forth the weapons aright is a thing of much difficulty; and this difficulty ariseth especially from the place into which these weapons being thrust into the body have penetrated. And therefore for him that wil attempt rightly to draw out the weapons forth of the body, there are two things mainly necessary; First, wel to consider and mind the substance and nature, the figure, situation, and connexion of each several part of the body: and then Secondly, to know the diversity of the weapons, from their matter, magnitude, and figure: and it is likewise altogether necessary (in the drawing out of the Weapons) to be cautious, that the veins, Arteries, Nerves and tendons be not torn or violated. For (as *Ambrose Parry* saith truly) it would be a thing very shameful, and much unbecoming an Artist, that the hand of the Chirurgeon should do more hurt then the iron weapon. But that the weapons may the more fitly and expeditely be drawn forth, let the wounded person be set in such a posture and figure as he was in when he received his wound. Which if it cannot altogether be done, yet lying along let him so be placed, that he may come as neer as is possible unto that figure.

How many ways the weapons may be drawn forth.

Now the Weapons are taken forth in a twofold manner, either by extraction, or impulsion; that is to say, either the same way that the weapon went in, or else that way that it tendeth. It is extracted the same way that it was thrust in, either without making any section, or else by a section made in the part. For if the weapon hath not pierced very deep, if it hath not passed thorow the great vessells and Nervous places; and if that either right opposite unto it, or the way that it tendeth, it hath bones, veins, arteries, or nerves; and lastly, if there be no great fear of any danger to follow upon a wide opening of the part; then in this case, it may be drawn back the same way by which it pierced into the body, and that without any section at all.

But if there be any danger, and cause to fear lest that the body may be torn, if the weapon be drawn back the same way by the which it entered in; the wound is then to be dilated, either by section, or else even without it; to wit, with that instrument which *Celsus* (*in his fifth Book, and Chap* 7.) calleth *Ypsiloeides*, or else with a Swans bill, or Storks bill, or some other dilating instruments, to the end that the weapon may be drawn forth the more easily. But then, the weapon is to be drawn forth either with the Hands, (if that may conveniently be done, as when it standeth out, and is fastned in the flesh alone:) or else with that instrument they cal *Volsella*, when it sticketh deeper then that we may well lay Hands upon it; or with those other instruments that the Greeks call *Beloulca*; of which sort are the long Cisers that are ful of Teeth, straight, or a little Crooked, broad in their extream part, and likewise round; unto which the Chirurgeons of latter times have given divers names from their several Figures; and they call them Crows Bills, Storks Bills, Ducks Bills, and Goose Bills; several Figures whereof we find extant in *Ambrose Parry* his tenth B. and 18. Chap. and likewise in *Johan. Andreas a Cruce*.

But if the weapons point hath penetrated further then unto the middle part of the Member; and that the space and distance by which the weapon is to be drawn back be greater then that which yet remaineth to be passed through, and that neither Bone, nor Nerve, nor Vein, nor Artery any way hinder it; it will then be more commodious (a Section being made) to drive the weapon forward by that part toward which it tendeth, and so to draw it forth by a wound new made. For in this manner it will be drawn out more easily, and the wound will the sooner be cured, in regard that now the Medicaments may on both sides be applied. But yet nevertheless if the Weapon be too broad, it will not then be expedient to drawn it forth through the other part, lest that we add unto the great Wound it self another likewise as great. And if also the Weapon be thrust in between two bones, the Members lying next unto them are to be widened (according to the usual manner) and drawn several waies, that so the space betwixt the bones may be the looser and wider, for the pulling forth of the Weapon thrust in between them.

But if some smal piece of a Bone, or a Thorn, or Splinter, or any such like, stick in the Wound (that can neither be drawn forth with the hands, nor any instrument,) it is then to be extracted by those Medicaments that have in them a power and virture to draw forth. And for this purpose there are commended (by *Dioscorides*, in his 2 B. and 58. *Chap.*) those things that follow; to wit, the *Heads* of *Lizards*, bruised smal, and imposed thereon; *Water Pimpernel or Brook-Lime, Dittany of Crete, the Roots of round Aristolochy or Birth-wort, Anemony or Wind-*

What Medicaments they are that draw forth those things that stick in a wound.

Wind-flower, the Root of Narcissus, of Gladiol or Cornflagge, and of the Reed, Sagapenum, Galbanum, Ammoniacum, Pitch, Pine-rosin, and the like, administred in the form of an Emplaster.

There is also commended the Emplaster of *Avicen*, that is Compounded of Leaven, Honey, or the Propolis (as they cal it) of Bee-hives, of each half a pound; Bird-Lime three ounces; Ammoniacum two ounces; the oldest Oyl three ounces.

And so is likewise the Unguent of Betony, and the fat of an Hare. Or,

Take *New Wax, one pound*; *Colophony, and yellow Rosin, of each four ounces*; *Ammoniacum, two ounces*; *Bdellium, one ounce*; *the Juyce of Citrons, three ounces*; *the Oyl of Yelks of Eggs, four ounces*; *of the Load-stone, five ounces*: And make an Emplaster according to Art. Or,

Take *Virgins Wax four ounces*; *Turpentine two ounces*; *the Load-stone one ounce and half*, *Hulled Beans, one ounce*; *Harts Fat, half an ounce*; And make an Emplaster according to Art. Or,

Take *Rosin of the Pine-Tree, two ounces*; *dry Pitch, one ounce*; *Ammoniacum, Sagapenum, Gum Elemi, of each half an ounce, Root of round Aristolochy, and of white Dittany, of each one dram and half*; *Cretan Dittany three drams*; *old Oyl, or the Feces of the Oyl of white Lillies as much as will suffice.* And make a Cerot. Or,

Take *Oyl of Olives one pound and half*; *new Wax, one pound*; *let them melt together*; *and then add Litharge of Gold one pound and half*: *then boyl them, after this adding and mingling therewith, of Galbanum and Opopanax, of each one ounce*; *Ammoniacum and Bdellium, of each two ounces*: *Let these Gums be dissolved in Vinegar, and then add of the Root of round Aristolochy, Mastick, Mirrh, Frankincense, and Lapis Calaminaris, of each two ounces*; *and in the Conclusion boyl them all together with a soft and gentle fire, adding thereunto in the latter end of the boyling, Oyl of Baies, and Oyl of Turpentine, of each four ounces*; *and stir them wel together during the boyling*: *then pass them through a Linen Cloath into cold water*; *and then softening all with the Oyl of Camomile or Turpentine*, Make an Emplaster. Or,

Take *Narcissus Onyons, two of them, Reed Root one ounce, Gladiol Root half an ounce, Mullein leaves one handful*; *rotten Doves dung, one ounce*; *wild Cucumber Root, and the Root of Round Aristolochy, and of white Dittany Root, of each three drams*; *Cretan Dittany half an ounce, the meal of the bitter vetch Orobus, a little quantity thereof, Honey as much as will serve the turn.* And make an Emplaster. Or,

Take *Wax, and Turpentine, of each six ounces, Colophony, Ship Pitch, of each one ounce*; *Ceruss, Roman vitriol, of each four ounces, Lap. Hæmatites, or the Blood-stone, and the Load-stone, of each two drams, Mastick, half an ounce*; *Frankincense, Camphire, Mummy, Dragons Blood, of each one ounce*; *Oyl of Juniper one ounce and half*; *Oyl of Eggs six drams, Oyl of Cloves two drams*; *of Saint Johns-wort, half an ounce*; *of Earth-worms an ounce*; And make an Emplaster.

Touching the drawing-forth of the Weapons out of Wounds you may see more in *Cels.* his 7. *B. Ch.* 5. and in *Paulus Ægineta* his 6. *B.* and 38. *Chap.*

But if by no artificial means the Weapon (or whatsoever else it be of any thing Extraneous) cannot be drawn forth of the Wound, the whole business is then to be committed unto Nature; which oftentimes in this kind worketh wonders, as it were; and expelleth those preternatural things that are thrust into the Body, by any waies whatsoever where there is any possibility: of the truth whereof we every where meet with Histories to confirm it. *Hippocrates* (as he tels us, 5. *Epidem.*) in one that had an arrow shot within his Groins, took forth the Head thereof six yeers after. And *Guilhelm. Fabricius* for one that had a knife run into the *Spina Dorsi* or Back-bone, drew it forth two years after; as he telleth us, in his *first Cent. Observat.* 62. The like whereunto (and a thing very Memorable) happened here at *Witteberg*. For a certain Student being wounded with a knife even to the Root of his Nose, and the internal Angle of his right Eye, half of the knife being by violence broken (almost as long as ones Finger) stuck there firmly fixed in the bone: which when neither the Physitian nor Chirurgeon took any Notice of, neither he that had given the wound would be known of any such thing as the breaking of the Knife, the wound was speedily consolidated. It happened notwithstanding, that after a quarter of a year, the sick person felt a certain pain in the upper part of his Palate, before the *Columella*; and afterwards there was an Ulcer opened: and yet nevertheless, neither the sick person himself, nor the Chirurgeon thought any thing of the Knife that lay hid within, but haply they thought that this Ulcer that was opened had its original from the rottenness of the bone wounded. Yet a little after it so happened, that behind the Columella there stuck forth some thing of a black colour, which they thought to be a shiver of the rotten bone. But the sick person coming to me for advice, I commanded the Chirurgeon that with his instrument he should search, to find what it was; who immediatly

discovered

discovered that it was Iron; and so we found that it was the point of the knife that stuck forth. And without question the edge of the Knife by its motion had opened that aforesaid Ulcer before the Columella. But yet nevertheless, although the Chirurgeon attempted the drawing of it forth, (the broader part of the Knife still sticking fast in the bones) the Knife do what he could was not by any means to be drawn forth; but that when al was done the whole business must be committed unto Nature; by whose assistance it happened, that the Knife hung forth every day more then other. At length, when the point of the Knife stuck forth in the Jaws almost the length of a Fingers Joynt, and that the sick person manifestly perceived some sensible motion thereof, (which before he had not done, in regard that by degrees and insensibly it daily conveyed it self downward, which he took no notice of;) he then conceived himself to be in extream Peril, fearing that the Knife by reason of the sharpness of its point should makes its way into the Bowels; and therefore with the Chirurgeon comes running unto me, to ask my advice. But then suddenly the broken piece of Knife being freed and set at liberty by its own motion, and falling more and more downward, the point thereof was laid hold on by the Chirurgeon, and so brought forth; and very little it wanted from falling into the Throat. And whereas (the bone being eaten through) a hole was left in the upper part of the Palate, which was a very great impediment unto him in his speech, (besides fit and convenient Medicaments, to cleanse, and dry much) at length I ordered him a thin plate of Gold, in the form of a shield, which in the back thereof had somthing sticking forth, and round as a Globe; this I caused to be provided for him, and then I ordered a little Spunge to be bound unto it; which said plate by the Spunge being put upon the hole, and there sticking, and shutting the hole, he spake distinctly enough to be understood. Yet notwithstanding the flesh began afterwards to grow and increase in the Lips of the Wound, (although but very slowly) and the hole became somwhat narrower. After I had furnished him with this plate, he departed hence: yet nevertheless the hole for the greatest part was filled up with flesh; and it was told me that he was now turned preacher, and that he could deliver himself very distinctly without that Golden Plate. And in *Guilhelm. Fabricius* his 2 *Cent. Obser.* 74. *Claudius Deodatus* relateth the History of a wound, which by a sharp Sword was inflicted upon the *Pylorus*, or at the top and enterance of the smal Guts (as all the Chirurgeons present thought, indeed; but yet notwithstanding *Gilhelm. Fabricius* denieth it, supposing the Gut Colon to be wounded, which on the left side is annexed unto the Reins) and that it was miraculously Cured. But when after this (the Wound being covered all over with a Cicatrice) the sick person felt neer about the part affected a sharp pricking pain, and a swelling withal, it so happened, that when about the end of the year he had dispatched his affaires, and was returning homewards, in the mid'st of his Journey he was constrained to eate and empty his Belly, and then together with his Excrements he voided forth by the Belly the very point of the Sword that was thrust into him. But seeing that now adaies wounds are more seldom inflicted by Arrows (then in former times) therefore also in our daies the Chirurgical Extraction of Arrows is very rarely required: but whereas now adaies most Wounds are made with bullets from Guns, there is therfore a greater necessity incumbent upon the Chirurgeons of our times, that they extract and draw forth those Leaden Bullets that from Guns are shot and sent into the Body; touching which I shall speak further anon.

Chap. 6. *Of the Provision that is necessarily to be made for the binding up of Wounds.*

IF in the Wound there be nothing sticking that is extraneous and of a different Nature from the part affected; or if there having been somthing sticking therein it be drawn forth, we ought then to endeavour that the lips of the wound may be joyned together. But now seeing that for the right performing of this, there is a certain provision and preparation to be made, as necessary thereunto (although notwithstanding for the most part the same provision is required likewise in the Curing of Fractures) therefore in the first place we shal repeat somthing in the general out of our *Institutions* touching the dressing and binding up of Wounds; and we shall afterward treat thereof more particularly.

Unto the binding up of Wounds there belong swathing, the injection of the *Splenia* (we shall shew you anon what these *Splenia* are) the fitting of the Splints, Illaqueation, or casting about of a binder, and the right placing of the part when it is bound up.

Of Swathing.

A swathe what it is. Now a Swathe is a binder that is both long and broad; and a due and fit swathing is a drawing about, and rolling together of the Swathe-bands a-

bout the Member that is to be cured.

Now touching Swath-bands, *Galen* (in his *B.* of *Swaths*) hath written sufficient, and indeed somewhat largely, and therefore for our better knowledg in this Particular, we are to acquaint our selves throughly with what he hath written. But that we may briefly speak something according to our purpose, (and as before we promised you;) Swath-bands may be made of Linen Clothes first put unto other uses and somwhat worn, that thereby they may be made more soft and pliable; but yet they must be so strong that they may not be broken. For although the matter of Swath-bands may be threefold, Linen, Woollen, or Skins, yet now adaies we seldom use any other but Linen only. But then these Linen Cloths must be Clean, Smooth, Soft; which have neither any Seams or Knots sticking forth.

Differences of Swathes

Now there are various differences of Swathes; which are all taken from the Figure, length and breadth. They differ in regard of their Figure, in that some of them are made so as to be woon'd up, long and equally broad, and rolled round together: others of them Cut; which indeed consist of one Linen Cloth, but this is cut either in its extreme or middle parts: others that are sewed together, that consist of Swathes and strings ending in several Heads. Swathes differ in their length, in regard that some of them are longer, others shorter; and so in their breadth likewise.

Differences in the binding.

And then of the binding up (that is done by the Swathe) there are two differences; one simple, another compound, or manifold. The simple is either equal, or unequal. The simple equal is only round, which on both sides bindeth together the Member affected in a circular fashion, without any declining on one side more then another. But the simple unequal is divided into *Ascia* and *Sima*; which yet differ only in regard of their being greater or less; because that *Ascia* declineth but a little from that which is round, but *Sima* very much. Of various and several sorts of Swathing there are many differences, taken from the similitude of the parts that are bound, or of certain living Creatures, or of other things; touching which we may see sufficient in *Galen* his *B.* of *Swathes*; and in his *Second Comment upon the B. of those things that are to be done in curing of Wounds, Text* 7.

The swathing how to be instituted.

But that the Swathing may be rightly performed, it is first of al to be considered, from whence the binding is to be begun. For sometimes the binding is to be begun from the part affected, sometimes from the sound place nigh unto the part affected, and at other times also from the opposite part. And then next of all, in what manner the Swathe is to be drawn about. For sometimes the Swathing is to be begun from one end of the Swathe, and sometimes from the middle thereof. And Thirdly, We are to look wel that the Swathe neither binde and press together the part too hard, and likewise on the contrary that it be not over loose. For if it be too loose, it will not sufficiently keep the part together; and by its overgreat compression it will occation both pain, and an Inflammation. But now that all this may be rightly performed, the use of Swathing will teach us.

The use of swathing.

Now the Use of Swathing is twofold; one of it self, but the other only accidentally conduceth unto the Cure. Swathing considered in it self maketh much for the Cure, in regard that it bringeth together the parts disjoyned, contracteth the parts dilated, and setteth straight the distorted and writhed parts, keepeth within due limits the Member being set in its right frame, as also the conjoyned parts, repelleth the Humor flowing in; and if it be already flown in, it driveth and presseth it forth again. For in hollow winding impostumations the binding is begun from the very bottom, and endeth at the Orifice of the Ulcer. The extenuated parts are so to be bound up that the sound parts may be pressed together, and that the Blood may be forced unto the parts extenuated: which will be done, if the Swathing be begun from the sound, or the opposite part; from whence toward the extenuated part it may be a little loosned; and at length rolled about after the most loose manner upon or neer the extenuated part. But in the parts dilated, and when there is need of driving back the influx of Humors, the binding is to be begun in the place affected, and the two or three first rollings about let them be closer and harder then ordinarily.

But by accident these Swathes conduce unto the cure, when they are so administred, that they may contain those Medicaments that are applied for the effecting of the cure. Touching these see *Hippocrates* in his *B.* of *Fractures, Comment.* 1. *Text* 21. and in his 2 *B. Touching those things that art to be done in the way of curing, Text* 30, 31, 32, 33.

Of Splenia.

For the better binding up, there are likewise administred those things they cal *Splenia* which are Linen cloths folded together, and so termed from the Figure of the Spleen. They were by the Ancients called *Plumaceoli* because that they were made of Feathers sewed

sewed up between two cloathes: they are likewise called *Pulvilli* from the resemblance they have with a bolster. Now they differ in regard of their Figure, which is either long, broad, or thick. Their Figure is threefold, to wit, according to the end for which they are propounded, and the manner of their being imposed. For somtimes they are laid upon the part straight and long waies somtimes in an oblique manner, and somtimes transversly. And indeed they are somtimes laid on double, somtimes treble, and now and then four double; somtimes single, and somtimes more of them, according to their use and that which they ought to perform, to wit, the strengthening of the binding, for Members that are unequal in thickness, or for the making equal and filling up of parts that are lean and hollow; that so by their means the whole binding may become equal; and also for the defence of the parts from the weight and pressure of the Swathbands; and Lastly, for the pressing forth, and drinking up of the *Sanies* and Ichorous Excrements. And they are somtimes imposed dry; but most commonly they are soaked, and moistened in some kind of liquor that is fit and proper for the Disease and the part affected. Touching which see *Hippocrates*, in his 3 *B. of such things as are to be done in the Curing of Wounds*, *Text* 1, 2. and in his 1 *B. of Fract. Text* 32. and in his 3 *B. of Fract. Text* 21. As likewise *Galen* in his Commentaries.

Of Ferulæ, *or Splinters.*

Somtimes (for the more convenient binding,) there are administred those things they call *Ferulæ*; to wit, smooth Splinters, that are wont to be fitted unto bones that are broken and out of Joynt, after such times as they are set again, and returned unto their due and proper place. *Hippocrates* and other of the Ancients made them of the woody bark of the *Ferula* shrub; and from hence also they have their Name. Now adaies (in the want of other) these *Ferulæ* are made of the thin shivers or long thin Chips of Wood, or the Barques of Trees, or paper glewed together, and pieces of a hard and thick hide. But yet we are here admonished by *Guilhel. Fabricius* (in his 4 *Cent. Observat.* 98.) that the barques of Trees (especially while they are new and green) are by no means to be administred in Fractures instead of the aforesaid *Ferulæ*. For when they are throughly dryed they are apt to be contracted about the Fracture, and to excite pains; and somtimes again to move the bones out of their places.

Hippocrates requireth such *Ferulæ* as are smooth, equal, plain, and a little hooked and sloping at the very ends, that is, such as are shaved smooth on the lower part of their ends, on both sides somwhat shorter then the Swathing lying under it, lest that they press together the part beyond the Swathing. Now they are imposed upon the Fracture on every side round about, so that they may not stand distant one from the other less then a Fingers breadth; and they are so to be fitted, that the ends of the said *Ferulæ* be not placed above the Heads of the Joynts that stick forth, or the Nerves nigh unto the Joynts; or that they touch upon the naked Skin. See *Hippocrates, touching those things that are to be done in the Curing of Wounds*, *Tit.* 11. and in his 1 *B. of Fract. Text* 40. and in his 2 *B. of Fract. Text* 5. 7. 11. 64. 69. 71. And *Galen* in his *Comment.* And *Paulus Ægineta*, in his *Sixth B. Chapter* 99.

And unto the extream parts also that are grievously wounded, or broken, or disjoynted, (the Hands especially) there are somtimes applied little Coffers, or Chests of smooth Wood, so wrought that they may answer unto the Figure of the Member; or else such as are made of thin plates of Iron, or a hard Skin, or paper glewed together; that so they may hold together the parts united and conjoyned, that so they stir not, neither move to and fro, and so again start forth and fal out of their places.

Of *Laquei, or Binders.*

Unto the binding up of Wounds there likewise belongeth the injection of *Laquei* (as they term them) which we may fitly call Illaqueation. Now this *Laqueus* is properly a bond so knit and tied, that what is drawn together, or pressed down by weight, may be shut up and closed. And the use thereof is, for the extending of bones broken and out of Joynt, for the keeping of them in their places when they are set, and for the streightening and close binding of the parts. The differences of these *Laquei* are very various, taking their Names either from the inventors, or from their use, or from the similitude and Figure of some thing or other, or from their manner of knitting, or from their effect: which since that they cannot well be perceived nor understood without a manifest Delineation, and very hardly from a bare description, therefore touching this Particular, Consult that *B. de Laqueis*, that is commonly ascribed unto *Oribasius*.

Of

Of the due placing of the Member after it is bound up.

After that the affected Member is rightly bound up, it remaineth that it be likewise fitly placed. Now the due and fit placing of it consisteth in this, that the part have that position which conserveth the Natural figure thereof, such as is without pain, and fit for the cure of the disease. Now the member shall thus be placed, if all its parts, Bones, Muscles, Nerves, Veins, and Arteries, have that situation that they are neither distended, nor pressed together; if the Member be softly and equally situated; if in a hollow ulcer or wound the Orifice (as much as may be) look downward, that so the Sanies may be purged forth; and lastly, if in the placing there be a mean kept in regard of the binding up, and that the binding be neither too loose, nor yet over streight and hard. And indeed that there may in the placing be an apt and meet figuration of the Member, we must especially have respect unto two things, unto the Joynts, and unto the Muscles; to wit, in respect of the Joynts. That the Member have a middle figure (as *Galen* very often calleth it) which is without pain, to wit that in which we are both born, and accustomed to keep all our Members when we are out of Action; and in which no Muscles at all do act; and such as is equally distant from the extream motion of the Joynts, or their extensions, and inflections: and in regard of the Muscles, to wit, that on one part it hath Muscles, and the whole entir fibres thereof; and that neither a whole Muscle, neither its fibres be distorted.

Now placing Consisteth either in reposition, or suspension. A member is then fitly put back, when by certain props and stayes (as feathers, fleeces of Wool, or soft Clothes) it is so born up that it is made quiet, and rising upwards, lie alwaies equally and softly, so that it be neither shaken by any motion, nor assaulted by any flux; or that any *Sanies* or *Ichor* be therein retained. And from hence it is that (if the thigh be broken, and bound up) *Hippocrates* supporteth it with somthing like a Counduit pipe, (the ham being stretched forth) from the hip even unto the foot. Our Chirurgeons use to apply some certain props of straw or of paper rolled together like a Counduit pipe, and within filled up with hurds, and so involved and wrapt up in the extreme part of the linen cloathes; by which the whole Member is firmly held together, lest that it should unawares be moved.

But the Member is hung in a string and supported thereby, when the sick person either lieth down, or now beginneth to walk abroad. For although that while the sick party lyeth in his bed it sufficeth if that while he is awake he have his hand softly inclining upwards; yet, lest that when he is asleep he should unawaers move it, therefore it is not amiss for him to have it hung in a sling of a swathband. But it is especially requisite when the sick party beginneth now to walk, that he carry his Arm wrapt up and hung in a swathe, (which the Greek Physitians call *Tænia*, and *Celsus Mitella*) the narrow heads wherof let them be cast about the neck; and for the breadth of it, in that part wherein the Arm is enwrapped and born up, let it be so broad that it may contain the whol arm, that so there may be no part thereof that is not equally supported. And here for the more fit underpropping of the hands there is oftentimes great need of those little Coffers or Chests, of which but even now mention was made; upon which the Hand (when it is bound up) is to be placed; and then (with the said *Capsula* or little coffer) it is to be put upon the swathband.

Chap. 8. *Of the swathing of wounded parts.*

And that we may apply unto Wounds all that hath hitherto been said of swathing in general; the Chirurgeon when he is ready to bind up the wound must in the first place be very careful in stanching of the blood, if it flow forth over abundantly. But since that there happeneth not unto all Wounds any such extraordinary and remarkable hemorrhage, (but only when the greater vessels are Wounded) of the stopping and stanching of the hemorrhage we wil speak more below in the *fourteenth Chapter*. And now at the present (as for what concerneth the very swathing it self of wounds, the lips of Wounds when they are disjoyned are to be drawn together, & conjoyned: & when they are thus brought together they are then to be kept conjoyned; which without the solution of continuity may be done two waies; either by swathing, or Glew, or by stiching, and sodering it together *per Glutinum* (as they term it) which what is meant thereby, we shal anon shew you.

Swathing. And First, as for swathing, this suiteth very fitly unto wounds that are made according to the length of the Member, and which are not very deep; and where we have hopes that by swathing alone the lips of the wound may be joyned together, there stitching and sewing

ſewing is not raſhly to be practiſed. But now let the linen ſwathe be neither too hard nor over ſoft; the breadth whereof ought to be ſuch, that being once caſt upon the wound it may not only comprehend & contain the ſaid wound, but may likewiſe comprehend ſomthing on either ſide, even unto the very confines of the ſaid wound But if the Wound ſhal chance to be longer, the binding up of the wound is then better performed by a narrow & ſtreight ſwath; that is, one of about three fingers breadth. Now this binding is accomplished with a ſwath of two heads, (as I may ſo ſay) or that hath a double beginning; and in Wounds that are not very long the middle of the ſwathe is firſt of all impoſed upon the oppoſite part of the wound; and the rolling of it about is begun from it, and drawn toward the Wound, and above the Wound it is ſtrained; and in this manner the lips of the Wound are rightly drawn together; and then after this, both heads of the ſwathe are rolled this way and that way, that ſo the lower part thereof may be drawn about by the lower part of the Member; but the ſuperior by the higher part of the member; and all to this end that ſo the humors may the better be preſſed forth of the part affected. Let this Ligature be ſtreighter and harder above upon the place affected, then in the parts that lie neer unto it; and let it be ſuch as is neither overlooſe, nor too ſtreight. For if it ſhould be too looſe, it would not contain nor keep in the lips of the Wound being drawn together; and if it be overmuch ſtrained, it would then cauſe pain, an afflux of the humors, and an inflammation. And therefore let the term or time of the ſtraining be, as long as the ſick perſon can wel endure it. And in the Winter (by reaſon of the cold) the rollings and ſwathings about may be the more; but in the Summer the fewer the better, leſt that by reaſon of the many windings about of the ſwath the part affected grow over hot. The knot is to be knit a good way diſtant from the Wound, or rather the heads of the ſwath are to be ſewed together. But now that in the greater ſort of Wounds the drawing together of the lips may be made the eaſier, the *Plumaceolus*, or little pillow, or linen Clothes many times doubled, but moſt commonly four double (of all which we ſpake before) are to be adminiſtred: but according to the judgment and opinion of *Avicen* (*in the fourth ſect. of his fourth Book, tr.* 1. *Chapt.* 8) The triangular pillows are far more commodious; which two of them together (on either ſide one) are put unto the wound; ſo that the ſides of both of them being diſpoſed and placed according to the length of the wound, (and therefore thoſe aforeſaid pillows, &c. ought to exceed the length of the Wound) may have reſpect each to other. For the ſwathe being drawn upon the Angle of the Triangular Pillow forceth forward the pillow (together with the lip lying underneath) unto the Contrary part; and (as *Avicen* ſpeaketh) ſtraineth together only upon the fiſſure or cleft of the wound; which would not ſo be, if thoſe pillows were four ſquare.

Of the ſtitching or ſewing of Wounds, with Glewing.

But now whereas in tranſverſe and long Wounds ſwathing alone will not ſuffice for the drawing together of the lips of the Wounds, and ſo keeping and preſerving them, in this reſpect therefore there wil be need of ſtitching. But ſeeing that in the Wounds of the face ſtitchings cauſe a great deformity, and in other long and great Wounds the ſtitches are oftentimes broken before the agglutination of the Wound; and becauſe likewiſe that tender bodies wil by no means away with ſewing, (which is done with the needle) therefore a certain Glutination, or ſtitching with gluing hath been invented, which draweth together the lips of the Wound without any the leaſt mangling of the wounded part, or pricking of it with the needle. Now this is the proviſion that is to be made. Strong Linen Cloathes are prepared, that are equal, ſoft, quadrangular, or triangular, or of ſome other figure, according as the nature of the ſituation of the Wound and member unto which they ought to be applyed doth require; let theſe be either folded together, or ſewn (ſo as that the ſtitches may be no great eyeſore) in that part wherein they have reſpect unto the Wound; and let threads now and then be paſſed thorow them in the broadeſt places of them. Unto theſe Linen Clothes are to be faſtned little handles or loops of threads many double, and twiſted, and then waxed; at the ſame diſtance that the ſtitches are wont to be made, or if you pleaſe, ſomwhat a leſs diſtance. Upon this linen let the aforeſaid *Glutinum* be ſpread, that is made of aſtringent and viſcous clammy Medicaments; ſuch as are, the white of an egg, Bolearmenick, Frankincenſe, Maſtick, Sarcocol, fine flour Parget, Tragacanth, Corralls, and fat Roſin, As for inſtance.

Take *Bole-Armenick, Sarcocol, Maſtick, Dragons Blood, of each two drams*: Let them be mingled with the white of an Egg. Or,

Take *Of the fineſt Flour, and Maſtick, of*

each

each half a dram; Bole-Armenick, Corals, Sarcocol, of each one dram; Dragons Blood, two scruples. Mingle al these with the white of an Egg.

And if we fear that the said *Glutinum* may be separated (which is chiefly caused by the *Sanies* or thin Excrements that flow forth of the Wound) then the Rosin of the Pine, or of the Pitch Tree is to be mingled together with the rest, these not admitting of any humidity. As,

Take *Dragons Blood, Frankincense, Mastick, Bole-Armenick, Rosin of the Pine Tree, of each as much as you think fit; and let them be mingled together with the white of an Egg.* The Linen being in this manner spread over with the said Glue, and furnished with their little handles, two on both sides, at the sides of the Wound, (the distance of a Thumb one from the other) are so to be fastned thereunto that the handles may rightly answer the one to the other: and they are there to be left so long, until that the Glue being dried up the Linen stick fast unto the Skin; which commonly is wont to be done in the space of four or five hours. The Linen now sticking fast unto the Skin, the handles or threads aforesaid are to be drawn close together, and then tied fast one to the other, that so the Lips of the Wound may be rightly united. And in this manner, without any pain at all, and without any Cicatrice and Deformity (such as is wont to be caused by the Needles point) the Lips of the wound are drawn together, and being thus brought together and united they are so kept and preserved a longer time then by that sewing or stitching that is done with the Needle. The aforesaid kind of sewing seemeth to have in it this one only inconvenience and discommodity, to wit, that it is of little or no use until after six or seven hours (for sooner then this it will not be dryed, so as to stick fast unto the Skin:) whereupon it is, that many do first administer the sewing, and then afterwards the glew. But the aforesaid delay can bring no great danger and detriment along with it. And if any danger be feared, instead of the aforesaid Glue, an emplaster may be provided, (which sticketh immediatly) such an one as is described by *Cæsar Magatus*, in his *first B. of Wounds, Chap. 59.* As,

Take *The Gum of the Fir Tree, four ounces; the Liquor of the Elme-Tree three ounces; Rosin of the Pine, Greek Pitch, and Ship-Pitch, and Wax, of each one ounce; Ammoniacum, Mastick, Tacamahaca, of each ten drams; Sarcocol, Dragons blood, Gum-Juniper, and Gum-Hedera, of each six drams, the Root of the greater Consound, of round Aristolochy, Bistort, and Tormentill, of each two drams,*

The Gums that will away with melting are to be dissolved over the Fire with a portion of that which sweateth out of the Fir-Tree; and then the rest that are wont to melt at the Fire being dissolved according to art let them be added, and then let them be well and diligently mingled together, that so they may be reduced into one Body; and then after cast them altogether into an Alembick, and by the heat of the *Balneum* draw forth the Liquor; and when you conceive that the feces are freed from al their Watery Humor, unto these when they are again melted by the heat add the rest of the powders, and mingle them together with al care and diligence; and then again destil them, until that all the Humor be wholly evaporated; and then (withdrawing the Fire) suffer the *Balneum* to cool. For so it is, that the matter which is conteined in the Vessel will become solid, like unto a Cerote, and it will be very tenacious; neither is it by the heat of a mans Body so to be melted and made thin that it forget its office and what it hath to do.

I my self also am wont to use this following, which may be provided with far less labour.

Take *Bole-Armenick, Mastick, Dragons Blood, Frankincense, of each one dram; Gum Tacamahaca, two drams;* And make a powder; which with a hot Pestle you may spread upon Leather, that an Emplaster may be made thereof.

Cæsar Magatus hath likewise a peculiar manner of applying this future by Gluing. He extendeth and spreadeth a part of such a like Cerote upon a new thin Linen cloth; and then with a pair of Cizers from this linen Cloth he cutteth off so many parts (of a Fingers length, or somwhat longer, and as broad as an ordinary point that we use to truss with, but in the ends of them somthing broader) as the stitches that seem to be requisite in a Wound, or not many fewer; and the first he applyeth in the middle of the Wound, and yet so, that it may stick only unto one side of the Wound in the half part of it, and that the rest be free. Unto this, at the side, (but yet opposite unto it) he applieth another; and so by turns he proceedeth, applying one on the right part, and another on the left: and after this, he layeth hold on the parts that are free, (and that as yet stick not unto the Skin,) one with his right hand, and the other with the left, and draweth them both together toward the opposite Lip, until that the Lips be so drawn together that they touch one the other: and afterwards he applieth both the parts that he held in his hand unto the opposite lip, unto which they did not stick; and here he is very Curious, and takes a great

a great deal of pains to make them ſtick right on all parts: and ſo likewiſe he proceedeth in the reſt of them; ſo that betwixt one and another there is left as much ſpace as is otherwiſe wont to be between the ſtitches.

And indeed the well experienced Chirurgeon, who by his long practiſe knows well how by ſuch like Emplaſters that ſtick cloſe unto the Skin (of which there are many ſorts of them to be made) to conjoyn the Lips of Wounds; this Chirurgeon, I ſay, in almoſt all Wounds (Yea even in the very firſt dreſſing) knows how very well to be without the ſaid ſewing or ſtitching made with the Needle, which is both cruel, Bloody, and painful. And certainly it were far better that the Chirurgeons ſhould accuſtom themſelves unto this manner of ſewing Wounds together; in regard that in the other which is performed with the Needle after a kind of Barbarous faſhion they oftentimes commit many Errors, whiles that in ſtitching of the wound they excite more pain then was cauſed by the wound it ſelf: and uſing Needles that are too thick they take in more of the Skin then is requiſite, and ſo often leave the Lips of the Wounds writhed, and pleited; inſomuch that the Skin is not Joyned cloſe unto the Skin, neither the Fleſh to the Fleſh; but the Skin is ſewed in the midſt between the Fleſh: or if they do their endeavor to avoid this evil they fal into another as great, by taking ſo little hold of the Skin that the Wound is left hollow, and the ſtitches within a very ſhort time break out again.

Of the Suture, and Buttons.

And al theſe Conjunctions and drawings together of the fleſhy and ſoft parts are performed without any wounding of the ſaid parts. There is yet another alſo, which is done by diſſolving of continuity. For not only the Ancient Chirurgeons, but thoſe likewiſe of our daies (in Wounds tranſverſe, and great, and altogether in thoſe wherein Swathing only will not ſuffice for the drawing together the Lips of the Wounds) uſe ſewing and Buttons.

What is required unto ſewing of Wounds.

Unto the ſtitching or ſewing of Wounds there are required three things, a Needle, a Thread, and the little hollow Inſtrument, having holes through one end of it.

A Needle.

The Needle that is required (for its more eaſie penetration) ought to have a Triangular point, (which the Currriers moſt commonly make uſe of,) indifferently thick, (that ſo it be not broken, or paſs through the more difficultly) and a little hollowed in the Tayl thereof, that the Thread hinder it not in its paſſage forth. Moſt Artiſts require a Thread of Silk; yet nevertheleſs others reject this, in regard that it eaſily breaketh the Skin, and they take one of Flax, doubling it, that it may be firm and not eaſily broken. And this they will have not to be over much writhed, but waxed, equal, and of a mean conſiſtence. And when the Needle is paſſed through one lip of the Wound, it is then likewiſe to be put through the other Lip of the Wound: and leſt that the Lip through which the Needle ought in the Second place to be paſſed through, ſhould in following fal under the other, and ſo be drawn aſide too much from the other, therefore without there is an inſtrument laid unto it, which they term *Cannula*, or *Canalicus*. To wit, a little Pipe, partly Gold, and partly Braſs, or elſe all of Silver, having holes through one end thereof, that ſo through the holes the Needle may paſs; and that the Lip of the Wound may reſt it ſelf upon the Pipe, leſt that whiles the Needle is paſſing through it ſhould be moved, and ſo not follow upon the drawing forward of the Needle and Thread. And yet nevertheleſs the Lip of the Wound may likewiſe be held together by the tops of the Fingers, to wit, the fore Finger, and the middle Finger; and with the other it may be ſewed together, if ſo be that the Thread paſs through readily, which will be, if in the Tayl the Needle be hollow about the hole (as we have ſaid) and that the Thread in reſpect of its thickneſs bear a proportion with the Needle.

Thread.

The Inſtrument Cannula.

Now the ſewing is performed after this manner. In the middle of the Wound (the Needle drawing after it a double Thread) if the Wound be great the Lips of the Wound are to be thruſt through, and a knot being tied the Thread is to be cut off a little above the knot. And then in the middle ſpaces on either ſide other holes are to be made with a Needle and ſingle Thread, and a knot being then likewiſe made the Thread is to be cut off; and this is to be continued, until the Lips of the Wound be rightly ſewed together. And this Suture is termed *Interciſſa*, becauſe that after every prick a knot is tied, and the Thread cut off. But we are well to look, that the ſtitches ſtand neither too wide, nor yet too cloſe; for if they be too thin, they will not rightly hold the Lips of the Wound together; and if they be over thick, they then cauſe pains and Inflammations. And therefore between one prick and another let the ſpace that is left be ſuch, that

The Firſt way of ſewing.

The Suture interciſſa.

the Skin may as it were follow the Needle drawing it. Some will have it, that betwixt every ſtitch there ought to be a ful Fingers breadth. But it is very ſeldom that there is need of ſo many ſtitches; neither do all Wounds require one and the ſame number of ſtitches; but according as the Wounds do gape more or leſs, ſo there will be need of more or fewer ſtitches. And yet notwithſtanding it will not ſomtimes be amiſs, that not only the Skin but likewiſe that ſome of the fleſh (if it lie underneath) be taken in, to the end that the ſewing may be ſo much the more firm, and that the Skin be not broken thereby. And yet nevertheleſs we are to look well unto it, and to be exceeding Cautious that the Tendons be not prickt with the Needle.

And this is altogether the moſt uſual and moſt Convenient manner and way of ſtitching and ſewing of wounds; in which (this is likewiſe to be underſtood for all other caſes) this only we are yet to acquaint you with (out of *Celſus* his 5. *B.* and 26. *Chap.*) that the ſtitches ought ſo to be made, that the very Lips are not indeed quite to touch one the other; that ſo if there chance to be any humor gotten together within, there may be made a paſſage whereby it may flow forth. And hence it is, that the Chirurgeons are likewiſe wont to thruſt in Tents anoynted with ſome fit and convenient Unguents; that ſo the Humors that are wont to be gathered together in the wounded part may flow forth; and then alſo that the Medicaments may the better penetrate unto the bottom of the Wound.

The Uſe of Tents.

Indeed *Felix Wirtzius* rejecteth the Uſe of Tents in Wounds of the Joynts, and of the Hands, in his *ſecond B.* of *Chirurgery*, and 13. *Chap.* But *Guilhelm. Fabricius* upon very good ground refuteth this Opinion, in his 4. *Cent. Obſervat.* 76. and by four Examples he proveth the ſame to be both abſurd and dangerous. The Firſt Example is of a certain Citizen of *Colen*, who neglecting theſe Tents, a Wound that he had received in his Hand cloſed up in the ſuperficies thereof; whereupon about the fourth day a great pain aroſe, which was followed by a Feaver, an Inflammation, and a *Phlegmone*, ſo that the Hand was in many places exulcerated; and it was not to be reſtored again without much labor and long time.

The Second Example is of a Citizen of *Lauſanna*, who pricked the hollow of his Hand with a Pen-knife. And becauſe the Chirurgeon (by reaſon of the narrowneſs of the Wound) could not by Tents keep it open, there followed thereupon moſt grievous Symptoms; and the ſick perſon could hardly be reſtored to his former ſoundneſs until he had long endured much Pain and Torture.

The Third is of a certain Country Woman, one *Hildena* by Name, who with a Thorn prickt the very tip of her fore Finger. But when as (for the cauſe aforeſaid) the ſuperficies of the Wound had cloſed up, and the *Pus* or filthy corrupt mattier was gotten together about the Nervous parts, there aroſe a great pain; and upon this there ſoon followed an Inflammation and a Gangrene, and from thence a *Sphacelus*. And yet notwithſtanding this Woman (having had her Finger cut off even unto the Hand-Wriſt) at length recovered.

The Fourth Example is of a certain Boor nigh unto *Lauſanna*, who had a Thorn run into his Ankle-bone. But he neglecting the ſame, and the Orifice of the part where the Thorn went in ſhutting up too ſoon, there aroſe firſt a pain; and then there followed ſoon after an Inflammation and a Gangrene; and at length a *Sphacelus* invaded and ſeized upon his whol Leg: and refuſing to give conſent that the Leg ſhould be cut off, he died within few daies after.

It appeareth therefore from theſe Examples, that Narrow Wounds (albeit they are in the Nervous parts) are ſo long to be kept open, until the Wound ſhall be ſufficiently purged. For ſo it is that in every Wound whatſoever there wil get together more or leſs of this *Pus* or purulent mattier, (as we ſhal afterward more fully ſhew you) and this, if there be not opened for it a paſſage forth, muſt needs be there reteined; and this by little and little groweth hot, and becometh very ſharp; whereupon in the wounded part (eſpecially if it be Nervous) there followeth a pain, which by attracting the Blood and the Humors exciteth and cauſeth moſt grievous Symptoms.

And yet nevertheleſs *Fabricius* here adviſeth us, that the Tents are with ſuch Art and induſtry ſo to be fitted and fabricated, that at the leaſt they may hold together the gaping ſuperficies of the Wound, until the reſt of the wounded parts (to wit, the Fleſh, and the Nerves) be ſufficiently purged; and yet ſo, that they may not by any means hurt the Nervous parts. And that therefore the depth of the Wound is diligently to be obſerved; and great care to be taken, that the edge of the Tent (and more eſpecially if either a Nerve, or any thing Nervous be diſcovered and laid open) preſs not together the bottom of the Wound. But now in thoſe Wounds that are ſo narrow that they will not receive

in

in any Tent that is thick, and that that is slender and weak (as that which is over flexible) is turned this way and that way, and therefore cannot reach unto the very bottom of the Wound; in this Case he tels us that his custom was to impose a piece of a Gold or Silver thread, (as long as the Wound was deep) wrapt up in fine Linen, and anointed with some Anodyne and Digestive Unguent.

When the Lips of the Wound shall in this manner be conjoyned, they are wont commonly (and indeed not amiss) to impose the white of an Egg well shaken together, and put into hurds, with this following powder.

Take *Frankincense two parts, and Dragons Blood one part*; And make a Powder. Or,

Take *Bole-Armenick and Terra Sigillat. of each six drams*; *Frankincense, Mastick, Sarcocol, of each two drams and half*; *Myrrh and Aloes, one dram and half*; *Tragacanth, Dragons Blood, of each one dram*; *Barley Meal, and Bean Meal, of each half a dram.* Make hereof a Powder, and mingle the same with the white of an Egg shaken together, and put upon hurds, and so imposed upon the wound; upon which also other hurds that is only wet with the white of an Egg is to be imposed.

Neither is this Medicament administred but for very good Reason; since that it suppresseth the Flux of Blood, asswageth pain, and preventeth Inflammation. But now if there be no fear at all of any such excessive Flux of the Blood, or of any afflux of the Humors, we shal not then need to make any such provision against it; seeing that the Hurds and those Medicaments stick so Tenaciously unto the part, that being throughly dried on they contract the said part, causing great trouble unto the same; and when they come to be removed they excite much pain.

Other waies of Sewing of Wounds.

And now although that what we have already said might suffice, as touching the stitching or sewing of Wounds; yet nevertheless we think it not amiss here further likewise to add some other waies of the Sewing of Wounds, as we meet with them in several Authors. For there is moreover another manner also of sewing of Wounds; which is indeed performed altogether in like sort as Leather-dressers are wont to sew their Skins together; and this is then only fit when the Intestines are wounded and the Veins and Arteries cut asunder.

There is yet another way of Sewing them, which is done with two Needles: and this way *Celsus* used, and describeth it in his 7. *B.* and 16. *Chap.* where you may see it fully set down.

The Buttons of Wounds.

There is among the Ancients mention made likewise of Buttons: For (as *Celsus* writeth in his 5. *B.* and 26. *Chap.*) if the Wound be in the Flesh, so that it gape, and that the sides thereof cannot easily be drawn together into one, then sewing is improper, and in this case buttons are to be imposed (the Greeks call them *Aggleræ*) that may only a little contract the sides, to the end that afterwards the Cicatrice may be the less broad. And because that the way and manner of Uniting the sides of the Wound by buttons was generally so wel known unto them; from thence it was, that neither the matter of these buttons, neither the form of them was ever sufficiently described by the Ancients. *Guido* (whom many follow) writeth that these buttons were made of Iron Circles as it were, or Semicircles, a little crooking on either part; the hooks whereof being on both sides fixed and fastened within the Lips of the Wound did answer exactly the one to the other. But seeing that in this manner to fasten in such hooks as these, and being so fastened there to keep them in the Skin, and especially the Flesh that is so sensible, was nothing else but a keeping there of so many pricking sharp-pointed Needles as it were, with an intolerable pain; it it not therefore Credible that the Ancients by Buttons do understand any such Iron Instrument, to be fastened within the Skin, and there exciting pains that were not to be endured. The Opinion of *Gabriel Fallopius* is far more probable, who (in his *Tract of Wounds in General, Chap.* 12.) tels us that the Button was that kind of sewing that above we called *Intercisa*, and which at this day is in very frequent Use; in the which both the Lips of the Wound are by a Needle drawing after it a double Thread thrust through; and upon the Wound with three turnings in both the Heads of the Thread are drawn together; and tied up into a knot. And although that in Authors there be mention made of Gold and Iron Buttons; yet notwithstanding we are here to know, that the Word Button is a general word, and signifyeth every Instrument whatsoever that Joyneth and keepeth together any things unto which they are applied. And so *Cæsar* (in the 4. *B. of his Warrs in France,*) speaketh of Beams or Rafters conjoyned with Buttons.

There was yet (as we read) another way among the Ancients of sewing and stitching of Wounds; (but this they thought not so convenient, and therefore it soon ceased as to the use thereof) in the which they on both

sides thrust through the Lips of the Wound so many Needles drawing Threads as they thought necessary for the Conjunction of the Wound; and then after this above the Wound they woon'd a Thread about both ends of the Needle; in the very same manner as Women (when they intend to keep their Needles in the Garments they are making) rowl together their Threads about both the ends thereof.

As touching the binding up of wounds, this is likewise to be observed; that we make an exact enquiry, whether the Wound be a simple or single one, or else whether it be reduplicated, and manifold. For it sometimes so happeneth, that although there be but one Wound in the Skin, yet notwithstanding in the Muscles under the Skin there are two or three. For if this should so chance, and that the Chirurgeon should Cure only one of the Wounds, and altogether neglect the other that lieth hid, then will *Pus* get together in that other wound, and there cause great pain, Inflammation, Feaver, and other grievous Symptoms. Of the truth of which *Gulielm. Fabricius* (in his 4. *Cent. Observat.* 84. and 85.) giveth us two remarkable Histories. Where he likewise teacheth us, that the hollow nook that lieth hid may be opened; and there he also describeth, and plainly delineateth unto our view those Instruments that are fit and requisite for this purpose.

Chap. 8. *Of those Medicaments that are necessary for the Curing of Wounds.*

And these are the offices of the Chirurgeon, which he ought to perform in and about the Curing of Wounds; but the very uniting and sodering together of the wounded parts is the Work and Task of Nature; which oftentimes likewise, without any help from Medicaments, (and this especially happeneth in inward Wounds) agglutinateth those things that are disjoyned. And therefore, since that Nature is the Efficient Cause of Conglutination, and Blood the matter thereof, it is necessary that these two be rightly disposed, and in a due temper. For first of all, the truth is, since that the faculty is not indeed hurt in it self, and yet notwithstanding may be frustrated of its end, unless the instrument (which here is the temperament of the part, and the innate heat) be as it ought; therefore we are to take care that the wounded part have its due and natural temper. And moreover (in the next place,) our endeavour must be that the Blood that floweth thereto exceed not its just quantity, neither be less then what it ought; and likewise that it be good and pure. For the vitious and bad Blood that floweth thereto is so far from being fit to Conglutinate, that oftentimes it exciteth many dangerous Symptoms. And therefore if it be impure it is to be corrected, and the vitious Humors all of them to be evacuated. And there is also a due and right Course of Diet to be instituted, and all sort of meats to be avoided that afford a naughty and unwholsome Juyce, from which the Blood that is generated must needs be vitious. When we have thus taken care in these things, then afterward in the curing of the Wound there are also two Offices of Nature. The first whereof is, that the *Pus* she generateth be in a due proportion; and Secondly, That she Conglutinate those parts that are disjoyned. For first of al, (and although that *Galen* make no express mention thereof, whiles that he treateth of the curing of Wounds in the general; yet *Rhases* in his 13. *B.* and 14. *Chap.* and *Avicen* in his 4 *Sect.* and 4 *B. Tract.* 3. *Chap.* 2. and *Celsus* in his 5 *B. Chap.* 26. tel us, that) there is a certain *Pus* or Purulent mattier flowing forth of the Ulcer so soon as it once begins to give any hopes of recovery; and therefore this *Pus* must in the first place be furthered in its motion, and that then the Ulcer is to be Cleansed and filled up, and at length after this is done the wound is to be closed up with a Cicatrice. And happy experience hath indeed approved of that kind of curing; and those Medicaments that are for this end applied are commonly called Digestives. Neither is this without Reason. For whenas even out of the smallest Veins (when they are cut asunder) in the wounded part there floweth forth some of that Blood that by Nature is destined to flow unto the part, for its nourishment, this sticking in the pores of the part, and it being so that it cannot be carried unto the part whither it tendeth, it is by Nature converted into *Pus*. And furthermore the very wounding it self hath Joyned with it some kind of Contusion, and the part affected is altered by the Ambient Air. And therefore there is a necessity that what is altered should impostumate, and be turned into *Pus*. And therefore in this the Physitian ought to succour Nature, and to administer those Medicaments that help forward that generating of *Pus* (these Medicaments they commonly cal Digestives) and afterwards to apply Sarcoticks, or such as Agglutinate. But here notwithstanding Authors seem a little to differ in their practise. For some of them (the said Digestives and Suppuratives being wholly neglected) presently administer those Medicaments that dry much, to wit, Balsams, either

ther Natural or Artificial (of which we shall speak more hereafter) with the which they both anoint the wound al over, and instill it likewise unto the very bottom of the wound, and by Tents also impose it upon the same. Others there are that in the first place make use of those Medicaments that further & help on the *Pus*, which they call Digestives. And *Hippocrates* himself seemeth to have approved of both these wayes, when (in his Book of Ulcers) he thus writeth. *Al the newer Wounds (saith he) as well themselves, as the parts situate round about them, are but little or not at all infested with an inflammation if they be with al speed suppurated, and if that the pus of the wound be no waies suppressed by some small bone, as being intercepted thereby: or if we take care to prevent that nothing may come unto the pus but what is necessary, and that in as small a quantity as possibly may be; but that we dry it as much as may be with a Medicament that is not at al troublesome.* And experience hath taught us, that in both these waies of curing the Chirurgeon hath attained unto his end, and what he desired. And yet nevertheless, it seemeth not that both these Medicaments are to be made use of without any kind of difference.

For in regard that those Digestive Medicaments so commonly made use of are more moist, if they be without great caution and overlong administred, the matter beginneth not only to be digested, but also to putrefy; and the Wound degenerateth into a sordid Ulcer. For seeing that Nature is the author both of Concoction, and also of the generating of flesh the native heat and the temper of the part (Natures instruments) are to be preserved; and we must endeavor that the medicaments may answer unto the temperament of the part. And therefore although that the former way of curing may have its place in those parts that are fleshy, as being such as are more moist, and in which there is much of the blood that is to be turned into pus sticking in the pores of the part, which (that so the pain and the inflammation may be prevented) ought as soon as may be to be converted into pus; which work of Nature those drier kind of Medicaments might more easily hinder: yet in the parts that are more dry those drier Medicaments seem to be more commodious and proper; which as they may preserve the temperament of the part, so they themselves may likewise help forward the necessary generation of the *Pus* or purulent matter. And therefore the safest way is, not alwaies to confide in one Medicament alone, but rather to compound them according to the Nature and temper of the part; and to mingle Digestives with Sarcoticks and those that Agglutinate; since that experience testifieth that such are used with far better success then meer Suppuratives; as *Franciscus Arcæus* writeth that with his Balsam or Unguent (which we shall anon acquaint you with) applied forthwith in the very beginning, he himself most happily cured the greatest and most grievous Wounds; the use whereof I my self have likewise very often experienced with very happy success. And therefore I will now subjoyn such Digestives, which are not meer Suppuratives.

Digestives, or those things that further the Pus.

There may then be provided Digestive Medicaments, or such as further the purulent matter, *of the yelks of Eggs, Butter, Oyl of Roses, Oyl of Mastick, Rosin of the Turpentine or Fir-Tree, Wheat flour, Frankincense, and Mastick.* As,

Take *Turpentine washed in white Wine, two ounces; the yelk of one Egg; Barley Meal, and Honey, of each a sufficient quantity*: And make an Unguent. Or,

Take *Turpentine washed in Wine, May Butter unsalted, of each one ounce; Frankincense and Mastick, of each a like sufficient quantity.* Mingle them. Or,

Take *Turpentine, half an ounce; Frankincense, one dram; fresh Butter, one ounce; the yelk of one Egg;* And mingle them. Or,

Take *Citrine Wax, one ounce; Oyl, four ounces; Frankincense and Mastick, of each two drams; fresh Butter as much as will suffice, the yelks of two Eggs*: Mingle them. Or,

Take *Oyl of Roses, half an ounce; Turpentine, one ounce; the yelk of one Egg;* And mingle them.

So soon as ever there is any appearance of good *Pus*, the next thing we are to do, is, that we Conglutinate that which is wounded and disjoyned.

The union of the Parts *how caused.*

Now we are taught by *Galen* (in the 91. *Chap.* of his *Art of healing*; and in the 3. *B.* of his *Meth.* of *Physick*, *Chap.* 4.) that the Union of the Parts disjoyned in Wounds is wrought in a twofold manner; to wit, either by a true Union, which is by a *Medium* of the same kind, and not by the intervening of any other substance; or else by a *Medium* of a different substance. The former Union they cal a Union according to the first Intention; because that such a Union is intended both by the Physitian, and also by Nature her self. The other they term a Union according to the Second intention; because that both the Physitian, and Nature, when they cannot attain unto what they primarily intend; they then do what they can.

In

In the former manner the soft parts and the flesh are united and grow together; but the hard parts in the other manner; to wit, the bones, and the Skin; of which those are united by a *Callus*, but these by a Cicatrice. Unto the former Union is required a substance of the same kind, and a strong Active faculty; which in the other are wanting. For in the Fleshy and soft parts there is present abundance of Blood; and in these the heat is strong; and thereupon the Blood by a very smal alteration may be changed into Flesh, whereby the wound may grow together. But in those parts that we call spermatick, and the harder parts, (the Nature of which parts being at a far greater distance from blood, and the Native heat of these parts being much weaker) it is not the very same that is generated anew, but some thing like thereunto. For instead of a Skin there is bred a Cicatrice (most like indeed unto the Skin, but harder and thicker then it) and instead of a bone there is a *Callus* produced. And this distinction of *Galen* (as being that which is generally and commonly received) I my self have likewise followed (in the 5 *B.* of my *Institut. Part* 2. *Sect.* 2. *Chap.* 4.) and even in his very manner. But it seemeth altogether to stand in need of some kind of Explanation. Now this especially consisteth in the division of the part into parts Spermatick, and parts proceeding from Blood; by which it is determined, that certain parts are generated from the Seed, and certain of them from the blood. Yea, some certain Physitians there are (among whom *Cæsar Magatus* in his 4. *B.* and 15. *Chap.*) who deny that the blood is the immediate Aliment of the Spermatick parts; but they write that there is a necessity, that if the blood ought to nourish the Spermatick parts, that then the seed must first be made.

But it is not my purpose here in this place in many words to discuss that Question; the which, as others, so *Andr. Laurentius* (in his 1 *B. of Anatomy, Chap.* 21. *Quæst.* 7.) hath so largely and fully controverted. I conceive this to be the truer Opinion, that the first delineation of all the parts in the Womb is wrought by the Formative faculty from and out of the Seed. Whereupon *Hippocrates* (in his *little B. of Originals*) writeth, *that the Conception hath in seven daies all whatsoever it ought to have; all the Members, the Regions of the Eyes, the Ears, the Hands, the Fingers, the Thighs, the Feet, the Toes, the Privities*, &c. But now seeing that the Mass of the Seed is but little, it is impossible that the Bulk of the whole Body should from the Seed acquire that magnitude that it ought to have. And therefore afterward the parts take nourishment and increase from the Mothers Blood in the Womb; and afterward the Child being brought forth into the light, the parts are augmented from the Blood, and so even unto the end they are nourished with the blood. Which manifestly appeareth even from this, that the very bones when they are at any time shaved yield forth Blood, which is their Aliment.

But now, that which some affirm touching those parts we cal Spermatick, that they are nourished by the Seed, is a thing most false. For how can so great a bulk of the Body be formed, nourished, and augmented from so smal a Mass of Seed? And then again, the Seed is no where else generated but in its own proper Vessels. Yea moreover, Children (whose bones nevertheless are nourished and augmented) do not generate any Seed. Neither is it sufficient, what *Laurentius* saith, that the blood variously changed, and suffering many alterations, made white, and thickned, is nothing else but Seed. For this is most false. For neither is the Seed any where else generated but in its own Organs; neither are other substances Seed, although that in whiteness they are like unto Seed.

And therefore albeit that those white and more dry parts (which they commonly cal Spermatick) be generated and nourished from the Blood suffering many Changes; yet nevertheless in very truth they are generated and nourished from the Blood. And therefore it is true indeed that the flesh that is generated for the agglutinating of the Fleshy part of the Wound is altogether like unto the former, as being such into which the blood (by reason of the neer alliance of the matter, and the strength of the Fleshy parts) is most easily changed: but yet I shall not rashly affirm, neither easily beleeve, that the Skin and the bones, and the rest of the Spermatick parts may be united by any thing Heterogeneous; and yet without any absurdity I think it may be said, that the Cicatrice is a Skin, and the *Callus* a bone. For although there appeareth some kind of difference between a Cicatrice and the Skin, and between a *Callus* and bone; yet nevertheless they are not of a different substance; but that dissimilitude proceedeth from thence, that the blood needeth many and more laborious changes, that it may be made Skin, Nerve, or bone, then that it may be made flesh; and the heat of these parts is the weaker, in regard that it was weakned by the Wound. Wherfore the Formative faculty indeed generateth both the Skin, and the bone, but such as are not of so great account as are those that are generated in the first Formation. And yet

in

in the mean time, although the Cicatrice and *Callus* differ somwhat from the former Skin and Bone, they are not for all this to be said to be of another kind. And that also even for this Reason, because that the Cicatrice is not at any time generated but from the *Cutifick* faculty, neither the Callus but from the *Ossifick* (or bone-breeding) faculty; and therefore hence likewise it is (as we told you above, in the 2. *Part*, *Chap.* 2.) that there is never any Skin generated from Flesh; but the Skin is evermore generated from the Skin; and indeed oftentimes a very great portion thereof, as is evidently to be seen in the Members that are cut off. For who is it that will not rather cal that Skin with which the Flesh of the Hand cut off is covered, then any thing diverse and different from it? But although that the Conjoyning and Conglutination of the Disjoyned parts be the work of Nature alone; yet nevertheless, that Nature may the more easily effect this, the Physitian comes in for her assistance, by administring certain Medicaments both External, and Internal. The External are *Sarcotick*, or such as *Generate Flesh*; and *Kolletick*, or such as *Agglutinate*: Touching which we have already treated more at large, in the 5. *Book* of our *Institut.* *Part* 1. *Sect.* 1. *Chap.* 9. But although (as there we have shewn you) they may be propounded as divers; yet notwithstanding, seeing that the Conjunction of the wounded parts is wrought by means of the Flesh; the same Medicament (as is there said) according to the diversity of Bodies, and difference of the wounded parts, is somtimes *Sarcotick*, somtimes *Agglutinative*, and somtimes likewise *Epulotick*, to wit, such as generateth a Cicatrice.

Sarcoticks. But now, let us see and consider, by what power and virtue those Medicaments do afford any benefit in the curing of Wounds. *Galen* in his *third B.* of the *Meth.* of *Physick*, and 4. *Chap* is very large and ful in treating of this subject; and there he teacheth us, that there are two kind of Excrements produced in our Bodies; the one more thin; which for the most part is Evacuated by insensible Transpiration, and somtimes likewise by sweat: the other more thick, that sticketh externally unto the Body, and such as we term Filth and Nastiness. And so, that which is more thick, if it stick in the Ulcer is wont to make it sordid and filthy; but that which is thin maketh the Ulcer over moist, and so becometh an Impediment unto Nature in her generating of Flesh: and therefore (as he tels us) the filth and impurities are to be cleansed away, and the humidity to be dried up: and so, that those Medicaments are Sarcoticks, that moderately heat and dry, and cleanse away those impurities without any biting, and are no waies Astringent: and that the end of Sarcotick and Agglutinating Medicaments is, not to permit any humidity at all to breed between the parts that are to be Joyned; as the same *Galen* teacheth in his *second B. of the Composit. of Medicam. according to the kinds*, *Chap.* 21. And that they ought not to be Astringent, lest that they should drive back that which floweth in, and stuff in those impurities into the part affected: and that they must not be over drying, lest that they consume that that floweth in; but only moderately drying, that what floweth unto the part may grow together into flesh. And this indeed is almost the common Opinion touching Sarcotick and Unlnerary Medicaments.

But some of the latter Physitians tel us that this is better performed by a Balsamick virtue (from whence likewise they cal certain Liniments that are administred for the Curing of Wounds, Uulnerary Balsams:) But what this virtue is, they do not sufficiently explain: which if it be rightly explained, this Opinion will not then seem much absurd. For *Galen* teacheth us, (and so likewise other Physitians very frequently) that the Chirurgeons pains must in this most especially be imployed, that the temperament of the wounded part may be preserved. For since that the Agglutination of the Wounded parts is Natures work; and that Nature, in this, as in all other Natural actions, useth as her instrument the innate heat and temperament of the part; if that be as it ought, and if it be vigorous and strong, then the Curing of the Wound is happily performed; and by the benefit of this Native heat it hath been oftentimes known that many have recovered of the most dangerous wounds. But if the temperament of the part be vitiated, and the part become weak, Nature can then neither rightly concoct the Aliment that floweth thereto, neither Assimilate it, nor expel the Excrements; from whence it cometh to pass, that there happeneth a conflux of Humors unto the part affected, that there is an extraordinary heaping up of Excrements in the part, and from thence many Evils and Symptoms are attracted. Whereupon *Hippocrates* (in his *B. of Wounds*) writeth, that *what is dry cometh the more nigh unto that that is sound*; and that *by how much the more moist any thing is the neerer it cometh unto that that is vitiated, and not sound.* And therefore it seemeth unto me very probable, that Medicaments *Sarcotick*, and Agglutinative, and in a word, all vulnerary Medicaments, do indeed dry; and yet notwithstanding that this is not the only and primary operation they have; since that

that many Wounds (if so be the temperament of the part be safe) may likewise be Cured without the help and assistance of these like Medicaments; and Nature of her self expelleth those Excrements that are produced in a due and mean quantity. But it seemeth probable unto me, that those Medicaments are therefore profitable and expedient in the curing of Wounds, in regard that they do not only dry, and consume the over great store of Humidity in the Wound; but in that they likewise preserve both the temperament, and the innate heat of the parts (which some of the latter Physitians cal Balsam) by their virtue, neerly allied and familiar unto every part; which virtue they semblably term Balsamick. And hence therefore it is, that because there is not the same temperament in al the parts, and that there is a Native heat proper unto each part, therefore the same vulnerary Medicaments are not fit and proper unto all wounded parts; but some are convenient for a fleshy part, others for a Nervous part that is wounded; like as *Gum Elemi* is useful for all the Nervous parts; and therefore also most fit and convenient in all Wounds of the Head, as oftentimes before we have told you.

And I am the rather likewise perswaded hereunto, even by this, that in Wounds (especially of the Joynts, where dangerous Symptoms appear to be neer at Hand) our more skilful Chirurgeons do not content themselves only with Unguents and Emplasters, but upon those also they impose Cataplasms with very happy success; the which in regard they do not reach unto the Wound it self, they cannot therefore throughly dry up the Excrements that are therein; but they only cherish and preserve the Temperament and Native heat of the part. And I have oftentimes seen in Wounds of the Nerves, (in which by Reason of the weakned Temperament of the part there hath been an afflux of Humors, and in which by reason of the imperfect Concoction of the Aliment thereunto flowing great abundance of Excrements have been stored up, the German Chirurgeons cal them *das Glied Vvasser*) that by the use of such Cataplasms the Wound hath been reduced unto a better State, and hath no longer voided forth so great an abundance of Excrements. Now those Cataplasms are prepared and made up of the *Roots of Marsh-Mallows, the Meal of Lin-seed, Fenugreek, Beans, the powder of the flowers of Camomile, Melilote, Betony*, and the like.

And yet notwithstanding, from this that we have said (to wit, that the main and chief scope of Vulnerary Medicaments is to preserve and strengthen the Native heat of the part,) it doth no waies follow, that by one Medicament the Wounds of all parts may be healed. But like as *Galen* (in regard of the dryness, which chiefly belongeth thereto) according to the various Temperament of the various parts administreth various and different drying Medicaments; so likewise according to the variety of the Temperament, the temper and heat of each singular part requireth divers Medicaments; so indeed, that what is fit and proper for one part may be hurtful unto another; and that which is proper and useful for a fleshy part may bring much damage unto a Nervous part. For the fleshy parts are endued with much heat; and therefore albeit those things they are Cherished with be not so very hot, yet nevertheless they have strength enough. But as for those parts that are bloodless, their heat is much weaker, and therefore they are to be cherished with such things as are more hot, and then more especially when they are much weakened with a wound. Yea it may so happen, that although in their first Qualities some Medicaments may seem alike; yet notwithstanding in regard of their substance (by reason of which some of them do sooner lose their strength and virtue, and others preserve it a longer time) they may much differ; Yea they may differ in their whole substance, and hidden property. Now that an instance may be given of such Medicaments *Galen* assureth us, in his *Composition of Medicaments according to the place affected*, and 1 *Chap.* where he inveigheth against such as deny that there are such Medicaments. But a Reason cannot easily be rendered for such Medicaments; only experience teacheth us, that some of them are more useful and efficacious in the curing of wounds, then other, and especially in the Wounds of these or those parts;) although that in their first Qualities they differ but very little. In the mean time I am of Opinion, that the manifest Qualities in such Medicaments that work at once from their whole substance are not altogether idle and useless; but that they are singularly useful for the drying up of that excessive humidity that is in the Wound. And as there are Medicaments which in the propriety of their whol substance are accommodated unto certain Particular parts, (as some to the Liver, others to the Brain, and a third sort unto the Lungs) so likewise it is not absurd to say, that there are some Vulnerary Medicaments that are peculiarly designed unto certain parts; some to the flesh, others to the Nerves, and a third sort to the Brain, &c. And most certain it is, (as experience also makes it manifest) that *Gum Elemi* is singularly useful in Wounds of all the Nervous parts, as

also

also for the Brain; and *Betony* for the head, so that it is a thing of much concernment that in the administring of vulnerary medicaments we make a due and fit choice: and not only so, but the Nature of the sick person is likewise seriously to be weighed; since that even experience tells us, that in wounds some certain Medicaments are more useful for some Natures, and again, that some other are hurtful. And this indeed is chiefly to be discovered by experience, (if not only by experience:) and what *Galen* (in his third *Book* of the *Meth.* of *Physick*, *Chap.* 8.) writeth touching exsicating Medicaments, the same is also true concerning all Vulnerary Medicaments, to wit, that due respect is to be had unto the excrements, and the state of the Wound. For if there be but few excrements generated in the Wound, and that the Wound be otherwise in a good condition, this is an evident sign and token of the excellency and usefulness of the Medicament thereunto applyed; whereas on the other side, if there be many excrements heaped up in the Wound, it is an evidence that the Medicament administred was unfit and improper. In the mean time, neither are the manifest qualities to be neglected; but I conceive that of them likewise we are to make a due and fit choice, according to the temperament of the whol body, and the part affected in particular. Neither are we in this to neglect, but carefully to heed the constitution of the Air; but in the hotter seasons the medicaments may be the cooler; and the cooler the season the hotter ought the medicaments to be that we make use of.

Vulnerary Medicaments.

Now the vulnerary Medicaments (both Sarcotick, and Agglutinating) are provided, and made of the Roots of the greater Consound, *Bistort*, *Tormentil*, *the leaves of Ladies Mantle*, *Shepherds pouch*, *Golden rod*, *Balsam apple*, *vervain*, *Speedwel*, *St. Johns Wort*, *Milefoil*, *Sanicle*, *Horsetayl*, *Elm*, *Plantaine*, *Betony*, *Cypress*, *Mouseare*; *the flowers of Red Roses*, *St. Johns Wort*, *Pomgranates*; *Cypress Nuts*; *Frankincense*, *Aloes*, *Mastick*, *the tears* (*or sweat*) *of the fir tree*, *Rosin Turpentine*, *Rosin of the pine*, *and of the Larch tree*, *dry Pitch*, *the liquor of the smal leaves of the Elm tree*, *Gum Elemy*, *Gum Junip. Gum Hederæ*, *Tragacanth*, *Tacamahaca the Gum Caranna*, *Sarcocol*, *Dragons Blood*; *Sealed Earth Bole Armenick*; *the Rinds of the Frankincense Tree*, *the stone Hematites*, *and Coralls*. Of which there are made divers compositions, Liniments, & unguents. The Chiefest of these Liniments is that of *Francisc. Arcæus*; viz.

Liniments, and unguents.

Take *Clear Turpentine, and Gum Elemi, of each one ounce and half; the fat of a Gelt, two ounces; Old Hogs Grease, one ounce; let them melt at the fire, and make a Liniment.* Or,

Take *Rosin, Wax, Turpentine, Oyl of Roses, of each two ounces; Frankincense, Mastick, Myrrh, of each two drams; Make an Unguent.* Or.

Take *Turpentine two ounces, White Rosin, Olibanum, Colophony, of each two ounces and half; Mastick one ounce, Saffron one dram; Wax half a pound; Common Oyl one pound and half; Make hereof an unguent according to Art.* Or,

Take *the Juice new drawn of Ladies Mantle, of Sanicle, of Saracen Consound, of each alike, as much as you think good; set them to the fire, and then add, of old Swines fat, and May Butter, of each alike as much as will suffice, and make an Unguent.* Or,

Take *White Rosin three ounces, May Butter six ounces, Juice of Ladies Mantile one ounce, Sanicle Wintergreen, of each an ounce and half, Goats beard, , Oyl of Olive, of each two ounces. Let the Juices be first boyled with the Oyl until the moisture be consumed, then add the Rosin, and after that the Butter: then let them be strained, and stirred well together until they be cold.* Or.

Take *the Herb Wintergreen, Adders tongue Sanicle, Speedwell, of each one ounce; flowers of St. Johns Wort, and Centaury the less, of each six drams: let them be cut very smal, and shut up in a Glass bottle. Add Oyl Olive one ounce, the fat of a Hog three ounces, unsalted Butter four ounces; let them stand in a hot place, or in Balneo Mariæ, for eight days; afterwards boyl them till the humidity be consumed, and then strain them; after this add Turpentine one ounce, Mastick, Frankincense, & Myrrh, of each half an ounce, Aloes Hepatick one ounce, and make an unguent.*

The Unguent likewise of *Cæsar Magatus* is very useful; As,

Take *our Oyl of St. Johns Wort one pound, Wax washed in Balsam water three ounces. Let them melt together in a narrow mouthed Glass vessell; when they are melted, ad unto them of our Balsam one pound, Gum Elemi three ounces; Balsam of Peru, Tacamahaca, Caranna, of each two ounces, (all these Gums are to be dissolved severally and apart with our oyl of St. Johns Wort) Ammoniacum and Galbanum in like manner dissolved, of each half an ounce; Myrrh, Frankincense, Aloes, Gum hedera, of each two drams; the Roots of Consound, Birthwort, Bistort, and Tormentil, of each one dram and half, Cretan Dittany three drams, Water Germander two drams, Mans*

fat prepared two ounces; Swans fat, one ounce; mingle them, and make an Unguent; and keep it carefully in a narrow mouthed vessel of Glass or Silver.

Balsams. | *Oyls and Balsams: natural, as the Balsam of Tolu, of Peru, and the like; and Artificial; as,*

Take *Oyl of Bayes two ounces; Mastick, Olibanum, Goats sewet, of each one ounce, and Mingle them.* or,

Take *the yellow that is in the middle of red and white Roses, and white Lilyes, of each as much as will suffice; pour in unto them Oyl Olive a sufficient quantity; and then set them in the Sun (in a Glass close stopped) for fourteen daies.* or,

Take *Turpentine, and Oyl of Bayes, of each four ounces, the Oyl of the yelks of Eggs, two ounces; Oyl of Roses half a pound; mingle them, and set them in the Sun, until they shall have gotten a yellowish colour.* or,

Take *Turpentine one pound; Galbanum, Gum Elemi, Gum Hedera, Frankincense, Mastick, Myrrh, of each two ounces; Aloes, Xyloaloes, Galangal, Cloves, Cinamom, Nutmeg, Cubebs, of each one ounce, Aqua vitæ three ounces. Let them be macerated together for a day and a night, and afterward let them be twice destilled; and keep that destilled oyl as a pretious Balsam.* Or,

Take *the Liquor of the bladders of the Elm defecated and prepared, one pint; the best hony purified three ounces, Juice of Tormentil, of the greater Consound, and of the mean Consound of each four ounces; mingle them, & boyl them over a gentle fire to the consumption of the Juices; and then ad the following powders.*

Take *Dragons Blood, Oriental Bole-armenick, Manna thuris, Horse Tayl, Mastick, of each two drams: Mingle them, and make a very fine pouder, and ad it unto those things above mentioned.*

The preparation of the liquor of the Elm-bladders is thus; in the moneth of *May* these kind of bladders are to be gathered, before there breed any Worms in them; and with this liquor a glass vial is to be filled up, and stopt with a linen cloth: after this a hole is to be made in the earth, two or three hand breadths in heigth; and in the bottom of the hole we are to put common salt three fingers high; upon which the vial is to be placed; and then the hole to be filled up with earth, so that the vial appear not; and so it is to stand for twenty five daies: then the dreggs are to be separated from the cleer substance; and that which is cleer is to be kept for use; which if you put of it self alone unto the disjoyned parts, it agglutinateth them.

Another Balsam.

Take *Frankincense, Myrrh, Sarcocol, Gum Junip. Gum Arabick, Gum hedera, Gum Elemi, Mastick, Dragons blood, Balsam of Peru, Tacamahaca, Caranna, of each one ounce and half. The tears or sweat of the Fir tree, the liquor of the little leaves of the Elm, of each one pinte; Rosin of the pine, half a pound; Tormentil roots, Roots of Bistort, of Orace, Birthwort, Consound, white Dittany, of each half an ounce; Juniper berries, and Bay berries of each six drams; spirit of the best wine, three pints; mingle them together, and destill them, and receive the water, the spirit, and the oyl, severally and apart; All of them are excellent good for the agglutinating of any Wound.*

Another Balsam.

Take *the oldest oyl you can get, four ounces; Venice Turpentine ten ounces and half, whol Wheat two ounces, St. Johns Wort two ounces and half, the roots of Carduus Benedict. and valerian, of each ten drams; the finest smal dust or pouder of Frankincense, two ounces; Hypocistis (or the excrescence of Cystus) half a dram; Bolearmenick and Dragons blood, of each half an ounce, the pouder of Earth-Worms two drams, the greater Consound one handful, Horse Tail half a handful; let the roots and herbs be bruised after a gross manner, and then put up into a vessel; and then pour in white Wine unto them; and after they shall for a while be thus infused, let the oyl and the wheat be added, and all boyled unto the consumption of the Wine. After this pressing and squeezing forth the Liquor with al your strength, ad the powders and the Turpentine, and then suffer it again to boyl a little, and so keep it in a Glass vessel for your use.* Or,

Take *Turpentine two pound, Common oyl three pints, Oyl of Bayes six ounces, Oyl of Cinnamom, two ounces; Oyl of Euphorbium, oyl of Cloves, and oyl of Bay berryes, Gum hedera, Ammoniacum, Sagapenum, Opopanax, Galbanum, of each one ounce; Frankincense, Mastick, of each two drams; Let them be together destilled; and make a Balsam for the Wounds of Nerves.* or,

Take *Clear Turpentine two pound, oyl of Linseed one pint, Rosin of the Pine six ounces, Frankincense, Myrrh, Aloes, Mastick, Sarcocol, of each three ounces; Mace, Ligne Aloes, of each two ounces; Saffron half an ounce: put al these into a Retort, and first of al let them be destilled by a gentle fire, and there wil come forth a cleer water; and a little after there wil follow a reddish oyl; then augment the fire, ever and anon more and more increasing it, unto the end of the destillation. This being done, separate the oyl from the Water, and keep them both assunder. This water in a short time will become of a reddish colour, and the oyl wil be of the color of a Rubie. This oyl is exceeding good*

good for Wounds, but especially the Wounds of the Nervous parts, of the bones, and of the Veins: for it Consolidates speedily, and without pain. Another,

Take *Earth-worms as many of them as you think fit: put them into a Vessel filled up with the Moss of the wild Sloe-Tree, to the end that creeping through the Moss they may be purged from their filth: add likewise unto them the yelks of Eggs hard boyled, and sliced, that they may serve them for food. Of these Earth-worms thus prepared, take one pound, and let them be well bruised in a Mortar; and then add Oyl of Roses one pinte, boyl them, and afterwards strain them; and unto the straining add of Mastick and Myrrh, of each two drams, the Root of Orace and Sarcocol, of each six drams; Turpentine, and Honey of Roses, an ounce and half; Mingle them.* Or,

Take *Oyl of Olives, one pinte; Turpentine, three ounces; flowers of* St. *Johns-wort, Mullein, of each a sufficient quantity, that there may be a Masse made: unto which pour of the best white Wine, a measure and a half; and boyl them til the Wine be consumed. Let the species be afterwards put in the Sun for two months, that so there may be made an Oyl or a Balsam.* Or,

Take Roots of the greater Confound, as much as you please thereof; put them in a new Pot, and pour in of the Oyl of Olives unto a good heighth; boyl them, and press forth the Liquor; the Juyce thus pressed forth, boyl it again so long, until there be none of the Waterinesse left remaining, and then afterwards,

Take *Of this Oyl, three parts; Oyl of Turpentine, one part; Flowers of* St. *John wort, and of the greater Celandine, of each as much as will suffice: let them be mingled and melted together, and so put into a Glass Flagon; and so let them stand for fourty daies in horse dung, and then you shall have a Balsam, which you are to instill Warm into the Wound.* Or,

Take *Oyl Olive, a pinte and half;* St. *John-wort, Betony, Prunella or Self-heal, Centaury, of each one handful; let the Herbs be bruised together, and with the Oyl let them be shut up in the Glass Vessel; and then set them in the heat of the Sun, for the space of fourty daies, there to digest; and afterwards press forth the liquor; which you may reserve for use.*

The following Oyl (as *Hieronymus Fabricius* tels us) is in *Spain* very much commended, for all Wounds of the Nervous parts.

Take *Of the oldest Oyl, three ounces; pure Turpentine eight ounces, whole Wheat, one ounce and half; Seed of* St. *Johns wort, two ounces; Roots of Carduus Benedict. and Valerian, of each one ounce; Frankincense powdered two ounces; let the Roots and Herbs be bruised in a gross manner, and put into a Pot; and then pour in so much white Wine that all may swim in the Wine, or at least be covered therwith; and after two daies infusing, let the Oyl and the Wheat be added; and then boyl them all until the wine be wasted away; and presently after having first strongly pressed forth the Liquor, add the Turpentine and Frankincense; then let them be again a little boyled; and kept for use in a Glass Vessel.* The manner of using it is thus. The Wound being first washed with cold white Wine, the whole Wound is then forthwith to be anoynted with the Oyl aforesaid a little warm; but if this cannot conveniently be done, it is then with a Pipe or Funnel to be conveied within the Wound; and immediatly the Lips of the Wound are to be brought together so close that they may touch, either by a Ligature, or by sewing, or by Gluing. And then the parts that lie round about are likewise to be anointed with the aforesaid Oyl. Upon the Lips of the Wound now drawn together you are to lay on a Linen Cloth wet in the aforesaid Oyl: and above upon this another wet in black Wine, and then wrung dry, and then upon this another dry Linen Cloth; and then Lastly, upon al the Swathe is to be rolled about, and fastened.

The Oyl of Hispana.

That Oyl likewise which they cal the Oyl of *Hispana* is much commended; and it is thus to be prepared, and made.

Take *Old Oyl of Olive four pound, Oyl of Turpentine, two pound; Frankincense one pound, Valerian,* St. *Johns-wort, Carduus Benedict. of each half a pound; Elect and Choice Myrrh, one ounce; Cutchioneal, four ounces; new Rosin of the Pine, three ounces; Malmesey three pintes.*

Let the Valerian be gathered in the month of *May*, and cast away the Roots. The St. Johns-wort may be gathered in the month of *July*, with the Flowers and Seeds. The Herbs therefore being broken with the Hands, and a little bruised in a Mortar, let them be infused in the Malmsey and put into an Earthen Pot covered over with Glass; of which said Pot let the third part remain empty of all those things aforesaid that are put into it, for four hours. In the next place let the Cutcheoneal (a little broken in a Mortar) together with the Oyl, be put upon the rest; and so without any Covering let them boyl by a gentle Fire, until the Wine be well nigh wasted; and here great care must be taken, that the Herbs be not burnt in the boyling. After this let it be taken from the fire, and while it is yet scalding hot let the Herbs be pressed and squeezed very hard in a bag first

soaked in Malmsey. And then let the Vessel in which the boyling was be carefully cleaned; (and yet nevertheless it will not be altogether dried, for there will still be left some of the Wine sticking to the sides) and in the same Vessel let the Oyl be again put to the Fire, with the Oyl of Turpentine, or that that sweats forth of the Fir-Tree; and so soon as ever it begins to boyl, let the Mirrh bruised and beaten very smal be added, and melted in a Mortar with a little of the Oyl that is in the Vessel over the Fire. Let Rosin in like manner be added, melted with the same Oyl; yet nevertheless it must be first strained through a strainer; and then add the Frankincense being very finely powdered; &; let al the other things be in the most exact and curious manner mingled together; and when they have boyled a little, let the Vessel be taken from the Fire; and when they are grown cold, let it be kept in a Glass Vessel, without any straining at al; and so let it be set abroad in the Sun, for fifteen or twenty daies.

The Oyl of St. Johns-wort, invented by Magatus.

Cæsar Magatus commendeth likewise the Oyl of St. Johns-wort, of his own invention; which is thus with much labor and pains to be made.

Take *the Tops of St. Johns-wort, three handfuls; Adders Tongue, the greater Consound, and Horse-Tail, of each one handful; white Wine well scented and strong, five pints; let the Herbs be bruised and macerated in the said Wine for the space of twenty four hours, the mouth of the Vessel being carefully and close stopt: and then making an expression, and straining what is so pressed forth, take the like Quantity of the said Herbs, and let there be a second infusion, and after that a third. The last infusion being made, and the liquor pressed forth and strained,* Add then unto the white Wine,

Of old Oyl six pound; the Tops of St. Johns-wort, two handfuls, Adders Tongue, the Herb commonly called Meddow-sweet, or Regina prati, the greater Consound and Carduus Benedict. of each one handful, the Root of white Dittany, the greater Consound, Birth-wort, Tormentile, Bistort, of each half an ounce; Scarlet Grain or Chermes Berry, two drams; Seeds of St. Johns-wort, six drams; and mingle them. Having bruised those things that are to be bruised, let them be macerated in Balneo in hot boyling water, the mouth of the Vessel being well stopt, for twenty four hours; and afterwards let them boyl in a double Vessel, tel the Wine be consumed; and then pressing and wringing forth the Liquor, and straining it through a bag first well moistned in the best white Wine, Add thereunto.

The Tops St. Johns-wort, two handfuls; Adders Tongue, the Herb Meddow-sweet, Consound, Woodroof, (which the Latine Herbarists call Matrisylva) *of each one handful; mingle them. The Herbs being bruised, and an infusion made in a Bath of scalding hot Water, or in Balneo Mariæ, for twenty four hours; and after this an expression being made, and the Liquor strained, (as before,) take the like quantity of the aforesaid Herbs, and make another infusion, as above; and so a third: and the last expression and straining being made, add to the Oyl, Leaves of St. Johns-wort, two handfuls; Betony, Pimpernel, Mous-Ear, the Herb Trinity, of each one Handful; of these make three infusions, as above; the last expression being made, and the liquor strained,* Add unto the Oyl,

Of the smalest Leaves of St. Johns-wort, two handfuls; Consound, the lesser Centaury, white Briony, Periwinkle, of each one handful; and here likewise let there be three infusions in this manner: Let the Vessel (which ought to be of Glass) be set in the Sun for three daies; and the fourth day let it be kept in a Balneum of Scalding hot Water, and there let it continue for twenty four hours; and afterwards make an expression, and strain it; and unto the Oyl let there again be added, The smal Leaves of St. Johns-wort that have attained unto their ful ripeness, three handfuls; Centaury the less, one handful; the fruit of the Balsam Tree, in Numb. 6. And then do as before. The last expression being made, and the straining likewise, Add unto the Oyl,

Dittany of Crete, one ounce; Roots of white Dittany, and the greater Consound, Birthwort, Orace of Illyria, Bistort, Tormentil, of each six drams; Scarlet Grain, two drams. Make three infusions after this manner: set the Vessel in the Sun for six daies, after that for two daies let it be kept in a Balneum of boyling hot water; then press forth the Liquor, and strain it: and thus do three times, (as above) and in the end, the last expression being made, and strained, Add unto the Oyl

The distilled Oyl of Turpentine, of the Gum or sweat of the Fir-Tree, of each half a pound; Seed of St. Johns-wort, one ounce; Root of Consound, Birthwort, white Dittany, Tormentil, Bistort, Orace, of each two ounces; Scarlet Grain, one ounce; Mirrh, and Frankincense, of each one ounce and half; Sarcocol, Gum Junip. Aloes, of each half an ounce; Apples of the Balsam Tree, twelve in Numb. Balsam of Peru, two ounces; slice the Apples, and bruise all the rest, mingling them with the Oyl; and let the Vessel be kept all the Winter time under Horse Dung; then take it forth, and press out the liquor, and straining it keep it for

your

your use in a Glass vessel, the mouth thereof being close stopt.

The vulnerary Balsam of *Magatus.*

The Vulnerary Balsam of Magatus.

Take *Gum Elemi four ounces; Balsam of Peru three ounces, Gum Tacamahaca, Gum Carranna, the liquor conteyned in the little bladders of the Elm, of each two ounces; oyl of Bayes, Styrax liquid, Myrrh, of each one ounce and half; White Frankincense, Gum Hedera, of each one ounce; the sweet smelling Laser, Ladanum, Styrax Calamite, (the fattest you can get) Ammoniacum, Bedellium, Opopanax, Galbanum, Sarcocoll, of each six drams; Roots of Birthwort, Master-wort, Angelica, White Dittany, Consound, Acorus, Orace, Tormentill, Bistort, the seeds of St. Johns Wort, of the Citron, Citron rind, of each half an ounce, Cinnamom, Cloves, Nutmegs, and Mace, of each one ounce; Mastick, Aloes, Dragons blood, Scarlet Grain, of each half an ounce; Cretan Dittany, one ounce; the oyl of the oyle Nut Ben, three ounces; Juniper Berries an ounce and half, Wax one ounce; Rosin of the Pine, one ounce and half; Cleer Turpentine, Gum of the fir tree, of each one pound and half; the best strong water, six pints;* Mingle them, the Gums being exactly melted; they may be melted apart by themselves, with some of the Turpentine, and the rest that are more drie beaten and bruised (in a gross manner) into a powder: and then let them all be cast together into a Retort, which may be kept for three days in a *Balneum* of Boyling hot water; then let it be luted and kept in the hot water, untill the Clay be throughly dryed; afterwards by a fire of Ashes or embers let the oyl be drawn forth in an Artificial manner; now first there will come forth a certain water, (which I call the water of Balsam, and it is to be kept by it self) and then the oyl, which we call Balsam.

The oyl of St. Johns Wort is here likewise of singular use; and it is thus to be prepared.

Oyl of St. Johns wort.

Take *the Tops of St. Johns wort fully ripe, three ounces; Macerate them for three days in sweet smelling Wine and then let them boyl in a double vessel, stopping close the mouth thereof; after this let them be squeezed hard and the liquor pressed forth: & then let a like weight of fresh St. Johns wort be cast into it; let it be again Macerated, boyled and pressed forth; let this be thrice done; and if the wine be diminished, add other instead thereof; after this,*

Take *Turpentine three ounces, old cleer oyl six ounces; Saffron one pound; boyl them in a double vessel unto the wasting away of the wine and then make an expression; and when you have purged the oyl from all its setling, reserve it for your use.*

The Balsam following is greatly commended by Dr. *Raimundus Mindererus.*

The Balsam of Mindererus.

Take *Turpentine of Cyprus, & oyl of St. Johns wort, of each as much as you think good; let them be melted together; melt likewise by it self of Gum Elemi a sufficient quantity, unto a Just consistence, and let it be added unto the rest. When they are almost cold, add a little of the destilled oyl of Wax, and Mingle them.*

Henricus ab Heer (*in his* Physical observations, Observat. 10.) *highly commendeth this Balsam;*

The Balsam of Henricus ab Heer for wounds and ulcers.

Take *the flowers of Thapsus or scorching fenel, St. Johns Wort, the leaves of Prunella or Selfheal, of each one handful; boyl them in the oyl of the seed of St. Johns wort pressed forth, and old red Wine, of each alike, untill the wine be altogether consumed, that is, untill that a drop of the liquor cast into the fire take the flame without any noyse at all; and so keep it for use. If you please, you may often macerate the same flowers, and after you have set them in the Sun for fourty daies, or kept them hot upon the fire, you may again press forth the liquor; which the oftener that you do it, the more efficacious you shall find the oyl; add if you think fit the Stone called Calaminaris, made hot, and quenched first seven times in wine; and then making it red hot, quench it in this oyl.*

And yet notwithstanding in the use of Balsams (especially if they be hot) there is great caution required, (as *Guilhelm. Fabricius* likewise acquaints us, in his *third cent. observat.* 97.) not only because that the lips of the wound being overfoon conglutinated, the *Pus* that is afterward generated is kept within, and so exciteth grievous symptoms; but likewise because that those kind of Balsams are not alike and equally convenient for the temperament of all the parts.

Emplasters.

The Emplaster of *Franciscus Arcæus* is of singular use. As,

Take *Oyl of Roses, of Violets, and of Camomile, of each one ounce; the soft fat of a Hen, the marrow of legges of Veal, of each half an ounce; Earthworms washed in Wine one ounce; New fresh butter six drams; the Mucillage of Marshmallows half a pound; Boyl them all unto the consumption of the mucillage, and then strain them; unto the straining add Litharge two ounces and half; vermilion three ounces; with a sufficient quantity of white wax make a Cerot; adding of Turpentine ten drams, Mastick half an ounce; or,*

Take

Take *the new drawn Juice of Betony, Agrimony, Sanicle, Ladies Mantle, Saracen consound, of each half an ounce; White wax and Goats sewet, of each half a pound; the best Rosin one pound; boyl them; and in the end add Mastick one ounce, and make an Emplaster. or*

Take *Wax, Rosin, Pitch, Vitriol, White Frankincense, of each four ounces; Turpentine six ounces; red Myrrh, oyl of Juniper, and oyl of Eggs, of each two drams; Camphire one dram and half; make an Emplaster, adding oyl of Roses as much as will suffice.* or,

Take *New Wax, and Rosin, of each one pound; Goats sewet, Hoggs fat, of each three ounces; Turpentine two ounces; Vinegar three ounces; and make an Emplaster.* or,

Take *Litharge of Silver. oyl of Roses, of each half a pound; Mucilage of Linseed, and of Orace Roots, of each two ounces; Boyl them unto a Just Consistence; and afterwards add Frankincense, and Mastick, of each one ounce; Wax and Turpentine, of each two ounces; and so make an Emplaster.* or,

Take *Wax three ounces; Rosin and Pitch, of each two ounces; of White Frankincense, Vitriol, Cerus, of each four ounces; oyl of Juniper berries, & oyl of Eggs, of each two ounces; Champhire a dram and half, Turpentine half a pound; Make an Emplaster.*

The following Emplasters are chiefly useful for Prickings.

Take Oyl Olive two ounces; Rosin, Bears fat, Goats sewet, and Bulls Sewet, of each one ounce and half; the fat of a Cow-heel, three ounces and half; May butter, six ounces; Litharge of Silver one pound; the scales of Brass one ounce and half; Mastick one ounce; New wax, or the oyl of the same four ounces; and make an Emplaster according to art.

Raimundus Mindererus likewise most highly commendeth his own Emplaster which he calleth Emplastrum opoteldoch *magnum Colcotharnum*; the description whereof, as we find it extant in his *Tract of Calcanthum, Chapt.* 7. is as followeth) of which he writeth that it is the best of al that are known for the healing of new wounds, and the drawing forth of things extraneous that are fixed in the wound; and so likewise in stinking and putrid ulcers. *Viz.*

Take of the newest and Cleanest Wax one pound; Cleer Turpentine, or (if you had rather) Cyprus or Venice Turpentine, six ounces; Gum Elemi three ounces; oyl of St. Johns wort, oyl of Myrrh of each one ounce and half; let them melt all together; and as so soon as they begin to run abroad, add unto them these things following; of the purest and cleanest Gum Ammoniack, Galbanum, Opopanax, of each three drams; Colophony six drams; Choice Mummy, white and transparent Amber, of each two drams; White Frankincense, Mastick purified, Dragons Blood, Sarcocol purged from its excrements, of each one dram and half; Aloes Hepatick half a dram; Myrrh one dram; let the Gums be dissolved in vinegar; and let them be joyned together in a fit manner, and according to art, stirring them ever and anon; and when they appear to be almost cold, then by degrees, & warily cast in of the Loadstone prepared six drams; Crocus Martis according to art prepared without a corrosive, and Tutty prepared, of each one ounce; Lapis Calaminaris prepared, five ounces; Litharage of Gold one ounce; Colcothar sweetened, or the Earth of Vitriol mortified and dulcified two ounces; let them be according to art reduced into an Emplaster, which when it is cold wil grow to be very hard.

The use thereof is thus; It is over live coals to be tampered with the fingers until it become soft; and then apart of it, is to be spread abroad like a Cake, and with it the wound is to be covered al over; and dayly let it be twice again wiped and made clean, and Malaxed, and so again let it be put upon the Wound; and thus with one smal part thereof more wounds then one may be healed.

Epuloticks. And then in the Conclusion, the wound is to be shut up with a Cicatrice: but in what manner the sayd Cicatrice is to be brought over the Wound we have shewn you before, in the second part, about the end thereof: and Certain Playsters likewise made of those things that we but even now mentioned may also bring a Cicatrice over the Wound; when they have first throughly healed the same.

Very useful also are those Emplasters that are commended by *Franciscus Arcæus*, (in his second Book, and fifth Chapter) to wit, the Leonine Emplaster, and the black. The Leonine is thus described.

Take Cerus three ounces; oyl of Roses half a pound; the Basilique Unguent one ounce; let them boyl together over a gentle fire stirring them all the while with a spatter of wood, even untill that a Cerote may be made, unto which ad of Verdigrease powdered three drams; then let them boyl again, until they shal have gotten a colour yellow, or somewhat reddish: and then make a Cerote. Of the black Emplaster this is the description.

Take Litharge one pound, old oyl and the strongest Vinegar, of each three pints; Mingle them over the fire, and make an Emplaster.

CHAP.

Chap. 9. *My Judgment, touching the Method of* Cæsar Magatus, *and* Ludovicus Septalius, *in their Curing of Wounds.*

AND thus, out of what hath hitherunto been said, it may plainly appear in what manner Wounds are first of all to be bound up; and what ought to be the first provision and preparation that we make for the Curing of the same. But how and in what manner we are further to order and handle them, I am now to acquaint you. For in very truth, the Ancients who have written of the Curing of Wounds, as also the Chirurgeons who have handled and healed them, do not at all differ in those things that are further to be done as touching the same, (as we shall presently shew you) but they all of them go almost one and the same way. And first of all some years since, *Cæsar Magatus*, Professor of Physick in the University of *Ferrara*, (in his *two B. of a rare kinde of healing of Wounds*, in the which he hath with much diligence and accuratenes treated of all things whatsoever that may possibly be said of Wounds) promiseth us a new Method of Curing Wounds; such as hath not hitherunto been attempted by any; and by which the said wounds may more speedily and happily be Cured, then they have been formerly by the Ancients, or hitherto by any whomsoever. *Ludovicus Septalius* extolleth and defendeth *Cæsar Magatus*, in his 8. *B. of Physick Observations, and Animadversions.* There is due unto both these their deserved praise, in regard of their study and endeavour to advance the Art and Practise of Physick, and to free the sick from their Diseases, and the long and troublesom way of Curing the same. And yet notwithstanding I conceive that I shal not in the least offend against the Publick, or the Private good of any, if I shall here in this place, without any detraction, set before you the Opinion of them both, and accordingly weigh them, and tell you my Opinion therein.

And first of all, *Cæsar Magatus* (in his 1 *B. of Wounds*, and 33. *Chap.*) accuseth *Galen* for having forgotten and omitted an Indication of the greatest moment, and for being wholly taken up with other things that are of far less moment; and there he writeth, that *Galen* was sollicitous, and troubled himself only with the Excrements that were bred; but as for the Cause from whence they are generated, he never so much as minded the same: and that he seemed to desire and require the wasting of the said Excrements, but then that he took no care at all to prevent the generating of them; to wit, in a word, that he was but little careful as touching the temperament and heat of the part. For if sufficient care be taken for the Temperament and strength of the part; he thinks that then there could not possibly be collected such great store of Excrements that might require this over curious, and indeed hurtful diligence. Now he thinketh that the heat may be sufficiently Cherished and Corroborated, if we prevent and hinder the diffusing thereof abroad, and that we preserve its quality: and that the diffusion thereof may be prevented, if we supply the want of that Natural Covering (such as is the wounded Skin) and this indeed by a Medicament that in its quality comes neer, and is a friend unto the temperament of the part. For so both the heat is cherished, and the quality thereof preserved by a Quality that is like unto it. And from all these premises he concludeth at length, that Wounds are to be more seldom wiped and cleansed then hath formerly been practised; to wit, lest that the heat of the part be hurt by the Ambient Air; but that it ought to be preserved safe under a continual Covering, and so Cherished and augmented; and thereupon he propoundeth a new way of Curing Wounds; touching which we shall now speak somthing. And indeed what we have already said is the sum and substance of the whol matter: but yet Nevertheless in regard that the Authors now mentioned do treat so largely touching the thing now in question, we shall explain it a little more cleerly.

Now the State of the Controversie is this; to wit, whether it be better once (if not twice) a day to uncover and cleanse the Wound; and laying on new Medicaments again to bind it up; or else indeed not to do this above once in seven daies at most. All the Ancient Physitians and Chirurgeons (unto these very times) have followed and practised the former way of Curing Wounds. And as for this latter way of Curing them, *Cæsar Magatus* (in the preface to his first B. of Wounds) tels us that he first of all saw it at *Rome*, which although that at the first he suspected it, and that it seemed unto him to rest and relie upon a weak and infirm Foundation, and to have no very good reason for it; yet nevertheless, that observing daily the rare and wonderful Events thereof, he began with himself strictly and accurately to examine and search into those Foundations and Grounds upon which it rested and relied. And there he writeth that in two things especially he found this new way of Curing

Wounds

Wounds to differ from the former common way. The first this, that the Wounds were very seldom opened: the other was this, that in this new way there was no use at all made of Tents and Liniments: of both these we shall now Treat, and speak of them severally.

Whether Wounds be often, or but seldom to be Cleansed?

Magatus and Septalius their way of Curing Wounds.

We will yet notwithstanding first of all propound and set before you their way of Curing Wounds. If a Wound be to be Cured, that is in a Body otherwise sound and of a good habit, and healthful Constitution, (in which there is neither any great Vessel, nor yet any Nerve hurt; but that it is simply in the Flesh; and that there hath flown forth sufficient of the Blood) they then command the Lips of the Wound to be Joyned together, so as that they touch one the other. The Lips being united and brought to touch, they then impose somthing upon the Wound that covereth it and so cherisheth the Native heat, and withal hath a power and virtue to dry, with some kind of Astriction; to the end that so the Blood that floweth unto the part that is wounded (for its nourishment) may be throughly purged from al its superfluous humidity, and brought unto a certain viscidity or Clamminess. And for this purpose, they administer Rosin Turpentine, or Rosin of the Fir-Tree; unto which (if they be more solid) they add a certain portion of Wax, that it may acquire a Consistence. They commend likewise for this end Tacamahaca, which that it may the more easily be spread, they soften it with the Oyl of the Male Balsam Apple, or of St. Johns-wort, a fourth or fifth part thereof. They commend also the Balsam of Peru unto which (if it be more solid) they give a Consistence by adding of Wax. They use likewise the Juyce that is contained in the smal Leaves of the Elm, thickned; as also the Cerote Barbarous (as they cal it) the Cerote Diapalma, and the Cerote of Betony with Tacamahaca: or some other Emplaster made of the Juyces or Decoctions of Vulnerary Plants; adding thereto, Aloes, Sarcocol, Dragons blood, Rosin Turpentine, and Rosin of the Fir-Tree. Of these Medicaments they spread somwhat thereof upon a Linen Cloth that may answer the greatness of the Wound, and may likewise take in somwhat of the adjacent parts; and this they impose upon the Wound. And then upon this they apply as many linen Clothes doubled or trebled, as are sufficient for the preserving of the Natural heat of the part, and the keeping off the injuries of the Ambient Air. And the Wound being after this manner bound up, they open it not until the fourth, fifth, or sometimes even the seventh day; and so (as they write) a wound (such as it may be) is now and then Cured with once binding up; and that very frequently two or three dressings do suffice. And yet notwithstanding, that the Linen when it is all foul and nasty may sometimes be taken off, and clean Clothes be imposed in stead thereof, this they allow of; provided alwaies, that this be done without any uncovering of the Wound. And withal they likewise make exceptions in some certain Cases, in which this way of Curing simply hath not place, (but that we ought in those Cases to use the old way of Curing) touching which we shall anon speak further.

Whether Wounds be often, or but seldom to be opened?

And that new way of Curing they prefer far before the former old manner; and first of al they endeavour to prove by certain Arguments and Reasons, that it is both more easie, and more safe: and then by certain Reasons they impugne and oppose that Ancient way; and then Thirdly, they endeavour to weaken and invalidate those Causes that are alleadged by the Ancients, and whereby they seem to be drawn unto the more frequent opening and uncovering of the Wound; and then lastly, they attempt the answering of whatsoever hath been by any objected against this new way of theirs: unto all which we shall speak in order.

And in the first place therefore, that this their new way and Method is both more easie, and more safe also, (and by which far many more have been and may be Cured, then by the old common way) they first of al appeal unto experience: and in special, *Ludovicus Septalius* writeth, touching the Wounds of the Head; that when in a time of great weakness and sickliness at *Millain*, in the space of one year very many of those that were wounded in the Head, and were ordered after the old wonted manner (to wit, by often opening of the Wounds, Tents, Liniments, and more frequent Terebrations, and Scrapings) miscarried and perished: and that afterwards this new way of curing being put in practise, to wit, by imposing an Unguent upon the Wound, anointing the Lips thereof with the Oyl of the Fir-Tree, and the wound only twice or thrice uncovered, and but one only Terebration (or piercing with the Wimble) being instituted, of fourteen that were wounded in their Heads there died but only one of them. And *Cæsar Magatus* (in his

1. *B.* and 40. *Chap.*) writeth, that the wounds inflicted upon the Head (with the falling in of the bone) within the space of twenty daies were perfectly cured in that manner. And likewise that in the same manner, and in the same space of time a wound of the head, with a cutting of the Membranes, was healed. And that a Wound inflicted on the Head with a Leaden bullet shot out of an Engine of War (so that the bullet pierced even to the more inward parts of the Brain before, neither could be found, or drawn forth) in thirty daies, after two or three openings and dressings was perfectly Cured.

I. And then in the next place, *Cæsar Magatus* (in his 1. *Book Chap.* 7.) alleadgeth these Reasons, which we will briefly propound.

The Reasons that moved Magatus *to prefer his new way of Curing wounds before the old.*

The First is, that this new way of Curing wounds doth best and with the most security perform all those things that are required in Curing. To wit, as for the Native heat, that Nature useth (for suppuration, generating of Flesh, and the glutinating of the Wound) as its chief Agent, (and which by Reason of the effusion of Blood, and the uncovering and wounding of the Natural Covering is dissipated and rendered very weak, and by the external Air is offended and altered) is made more strong and vigorous, whereas in this new way and Method of Curing the Wounds are kept covered. For when the Wounds are but seldom uncovered, that Artificial Covering supplieth the defect of the Natural covering which is the Skin; and so neither the Native heat is scattered and dissolved, neither is it at al altered by the Ambient Air. And for this Reason *Septalius* wondereth that *Galen* should omit this main and principal scope, (which is to preserve the Native heat) and that his care and study is only to take away the Impediments.

And Secondly, He therefore thinketh that Wounds are most happily cured in this new way of theirs, because that in this way those things that retarde and hinder the Curing of Wounds are sooneſt and best of all turned and taken out of the way. For whereas one main impediment (among all those other that chiefly hinder the speedy and safe curing of Wounds) is the confluxe of Humors unto the wounded part; they think that that impediment is by this their new way best of all prevented. For since that the afflux is caused either by transmission, or else by attraction (by Reason of the pain, and heat) both these are best turned away by this their new manner of curing. For if the Wound be but seldom opened, the heat is then by the covering preserved and fortifyed; neither is there any pain excited, as it is wont to happen by the frequent handling and cleansing of Wounds. For all those inconveniences and discommodities are avoided by this new way of curing, whilest that the part is but very rarely moved from its due and proper Scituation, is very seldom loosned and unbound, so that likewise there is not often occasion for its binding up; and (as he addeth in the 32. *Chap.*) if any winde or Humor distend the part, so that there be great pain caused thereby, it is speedily discussed by the strong and more Vigorous heat.

Thirdly, Of all those things that impede and withstand the Cure of Wounds, the chiefest of them is the exposing of the Wound unto the Ambient Air, by which the innate heat is altered and weakned. But now this is prevented, if the Wound be but seldom uncovered by opening thereof.

Fourthly, whereas *Hippocrates* (in his 2. *Sect. of Fractures, Title* 7.) commendeth that Cure under which there is little or no impostumation and loss of the bones, this appeareth to be so in this new way of curing; and therefore he determineth, that this is the most perfect: and this *Magatus* proveth by an example of his own; for that in this manner he had Cured Wounds of the Head (wherein there was likewise an extraordinary hurt of the bone, in so much that any one would have Judged that a great part thereof would have dropt out) without any impostumation and abscession of the bone, or any thing else.

Fifthly, He therefore thinketh that this new way of curing is to be preferred, because that under it fewer Excrements are generated then under the common and wonted manner, which (as he writeth) is manifest by experience.

Sixthly, *Cæsar Magatus* (in his first B. and 32. Chap.) bringeth this likewise for a Reason: because that those things that are extraneous and strangers to the Body, (and which at the first could not be drawn forth by the Chirurgeons, being such as require the work of Nature,) may more easily be driven forth, if the Wounds be but seldom uncovered; and that for this very Reason, to wit, because that in this new way and Method the Natural heat is more rightly preserved, cherished, and augmented; as was said before in the first Reason.

And Seventhly, in the place alleadged he produceth this for one of his Reasons; that in this his new way the virtue of the Medicament that was administred in the first dressing, is best of all continued and made to endure even unto the perfect agglutination of

the Wound; and especially if it be of such an essence that it cannot hastily be dissipated. And as for those Excrements that usually are here to be found, he thinketh also that it cannot be by them corrupted; since that the Excrements that are generated are not worth a speaking of.

II. They in like manner reject the Ancient Way and Method of Curing Wounds; as drawn thereunto both by experience and Reason. Experience indeed, because that (as is said before) under the Ancient way of Cure fewer Patients, and with far more difficulty, do recover of their Wounds, then under their new way. And as for the Reasons they alleadg, they are these.

The Reasons moving Magatus and Septalius to reject the Ancient way of Curing Wounds.

The First is this, because that under the ordinary and wonted way of curing, the wounded part is exposed unto the Ambient Air; and by it the Natural heat thereof may be dissolved, offended, and weakned; and that thereupon the part is rendered the more apt and Obnoxious unto a reception of the Afflux of Humors; and the Concoction therein is less happily perfected; and so there are generated greater store of Excrements, that in time prove a great impediment unto Nature in her work.

Secondly, They say, that from this frequent unbinding and loosening of the wound, the handling thereof, and the moving of the part, the cleansing thereof, and the laying on of new Medicaments, and by means likewise of the new binding up, a pain is oftentimes excited, which they say may very well be the cause of a Fluxion. For it can no waies be, (saith *Cæsar Magatus*, in his 1. *B.* and 32. *Chap.*) but that, while we handle the part, there will be some pain excited; and indeed the greater by how much the greater the Wound is, and the part wherein it is endued with an exquisite sense. For we are forced in the opening of the Wound, and the new binding it up again, to move the part from its former Scituation. We take away the Medicaments, we cleanse and wipe away the *Pus*, we impose new Medicaments, and then we binde up the Wound again: al which operations cannot possibly be performed without pain.

Thirdly, They object, that if the Wound be too often opened and uncovered there will then Exhale much of the heat and Spirits.

Fourthly, and last of all, That Nature also as often as the Wound is loosned and uncovered, so often is she disturbed, and distracted from her proper work and office.

III. *Cæsar Magatus*, (in his 1. *B.* and *first Chap.*) and *Ludovicus Septalius* (in the 1. *B.* of his *Physical Animadversions*) after this manner endeavour to infringe those causes and Reasons, for which it seemed necessary unto the Ancients, and at this day doth seem altogether needful and requisite, that Wounds should often be uncovered, and new Medicaments imposed and laid on.

Magatus his Confutation of the Reasons of the Ancients, for their often uncovering of Wounds.

And first of all, this is brought for a common and received opinion, that in hollow wounds there is evermore generated a double kind of Excrements, thick, and thin; as it appeareth from *Galen*, his 3. *B. of the Meth. of Curing*, and 9. *Chap.* and that therefore we are alwaies so to reckon, that it ought to be throughly dried up, and wiped away; and that therefore the Wound is daily to be opened, that so the *Pus* may be cleansed away, and new Medicaments applied. For those that were at first laid on cannot long keep entire their strength and virtues, in regard that they are dissolved by the heat of the part and also corrupted by the mingling of the Excrements. But if the Excrements be not throughly dried up, and purged forth, being retained in the Wound they hinder the generating of Flesh, and the conglutination of the Wound; and become likewise more sharp and Corrosive; Yea further, they often acquire a putridness, from whence may proceed Pains, Inflammations, Impostumations, Worms, and Gangrenes.

The Answers.

Now unto this they thus Answer; first of all, that there is no great danger threatened from the *Pus*; since that there is no necessity that there should be any great store thereof bred in Wounds, but then only when by Reason of the frequent uncovering of them the Native heat is debilitated. Neither is there any need (say they) that these Excrements should be consumed by the imposing of various Medicaments; seeing that the Wounds of the internal parts, the Liver, the Lungs, the Tongue, and other parts, (in which we cannot possibly come to apply Tents, or Liniments spread over with unguents) they are yet nevertheless healed by Nature. And albeit, (as *Cæsar Magatus* writes, in his 1. *B.* and 44. *Chap.*) it may be admitted, that two Excrements (to wit, a thick, and a thin) may be generated in the Wound; yet nevertheless he thinks not this a sufficient Reason why the wound should be often uncovered. For the thin Excrement may partly be digested by insensible exhalation; and partly driven quite forth of the Wound by the heat

of

of the part; and for the thick, there is so little thereof at the very first, that it needeth not at all any Medicaments to cleanse it away; and that after in process of time it is confounded, and becometh one with the *Pus*, and so is by Nature expelled forth together with the same.

Secondly, For this Cause likewise the frequent uncovering of the Wound is held necessary, in regard that there is sometimes need of Manual operation; since that in the Cavity of a Wound there may be collected many Excrements that cannot possibly be purged forth by any Medicaments; but they are to be cleansed away by the operation of the Hand.

Answer. But now *Cæsar Magatus* (in his 44. *Chap.*) denieth this; and there determineth, that the Excrements that are bred in a Wound may partly be insensibly digested by exhalation, and partly by Nature sensibly expelled by the Wound, when there is present a fit afflux, and this no waies hindered, and detained in the Cavity of the Wound.

Thirdly, Wounds are therefore (according to the common opinion) often to be uncovered, that so according to the various State and conditions of them various and different Medicaments may be imposed; first of al, Suppurating or Digestive Medicaments, then Absterstive, after that such as generate flesh; (and sometimes likewise such as take away superfluous and proud flesh) and lastly, such as produce a Cicatrice. Al which seeing that they cannot possibly be effected by one only Medicament, therefore the Wound is often to be opened, that so unto every state of the wound fit and convenient Medicaments may be administred.

Answer. Unto which Argument *Magatus* (in his 1. B. and 44. Chap.) endeavoureth to give an Answer; to wit, that this is indeed necessary in the old way of curing, but not in his new way; as being such in which the care of the Excrements is for the most part committed unto Nature her self: and in his 37. *Chap.* he writeth that he is wont to commit the whole work to Nature; and that it is sufficient, that the Medicament serve instead of a covering, and discharge the Office thereof, by cherishing and defending the Natural heat; and that the same Medicament may in all Wounds undergo the Nature of a covering, and serve instead thereof. And he saith that he himself hath observed, that Wounds have been suppurated, throughly purged, and filled up with flesh, by the help only of the ordinary and common Digestive. Now he thinketh that the Medicaments cannot perform this any other waies then by their corpulency and bulkiness, whiles that they hinder and forbid the efflux of the heat, and defend the part from all external injuries: but that it maketh no great matter, what quality shal be adjoyned unto this corpulency; especially, in regard that for the most part such Medicaments are made choice of that are of a temperate heat, and most agreeable unto our Nature. And at length *Magatus* concludeth, that by any Medicament of a convenient corpulency, (provided that it be not poysonous, and corruptive, or so sharp and Corrosive that it excite and cause a fluxion) all hollow Wounds that are curable may be cured, and filled up with flesh.

Fourthly, It is therefore also thought that Wounds ought often to be opened and uncovered; that so it may be known, what the effect is of the Medicament applied; and whether or no it be sufficiently drying; whether the Wound be moist, or not, that so the driers may answer in a due proportion unto the moisture; since that the more moist Wounds are to be cured with the drier Medicaments; as *Galen* tels us, in the *third B.* of his *Method*, and 3. *Chap.*

Answer. But unto this *Cæsar Magatus*, and *Ludovicus Septalius* give this Answer, that for the cause aforesaid there is no need at all of this frequent uncovering of the wound, seeing that in this new way of curing the care of the Excrements is not to be committed unto Medicaments, but unto Nature, and the natural heat; and our study must be only how to cherish this Native heat.

Fifthly, And for this cause also the more often uncovering of the wound seemeth to be necessary, that the state of the wound may be known; and that the Symptoms that are wont here to happen may the better be prevented; and those things of which *Hippocrates* maketh mention, 1. *Prædict. Text* 18. 5 *Aphor.* 65, 66, 67. 6 *Aphor.* 4. may be sufficiently known.

Answer. Unto which they Answer, that al those things may be known some other way, and by other means; as namely, from the itching, the heat, the smel that comes from it, the beating pain, the terrible Feaver, heaviness in the part, and the like: and that evermore the Eyes of the minde are sharper sighted and see more cleerly then the Eyes of our Body.

Sixthly, And for this cause likewise the wound seemeth to require frequent opening, that so the Swaths and little Pillows, and the Linen clothes laid thereon may be wiped and made clean: which *Hippocrates* (in his *B. of the Office of the Physitian, Sect.* 2.) and *Galen* (in his *Commentary*) do both of them strictly enjoyn; in regard that the filth

and impurities of the Wound may excite an Itching Pain, and at length an Inflammation.

Answer. Unto which *Septalius* answereth, and granteth that the Swaths may indeed be changed, provided that the Wound be not uncovered.

Seventhly, For this cause likewise the Swaths and coverings of the Wound seem to require often changing, that so the hurtful Exhalations that are bred in the Wound may pass forth; in regard that being kept shut in they disaffect the wounded part, and alter the temperament thereof.

Answer. But unto this also *Magatus* answereth that there is no necessity that the wounded part should have so many and such Linen Clothes put upon it, neither that it should be so close and strictly bound up, but that the offensive vapors might exhale, and not be supressed. And that if the *Pus* hath a passage forth, much more then may the Vaporous Excrements be scattered, and find a passage forth: and that should they be stil kept in, yet they never bring so much hurt and damage as cometh by the uncovering of the wound.

But in very truth, (that I may briefly shew you my opinion touching this controversie) I will not in the least detract from the Reputation of these men, (*Cæsar Magatus*, and *Ludovicus Septalius*) men so Famous and Eminent, that they are not to be so much as named without due honor and respect: and yet nevertheless I shall take the liberty to say, that here in this controversie they seem to me to seek (as we say) a knot in a Bul-Rush: and that there is not any sufficient cause to move them to find fault with that Ancient way and Method of curing of Wounds; and so to extol this new way of their own. For first of all they themselves cannot but confess that in the old way of curing (for so many Ages past) many and the most grievous Wounds have been happily Cured. And then again, neither can they deny this, that that new way of theirs hath place only in a simple Wound, (the wounded person being of a sound and good habit) in which there is neither any great Vessel cut, nor yet any Nerve hurt: and we likewise admit the same for a truth. For such Wounds as these, in regard that they have no danger at all attending them, (and that they may likewise be Cured by Nature alone, without any help at all from Medicaments) we do no way approve of either the Curiosity, or the unseasonable diligence of those that without any urgent cause at all will be often uncovering the Wound, every day, not once only, but twice or thrice; and we grant also (as a thing very commonly known) that such like sleight Wounds (if you lay but a little Lard thereon, or some such like thing, and with one or two bindings up) are cured of their own accord, and by the strength of Nature. But on the contrary, they themselves acknowledg (and of necessity it must be confessed) that there are many wounds in the curing of which there are so many obstacles and hinderances in Natures way, that if they be not removed by the Physitian, Nature will never be able of her self to unite the wound, and therefore that simple provision is not sufficient in those Wounds. And they likewise altogether grant and allow of an opening of the Wound, if there be any thing to be done therein that cannot be performed without a Manual operation; and if there be any necessary Medicament to be imposed, and that there be danger in the omission thereof, which they grant ought instantly to be remedied, and prevented all that may be. For if (as *Septalius* puts these cases) the body be Cacochymical, or that some one or other of the greater Vessels be cut, or a Nerve hurt; if withal the flesh shall be battered and bruised, (which may have need of Suppuration) if the Wound hath so narrow an Orifice that the *Pus* hath no passage forth of it; if any bone shall be hurt, or any Noble and principal part uncovered, (so that there shall therefore be need of Manual operation;) if there shal be much *Pus* and Excrements generated in the wound; (from whence a pain, a corruption of the part, an Inflammation, and breeding of Worms may proceed) if proud flesh shall abound; if there shall be present a vehement pain; if an Inflammation or a Gangrene be feared; if any smal bone, or any other substance stick fast in the wound that is to be taken forth: or if (as *Cæsar Magatus* in his 1. B. and 38. *Chap.* puts the case) the flesh groweth forth too much; if an Hemorrhage be urgent and require it; if there be nigh at hand a Gangrene and corruption of the part; if there be present an extraordinary putridness and nastiness of the part; if there be many Excrements heaped up & an Inflammation of the part nigh at hand; if any Heterogeneous and Extraneous Body stick in the Wound; if an Impostumation follow thereupon, and that there be present any Pain, Itching, ill savour, or any bones be broken: in all these cases they of their own accord grant that this simple binding up of the wound (in this their new way) will not suffice, but that the other more laborious provision and operation of the Ancients is necessary, and to be preferred before

The general examination and inquiry into the Opinion of Magatus *and* Septalius.

fore this their new way and Method of curing.

And therefore, since that the exceptions are too many for the Rule, and derogate much from the same, I conceive that this their new way of Curing wounds is very rarely sufficient, and that for the most part many destructive Symptoms and evils (if the wound be not opened until the fourth, fifth, or seventh day) may ensue and happen thereupon. And therfore we likewise willingly grant, that Wounds without urgent necessity are not too often to be opened, and over rashly to be exposed unto the Ambient Air: and yet withal likewise understand me with this caution, that if the Wound be over seldom and but now and then uncovered, cleansed, and necessary Medicaments laid thereon, much damage and danger may befal the Patient. And therefore it is affirmed indeed that this new way of curing Wounds is easier, shorter, less troublesom, and more safe then the Ancient Method: but it is not in the least proved. And be it so, that it is less troublesom, more compendious and short, and likewise more easie; it cannot (this notwithstanding) be proved, neither will it follow, that it is alwaies the more safe and secure way. For who is he that dareth (or can safely) admit of this new way of curing, in those deep and narrow Wounds that are by pricking, and by Weapons that have sharp and not thick points; and that will adventure to commit unto Nature such a like Wound, imposing only some covering thereupon, and so not open it before the seventh day? For true it is indeed, that Natures intention in endeavouring the Conglutination of the Wound is at that time likewise right, as well as at other times and in other wounds; but it may so happen, that the Wound may Conglutinate in the superficies, before it be conglutinated in the bottom thereof; from whence *Pus* cometh to be collected in the bottom of the Wound, which bringeth with it many and great dangers; and therefore such a like wound is again to be opened, as sad experience hath often taught us.

But that we may (in special) weigh and consider the Arguments on both sides, we wil first of all examine those Arguments that drew those eminent Men (*Cæsar Magatus*, and *Ludovicus Septalius*) into this Opinion.

A more special examination of the Reasons of Magatus *and* Septalius.

And First of all, as for the experience they talk of; the Ancient way of curing hath likewise the same to plead for it; seeing that none dares deny, that infinite numbers even of such as have been most dangerously and desperately wounded have been cured thereby. And yet nevertheless I hinder none; but let every man consult experience, and make inquiry, whether he can find out any thing that is better; yet alwaies provided that what he hath so found out may be practised without any damage or danger unto the sick party. But as for that which *Ludov. Septalius* alleadgeth (in special) touching the Wounds of the Head, and that many (in a very tickly time at *Milain*) this way recovered thereof; Yea, (as he writeth) more then those that were cured in the former old way; he doth not here sufficiently explain himself, what kind of Wounds these or those were. For of the Wounds of the Head, it is possible that some of them may be mortal, and others of them curable. But *Cæsar Magatus*, although he describeth the qualities of those Wounds in the Head, of which he bringeth a few examples; yet nevertheless, he doth not prove this, to wit, that those wounded persons were cured by reason of that new way of curing; and that they might not as wel have recovered if the old Ancient way and Method had been practised. For he himself oftentimes very rightly inculcates, and writeth very cleerly, that it is Nature that cureth the Wound, and not the Physitian, or Medicaments. For if the *Pus* ought to be moved, this is performed by Nature; or if that flesh be to be generated, and the broken bones to be strengthened by a *Callus*, these are the work and business of Nature. If the Wound be to be Agglutinated, it is she that must do it; and if the Excrements ought to be expelled, this is likewise her Office. And through the strength of Nature there happen Miracles oftentimes in Wounds; Yea (as he proveth in his 37. *Chap.*) a strong Nature wil likewise bear out and overcome the Errors of the Chirurgeon committed in the Cure. And so (no doubt) may those Chirurgeons that stil use the old way and Method of curing produce the like examples on their part. That Student that was run through the *Thorax* (his Lungs being withal wounded) of whom we made mention, in the 2. *B. of our Practise*, 2 *Part. Chap.* 11. and a little above, in the 3. *Chap. of the Wounds of the Lungs*, was cured within the space of one Month: the care of which Wound (in regard that it was inward) was chiefly to be committed to Nature; and the cure thereof to be ascribed unto her, and not either unto the old, or the new way of Curing. And *Glandorpius* relateth that a Wound of the *Oesophagus* was in twenty four daies drawn all over with a Cicatrice, as you may find the relation in his *Speculum Chirurgic. Observat.* 30.

And

And indeed I will (in the next place) most readily grant him, that those frequent terebrations (which seem sometimes to be instituted rather for the exercising of the Chirurgeons Body, then for any need the Patient hath of them) are not alwaies safe; and that they sometimes bring more damage then benefit unto the sick person But yet that the Wounds of the Head are not to be uncovered before the fifth or the seventh day, this I shall not so easily grant him; seeing that such Wounds pass through divers parts: and heap up divers sorts of Excrements; and for the most part there is Blood collected between the Skul and the Membranes of the Brain; which is therefore with al possible speed to be evacuated. For which cause the Terebration also and the perforation of the Skul is sometimes necessary, lest that this Blood if it be kept in putrifie, and so cause grievous Symptoms, Yea, and (as oftentimes it doth) bring Death it self upon the wounded person: which may likewise very easily happen, if those Wounds should seldom be opened and cleansed.

Secondly, The Reasons alleadged by *Cæsar Magatus*, (and out of him by *Ludovicus Septalius*,) are of no great moment, at least they carry not that weight in them that may perswade the rejecting of the old and usual way of curing Wounds. First, they mainly urge this, (and indeed herein chiefly consisteth the very strength and pith of this Opinion) that the heat of the wounded part is to be preserved: and they accuse *Galen* for that he hath omitted an indication of the greatest moment, and that he hath troubled himself more then he needed in other things of far less moment; and about the generating of Excrements in the Wound: whereas if the innate heat be preserved, there will be but very few Excrements bred, and those that are, will be such as can no waies hinder the glutination of the Wound. Where we willingly grant, and do confess, that Nature as she is the Curer of other Diseases, so she, is the healer of Wounds likewise; and that it is she alone (and not the Medicaments) that by the benefit of the Natural heat doth perform this glutination of Wounds; and therefore that the innate heat, and the natural temperament of the part is carefully to be preserved and cherished. And this (albeit that *Galen* hath passed it by in that place where he professedly treateth of the Cure of Wounds; but whether he hath therein done well or ill, I here dispute not:) yet notwithstanding in other places he often inculcates, that there cannot possibly be any curing of the Wound, unless the part obtain its own Natural temper: and those very Medicaments (which are called Sarcotick) are provided for that very purpose, the Conservation of the heat of the part, as we said before in the precedent Chap. But here two Questions arise; the first this, whether the natural heat be preserved bettter in this new way, or in that other old and wonted Method of curing; and whether or no there be any necessity that more excrements should be generated in the old way, then in this new manner of curing. The Second Question is this, whether the alone preservation of the Native heat be sufficient for the curing of the Wounds? We deny both. As for the First, it shall be shewn in the following Arguments, that the more rare and seldom opening and uncovering of Wounds is oftentimes more hurtful and prejudicial unto the Native heat, then useful and serviceable thereto; but on the contrary, the more frequent uncovering of the Wound, (and as oft as there is need thereof) is no way offensive unto the Native heat; and that therfore it is not by reason of the uncovering of the Wound, but by reason of the debility of the heat, or the constitution of the part, or the Body, that those Excrements are generated. For when there is blood poured forth in the Wound, from hence it is that the heat and spirit is dissipated, and the part rendered the weaker; from whence it is likewise that in the Concoction that is made in the part there are very many Excrements generated. And that sometimes fewer, and sometimes more Excrements are generated in the Wound, this is not therefore because that the Wound is more seldom or more frequently opened and uncovered, but because the whol Body, and the wounded part are more or less disposed unto the generation of the said Excrements. But as for the Second, to wit, that the innate heat alone is not alwaies sufficient for the curing of the wound, this is apparent; since that there oftentimes so many impediments and obstacles cast in Natures way, that unless they be by the Physitian removed, and that indeed very frequently, even every day, Nature can by no means attain unto her end and drift. The *Pus* first of all, and the Excrements that are collected in the wound, are to be evacuated; and sometimes a passage forth likewise made for them (as oft as need requireth) by Tents; and those Medicaments that cherish the heat, dry up the Excrements, and hinder the generating of them, and help forward the Glutination of the wound, are often to be laid on; since that when they are once laid on they are soon defiled with the *Pus*, and *Sanies*, (that is to say, the thick and thinner Excrements of the wounds) and thereby weakned; and the virtue of them is likewise otherwise dissipated by

by the heat of the part. And albeit that *Galen* (where he treateth of those Medicaments that are necessary for the curing of Wounds) maketh no particular mention (in special) of those Medicaments that cherish and preserve the Natural heat, (which that he ought to have done, I deny not) yet notwithstanding he elsewhere very frequently tels us, that the heat and temper of the wounded part is to be preserved; and that unless the temper of the part be in a right frame and Condition, it is not possible that the Cure of the Wound should ever succeed happily; and those very Medicaments themselves that he often propoundeth for the drying up of the Excrements of the wounds, do Cherish the heat: and as I said in the foregoing Chap. it seems to me, that those Digestive, and Sarcotick, and Glutinating Medicaments, are made and provided, rather for the conservation of the native heat, then for the doing of any thing else.

The second Reason that *Magatus* brings for his new way of Curing wounds, is this, that there cannot be excited any Afflux of humors, since that in this way the heat of the part is preserved, and that by the often handling of the wound there is not any pain caused that may excite a Fluxion. But (as we shall further shew you in the following Reason) the truth is that in this more rare and seldom opening of the wound the heat of the part is not better preserved then in the former old way. But then as touching the pain that may be excited by the more frequent uncovering of the Wound, the Cleansing and purifying thereof, the imposing of new Medicaments, and the new binding of it up, it is the part and office of the skilful Chirurgeon so to handle the wounded part, that the least pain (and as little as possibly may) be excited. Neither in the evacuation of the *Pus* is the part to be pressed down hard together, but the said *Pus* is most lightly and gently to be wiped away; unless haply the Wound be sinuous and full of turnings. For in such wounds the pressing together of the Sinuous winding part is both useful and necessary; yea moreover, for the better pressing forth of the *Pus* from the very bottom of the *Sinus*, there are likewise little pillows or Cushions to be imposed. And then the benefit and commodity that ariseth from that short and momentany pain will not only countervail, but likewise far exceed the discommodity and inconvenience.

Thirdly, Neither is this that he alleadgeth for his third Reason, of any weight or moment; to wit, that in this new way the wounded part is more rarely exposed unto the Ambient Air, then in the ordinary and usual way. For the good and Benefit that proceedeth from the Cleansing of the Wound and the imposing of Necessary Medicaments, is far greater then the hurt and damage that is brought thereunto by the admission and letting in of the Ambient Air. And this discommodity may likewise in great part be prevented, if the Wound be not uncovered in a cold Air, but in that that is somwhat warm or temperate; and that this be no oftner done then urgent necessity shall require; and that before ever we begin to open the wound, all things Necessary and Requisite for this new binding up be at hand, and in such a readiness, that the whol business may be performed with al possible speed.

Fourthly, Neither is this any sufficient Reason for the preferring of this new way of curing before the old, to wit, that in a wound of the head the bone that was impostumated, and no hopes but that it would be lost, hath yet in this new way been preserved. For it is not as yet proved, that the same might not as wel have been in the Ancient way and Method of curing; and it is daily observed, that in the use of the old way, those bones that seemed to be impostumated and like to fall out, have yet again been Agglutinated unto the rest.

Fifthly, *Magatus* affirmeth, indeed, that under that new way there will be fewer Excrements collected then under the Ancient way: but he doth not prove this; and he evermore presupposeth that the innate heat is more rightly and better preserved in the more rare and seldom opening of the wounds then in the frequent uncovering of the same. And we grant indeed, that by the vitious and faulty concoction of the part, many the more Excrements may be bred therein; but this notwithstanding we deny, that these Excrements proceed only from the debility of the heat caused and contracted from the Air; in regard that there may be very many causes thereof, to wit, the abundance of vitious humors in the Body, and the conflux of them unto the wounded part, some of the greater vessels hurt and pouring forth much blood, a contusion and bruising of the part; and many other such like.

Sixthly, Unto the sixth Argument we Answer, and grant indeed, that there is also a more happy expulsion made by Nature of smal bones, and other Extraneous bodies, if the innate heat of the part be strong and vigorous: but then notwithstanding this is yet again to be proved; and it is not to be presupposed, that the Native heat is more rightly to be preserved and corroborated in this more rare uncovering of the wound; as we said

said before, in answer unto the first Argument.

Seventhly, and lastly, *Magatus* alleadgeth likewise this for an Argument (but without any proof at all) that the virtue of the Medicament at first imposed for the perfect agglutination of the Wound will the better endure and be kept intire: touching which hereafter in the causes for which Wounds are often to be uncovered, (in the first Reason) we shal speak further.

And now likewise (in the next place) those Arguments for which they reject the Ancient Method of curing Wounds, are by us well to be weighed and considered. And as for what concerns experience, the question is stil in Controversie, and not as yet determined, to whether of these two waies the better is to be ascribed; seeing that it cannot be denied that hitherto infinite numbers have in the old way been cured. And here we are to take special notice, that many things in the curing of Wounds are oftentimes attributed unto Art, and the skil of the Artist, that are rather to be ascribed unto Nature, that is the alone curer of Wounds, as of all Diseases whatsoever. And *Cæsar Magatus* himself confesseth, (in his 1. *B.* and 31. *Chap.*) that a strong and vigorous Nature correcteth likewise many errors that have been by the Artist committed, sleighting and overmastering those things that might have proved prejudicial unto her through the ignorance and inconsiderateness of the Chirurgeon: and this (he saith) that himself hath frequently found by experience, whiles of set purpose he took little pains, nor much troubled himself thereabout, as being minded and resolved to observe what Nature in those stronger bodies was able of her self to perform; and that therfore he somtimes administred those Medicaments that were not altogether so fit and convenient, and that yet notwithstanding the sick party by the help and assistance of Nature recovered, and became sound again.

But now as for those Reasons that he objecteth against the Ancient way, the first of them is this; that the wounded part is too often exposed unto the Ambient Air, from whence its heat is weakned, and so thereupon great store of Excrements bred and treasured up. But as for this that is so often imputed unto the Ambient Air frequently admitted into the Wound, and that for this cause alone the greater abundance of Excrements are collected, this is only said, but no waies proved. For these Copious and abundant Excrements do not proceed from the Air, but they have other causes. For that smal and inconsiderable appulse of the Air (which yet notwithstanding, as I have said, is by all means possible, and as much as may be, to be avoided, and the operation therefore to be performed in a warm place) it cannot cause so great an alteration. And moreover also, the Excrements are likewise collected, because that the Blood and Humors faln forth of the Vessels are necessarily converted into *Pus* and *Sanies* (that is to say, thick and thin Excrements) although the temperament of the part be sound and unhurt. But that the very temperament of the part may be hurt even by the Wound it self, as also by the cutting and opening of the Vessels, and likewise by the efflux of the Blood and Spirits, is a truth that cannot be denied: and *Cæsar Magatus* himself (in his first B. and 9. Chap.) taketh upon him to prove the same at large. And this very weakning of the part (by Reason of the wound inflicted) and the change and alteration of the temperament, is the cause, that not presently and on the very first day the *Pus* is generated in the Wound, but for the most part on the fourth day, to wit, when Nature hath recovered and gotten her strength again, and the heat of the part is renewed. And furthermore, the Bodies on which Wounds are inflicted are not evermore exactly sound and pure, (but oftentimes Cacochymical) albeit they may seem exactly sound; which although they receive but some very light and sleighe wound, yet this in these Cacochymical bodies degenerateth into an Ulcer, by reason of the vitious humors that abundantly flow unto the wounded part.

As for what is in the Second place objected, that from the frequent loosening of the wound, the often handling and moving of the part, a pain and thence a fluxion may be caused in the part affected with the Wound, unto this objection we have already before given an Answer. To wit, that the experienced and skilful Chirurgeon may very easily prevent the said pain: and although that some pain should chance to be excited from the uncovering of the Wound; yet nevertheless the inconvenience and pain that would arise from the reteining and not cleansing away of those Excrements might prove far greater, and of a more dangerous Consequence.

Thirdly, *Magatus* (although without cause) feareth, lest that in the uncovering of the Wound there should happen a dissipation of the spirits and Native heat. For if there be any such dissipation of the Spirits and heat, this happeneth together with the very effusion of the blood. But then so soon as this flux of the Blood stoppeth, the orifices of the Vessels do again shut close, so that there needs no fear at all of any such dissipa-

tion

tion of the Spirits; and Nature being otherwise follicitous and careful about the preservation of the spirit and the Radical heat, expelleth the offensive and hurtful Excrements and stil reteineth those that are useful; as we may plainly see it to be done in Critical Evacuations.

Fourthly, and lastly, they object this also, that as often as wounds are unbound and opened, so often is Nature disturbed and distracted from her proper Office and Work. But there is no ground at all for this fear. For Nature cannot in so short a space of time (as while the Wound is opened and bound up again) possibly be disturbed, unless there happen a very great and extraordinary alteration. But it will be rather disturbed, if the Wound be not cleansed from those Excrements.

III. *Cæsar Magatus* and *Ludovicus Septalius* do not solidly confute those causes by which the Ancients, and all the Chirurgeons even unto our very times, were moved and drawn unto this often opening and unbinding of Wounds.

For First of all, that they determine and conclude that Wounds are therefore often to be uncovered, that so those Excrements that are necessarily generated may be evacuated; this (say these) is not indeed Requisite, and altogether needful; in regard that the thin Excrement may partly be digested by exhalation, and partly be driven out of the wound by the heat: but as for the thick, (if any such be generated) it is confounded and mingled together with the *Pus*, and so by Nature expelled together with the said *Pus*. But experience it self teacheth us that this is most false, that the thin Excrement is alwaies digested by exhalation; seeing that oftentimes we find that it rendereth the Wound exceeding moist, and that there floweth forth great store thereof. And for the thick Excrement, although it be mingled with the *Pus*, yet notwithstanding it is not of its own accord wholly evacuated; or if it be evacuated, it is but very slowly; and therefore being retained it acquireth an Acrimony, and so causeth a pain, and a new afflux; and therefore it is speedily and seasonably (before this shal happen) to be evacuated and cleansed away; and for this Reason the Wound is to be uncovered as oft as need shall require. For neither indeed doth Nature her self expel these Excrements. Nature (the truth is) doth separate the useful Excrement from that that is altogether unuseful. But when the Excrements are thus separated, the useful from the unuseful, and stick in the Cavity of the wound, Nature hath then no more that she can do, for it is not in her power to expel them; but the Excrement either of its own accord, and by reason of its weight floweth forth; or else it is thrust out by the flesh growing underneath it; and this if it be not done, it is left stil to remain in the wound. Neither also can the wounded part be alwaies kept in such a Scituation, and so placed, that the *Pus* by its weight tending downward should of its own accord flow forth. For all wounds whatsoever that are inflicted in the fore parts of the Body are altogether unfit for such a Scituation as is requisite for a Spontaneous efflux of the *Pus* or Noisom purulent Mattier; seeing that it is no waies convenient, that the Patient should lie upon his face. And so likewise the Wounds of the hinder part, although that they be so Scituated that the *Pus* may easily flow forth from them, yet nevertheless, a lying upon the wounded part is no waies fit and convenient, but painful, and troublesom, in regard that the whole bulk of the Body presseth and weigheth down the part affected. And in Wounds of the Head that pierce through the Skul, it is much more difficult to find such a Scituation, that all the *Pus* of its own accord and by reason of its gravity should easily flow forth, albeit the Wound be but seldom uncovered.

But *Magatus* wil not yet yield for al this, but in the 33. Chapter throughout, of his first B. he endeavoureth to prove that it is not necessary, that Wounds should be often uncovered, to the end that the thick Excrements should be cleansed away; & he endeavoreth likewise to demonstrate, that the thick Excrements, as also the very *Pus* it self, may be evacuated without the use of abstersives. And first of all indeed he alleadgeth this out of *Galen*, that he writeth (in the 13. *B. of his Method of Curing*, and 5. *Chap.*) after this manner. *But if there be some notable* Pus *contained in the suppurating particle, it is not expedient (as some do) forthwith to cut and make an incision, but rather we ought to attempt an exhalation by Medicaments avayleable for this purpose; the use whereof may be conjectured from the affect it self.* From hence he concludeth, that there is no need of Abstersives, where the *Pus* may be dissipated by Discussives. But, (that I may not now dispute this question, whether or no we may safely and securely endeavour in Impostumes to wast and consume the *Pus* with Discussives alone) be it so indeed, that this may possibly be done; yet (as he himself writeth) for the effecting of this there will be need of Medicaments that are strong and prevalent, and fit for this purpose. But when (I pray you) shall such like Medicaments be administred in Wounds, to the end that the *Pus* may be discussed? He writeth moreover, that in Im-

postumations when they are broken, oftentimes the *Sinus* (though they have been very notable, and such as have sent forth great store of *Pus*) have been filled up with flesh, no Abstersive at all having been put into the Cavity thereof, but only some Medicament laid unto the very mouth of the same; of which it was not possible that any thing should reach so low as the bottom thereof. But unto this I answer, that this is not alwaies done; but that there is oftentimes need of casting in Abstersive Medicaments; or if such may not be administred, that then the *Sinus* is to be pressed together, that the *Pus* may both flow and be pressed forth; and that this is often to be done, and for this Cause the Wound is also often to be uncovered; and that the *Pus* is by no means to be detained in such a *Sinus*. And lastly, He writeth that even internal Wounds may be also cured, although the impurities and Excrements thereof be not cleansed and done away. But I answer, that neither is this alwaies done, but in those parts only in which there are but few Excrements collected, and such as have an open and prone passage forth of them. Otherwise if the Excrements be long detained, those Wounds are not to be Cured; and this we see to be often done in the Lungs, in which from the Excrements retained Ulcers and at length the *Phthisis* or consumption is generated. And indeed, oftentimes the *Pus* and Excrements stick so close and fast unto the sides of the Wound that they cannot possibly of themselves flow forth, but that they must of necessity be cleansed away by a manual operation.

Thirdly, That therefore the Wound is often to be uncovered, that so according to the various state of the Wound, sometimes digestives, and sometimes abstersives, sometimes those that generate flesh, and sometimes again those that wast and eat away superfluous and proud flesh, may be adminstred: unto this indeed *Cæsar Magatus* answereth, that there is no need at all of that change of Medicaments, in regard that the whole business is to be committed to Nature. And that it is sufficient, if there be only a covering imposed upon the wound, that by its corpulency may prevent and hinder the efflux of the Radical heat, and that may preserve and cherish the same, and that therefore with one only Medicament divers times a Wound may be healed. But here false Principles are presupposed. The First is this, that Nature of her self alone is able to perform all those things that are necessarily required for the healing of a Wound. Indeed it is true, that Nature doth concoct, separate such things as are of a heterogeneous and different quality, and generateth flesh; but the Excrements when she hath separated them, she cannot alone and of her self expel them; but they are oftentimes so pertinacious that they will stick unto the part, do she what possibly she can. Neither do they also flow forth of themselves, and of their own accord; or is the Member indeed so to be placed, that they may of their own accord flow forth, as a little before we likewise told you. And therefore then in that Case there is need of Medicaments that may keep them from being over nasty; yea and oftentimes also of a Manual operation, whereby they may be throughly cleansed. Another of his false Principles is this; that Nature in her work standeth in no need of any Medicaments whatsoever, that so she may be holpen and assisted thereby; which that it is false even experience it self teacheth us; wherein we see most manifestly that Digestives that in the beginning are of singular use, in the progress of the Disease prove very hurtful: and this *Cæsar Magatus* himself likewise confesseth; for in his 1. B. and 37. *Chap.* he writeth that he had observed that by the use of a digestive the most grievous Wounds inflicted by Bullets shot from Guns have been suppurated, throughly purged, and filled up with flesh; but that afterward by reason of the over great humidity there hath grown a flesh upon it that hath wanted Corrosives to eat it out and consume it. His third principle (that by consequence followeth from hence) is likewise false; to wit, that one only Medicament is sufficient all the whole time of the Disease, provided that by its Corpulency it may be unto it instead of a Covering. For if this should be so, and were indeed true, then instead of an Emplaster we may as wel put any piece of Leather upon the Wound, or make use of one kinde of Emplaster for another, so that it be not deadly and poysonous, sharp, and Corroding: and yet notwithstanding he never as hitherto heard of any wise Physitian that ever did thus. And in this very point likewise *Magatus* expresly contradicteth himself, who (in the 36. *Chap.* of the same B) writeth most truly, that not every kind of covering (how ever it be made and provided) is fit for the defence and corroborating of the Natural heat; or that it is convenient for the temper of every part; and that, what is a very fit and convenient covering in one part may in another part be altogether unfit, inconvenient, and indecent, yea likewise that it may be a very hurtful & dangerous covering.

Fourthly Whereas it is the common Tenet, and that we are usually taught, that therefore likewise Wounds ought often to be uncovered, that so the virtue and effect of the Medicament may be known what it is, and whether

ther the Wound be moiſt, yea or no, that ſo Convenient driers may be laid thereto, according as there ſhal be occaſion; unto this *Cæſar Magatus* anſwereth that there is no need at all of any ſuch ado, or that we trouble our ſelves ſo much thereabout, in regard that the whol buſineſs and the iſſue therof is to be committed to Nature. But he doth not well in ſo determining. For the truth is, that Nature doth indeed evermore intend that which is beſt, but yet notwithſtanding ſhe cannot alwaies obtain what it intendeth; either becauſe ſhe is weak, or elſe in regard that ſhe is oppreſſed and overwhelmed with too great an abundance of that Object on which ſhe acteth: and therefore both the temperament of the wounded part is to be cheriſhed with Medicaments, (and theſe indeed ſome at one time, and ſome at another;) and the Excrements alſo by which Nature is oppreſſed and overburthened are to be dried up, and evacuated. And therefore we conclude, that it is overraſh and altogether unſafe to Commit the whole buſineſs unto Nature, and to ſtand looking on as an idle Spectator; ſince that it may eaſily ſo happen, that overmuch Humidity abounding in the Wound it may ſoon degenerate into an Ulcer.

Fifthly, And for this Cauſe likewiſe ſomwhat the more frequent uncovering of the Wound is held to be neceſſary, that ſo the State of the Wound may be known, and the Symptoms likely to happen thereupon may be prevented. *Cæſar Magatus* rejecteth alſo this Cauſe, and afferteth, that from other Signs, (to wit) Itching, Pain, and the feat ſcent that cometh from the Wound, we may give a ſhrewd gueſs; and he poſitively determineth that an Artificial Conjecture is the beſt; and that we may more rightly make our conjecture by the Eyes of our mind, then by thoſe of our Body, ſince that they are ſharper ſighted then theſe. But thoſe conjectures are oftentimes very uncertain: yea ſomthings may now and then happen unto a Wound that will no way be taken Notice of but only by ocular inſpection, and ſuch are the *Fungi* of the Brain, Worms in Wounds, and fleſh growing upon them. And though it be true that at the length there will ſome certain ſigns diſcover themſelves; yet it is no way ſafe, that the Phyſitian ſtand as an idle Spectator, until ſuch time as thoſe ſigns (to wit Pains, Feaver, Noyſom ſmels, and the like,) ſhall happen, and manifeſt themſelves. For when theſe once come upon the Patient, he is then moſt commonly in the greateſt danger; which by ocular Inſpection might have been eaſily foreknown, and ſafely prevented: and oftentimes in the ſpace of one day, yea of a few hours, ſome grievous evil may befal the ſick perſon. And ſo *Paræus* relateth, that he had ſeen Wounds, in which (unleſs they were daily opened, and new Medicaments laid on) Worms would continually be breeding.

Sixthly, And for this cauſe alſo the wound is to be frequently uncovered, that ſo the Swaths, little Pillows, and Linen Clothes, may be made clean. But *Cæſar Magatus* and *Ludovicus Septalius* ſleight, and account of this as of a thing of no reckoning: or if we may at any time change the Swathes, they allow it only, with this Proviſo, that the wound be not uncovered. But theſe ſhould have conſidered with themſelves, that if the Swathes be foul and unclean, much more the Wound, and the coverings neerer unto the ſame, muſt needs be Naſty and unclean, ſince that the ſanies or thin Excrement doth firſt and moſt of all defile thoſe things that do neereſt touch upon the Wound.

Seventhly, And Laſtly, whereas even for this cauſe the more frequent opening of the Wound ſeemeth to be neceſſary (as is alſo the change of the Swathes, and little Pillows,) that ſo the ſtinking Vapors in the Wound, (bred of the *Pus* and Excrements) may the better exhale, (which if they be ſtil detained & ſhut up in the wound, they affect the wounded part, and much change and alter the ſame:) unto this *Septalius* Anſwereth, that the Wound is not to be bound up with ſo many and ſuch Linen Clothes that thoſe Vapors ſhould be ſuppreſſed; and if that the *Pus* find a paſſage forth, he thinks then that thoſe Vaporous Excrements may much rather be blown abroad, and diſſipated: and if they be altogether retained that they are not likely to bring ſo much damage unto the Patient, as may befal him from the uncovering of the Wound, and the alteration of the Ambient Air.

But in whatſoever manner the Wound is bound up, (which yet notwithſtanding they themſelves grant that it ought ſo to be bound up, that it may be defended from all external injuries) thoſe Vapors may eaſily be detained, yea they may inſinuate themſelves into the Linen Clothes, and the Swathes; and hence they may offend the wounded part by their ſtench and noyſomneſs. And this is that very thing that is now in Queſtion, whether all the *Pus* may be evacuated, unleſs the Wound be often uncovered. The alteration alſo that is cauſed from the external Air cannot be ſo hurtful and offenſive, (in regard that it partaketh not of any ill quality) as is that which proceedeth from thoſe putrid and ſtinking vapors ariſing from the *Pus* and *Sanies*.

Whether there be any use at all to be made of Tents, or Pensils, in the Curing of Wounds.

The other thing wherein *Cæsar Magatus*, and *Ludodicus Septalius* dissent from the Ancients, and from other Physitians and Chirurgeous, is this, that they assert, (and endeavour to maintain this their opinion) that there is no use at all to be made of Tents in the Curing of Wounds. *Magatus* to prove this (in his 1. *B.* and 5. *Chap.*) useth these Reasons.

The Reasons that move Magatus to reject the use of Tents.

The First Reason is this; because that Tents are neither therefore to be instituted, that they may keep open the mouth of the Wound, neither that by them Medicaments may stick unto the sides of the Wound. The former of these he proveth in this manner, that before the Wound is conglutinated the orifice thereof is alwaies patent and open; so indeed, that if we desire and endeavour it never so much, yet we are not able to shut close the mouth of the Wound. And he thinketh likewise that there is no need of Tents for any other use or purpose, since that the Medicaments may be so melted, that they may very conveniently be instilled into the Wound.

The Second Reason is this, because that they are injurious, and by their weight very troublesom and grievous unto the Nature of the wounded part: whereupon it is likewise that Nature is alwaies laboring to expel them.

The Third is, because that they distend the part, press it together, excite pain, and thereupon produce new fluxions.

The Fourth is, because that these Pensils and Tents may be filled with base corrupt Humors, and so defiled therewith, that they may acquire an ill quality, by which they may hurt the wounded part: and they do moreover hinder the Evacuation of the *Pus*, and cause that the said *Pus* acquire and get it self a depraved and Malignant quality.

Fifthly, They say that *Hippocrates* and *Galen* when they write of the curing of Wounds, do never make any mention of these Tents; as we may see in *Galens* 14. *B. of the Meth. of Curing, Chap.* 4. and in *Galen his B. of Fractures, Sect.* 3. *Comment.* 21.

The Reasons of those that make use of Tents in the Curing of Wounds.

But now on the contrary, Those that make use of Tents, give these Reasons for their so doing. The First is this; that in the wounds the use of Tents is therefore necessary, that by the help of them the orifice of the Wound may be kept open, and a passage may be made for the *Pus* to flow forth.

The Second is this, that for this cause Tents are to be made use of, that so by means of them the Medicaments may every where touch the Wound, and that they may penetrate even to the very bottom thereof.

Thirdly, For this Cause likewise Tents seem to be necessary, because by them it may be prevented, that the upper part of the Wound be not closed up before the deeper parts thereof be filled up with flesh.

The Answer of Magatus unto the said Reasons.

Unto these Reasons they Answer; unto the First thus, that there will not be more Excrements generated in the Wound (if there be a due Course taken in the curing thereof) then what may easily be expelled forth by Nature. And then that although Excrements should be generated, that yet Tents do rather shut up the passage forth of the *Pus*, then any waies keep it open. And unto the Second they Answer, that there is no need of Tents, since that the Medicaments (if they be liquid) they will of themselves penetrate unto the bottom of the Wound; neither therefore is there any need of so often repeating and imposing of new Medicaments. Unto the Third they Answer, that the continual efflux of the Excrements by the external wounded parts doth hinder the meeting together and uniting of the Lips, before the Cavity be filled up with flesh.

My own Opinion.

But that I may briefly shew you my opinion touching this Controversie, I do indeed willingly grant them, that in such Wounds as are superficial, straight, and such as generate but little *Pus*, Tents are not at all necessary; neither is the curing of the Wound rashly to be retarded by the putting in of the Tents. But if the Wound be deep, and oblique, so that there be no right and straight passage for the flowing forth of the *Pus*, and that there be much *Pus* generated; in this Case Tents seem to be altogether necessary, that so by them there may be made an open and free passage forth for the purulent matter; and that a way may be left, by which the Medicaments may penetrate unto the more inward parts of the Wound; and that by this means the orifice of the Wound may be kept from Conglutinating and closing together, until such time as that which is in the bottom of the wound shall be first Conglutinated: which if they be neglected, and that the *Pus* and Excrements be still retained in the Wound, they may easily prove the Causes of

of the extreameſt pains and dangers; as a little above (in the 7. *Chapter,*) we gave you ſome inſtances and examples of this very thing, out of *Guilhelm. Fabricius* his Obſervations.

Anſwers unto the Reaſons of Magatus.

Now as for what they Anſwer unto theſe Arguments, and what they likewiſe object, they are neither of them of any great moment.

For Firſt of all, whereas it is ſaid, that Tents are not neceſſary, that by them the Wound may be kept open, ſince that the orifice is of it ſelf alwaies open, this we altogether deny. For oftentimes Wounds (according to the various Scituation of the Patient, that he then had when he was wounded) are oblique, and ful of turnings and windings; ſo that although the ſides and lips of the wound be not as yet cloſed up, they yet nevertheleſs ſo touch and lie one upon the other, yea and oftentimes ſo preſs one another, that there is no open paſſage left for the *Pus* to flow forth.

Secondly, For this very cauſe, and when the Wounds are not ſtraight, the Medicaments cannot ſo eaſily penetrate unto the bottom. And albeit that the Wound be not writhing and oblique; yet notwithſtanding it wil not alwaies be Convenient to inſtil into the Wound Medicaments that are over fluid, ſeeing that they may be eaſily waſhed away again by the *Sanies* or thin Excrement: but there will be oftentimes occaſion to make uſe of the thicker and more viſcid ſort of Medicaments, which being conveyed into the Wound by the Tents will ſtick ſo much the longer and more firmly unto the wounded parts; and thereupon they will the more rightly put forth their Virtue and efficacy.

Thirdly, That the ſuperior orifice of the Wound is never Conglutinated before ſuch time as the inferior Cavity is cloſed up (and that therefore the orifice of the Wound needeth not to be kept open with Tents) this is falſe; and experience very often teacheth us the Contrary: and *Guilhelm. Fabricius* (in his 4. *Cent. Obſervat.* 7.) reciteth two Examples of Wounds, whoſe orifices were very ſuddenly healed, and yet the Wound within all this while not cured; from whence it happened, that there was abundance of *Pus* collected within; and from thence many grievous and dangerous Maladies excited. And wheras they ſay, that the continual efflux of the Excrements wil cauſe that the orifice of the wound ſhal not be cloſed up, herein they contradict their own former preſuppoſals, when as they aſſerted before, that there would be altogether very ſmal ſtore of *Pus* generated in the Wound.

Fourthly, The Tents ought not neither to be over thick, that ſo they may not preſs the part, nor diſtend it, nor by any means whatſoever cauſe unto it any trouble, grief, or pain, and that they likewiſe ſhut not up the paſſage of the *Pus* or purulent mattier. And if now and then any ſuch thing ſhould happen, (ſuch as that that *Ludovicus Septalius* in his 8. *B.* of *Animadverſions, Num.* 10. alleadgeth out of *Hippocrates* in his Hiſtory of a certain perſon at *Maſſilium*) the Errors of the Artiſts are not to be imputed unto the Art it ſelf; whenas haply they uncovered not the Wound ſo oft as was requiſite. And yet nevertheleſs we are here to give you to underſtand, that albeit we are to uſe our utmoſt endeavour, that Wounds may be Cured without all kind of trouble and pain; (or at leaſt that they may be healed with as little as poſſibly may be:) yet notwithſtanding it is not to be expected, that in the curing of Wounds there ſhould be at any time a total and abſolute freedom from all pain and trouble, no more then there is in the curing of other diſeaſes. And indeed if al things were to be omitted and forborn that are any waies the Cauſe of any trouble whatſoever; then the ſewing of the Wound, as likewiſe the Swaths, and binding up of the Wound were all of them to be omitted. But the Rule is good in this caſe, that alwaies of two Evils the leſs is to be choſen.

Fifthly, Neither are Tents therefore to be omitted, becauſe that being defiled by the *Pus* they may hurt the wounded part. For as often as they ſhal be thus fouled and made naſty, they are to be drawn forth; and this very thing impugns the rare and ſeldom opening of the Wound.

Sixthly, And laſt of all, although that *Hippocrates* and *Galen*, where they treat of the Curing of Wounds, do not make expreſs mention of theſe Tents; ſo neither yet do they forbid the uſe of them: but rather out of the precepts of *Galen* as touching the Curing of Wounds it may be proved, that the uſe of Tents is oftentimes by him allowed and approved of.

All the premiſes being therefore thus agitated and diſcuſſed *Pro* and *Con*, the thing ſeems to come to this; and the whole ſum and ſubſtance of this Controverſie amounteth to thus much; that light and ſleight Wounds, and ſuch wherein there is not much *Pus* generated, may be committed unto Nature; and that it matters not much if ſuch Wounds as theſe be but ſeldom concovered. But yet I would not in the leaſt perſwade any Man, that in thoſe Wounds that are more grievous, and in which there is generated great ſtore of *Pus* and Excrements, he ſtand as an idle ſpectator,

Spectator and Trifler, doing little or nothing himself, but committing the whole business to Nature; in regard that from the neglect and omission of the necessary opening of the Wound, there may more danger and damage arise in one day, then can afterwards be removed in a whole Month.

And so likewise for Tents: as on the one side where there is no need of them, I would not perswade to the putting of any into the Wound, (much lets that there should be such Tents made use of that may cause pain, excite a fluxion, or hinder the flowing forth of the *Pus*;) so on the other hand, where necessity urgeth, and the Causes before mentioned require the use of them, there I conceive they cannot possibly be omitted without damage and danger. But yet nevertheless in regard that experience perfecteth Art, (example shewing us the way;) I shall not withstand or oppose any man in his making trial and experience even of this way likewise, so that it be (as I have said before) without any danger unto the Patient; and as *Magatus* himself adviseth, (in his 1 B. and 40. *Ch. about the end thereof*) beginning alwaies from those more light and easie, and from these by degrees proceeding unto those that are more grievous and difficult.

Chap. 10. *Of the VVeapon Salve.*

THose things that have been (in the *precedent Chapter*) spoken touching the opinion of *Cæsar Magatus* and *Ludovicus Septalius*, as concerning the curing of Wounds, put me now in minde of that Unguent they commonly cal the Weapon Salve. For as those simple Wounds of the flesh (as hath been said in the *foregoing Chapter*) are Cured by the benefit of Nature alone, without any other great provision, without any frequent opening of the Wound, and without the applying of many Medicaments: So those Wounds likewise that are said to be cured by this Weapon-Salve, my Opinion is, that they are cured by the help and assistance of Nature alone. But in regard that there are many who have asserted the contrary; therefore we think it not amiss in this place to make some enquiry into this Opinion of theirs; and to tel you what I conceive is to be thought as touching this Weapon-Salve.

Now we shall First of all give you the descriptions of this Unguent or Weapon-salve; and then we shall acquaint you with the use of it, and what Arguments are usually brought for the defence therof. Now most are of Opinion, that *Paracelsus* was the first that found out this Weapon-Salve, and therefore the invention thereof is by very many ascribed unto him; but whether he were the first that we find to have made mention hereof or not, of this there is no question, but that he hath been very forward in the divulging of it.

Paracelsus himself (in his 1. B. *Archidox. Magicæ*) hath this description of it.

Paracelsus *his description thereof.*

Take *The Moss of a Dead mans Skul, two ounces; Mummy half an ounce; Mans fat, two ounces; Mans blood, half an ounce; Oyl of Linseed, two drams; Oyl of Roses, and Bole-Armenick, of each one dram; mingle them, and make an Unguent.*

Into which he puts a piece of Wood that hath been soaked in the Blood that comes from the wound, and then throughly dryed; and every day constantly he covereth the Wound with a new Swathe that had been throughly moystened in the Urine of the wounded person. But then for the anoynting of the Weapon, he addeth yet further, *Honey, one ounce; and Bulls fat, one dram.*

John Baptista Porta (in his 8. B. *of Natural Magick*, and 12. *Chap.*) writeth thus of it. *The Weapon Salve (saith he) was a good while since by* Paracelsus *given to* Maximilian *the Emperor; who having made trial of it esteemed it very highly all his Life after: of which there was some bestowed on me by a certain noble person then living in this Emperors Court. If the Sword that gave the Wound were brought, or a piece of Wood wet in the blood of the said Wound, the wounded person was then cured, albeit he were never so far off.*

Porta *his description of the weapon salve.*

Take *Usnea, or the Moss that groweth upon a skul left in the open Air, and mans fat, of each two ounces; Mummy and mans blood, of each an ounce and half; Oyl of Linseed, Turpentine, and Bole Armenick, of each one ounce; let them be all wel mingled together in a mortar; and then preserved in an Earthen Vessel somwhat long and narrow. Dip the Sword into the Unguent, and so leave it; let the wounded person in the morning wash the wound with his own Water; and so adding nothing at all thereto, let the wound be bound up; and it shall be cured without any pain.*

Crollius *his Description.*

And *Crollius* himself likewise attributeth this Unguent or Weapon Salve unto *Paracelsus*; and he cals it the Sympathetick Unguent of *Paracelsus*; and thus he describeth it.

Take *the fat of a Bore Pig or Brawner, and Bears fat, of each four ounces; The older these Creatures are the better is their fat. Let both these fats first of all (for the space of half*

an

an hour boyl in red wine over a gentle fire. After this it is to be poured out upon cold water and the fat swimming a top is to be taken off with a spoon, and whatsoever sinks to the bottom throw it away. Then afterwards,

Take, of Earth worms washed in Wine or Water, two sextaries; let them be put for a while into the Bakers oven in an Earthen pot covered, where as they must be baked, so you must have a great care that they be not burnt; and after this, beat them into a pouder.

Take Of this Pouder, the dryed brains of a Brawner, Red Saunders that smells sweet, Mummie, and the Hæmatites or Blood stone (as he calls it) of each one ounce. After this,

Take Usnea, or Moss from the skul of one that died a violent death, let this Moss be cut off from the skul in the increase of the Moon, and she being then in a good house, as that of venus (if it be possible) but not of Mars, or Saturn, the weight of two silberds or thereabout. And all of them being bruised together, and well mingled with the fat, let there be an unguent made according to art; and then in a Glass vessel stopt (or if you think good, in a Box) let it be carefully kept for use.

If after long time the unguent happen to be over dry, it may be a new moystened and softened with the aforesaid fat, or virgin houy. Let the Unguent be made, the Sun being in the sign Libra.

The Use of this unguent.

Now as touching the Efficacy and use of it, he thus writeth: This cure is performed by the Magnetick attractive virtue of this Medicament, caused by the constellations, which thorow the medium of the Air is brought unto the wound, and Joyned therewith, that so the spiritual operation may be drawn forth into effect. Its wrought (I say) by means of the Astral and Elementary conjunction.

There are therefore three things that by this unguent cause so admirable an Effect. 1. The Sympathy of Nature. 2. The influence of the heavenly Bodies, perfecting their operations by the Elements. 3. The Balsam, which being endued with a virtue of healing is naturally applyed unto any man, wit out any difference. With this unguent are cured all Wounds, by what weapon soever they be inflicted, and whatsoever the sex be, (and yet so notwithstanding that neither the Nerves, Arteries, nor yet any one of the three more principal members be hurt) so that the Weapon may but possibly be had, although the patient be many miles distant from us And in regard that it is of a Conglutinating, Suppurating, and renewing Nature, it doth not permit (if it be rightly applyed) any hurtful symptom to follow upon it.

The manner of applying the unguent, or weapon salve.

First, Let the Weapon wherewith the man is Wounded be anoynted every day once, if necessity require it, and the wound be great: but otherwise it will be sufficient, if the Weapon be anoynted every other, or third day; and then let it be kept in a Clean Linen Cloth, and in a place a little warm but not over hot, lest that any damage should thereby be brought upon the Patient: We must likewise be very careful that the Weapon fall not down from on high, neither that the wind blow upon it in a cold place; for if this should happen the Patient will run mad.

Secondly, Before you anoynt the Weapon, Consider, whether the Wound were made with the point, by pricking: and if it were, let the Weapon be first anoynted upwards, (and not below) and so descending toward the point thereof; for otherwise much hurt may be brought upon the Patient.

Thirdly, But if thou canst not certainly know how deep, or in what manner the Weapon entered into the flesh, thou mayst then anoynt it all over; but otherwise it will be sufficient to anoynt that part of the Weapon wherewith any one is hurt.

Fourthly, There is no Necessity of sewing the wound together after the manner of Barber Surgeons; but every day only to bind it up with a clean linen Cloth, first wet in the Patients Urine.

Fifthly, That day that any one anoynts the Weapon, let him abstain from Venery.

Sixthly, Before the anoynting of the Weapon, let the Wounded persons blood be with al speed stanched.

Seventhly, In fractures, and ruptures of bones, you may add unto the unguent some of the powder of the greater comfry, or the roots of black Hellebor.

Having the weapon wherewith the Patient was hurt, if thou be desirous to know whether the Patient be likely to live, or to die of his Wound; thou art to make the trial in this manner. Take the weapon and make it hot over the coals, so hot that thou can hardly endure thy hand upon it; and then sprinkle upon it some powder of Red Sanders, and the blood stone; and if the Weapon then sweat drops of blood, the patient will die; but if not, he wil escape it.

But if we would know whether the Patient order himself aright in his drink and other Requisites: this may thus be known, if there be in the weapon spots of blood, he is disordered; but if no such spots, then the Patient ordereth himself aright.

We are moreover to take notice; first, that if we have not the Weapon, (or instrument whatsoever it were) yet nevertheless that any violent

openi-

opening of the Skin, and hurting of the flesh, by which any Blood goeth forth, may be Cured with this unguent, so that a little piece of Sallow Wood be moystened in the bloody opening; and after that the Blood sticking thereto be dryed (not by the heat of the Sun, or the fire, but of it self, and own accord) it be then put into the above mentioned Unguent, kept close covered in the Box, and there left.

Secondly, If the Wound should be great and deep, it may then be cleansed every morning, and bound up with a new Linen Cloth, without any other use of Extraneous Oyls, Unguents, and the like; and then this wound (how ever it were inflicted) will heal of it self; and it sufficeth that the little piece of Wood once only moystened in the opening of the Bloody wound, be then put into the Box of Unguent (as aforesaid) and there left to remain, until the Wound be perfectly Cured.

Thirdly, But yet notwithstanding, as oft as any new Wound is to be healed, there is alwaies required a new piece of Wood.

Fourthly, But if it be so that the Wound will not bleed, it is then with the Wood so long to be scarified, until the blood flow forth: and so likewise in the curing of the Tooth-ach; the pained Tooth is so long to be scraped with a Pen-knife, until it bleed; and then the Pen-knife after the blood is dryed up, is to be anoynted with this Unguent; and so the pain is presently asswaged. If a Horse be prickt with a Nail in his Foot, let the Nail be first of all drawn forth, and anoynted with this Ungment, and the Horses Foot shall immediately be cured, without any suppuration at all.

And so in this same manner all living Creatures having flesh and Bones may be Cured.

The description of Gabelchoverus.

Oswaldus Gabelchoverus (in his *Practica Germanica,*) thus Describeth it.

Take *the fat of a Boar, and of a Bear, of each one pound; and these being melted he poureth them into red Wine, Unto this fat he addeth powder of the Blood-stone, one ounce; Red Saunders, six ounces; Earth-worms prepared two drams; Usnea or Moss of a dead mans Skul, as much as may be gotten; and then he mingleth them, and maketh an Unguent: touching the use whereof he writeth almost the very same that* Crollius *doth.*

Another Description.

Others have this Description of it.

Take *the Lard of a Brawner (melted on the fire, and poured forth upon cold Water) as much as you think good; the powder of prepared Earth-worms, the powder of the Blood-stone, and of Red Saunders, and Usnea or Moss of a mans Skul, of each as much as will suffice, and mingle them at the Fire.*

Johannes Wittichius leaveth out the *Usnea* or Moss, and he thinks the matter not great, whether it be put in, or left out of the Composition. Neither doth he add the Mummy, or the fat, or the Blood. And this others likewise do. And I my self knew one, who undertaking such a Cure, Compounded (as oft as he pleased) this Unguent only of the *fat of a Porker,* and a few other things, without any of the said *Usnea,* or any thing else taken from the Body of Man.

Colerus *his Description.*

That Polypragmatick *Johannes Colerus* (in the 18. B. of his *Oeconomy,* and 154. *Chap.*) gives us this Description.

Take *the fat of a Brawn, and of a Bear, of each half a pound; Moss of a Mans Skul, one pugil; Earth-worms, one quart; Blood-stone, two ounces; Red Saunders, and Root of the greater Consound, of each three ounces; mingle them, and with Wine make an Unguent.*

Neither do they all agree as touching the time wherein they would have this Unguent to be made. *Crollius* requireth the preparing of it, the Sun being in the Sign *Libra.* Others do include this time within narrower bounds yet; and they will have it to be only the tenth and eleventh day of *September.* But others there are that allow us any time for the providing of it.

But now as for the manner of using this Medicament; it having been so fully and largly described and set down before out of *Crollius,* I hold it needless here to repeat it.

The manner of using it.

The Sum is this in a word; the wound it self is not to be anoynted with this Unguent, but the weapon; or the instrument what ever it be wherewith the wound is inflicted: or if this cannot be had, then any other weapon, or wood, (but more especially that of the Sallow Tree) or any thing else put into the Wound, and there died and stained with the blood of the wounded person. And they likewise conceive that it matters but very little, (or not at all) whether the wounded party be present, or many miles distant; neither have they any regard at all unto the wounded person, but only unto the weapon, that this be anoynted. But yet nevertheless, some there are who give in charge likewise, that the Wound be every day washed and made clean with Urine or Wine.

But now lest any one should doubt of the effect of this Medicament; they first of all appeal unto Experience: and *Rudolphus Goclenius* the younger writeth that he is able to nominate Emperours, Kings, Princes, Earls, and Lords, (whose Authority and Credit was no way to be called in question) that

that were ready to give their testimonials touching the efficacy of this Unguent.

Reasons alleaged for their weapon-salve:

Moreover the Patrons of this Unguent think (as they tel us) that there may be natural causes rendered of this Action. And *Crollius* term al ignorant and simple that doubt of the efficacy of this Medicament, or that refer this Cure unto Sorcery. But now that they may prove that this Cure may be performed in a Natural way, they first of al take a great deal of pains to prove, that there are some actions to be instanced in, that are not wrought by the intervening of any Corporeal contact, but by an occult Sympathy, and *Magnetism* (as they call it.) And so the Load-stone draweth Iron, albeit that it touch it not corporeally; and it is moved toward the Pole. The Stars do also Act upon these inferior Bodies, without any the aforesaid Contact. The *Torpedo* or Cramp-Fish affecteth the hand of him that holdeth the Spear. There are some likewise that can by no means endure to be in the Room with a Cat shut up in a Basket; and although they see her not, yet they can by no means brook her presence; so that, unless either the Cat be carryed forth, or themselves removed into some other Room, they presently fal into swounding fits. Dogs likewise know their Masters foot-steps, as also the treadings and traces of wild beasts, by which they follow and pursue them. The shade of the Yew-Tree is very hurtful unto mankind. And very many more of such like instances and examples that may be observed in Nature, they heap up, to prove that there may be Natural occult Actions without any Corporeal Contact: which (because that they are most manifest in the Load-stone) therefore from it they cal them all in general Magnetick Actions.

Another thing that they presuppose and take for granted, is this, that there is a certain spirit of the world, diffused al the world over; which spirit (say they) is the Director and Vehicle of al occult powers and Actions; and which conjoyneth and keeps together all the parts of the world; and causeth a sweet and admirable agreement and harmony between them.

But Thirdly, As for what concerns the virtues of the Weapon-salve, they tel us that there is in it a two-fold virtue, one in the Unguent it self, to wit, of Consolidating and agglutinating of the Wound; and the other that that is in the Weapon anoynted, & which carrieth that power unto the wound. They derive this former virtue from many things of which this Medicament is compounded, and from the influence of the Constellations, as also the Astral and Elemental Conjunction. And therefore (as we told you before) some there are that never make this Unguent but at such a certain time of the yeer, and position of the Stars. But the other virtue they derive from the Natural Balsam, which together with the Blood sticketh upon the Weapon or instrument pressed upon the Wound, but first besmeared with the Blood of the wounded person. For this Balsam (say they) by reason of that Sympathy it hath with the Wounded part communicateth unto the Wound the said virtue of the Medicament, by the Mediation of the spirit of the World. And for the confirming of this they produce likewise other examples. The *Zenith* (as they term it) of young Maidens being cast into the fire (they say) very grievously hurteth the virgin from whom it came; and that the *Secundines* (or after births) if they be ill handled wil cause great damage and danger unto that Woman out of whom they flowed. Although they do not likewise here sufficiently and cleerly explain themselves. For *Crollius* writeth, that this Cure is performed by the Magnetick attractive virtue of the said Medicament caused by the Constellations; which virtue (say they) by the *Medium* of the Air may be brought unto the Wound, and conjoyned therewith: and then immediatly he addeth that there are three things that by this Medicament Cause so admirable an effect. 1. The Sympathy of Nature. 2. The influence of the Celestial Bodies, performing its operations by the Elements. 3. The Balsam, that being endued with a healing virtue is Naturally put upon any one whatsoever, without any distinction of either Person or Sex.

Reasons against the defenders of the weapon-salve:

But in very truth (that we may briefly open unto you, and shew you our Opinion touching this Unguent) that which in the first place rendereth it very suspicious, is this, that they give us not one only way for the composition of this Unguent but very many; and in some of them those things are omitted and wholly left out, from which others derive al the virture of this Medicament; as is apparent from the many descriptions above mentioned. And so *Wittichius* leaveth out of the Composition the *Usnea* or moss, the Fat, and Blood of man; which yet nevertheless others make the very Basis, and Foundation of all the virtue of this Medicament; and it is with them the principal part thereof. And yet nevertheless they will all of them promise you the very same effect: and every of them extolleth his own as fit and proper for al Wounds, whatsoever the Weapon be wherewith they

are inflicted; and whether they be by pricking, or by Cutting, or by any thing cast at the party, or by a fal; albeit that *Goclenius* indeed and *Crollius* do except those Wounds that are in the Nerves, Arteries, or any of the more principal Members, as the Heart, Brain, &c.

What others object against the Composition of this Medicament, to wit, that the Authors of this Unguent require the *Usnea* or Moss that is cut off from the Skul of a Man hanged, as also joyning therewith Mummy, Mans Blood a little warm, and Mans fat, and that in the Mans Blood and fat they think the marrow and pith of the whole business (that is to say, the whole virtue of this Unguent) to consist; which these Judg to be superstitious; this Objection I no waies own, neither will I defend it; it being so well known, that Mans fat, and Skul, Mummy, and *Usnea*, are made use of by other Physitians (without any superstition) in the Curing of Diseases. And yet notwithstanding of this I must here admonish you, that (seeing that Magitians and Wizards (as will appear out of *Apuleius* upon the 2. and 3. *B.* of *Ovids Metamorphosis*; and *Nicolaus Remigius*, in his 1. *B.* of *Dæmonolatry*, and 16. *Chap.* and 2. *B. Ch.* 1. and others also that have written of witches and Sorcerers) seeing (I say) that these are wont in their sorcery to use mans Blood and Flesh, and other parts of Mans Body, every one ought to be careful (who will make use of such Medicaments) that he do not superstitiously use the said Medicament, for the procuring of a Natural effect; and so thereby gratifie the Devil, (who is the enemy of Mans both Soul and Body) and so unawares do him Service; which may be done, if he use such Medicaments for those effects that are not in the Natural power of those things; and therfore if those effects shal follow, they are to be imputed and ascribed unto the Devil, (by such like superstitious practises laying snares for mankinde,) rather then unto the thing it self.

As touching the effect of this Medicament; that it doth not evermore answer the desire and expectation, we are shewn by *Guilhel. Gabritius*, in his *third Cent.* and 25. *Observation.* And be it so, that (as many great and eminent persons have testified) divers who have made use hereof have recovered: yet nevertheless these can atteſt no more but this, that the person was wounded, that unto him there was administred this kind of Cure by the Weapon-Salve, and that this person recovered: but that he recovered by the virtue of this Medicament, this they cannot testifie. For there may be oftentimes many things conjoyned with some effect, that are not the Cause thereof. And therefore, as it doth not follow, that such a person walking it Lightened, therefore his walking was the cause of the Lightening; so no more will it follow, this wounded person was healed, and he applied the Weapon-Salve, therefore the Weapon-Salve was the cause of the cure; unless it be demonstrated, that from the said Unguent this effect necessarily followed. And in nothing indeed is the fallacy of the cause more frequent then in Physick; where oftentimes the healing of some Disease is attributed unto this or that Medicament; whereas the truth is, it proceeded not from the said Medicament, but either from Nature her self, or else from such other Medicaments as were administred before, together with, or after the said Medicament whereunto the Cure is ascribed. And a very great difference there is between Physick and other Arts. For in other Arts the effect being upon somthing that is solid dependeth wholly upon the Artificer: and if there be any thing well or ill done by him, all this is to be imputed and ascribed unto the Artist, unless it so fal out, as happily it may, and often doth, that by reason of the unfitness of the subject matter, (for as we use to say, a Mercury or Statue is not made of every piece of Wood) or else by reason of some fault in the Instrument, somwhat may happen to be done amiss; since that, as we told you before (in the *first B. of our Institutions*, and 1. *Chap.*) the subjects of other Arts do nothing at all, but only obey the will of the workman: whereas in Physick, the subject matter thereof hath a certain innate power; by which (being assisted by the Physitian) for the most part of its own accord it tendeth unto health: from whence it is that by *Hippocrates* (6. *Epid. Comm.* 5. *Text* 1.) they are said to be the *Curers of the Diseases of Nature.*

So that the whol business in short comes to this, that the State of the Controversie here is not, whether in a person wounded, and recovered again, the Cure were done by the Weapon-Salve; but this, whether or no the Weapon-Salve were the Cause of the healing of the Wound; touching which we are now to make a little further enquiry.

Now it being so that Nature (as we shewed you above) is the Cause of the Wounds Conglutination, but without the virtue of any Medicament, (under what Notion or Consideration soever,) and that oftentimes likewise even by Lard (or some other thing of no great moment) laid on, many Wounds without the help of any other Medicaments, or any assistance from the Physitian, have been Cured; therefore, in the Cure likewise that is by some thought to be done by this Weapon-

Salve,

Salve, the Conglutination of the Wound is to be aſcribed unto Nature alone, as the next and principal cauſe. Which being ſo, and the truth thereof being ſuch that it cannot be denied, now in the next place we are to enquire, whether in the ſaid Cure the healing of the Wound be to be aſcribed unto Nature alone; or elſe indeed whether or no there be not likewiſe ſome Concurrent efficacy of the Weapon-Salve. Unto me the former ſeemeth the more probable, therefore, becauſe that it is a truth moſt certain (as but now we told you) that Wounds are oftentimes Cured by Nature alone without the Concurrence of any Medicament; the truth whereof is ſufficiently atteſted likewiſe by internal Wounds, unto which there cannot poſſibly be any Medicaments adminiſtred. And hitherto tendeth the whole buſineſs in the curing of Wounds (according to *Cæſar Magatus* his way, touching which we have ſpoken in the foregoing Chapter) to wit, that the whole work be committed to Nature, that the heat and temper of the part (it being the inſtrument) be kept entire, and that without urgent neceſſity it be not moleſted and diſquieted by Medicaments. And ſometimes we ſee that ſuch dangerous Wounds chiefly and eſpecially by the benefit of Nature, without the application of any Medicament, (or ſuch as is of no great moment) are cured; ſo that it ſeems to be aſcribed rather unto a Miracle, then the Medicaments. Of which very thing the Obſervations and Examples are every where ſufficiently known. Neither yet notwithſtanding are the Patrons of this Unguent ſo bold as to extend the virtue thereof unto al Wounds; for (as a little before we told you) *Crollius* and *Goclenius* do except the Wounds of the more principal Members, as alſo of the Nerves and Arteries: and there was never yet found any that durſt make uſe of this Unguent in Wounds cauſed by Gun ſhot. And who is there that dares deny that other lighter and ſleighter Wounds may be cured by Nature alone? And if any thing extraordinary, and that which ſeemeth to exceed the power of Nature, happen at any time in the ſaid Cure by the Weapon-Salve, we ought well to conſider, and look unto it, whether it be not wrought by the aſſiſtance of the Devil, thereunto engaged by a Compact and agreement, either explicite, or implicite.

And now therefore it being a known truth, that Nature alone (and as the next Cauſe) may agglutinate Wounds, and that Medicaments (as above we ſhewed you) do perform nothing elſe then the preſervation of the native heat, and the Natural Temperament of the part, or the removal of thoſe impediments that hinder Nature in her work; we are now in the next place to ſee, whether the Weapon-Salve can perform thoſe things.

Whether the Weapon Salve can Act at a diſtance?

Where we inſtantly meet with this firſt difficulty, to wit, whether poſſibly the Medicament that is not anoynted upon the Wound it ſelf, but upon the Weapon, or any thing elſe that is beſmeared with Blood from the Wound, can yield any benefit, eſpecially if the wounded perſon be abſent, and many miles diſtant from the anoynted Weapon. And indeed to prove this, they uſe two Reaſons, as we alſo told you formerly: the firſt is this, that there may be actions from occult and hidden qualities, and at a diſtance, (which they cal Magnetick actions) becauſe that by the ſpirit of the world the virtue of the Unguent may be conveyed unto the Wound, as we ſee it to be done by the Sympathy and Antipathy of many things.

But neither proveth the thing that it ought to prove. For firſt of all, albeit we grant that ſuch Actions there are, and that thoſe things that mutually Act, and are paſſive, do not alwaies corporeally touch one the other; yet nevertheleſs, that this is ſo in the Weapon Salve, and whether or no any virtue can be derived from the Weapon anoynted unto the Wound at ſo great a diſtance and interval of places, this is yet to be proved. For it doth not follow, there are ſuch admirable actions of other things, and therefore alſo the Weapon-Salve hath ſuch a vertue. And that this is not done, he ſhal eaſily perceive that will but conſider thoſe other Actions of this Nature, that are performed at a diſtance. Since that the operation followeth the being of a thing, it is therefore neceſſary that between the Agent and the Patient there ſhould be a certain conjunction and mutual Contact. But now, in regard that the things between which the Action is do not all of them touch one the other with their Bodies, there is a neceſſity that they ſhould touch in ſome other manner. And this is twofold: for

Action at a diſtance twofold:

either the thing that is ſaid to act at a diſtance, ſendeth forth ſomthing from its own Body and ſubſtance, (which the Ancients called *Effluvium* or Aporrhoia, and Phyſitians where they treat of Contagion, cal it *Miaſmos*; touching which ſee further in the *fourth B. of Feavers, Chap.* 4. and the 2. *B. of our Inſtitutions, Part* 2. *Chap* 12.) to wit, when there flow forth of the Body the ſmalleſt imaginable parts, and Atomes, and by the *Medium* of

the Air (or some other body,) are transferred unto another body, and affect it with that virtue which it hath in common with the whol entire body. But now as for such small bodies as these, they have no Regular motion at al, but according to the motion of the Air they move inordinatly this way and that way, and by every blast they are variously dispersed; like as we may see in the smoak of Candles when they are extinguished, and of other things when they are first lighted and kindled. But other bodies there are that Acting at a distance do not indeed send forth from their own body any thing that may be transferred unto another body, but only they send forth a *species* as we may call it; and in this manner, by means of these sensible *species*, as light, sound, smel, and the like, even the distant bodies are affected. And very probable it is, that there are more of these like sensible species then what are perceived by our senses. And this is commonly sayd to be done by a virtue, or virtual contact. And yet nevertheless virtue doth always presuppose a substance from which the said virtue floweth. So the flame being extinguished, the illumination or light that comes from it that also ceaseth. And moreover secondly there is likewise a fit subject required, thorow which it may be propagated; which if there be not, the Action ceaseth. And so an opacous and thick body being interposed betwixt the light body and our sight, the Illumination ceaseth. Thirdly, this virtue is likewise diffused orbicularly, and at a certain distance; Naturalists term it the sphere of Activity; which in some things is greater, and in others less. The greatest of all is in light or lucid bodies, but a less in those bodies that yield a sound. But yet the greater the lucid and lightsom body is the greater also is its sphere of Activity: and hereupon it is, that the starrs of all other bodies do scatter and disperse their light from them furthest in distance and widest in breadth.

We are now therefore to make enquiry (in regard that it is of a certainty that the Weapon salve with which the Weapon is anoynted, is in body absent and distant from the wounded party) whether the weapon-salve touch the Wounded body either of these two waies; for a third way there is none. Neither can this be done by Accident & some quality; since that an Accident doth not pass from one subject to another, neither diffuse it self at a distance, and unto any other body. Now I say that this is not done, neither indeed can be, either of these wayes.

The Weapon-salve doth not Act by sending forth any small bodies.

For first of all, those Atomes or Effluvious bodies that flow forth, having no certain motion of their own, but moving inordinately hither and thither, this way and that way, how can these possibly directly and in a straight line tend unto the wounded person? Neither is there any Cause, that we should here fly unto and plead the likeness of Substance. For although that those smallest bodies do at the length apply themselves unto others of their own kinds, (as we may plainly see in thunder and lightning) yet notwithstanding when they at first exhale out of the body they wander up and down inordinately, this way and that way. And much less may we have recourse unto the spirit of the World, by whose carrying and conveying whereof these smallest bodies may from the weapon anointed at length come unto the wounded person, and the wound it self. For those things are indeed spoken of the spirit of the world, but they are not proved; yea but rather they are opposed by reasons strong and weighty. And furthermore, since that this cure extends it self very far in length, and (as they will have us beleeve) at the distance of some miles; if this were done by the effusion of those small bodies, seeing there is so very little of the Unguent, and yet much less of that natural Balsam that sticketh unto the Weapon, that Unguent with the Balsam would easily fly abroad into the Air, and there vanish; and so the very foundation of the cure being taken away and gone, the cure it self must needs cease.

The Weapon salve doth not Act by any species,

But if they will say, that his Action is performed by the species, or Magnetick action, they ought first of all to prove that there are such species in this Unguent; (for indeed Nature hath given unto some simples and things natural, not compounded by art, a virtue of sending forth such like species as these we speak of) and then they must shew us what the nature of them is, and what their sphere of Activity. For it is no way credible, that the virtue of this Unguent should extend it self for twelve miles round about, and so orbicularly. As for what concerns the Loadstone, (from which they are wont to term these magnetick actions) the Load-stone doth indeed attract the Iron although it be at some distance from it; but if very far removed, and beyond the sphere of its Activity, it doth not attract: and the very same is likewise well known, to be done in other such like occult and magnetick Actions. For the Loadstone, and other the like bodies, do put forth their virtues

tues in a ſtraight and direct line, which yet nevertheleſs are not extended *in infinitum* (as we ſay) and they are oftentimes likewiſe intercepted by the interpoſing of other things. So the Sun-beams by the coming between of an opacous body are excluded. Who then can believe, that from ſo ſmal a pittance of the Unguent, and ſo little of the blood, there ſhould break forth ſo many of theſe ſmall bodies or ſpecies, thorow the cheſt in which the anoynted weapon is ſhut up, and that they ſhould thence be carried ſo great a diſtance, (even twelve miles) that they ſhould penetrate thorow Mountains and Walls, and tend directly unto the wounded perſon cloſe ſhut up within his Chamber, or in bed, and that there they ſhould paſs throw thoſe many double ſwathes wherein the wound is wrapped, and ſo inſinuate themſelves at length into the wound it ſelf? The Loadſtone is moved unto the Iron; but this unguent is not anoynted upon the Wound, but upon the Weapon. And the Loadſtone indeed being but only moved toward the Iron, draweth it; but now in the right uſing of this unguent, what a company of Ceremonies and ſuperſtitious practiſes there are uſed we have ſhewn you before. And in other reſpects alſo there appeareth a very vaſt difference between the Loadſtone and this Weapon ſalve. The Loadſtone is a natural body and ſo hath its Natural Effect, which evermore worketh in one and the ſame manner. The Weapon ſalve is a Compoſition out of many things; and by ſome it is made one way, and by others after a different manner, and of other things, as before we have ſhewn you. And the Unguent ought alſo to effect many things, to wit, perform all thoſe things that are Neceſſary for the curing of the wound, preſerve the Wound free from pain, and likewiſe bring pain upon it if it be not rightly preſerved, or if it chance to be defiled. For if it ought to perform all that that is otherwiſe the work of Nature in the curing of Wounds; there will be then altogether a neceſſity that it perform many things; to wit, that it concoct whatſoever is to be concocted, that it expel the *Pus* and excrements, and that it generate fleſh. Yea moreover it ought to perform the office both of the Phyſitian, and alſo of the Medicaments, which is indeed very various. For neither are all thoſe bodies that are Wounded alike diſpoſed; ſome of them being ſound bodies, others Plethorick, and a third ſort Cacochymical; the parts likewiſe are various, as fleſh, Nerves, Membranes; which require Medicaments of a different kind; the virtues of all which this unguent ought to ſuſtain. And if a man ſhall at one and the ſame time (as it very often happeneth) receive divers wounds in different parts of his body, and from different weapons; the queſtion then wil be, whether it be ſufficient to anoynt one of the Weapons only, and whether or no the virtue thereof wil be conveyed unto al theſe ſeveral wounds; or whether or no all the weapons are to be anoynted; and whether each particular unguent wil do its own office, and this tend ſtraight and directly unto that wound that was inflicted by this weapon; and that unguent likewiſe unto another wound made by that other weapon?

A reaſon ſhould likewiſe be rendered why the unguent ſhould not perform the ſame while it is in the box, which they ſay it performs when it is anoynted upon the weapon. For they have no ground to ſay that by the benefit of that baliam that is in the blood the virtue of the Medicament is carried and conveyed unto the wound. For if all that whol blood were reſolved into Atomes, it would not be ſufficient to fil up all that ſo great a ſpace. Neither have they as yet proved, that the blood can ſend forth out of it ſelf any ſuch ſpecies. And if by the benefit of the blood the virtue of the Medicament may be carried unto the wound, why ſhould it not then likewiſe carry to the wound the virtues of other things, into the which out of wounded perſons the blood is oftentimes abundantly poured out, which yet we ſee that it doth not.

But now as for thoſe things that they alleadg in ſpecial couching the Secundines, and the firſt menſtruous blood of Virgins, and as for their aſſerting that if this blood be not rightly handled, there is much hurt and damage brought unto thoſe maydens, theſe things are to be imputed unto the ſuperſtition of theſe young Women. And if in woman kind the Secundines being caſt forth into ſome unclean places bring damage unto theſe women from whom they came, why is not the like done in bruit Creatures, whoſe Secundines or afterbirths being caſt forth and buried in dung do oftentimes putrefy? And in what place ſoever you dig and bury theſe ſecundines, they yet notwithſtanding rot and putrefy. And why alſo do not the *Molæ* (or falſe conceptions) which women uſe to burn, bring any hurt and damage unto the Woman from whom it proceeded? And why ſhould the firſt menſtruous blood if it be burnt bring damage unto the virgin, and none of the reſt?

Theſe things being as we have ſaid, and the caſe thus ſtanding, there is no need of any further tedious diſpute touching thoſe virtues that this unguent is ſaid to have in curing the Wound, ſeeing that it is hitherto

ſufficiently

sufficiently proved, that there cometh no virtue at all from this Unguent unto the Wound. And if this Unguent had indeed any virtue at all in it either of preserving and cherishing the temperament or the innate heat of the part (they commonly cal it the Balsam) or of drying up the Excrements, it would better and more commodiously exercise and put forth this virtue, being anoynted upon the wounded part it self, then upon the Weapon. And besides all this, if (as some will have it) the virtue and strength of this Medicament consist in the Blood and fat of Man, why then do some of them likewise apply it unto the Wounds of other living Creatures, to wit, of Horses, &c.? For how great is the Difference between a Man and a Horse?

But that *Crollius* and some others (that I may not here altogether omit the mentioning of this also) derive the vertue of this Medicament from the Heaven, and therefore command the preparing of it in such a certain position of the Heavens: Neither will that at al patronize this Cause. For they have not as yet proved, that there is in the Heavens or any of the Stars any virtue at all to heal Wounds; or that if there were any such virtue in these, that it doth so mingle it self with this Unguent, that as if it were in a manner bound and shut up, it may be carried up and down about with us, and drawn forth into use and Act when we please.

And so likewise as touching the manner of using this Medicament, this also hath no Foundation to uphold it, neither doth it want for superstition. For first of al, seeing that they place the whole Cause of the Cure in this, that the virtue of the Medicament is derived unto the Wound by the benefit of the natural Balsam that is in the Blood; why then do they anoynt only the Weapon with the which the man was wounded, or some other Weapon, or a piece of Wood bloodied with the Blood of the Wound; and why do they not as well anoynt his shirt, or the other Garments of the wounded party, or a Stone, or any thing else what ever it be upon which the Blood hath been spilt or poured out: and if not, there is then some implicite underhand compact with the Devil to be suspected. And moreover, why if the wound be made with the pricking of a Sword do they anoynt the Sword in the point thereof towards the hilt; but if the wound be made by the Cut of a Sword, then they anoynt it from the edge towards the back: and if it appear how far and deep the Sword penetrated into the wound, so far they anoynt it, and no farther; but if it doth not appear how far it pierced, they then anoynt the Sword all over: all which are no better then Superstitious Ceremonies, and of which no Reason can be rendered. For if the power and faculty of the Medicament be Natural, what doth this or that manner of using it in the anoynting make to the thing it self, and whether or no doth it add any new virtue and quality thereto? If the vertues be Natural, there is no need of any such Ceremonies; as it plainly appeareth in all Natural things whatsoever. The Load-stone draweth the Iron; and the Iron being touched with the Load-stone is moved unto the North-pole, without any of the aforesaid Ceremonies. And furthermore, some there are that anoynt the Weapon once every day, others every Second, or Third day; and some content themselves with once only anoynting. And some there are, who (that so they may not Erre in the anoynting) wholly dip and plunge the Weapon (or Sallow Wood, that now and then serves in stead thereof) into the Unguent kept in a long Box, or little Chest, until the Wound be perfectly healed; but they altogether neglect the Weapon it self, that dip the Arms (or that they make use of in their stead) all over in the Unguent. But others there are that keep the anoynted Weapon in any temperate place what ever it be; and others likewise shut it up in a little Chest. But al of them generally are exceeding Cautious in this, that the Weapon be never kept in any place that is over hot, or over cold, and that it be not polluted with filth and impurities: for if this should happen, the Cure will by this means be hindered, and a most grievous pain in the Wound procured unto the sick person: All which are meerly frivolous and superstitious. For seeing that (as it is before sufficiently proved) there cannot possibly be any action of the Weapon-Salve upon the wound at a far distance, and interval of place from the Wound; so likewise we say, that it cannot possibly excite any pain. And therefore we conclude, that if this at any time happen, it is then caused and procured by the help and assistance of some evil spirit. And most certain it is, that the Blood of wounded persons is not alwaies poured forth into clean places, but oftentimes into places very noysom and unclean; and that in the Winter time it is frozen; and that the Bloody Linen Clothes are washed with warm Water, and the wood be sprinkled with the Blood oftentimes burnt, and yet nevertheless the sick person doth not hereupon feel any pain, or suffer any damage whatsoever.

And furthermore we say, that they attribute unto this Unguent things altogether impossible,

possible, and those virtues all which are never to be found in any one Natural Medicament. For they affirm that by this Unguent may be Cured all wounds whatever, whether inflicted by downright cutting, or pricking, by a fal, or any thing cast at the party. But great is the diversity of Wounds according to the various Circumstances that attend them; and therefore there is not required one only Medicament, but divers Medicaments are required unto the Curing of them. A Wound inflicted by a sharp and keen Weapon is Cured without the generating of much *Pus*: but in that which is from a blunt Weapon, whatsoever is bruised must of necessity al of it convert into *Pus*. And there is also an exceeding great difference of the parts. In a fleshy part (especially, when the man is of a sound and healthy Constitution) the Wound is easily Cured; but much harder is that Wound to be Cured that is inflicted upon the Brain, Nerves, Tendons, and Ligaments, (especially the greater ones) such as are those in the Hams. They promise the Patient likewise that the Cure of the Wound shal be altogether without pain: which in all parts to perform is a thing altogether impossible. For certainly if a Nerve be prickt, there is no man that can make good his promise, that here in this no pain shall afflict the Party.

And that we may now conclude whatsoever may be further said in this Controversie; the Curing of the Wound that is ascribed unto this Weapon-Salve, (as hath been said) is for the most part to be attributed unto Nature, whose work alone it is to Cure not only light and trivial Wounds, but oftentimes also Wounds most grievous and ful of danger. Which appeareth even from this, that there are so many several descriptions given us of this Unguent; and that there have been some, who instead of this compound Weapon-Salve have made use of Lard only, or Hogs fat, and yet notwithstanding the Wounds have been Cured; which *Johannes Colerius* testifieth (as before we alleadged him) that he himself had seen; as we may find it in the before cited place of his *Oeconomicks*. But now, if upon the administring of this Medicament some most grievous Wound shal be healed, which may seem altogether to transcend the power of Nature, this cometh to pass by the power of the Devil himself, drawn thereunto by some compact either explicite or implicite. Neither is the suspition hereof any wales to be lessened, or removed, by what is said by some, to wit, that all the simples that make up the Composition of this Medicament, Unguent, or (as it is commonly called,) Weapon-Salve, are all of them altogether Natural; and that in the Composition hereof, or the anoynting therewith there are neither Characters, nor Conjurations, nor Charms and Inchantments made use of. For the Devil doth oftentimes hide and conceal the Compact that he makes not only under Characters and Consecrations, or a certain form of words, but likewise even under things Natural, if at his command (which is done indeed in the first and explicite Compact, wherein others that administer and apply the same things implicitely and inconsiderately may likewise involve themselves) things that are Natural be made use of for other purposes then what they were Created for by God; and oftentimes Diabolical and Magical Actions are concealed and obtruded under the veil of Magnetick Actions. And therefore, although it be granted, that by this Unguent the wounded person is healed (which yet nevertheless is, as we have said, wrought by the benefic of Nature) yet it is not impossible, but that the Devil, that he may destroy the Soul, by Gods permission in many things may help the Body after a certain manner: yet it is very Credible, in regard that he is the implacable enemy of Mankinde, and evermore ready and provided to do them all manner of hurt and mischief, that he may seduce and draw men (as far as lieth in his power) from God the Creator, and Author of all good; and from the Means by him ordained, unto things superstitious, and unwarrantable practises.

Chap. 11. *Of Altering Medicaments, and Vulnerary Potions.*

WE told you before, that there are two sorts of Medicaments that are made use of in the Curing of Wounds, external, and internal. Touching the external we have hitherto spoken; we will therefore now in this Chapter handle the internal. Now those are of two Sorts; some only altering, and some in special called vulnerary. Altering Medicaments, are Coolers, Thickners; and such as are but lightly (lest they might otherwise breed obstructions) Astringent: which are to this end administred, that they may hinder the Humors that they easily wax not hot, become fluxile, and receive a putridness. And such are made of *Succory, Endive, Sorrel, Plantane, Tormentil, Roses, Purslane, Water Lilly, Borrage, Saunders, Juyce of Citron, Juyce of Pome-Granates, Harts-Horn, Margarites, and Coralls*: out of which there are made Decoctions, distilled Waters, Syrups, Electuaries, and Potions.

And

Whether Vulnerary potions are to be made use of.

And moreover there are made use of certain Medicaments, potions more especially, that are termed vulnerary. Touching which notwithstanding Authors differ amongst themselves. For some of them (among whom is *Balduinus Roussæus*, in his *Medicinal Epistles*, *Epist.* 66.) do indeed admit of them in those wounded parts unto which these kinde of Potions do reach, as the Gullet, Stomack, and Intestines, and then they have in a manner the place of Topick Medicaments; but in the external parts they reject them, for these Causes.

The Negative.

First, Because that in the writings of *Hippocrates* and the Ancient Physitians they finde no mention made of these vulnerary potions. Secondly, because that by Reason of the distance of the Scituation, they will not beleeve, that these potions can possibly penetrate unto the extream Limbs, or the Head; nor yet unto the greater and thicker Guts, unto which therefore when they are wounded Medicaments may more commodiously be injected by Clysters, then given to drink; yea they conceive that those Astringents that for the most part are mingled therewith may hinder that those Medicaments may not penetrate unto the more deep and inward parts. Thirdly, Because that there is a great difference between the Medicaments out of which these potions are prepared; since that some of them are hot and opening, as *Betony*, *Speed-well*, *Mug-wort*, *Avens*, *Carduus Benedictus*, &c. as also Cold, and Astringent, as *great Comfrey*, *Winter green*, *Horse-Tail*, *Burnet*, *Tormentil*, &c. So that it doth not sufficiently appear of what faculty the Medicaments ought to be, out of which these potions are prepared, and what virtues these potions have in them. Fourthly, whenas yet notwithstanding they are most of them Astringent, they think that being administred they bring more hurt then good and benefit unto the Patient; in regard that they obstruct the Liver and the other more noble bowels.

But in very truth, it is not indeed to be denied, that among the more Ancient Physitians (to the best of my Remembrance) we scarcely meet with any mention made as touching these Medicaments: and yet among the Physitians of latter times very frequent and common hath been the use of them. And yet nevertheless those things that *Galen* hath in the 5. of his *Method*, *Chap.* 9. touching potions in Wounds of the Thorax, those things (I say) seem to come very neer unto these, and to suit and answer unto these potions. And the Author of the *B. de Dynamidia*, *Tit. de Plaga*) maketh mention of these potions; who administreth out of Wine *Mouse-Ear*, *Plantane*, *Strawberry Leaves*, *Avens*, *Pimpernel*, *Ground Ivy*, *Betony*, *Agrimony*, And in his Title, *touching the Curing of Wounds*, he prescribeth *Mouse-Ear*, *Agrimony*, *Ground Ivy*. And in the Antidotary of *Mesues*, *about the end of the* 11. *Distinction*, after the Emplasters, there is extant such a potion.

Take *Avens*, *Root of Mug-wort*, *Pimpernel*, *Camomile*, *five leaved Grass*, *Black French Horehound*, *Violets*, *Hemp stalks*, *the tender tops of the Bramble bush*, *of each one handful*; *Madder*, *according to the weight of al the other*. *Let all these boyl in Wine unto the one half*; *and afterwards let them be strained*; *unto the straining add a third part of Honey*; *and then boyl them again*, *and strain them*.

The truth is, *Christophorus Georgius* (in his *Comment.*) writeth that this Medicament is no where to be met with in Ancient writings, or Books; and *Johannes Manardus* (in his *Comment upon this place*) writeth that he knew not by what accident this mixture had crept into this place, and that the potion was added unto the Emplasters. And yet nevertheless, the same *Christoph. Georgius de Honestis* confesseth (in the *same place*) whether it be *Mesues* his potion, or any ones else, that it is to be found described in many other Authors: and *Johannes Manardus* (in the same place) writeth, that these kind of Potions are very useful both for new and old wounds; and that he himself had more then once made trial of them; and that with them alone he had cured the worst and most desperate Ulcers. And these have been likewise used by others, and those not only Empiricks, but also most learned, able, and skilful Physitians and Chirurgeons; *Guido* (part 2. of his little Chirurgery, Chap. 9. *John de Vigo*, *Lib.* 3. *Chap.* 10.) *Johannes Anglicus*, *Nicolaus Massa*, *Epist.* 38. *Johannes Tragant.* *B.* 2. of his Chirurgical Institutions. *Johannes Andreas a Cruce*, *of Wounds*, *Tract* 2. *B.* 4. *Chap.* 4. *Faliopius*, in his *B. of Wounds*, *Chap* 24. *Petrus Andreas Matthiolus*, in his *fourth B.* upon *Dioscorides*, and *Chap.* 16. *Ambrose Parry B.* 18. *Chap.* 28. *Hieronymus Fabricius ab Aquapendente*, in *B.* 2. of his *Chirurgery*, *Chap.* 23. *Ludovicus Septalius*, in his 8. *B. of Medicinal Animadvers. Num.* 181. And others (a great many more of them) whom experience taught, that these potions were exceeding useful in the Curing of Wounds. And therefore, to oppose and thwart experience, and to reject, or neglect Medicaments approved of by long use and practise, it is a thing no way fit to be done. For as *Galen* writeth (in his 5. *B.* of the *affected places*, and 3. *Chap.*) *It is better* (saith he)

he) *to seek out how things that are done are wrought and affected, then to deny that they may at all be done.* Neither is this sufficient for the rejection of Medicaments, that there hath bin no mention made of them in the Books of the Ancients; for many most useful Medicaments have been found out by those of latter times, that the Ancients were altogether ignorant of. Neither are they administred for that end that Topicks are, or those potions of which *Galen* maketh mention, in his 4. B. of the *Meth. of Curing, Chap.* 7. And therefore albeit that they do not externally reach so far as the wounded parts, as other Topicks; yet nevertheless, they may through the Veins penetrate even unto the very Wounds themselves. Neither by Reason of their astringent virtue which certain of them have from those Medicaments is there any cause to fear that therefore they cannot penetrate unto the exterior Members; or that they are likely to breed obstructions in the Bowels. For this inconvenience may easily be Remedied and avoided by the admixture of other things that have in them rather a power of opening, then binding. Neither lastly, are the virtues of all Medicaments to be valued only from the first qualities, and such as arise from, and depend upon them; but from the properties that arise from the whole substance, which are suggested unto us only by experience. But now the virtues of these Medicaments, although they cannot easily be defined, but may be manifested by experience; yet notwithstanding in this all Authors agree among themselves, that these ought not to be made use of in the beginning, and when there is as yet no danger appearing by reason of the Wound, and that Topicks are sufficient for the ful and perfect Cure; as likewise where there is present a fever and an Inflammation; which by the use of these (they being for the most part hot) may easily be augmented: but as for other Causes so especially for this; to wit, the vitious Constitution of the part, Wounds oftentimes do not easily receive a Cure; and thereupon it is that they may happily and succesfully be made use of, not only in Wounds, but likewise in Ulcers and Fistula's. For it is a thing that is very much Material, how the wounded part and the blood therein are disposed; and what things soever they are that hurt the Wound, they all of them are for the most part communicated unto the Wound by the fault of the Blood; as *Tragautius* tels us in the 2. B. of his *Chirurgical Institut. Chap.* 12. And it being so, as we see, that some kind of meats are more fit and Convenient for wounded persons, and some again offensive and hurtful; why may we not therefore give the Patient to drink such Medicaments as cause that all things in the Blood and about the affected part may be rightly disposed, and in good order? Touching which, *Ambrose Parry* (in the *place before alleadged*) thus writeth: *Nature being assisted (saith he) by such a potion, hath often seemed to me to work effects wonderful and Miraculous, in the recovery of bones rotten and impostumated, and the Consolidation of Ulcers. For these potions albeit that they do not by the Belly purge away the Noxious and offensive Humors; yet nevertheless they are very efficacious in the cleansing of Ulcers, and the preserving and freeing of them from all that filth of the Excrementitious Humors, the defecating and carrying away the dregs of the Blood, and the purging of the Wound from the thin Ichorous Excrements, and all impurity; in the agglutinating also of broken bones; and the restoring of the Nerves unto their pristine Union. And presently he addeth this further; by this admirable and laudable Medicament the flesh and any other substance that is lost and perished may readily be restored and made good again, and the part restored unto its former Union. And* Pet. Andræas Matthiolus (*in his* 4. B. *upon* Dioscorides, Chap. 16.) *saith thus: By such potions I have seen healed as wel the Wounds of the Thorax as those of the Intestines, which were thought to be mortal, and altogether incurable by any help and means whatsoever.* And this these Medicaments do altogether and without fail perform, to wit, that they consume the excessive humidity of the blood that is wholly unfit for agglutination; that they supply a due and fit matter for the generating of flesh; and Thirdly, that by their moderate astriction they prevent and hinder the afflux of humors unto the wounded part. And *Guido* of *Gauliacum* (*Tr.* 3. *Doct.* 1. *Chap.* 1.) writeth thus in the stile of his Age: *In Ancient Ulcers* (saith he) *in case of any parts Fistulated and Cancerated, as also in Blood congealed in the interior parts, and in case of* Sanies *gotten together in the Breast and Intrinsecal Glandules, and in Croakings of the Guts, I have somtimes used these potions.* And out of him the very same hath *Johannes Tragautius* (in his 2 B. of *Chirurgic. Institutions*) and *Johannes Andræas a Cruce* writeth very confidently, that in these cases he himself was wont to make use of these potions; and most of all in Wounds of a long continuance, when they have come to be Fistulated, and refractory against all other Remedies. And *Ludovicus Septalius* (in the *place alleadged*) writeth thus: *When we once perceive (saith he) that great store of excrements are from day to day generated, either by reason of Errors committed in point of Dyet, or by reason of the overgreat abounding of*

naughty and vitious Humors in the whol Body, or else by reason of somthing amiss and faulty in the Wound; the Body being first evacuated, and the time of the Inflammation passed over, we thought good oftentimes to make use of some vulnerary potion for many daies together, until we saw that the matter was wholly consumed.

Now the simples out of which they are made and prepared, are divers, *Johannes Andræas a Cruce* writeth that there are only four Herbs that may be extolled and commended for this use, to wit, *Ladies Mantle, Avens*, the Herb *Periwinkle*, and the *Herb Trinity*, which is a species of *Trifoyl* or *three Leaf Graß*. But indeed there are many more Plants in use for the making of these potions; to wit; *The greater and leß Consound; Sanicle*, Saracennical *consound, Agrimony, Winter-green, Speed-wel, Mug-wort, Plantane, Savine, Horse-Tail, Adders Tongue five leafed Graß or Cinquefoil, wild Tansey, Vervein, the Red Cabbage, Neep or Neppe, (some cal it Cat Mint) Golden Rod, the lesser Centaury, St. Johns-wort, Tansey, Vipers Bugloß, Rupture wort, Water Germander, Straw Berry Leaves, the Roots of Tormentil, Pimpernel, both the Aristolochies or Birthworts, white Dittany, Valerian, Bistort, Gentian, Rubarb, Rhapontick, the Flowers of Lillies of the Vally, of St. Johns-wort, and Roses, Crabs Eyes, Sperma Ceti (commonly called Parmacitty) the Lentisk Wood, Mummy, Mace, Bole-Armenick.*

The Materials of vulnerary potions.

Of these there are made divers Compositions, but more especially potions and pouders And yet nevertheless in the preparing of these there is in the general to be observed; to wit, that those Plants which are appropriated unto the wounded part or the parts nigh unto it (as for instance, in the Wounds of the Head, *Betony, Roses*; in the Wounds of the Breast, *Speedwell*; in the Wounds of the Liver, and about the Liver, *Agrimony*; in the Wounds of the Reins, or about the Reins, Straw-berry leaves) are to be made choice of.

Potions.

Take Red Mug-wort, one ounce; Leaves of Tree Ivy, the Herb Winter-green, the greater and leß Sanicle, Ladies Mantle, Saracennical Consound, of each one ounce; Daisies, half an ounce; let them be cut smal, and infused in half a pinte of the best Wine, and cleer running Water, one pinte and half: let them stand in the Balneum shut and close covered, by the space of three hours, in the heat: and then after this let them be taken forth, and stand all night: in the morning add, Sugar four ounces; Nutmeg, Crabs Eyes Mummy, of each two drams; and make a potion. *Or,*

Vulnerary potions.

Take Ladies Mantle, Sanicle, Saracennical Consound, wild Ivy, red Mug-wort, of each one handful; pour in unto these four measures of the best Wine; boyl them in a close pot over a gentle Fire, until the fourth part be consumed and wasted away. *Or,*

Take Winter-green four handfuls, the Leaves of ground Ivy three handfuls, the Roots of white Gentian four ounces; when you have cut them smal, put to them of old stale Beer as much as will suffice; let them stand al night, and afterwards destil them. *Or,*

Take Sarracennical Consound, (all of it, both Root and Leaves) one handful; boyl them in good Wine, until a third part be wasted away; and give the Patient Morning and Evening a draught of this to drink. *Or.*

Take the Herb Tormentil, Straw-berry leaves, Sanicle, Matrisylva or Ladies Bedstraw, and Winter-green, of each one handful; boyl them in beer, and give it the Patient to drink. *Or,*

Take Herb Winter green Herb Periwinkle, the Herb Bugle, Mug-wort, Pimpernel, and Agrimony, of each two handfuls; boyl them in Wine unto the one half; and give the wounded person a draught of this Mornings and Evenings. *Or,*

Take the Lentisk Wood, and Oake Missletoe, of each two ounces; the Roots of Consound, Aristolochy, Centaury, Valerian, Madder, Tormentil, and Bistort, of each half an ounce; Common Water Chalibeated, (that is to say, wherein steel hath been often quenched) six quarts; mingle them, and make an Infusion according to Art for twenty four hours; and afterwards let them boyl in a double Vessel, until the one half be wasted; and when in the boyling it is come to the third part, then add of Parsley Roots, the tops of the Bramble Bush, Hemp, Mous-Ear, Herb Trinity (a species of Trifoyl or three leaved Grass) Herb Climer or Periwinkle, Horse-Tayl, Straw-berry leaves, Flowers of Valley Lillies, of each half a handful; Rhapontick, two drams; Cinnamom, half an ounce; but in the end of the Decoction add of Aromatick Wine, three pints; and then having pressed forth the liquor, and strained it, with Sugar make a sweet and pleasant drink. *Or,*

Take *Guajacum Wood prepared four ounces; the Rinds of the same Wood, and Sarsaparilla, of each two ounces; Citrine Saunders, and Tormentil Root, Bistort Root, Valerian Root, white Dittany Root, and Consound Root, of each half an ounce; Common spring Water, two Gallons; mingle them, and make an Infusion according to Art, for twenty fours hours; after this let them boyl in a double Vessel, unto*

the

the consumption of the third part; and then add, of Horsetayl, Betony, Mousear, Cretan Dittany, Wintergreen, Wild Tansey, topps of the Bramble bush, herb trinity, and Strawberry leaves, of each half a handful; Cinnamom half an ounce; let them boyl together, until there remain three Quarts; and in the end of the boyling add of the best White Wine, three pints; and then making a strong expression of the liquor, and straining it, make thereof with hony or sugar a sweet and pleasant drink for the Patient. But if the Wounded person should have a fever hanging upon him you must then leave out the Wine in the aforesaid decoction.

The following Potion likewise of the Nobles of *Berine* is very much commended; by which alone (as it is commonly reported,) the most grievous wounds are oftentimes cured; of which mention is likewise made by *Guilhelm. Fabricius*, in his 4 Century, *Observat.* 84.

Take *Wintergreen, Golden rod, Mugwort, Sanicle, Red Beets, of each as much as you think good: the Plants are to be gathered in the Month of* August, *then dryed in the shade, and afterwards beaten into a pouder; take equal parts of the powder and mingle them*; then,

Take *Of this pouder one spoonful; let it boyl in one measure of White Wine: give the wounded person a draught of this blood-warm, thrice a day; and so continue it until the consolidation of the Wound; Give the Patient (if he be weak) two spoonfuls hereof.* Aanother Potion.

Take *Clary, Wintergreen, Periwinkle, Sarracennical Consound, Ladies bedstraw, Sanicle, Speedwel, Ladies Mantle, tree Ivy, Mugwort, of each three handfuls; Album Græcum (or if you will, white Dogs-tird) pickt up in the month of* March, *two ounces and half; old beer a little tart and sourish, the proportion of one little earthen Cup; let them stand digesting for fourteen daies; and afterwards let them be destilled; and reserve it for use in glasses wel and close stopped: of this you are to give three spoonfuls at a time, thrice every day.*

And for this use and purpose there are likewise powders to be provided.

Pouders. Take *Nutmegs one ounce; Crabs Eyes one ounce and half; make a pouder; and give half a dram, or a dram at one time with wine.* or,

Take *Red Corral, three drams, Margarites, Spodium, of each six drams; Crabs eyes two ounces, Mingle and make a powder. Give unto the wounded person of this powder one dram at a time in Wine or Water.*

And such like Electuaries may be provided likewise: As,

Electuaries. Take *Conserve of Red Roses, and Betony of each two ounces; Tormentil and Consound, of each one ounce; Mace two drams; Red corral one dram; Crabs Eyes prepared half a dram, and with the syrup of sorrel make an Electuary.* or,

Take *Juice of Plantane, Horstayl Sanicle, Mouseare, Speedwel, of each two ounces; the greater Consound roots rosted under the embers and passed thorow a hayr sieve one ounce; white Sugar one pound; boyl them to the Consistence of an Electuary; and in the end ad Conserve of Roses one ounce; Tormentil half an ounce, and mingle them.*

And yet nevertheless, we are not so to trust and confide in those potions, as to neglect al other Topical Medicaments. For if we should thus do, the Wounded person may possibly fall into some great danger and hazard; of which we have a very remarkable history in *Guilhelmus Fabricius* his 4 *Cent. Observ.* 83.

Chap. 12. *Of the Dyet of Wounded persons.*

The Diet of wounded persons. And thus much may suffice to have been spoken touching the Chirurgical part, and the Medicaments Necessary in general for the curing of Wounds. It remaineth now that we speak some what of the Dyet that is to be observed by wounded persons. Let the Air be temperate, or a little inclined to Warmth; touching which *Celsus* (in his fifth Book. Chapt. 26.) thus; the *Place (saith he) in which the wounded person shal lie, it ought to be somewhat warm.* But a cold Air is greatly hurtful and an enemy unto all Wounds. And although that a hot Air be convenient enough for the wound; yet in regard that it heateth the body, moveth much the humors, and rendereth them fit and apt for motion, and so may easily give an occasion for fluxions, which are otherwise too apt to happen in Wounds, therefore it is not fit and allowable for wounded persons: touching which *Celsus* thus, in his fifth Book, and *Chapt.* 26. *The most opportune time (saith he) for the cure is the spring; or at least, that time that is neither fervently hot, neither yet over cold. For the truth is that both overmuch heat and too much cold, they do both of them infest and offend Wounds.* But now if such an Air may not be had that is naturally such, it is to be made such by the help of art. Let the Air be likewise pure; and that which is stinking, or any ways impure is carefully to be avoyded.

The food of the Patient.

And as for the meat and drink of the Patient, (since that from the blood both the flesh and whatsoever else is Necessary for the agglutination of the wound is generated) they ought to be such from which good and pure blood may be bred; and such as may not afford the least occasion and matter for many excrements, and dangerous Symptoms But meats of an ill Juice must heedfully be eschewed, such as Garlick, Onyons, Swines flesh, Pease; and the Patient must altogether abstain from meats that are hot, sharp, tart and biting, and of an ill Juice; and he may only feed upon those meats that yield a good Juice, and are of easy concoction. And let the food he takes be such for the quantity thereof that it may be concocted by Nature and such as may supply a moderate quantity of blood. For if too great abundance of blood be generated, it supplyeth matter fit for fluxion, inflammation, and other symptoms. And indeed his food that he taketh ought to be in such a quantity, that there may flow unto the wounded part so much blood as was wont to flow thither while the part was sound and without any distemper; seeing that the wounded part if it be rendered weak and infirm is not able to concoct and assimilate so great a quantity of blood as it did before; whereupon there wil be generated either an inflammation, or great store of excrements, and so the wound wil be made overmoyst. Let his meats likewise in the general be so ordered, that they may restrain the flux of humors, rather then excite it; & they ought to be altogether such, that if there be any thing amiss in the blood, and humors, it may rather correct then further augment the same. And if any evil accident shal befal the Wound, all indeavour ought to be used, that so the food may oppose and withstand the same. And yet nevertheless it is not one and the same kind of dyet that is fit and proper in all wounds. For if the wound be in a fleshy part, and that there be no danger of an Inflammation, then a more plentiful dyet may be allowed: but if the wound be in the Nervous parts, and that there be danger at hand of an inflammation, then a more spare diet is to be prescribed, that so there may flow unto the wounded part the less store of blood, and the matter of the inflammation may be withdrawn and kept back. And indeed, by how much the danger in the wound is the greater, by so much the more spare ought his diet to be: but so soon as the danger of the wound is diminished, then his diet may be by degrees augmented, so that he may feed somwhat more fully, but yet stil with a due moderation. And therefore, albeit that *Hippocrates* (in his B. of *Affects*) saith, that *Wounded persons ought* to be pinched and *afflicted with hunger*; this is not simply so to be taken; but that we are alwayes to heed the danger of the wound, and especially of the inflammation conjoyned therewith; and according as this danger shal be greater or less, so the diet prescribed may be more ful, or ought to be more sparing, as we may see out of the same *Hippocrates, in his Book of Fractures, comment* 1. *Text.* 44. *and Comment.* 3. *Text.* 12. *as* also out of *Galen*, in his Commentary upon those Texts of *Hippocrates*. But yet notwithstanding there is some consideration and respect to be had unto the Age, time of the year, Region, Custome, and Temperature, according to that 17. Aphorism of the first Section.

His Drink.

As touching the Patients drink; in our Regions Beer may fitly and conveniently enough be drunk; I mean, that drink that is made either of Barly or of Wheat: and this is to be made somtimes weaker, and somtimes stronger, according to the state and condition of the wounded party, and the wound it self. Wine is not allowable in those wounds that are dangerous, and where there is present, or the danger of an Inflammation threatened and neer at hand; in regard that it may (by reason of its heat and thinness) be a vehicle or means to convey the humors unto the part affected. And therefore *Hippocrates* (in his Book of Ulcers, text 1.) writeth in this manner. *A small and moderate quantity of Meat, and the drinking of water, is mostly fit and requisite in all Wounds whatsoever; but yet rather in those that are new and fresh then in those that are old and of a long standing; and then especially when in the wound there is present an Inflammation, or if there shal be any feared; or when there is any danger lest that any thing may be vitiated; or when the wounds of a joynt are attempted by an inflammation; or when there is any fear of a convulsion at hand; and lastly, when the Belly hath received a Wound.* And therefore for those that have been long accustomed to drink water, (and where there is no great plenty of beer) either simple and pure water may be administred unto the patient; or else a Medicate water, destilled out of the *juice* of *Pomgranates, Coriander seed, Citron rinds,* or *Barley water*, or the water destilled out of the whol Citron. When the danger of the inflammation is past, then that wine that is thin and weak may be allowed the patient now and then. In wounds that are more grievous and ful of danger, Medicate drinks may be provided and made of vulnerary herbs.

As

Motion, and rest, which of them fittest for those that are wounded.

As for what Concerns the motion and rest of the body; Rest is most convenient for wounded persons; but more especially for the wounded part. For motion moveth and scattereth the humors, and rendereth them apt to flow; and the moving of the wounded Member exciteth a pain in it: and yet nevertheless, for the Patient to walk easily and gently (his leggs being sound, & unhurt) it wil be no way amiss, but very good for him so to do: touching which *Celsus* (in his fifth Book. and *Chapt.* 26.) thus gives us his opinion. *The best Medicament likewise (saith he) is Rest and quietness: and to Move and walk (unless for those that are sound, and in health) is not so fit and convenient: but yet nevertheless, it is least dangerous in those that are wounded in their head, or Arms; but more unto such as are wounded in their inferior parts. But motion or walking is then least of all convenient, when the wound is either in the Thigh, or the Leg, or the Foot.*

Affects of the mind how they are to be ordered

The Commotions likewise, and all perturbations of the mind are carefully to be avoyded; and more especially, wrath and Anger. And therefore those persons that may be an occasion of incensing and provoking to anger the sick person, are not to be permitted to come where he is; nor so much as any mention to be made of them in his hearing. But the Patient ought rather to be moved and stirred up unto a moderate and fitting mirth and cherefulness, and all possible tranquillity and calmness of Mind. And of all other things that are prejudicial unto the Patient at this time, the use of *Venus* and the company of women is the most hurtful. Immoderate and overlong watchings are also very offensive; in regard that they inflame, and cause a commotion in the humors. The sick persons belly must be kept open and soluble; and if it chance at any time to be stopt and shut up, it is then again to be opened and loosened with mild and gentle Clysters.

Chap. 13. *Of keeping the flux of humors from the Wounded part.*

And thus much touching the general cure of Wounds; which yet notwithstanding is sometimes to be varyed according to the variety of the subjects, the Nature of the wounded part, and the condition of the diseases, and the symptoms that flow thereupon; and of this we shall now speak.

And first of all indeed, it oftentimes happeneth, that the body that is wounded may not be exactly and perfectly sound; but that it may be either Plethorical or cacochymical; so that there may be great cause to fear, lest that either great abundance of blood or the vitious humors that have been long treasuring up in the body may by occasion of the wound rush unto the affected part, and there excite various evils. And therefore we are to use our utmost endeavour to hinder and prevent the afflux of the humors unto the wounded part. Now this flux is especially prevented, if care be taken to hinder all those causes that may excite the said flux: and moreover al those things that may overmuch and preternaturally heat the wounded part, excite a pain therein, or render the same soft, loose (and so consequently the more apt to receive the flux) or overheat the humors, disperse them, and so render them the more fit for motion, are wholly to be removed, and taken quite away And such a care and orderly course there ought also to be taken in point of dyet, that it may not in any wise generate either too great abundance of blood, or bad and corrupt humors.

And furthermore, we are likewise to succour and help the weak and infirm part by those things that corroborate and strengthen it; the pain (if there shall be any) is to be mitigated; if there be present any heat, it is to be altered; and at length the overgreat abundance of the blood is to be lessened, and the vitious humors to be evacuated: and this may fitly be done either by vene-section, or else by purgation.

Venesection, or blood letting

And therefore, if blood abound in the body, so that there be cause to fear the afflux there of unto the wound; it is in this case (unless it hath already before much flown forth) very fit to open a vein, and let forth a due quantity thereof; Touching which *Celsus* (in his fifth Book. and 16. *Chap.*) saith thus; *The Physitian ought to take forth some of the blood, thereby to cause a dryness*; And presently he adds; *let the blood therefore flow forth more abundantly, that so there may be the more abundant dryness: but if it flow not forth sufficiently, let the vein be opened as much as may be; if it be so that the patient hath strength enough to bear this loss of blood.* And this is chiefly to be done in great wounds, in which there is cause to fear an Afflux of the blood, by reason of the pain of the Wounded part; and here in this case blood is likewise to be drawn forth, albeit that it doth not overgreatly abound in the body: whereupon *Hippocrates* (in his Book of the Joynts) in the bruising and wounding of a Rib, prescribeth

beth the taking forth of blood out of the Arm; where *Galen* in his *Comment* upon the place, addeth; *Although (saith he) there be no extraordinary store of blood abounding in the body, yet in those kind of blows and bruises we must have recourse unto vene section, and letting out a due quantity of blood.* And in his second Book of the *composition of Medicaments according to the places*) he commendeth (in the first and chiefest place) venesection, for all pains of the head proceeding from a blow.

But now that this venesection may perform the whol work, and that it may cause not only evacuation, but likewise revulsion; the vein is therefore to be opened a good distance from the part affected, and on the contrary side, as elsewhere we have told you, touching revulsion. Now this is to be done with al speed possibly, even the very first day of the wound and indeed before there be any medicament administred, that so the afflux of the blood unto the wounded part may be prevented.

As for the quantity of the blood to be let forth, it ought to be according to the store that is in the body; and according likewise to the strength of the Patient, and his ability to bear it. And therefore if there flowed forth much blood before, then venesection is to be omitted. But if there flowed forth little or no blood before, then you may now let forth a due proportion thereof; but alwaies according to the strength of the Patient and no otherwise: which you may best of al know by the Age of the wounded person, the habit of his body, the time of the yeer, and other Circumstances; touching which we have already spoken in its proper place.

Purging.

But now, if vitious humors abound in the body then there wil be need of purging. For it being so that the Wound is so much the more successfully and more speedily cured, by how much the more sound the part is, and of a good constitution; and that the ill constitution of the wounded part doth much hinder the cure: we are therefore by all means possible to do our indeavor, that so the vitious humors may not flow unto the part affected.

And thereupon seeing that by occasion of the Wound it may very easily come to pass that they may flow unto the part affected: if they be found in the body, they are forthwith to be evacuated. And this is to be done in great wounds and where we have cause to fear lest that by reason of pain the depraved humors should rush unto the wounded part; as also in those wounds where there is any kind of cutting or dilating to be used, and where any bones is to be made bare of its flesh; and in a word, in al wounds whatsoever wherein the pain is more vehement then ordinary. But smal Wounds, and such likewise as are free from pain may be cured even without any purging: but yet notwithstanding if the belly be bound, it is then to be opened and loosened with a Clyster.

Whether those that are wounded may be purged.

There are some indeed that are utterly against purgations in any wounds whatsoever, as fearing lest that the humors being much stirred and disturbed by the sayd purgations should flow so much the more unto the wounded part. But *Hippocrates* admitteth of them; as we may see in his fourth Book of *affections*, touching *Fractures*, *Text* 48. *Comment.* 3. and *Galen in the fourth Book of his Method of curing*, *Chapt.* 4. *and* 6. And indeed reason it self perswadeth hereunto. For if hot, thin, and cholerick humors abound in the body, they render the blood very apt for motion; and then by means of pain and want of rest they easily become hot and are inflamed, and so afford an occasion for a feaver.

But now, albeit that all the vitious humors abounding in the body, are to be evacuated; yet notwithstanding, (as we have sayd) more especially the hot, Cholerick, and wheyish humors are to be evacuated; which are more apt for motion and flowing; and such as make much for the generating of inflammations and Erysipelases, and such as do very easily excite feavers. Even at the very first beginning a purgation is to be appointed, to wit, before ever there be any afflux excited, and that any feaver shall happen. But if there hath already happened any feaver, purgation cannot then so conveniently and safly (but indeed with some kind of danger) be instituted and appointed.

And therefore to purge (in Wounds) there are most fitly and safely to be administred, *Manna, Syrup of Roses Solutive, Rheubarb, the Leaves of Sene*: and of compositions, *Tryphera Persica Elect de Psyllio, Elect. of Roses of Mesues*. But we must abstain from the hottest purging medicaments; lest that there should thereby be excited an afflux of humors, that might dispose the wounded part unto an inflammation. But in what manner the purgation is rightly to be ordered, we have elsewhere already shewn you.

CHAP.

Chap. 14. *Of the Wounds of the Veins and Arteries; and of the ſtopping the Hæmorrhage in Wounds.*

AS touching the wounded parts themſelves, oftentimes by reaſon of them there is ſomething that is peculiar to be done in the Curing of wounds. How and after what manner the Cure of the wounds of private parts is to be rightly ordered, we have already told you in thoſe places which we ſhall afterward alleadg. In the general, the wounds of the Veins, Arteries, Nerves and Nervous parts, do require a peculiar and proper kind of Cure.

The Hæmorrhage in Wounds:

And Firſt of all, indeed, the Wounds of the Veins and the greater Arteries have this peculiar unto themſelves, to wit, that there is alwaies ſome notable Hæmorrhage to accompany them; which oftentimes cauſeth Faintings and Swoundings, and other dangerous Symptoms. But now the Blood floweth either out of the Veins, or out of the Arteries; and of theſe, ſomtimes indeed out of the greater, and ſometimes out of the leſſer; and either out of one alone, or elſe out of many. And although that the wound inflicted upon the Veſſel be the prime and principal Cauſe of the Hæmorrhage; yet it happeneth (and that very often alſo) that the blood may indeed now and then be ſtopt for a while, and yet it may afterwards ſuddenly break forth again; and this more eſpecially chanceth upon the Commotion of the minde and provocation to anger. And ſo likewiſe the preſence of the Patients Adverſary, that gave him the wound, maketh greatly for the cauſing of a new and freſh Hæmorrhage in the Wound: for which very Cauſe it is ſomtimes found by experience, that the Blood that was before ſtanched and ſtopt, begins again to flow forth afreſh. And I my ſelf remember, that one Brother having wounded another, and while the Wound was binding up the Brother that gave the Wound coming in to viſit the other, (albeit that they were now reconciled) the Blood ſuddenly brake forth afreſh; and this without doubt from the ſecret commotion of the minde; for upon his departure, and being forbidden to give any more viſits, the Blood again ſtanched.

Signs Diagnoſtick.

But now, ſeeing that the Blood floweth either out of the Veins, or elſe out of the Arteries; that which floweth forth of the Veins is more thick, more black and dark, and leſs hot; and it floweth forth without any great violence and ruſhing, and with an equal pulſe, and doth far leſs deject the ſpirits, (all things elſe being anſwerable) then that which cometh forth of the Arteries. But now that that cometh out of the Arteries may rather be ſaid to leap forth with violence, then to flow; and in the pouring out it is more hot and fervent, more thin, more yellow, and more frothy; and it is evermore accompanied with ſome notable change and alteration in the Pulſe, together with a weakneſs and dejection of the Patients ſtrength. If it be one of the greater Veſſels that is opened, then the Blood floweth forth in the greater abundance, and with ſo much the greater violence; but with far leſs, if it be one of the leſs Veſſels that is opened, and wounded. But now, what Vein or Artery it is that is wounded, and whether only one or more of them be wounded, this muſt be known from thoſe that are expert in Anatomy.

Prognoſticks.

1. An overgreat Hæmorrhage in Wounds is very dangerous: for the Blood is the Treaſure of the Life; and when the vital ſpirits are called forth, it cauſeth a weakneſs of the Pulſe, (it being ſo ſmal that it can hardly be diſcerned) as alſo a frequency and inequality thereof, and ſomtimes an intermiſſion therein, a fainting and ſwounding, a *Syncope*, an extream Coldneſs and Chilneſs of the outward parts, and inordinate ſweats, a Convulſion, ſighings and ſobbings, Deliries, and at length death it ſelf. And hence it is that *Hippocrates* (in the 5. *Sect. of his Aphoriſm. Aphor.* 3.) ſaith, *that a Convulſion or Sighing happening upon an abundant flux of the Blood is alwaies very evil and dangerous.* And in the 7. *Sect. Aphoriſm.* 9. *that a Deliry, or a Convulſion alſo happening from the abundant flowing forth of the Blood is evil and ful of danger.* And indeed it is ſo much the more dangerous, if a Convulſion be joyned with a Deliry, and that the Deliry happen not alone without the Convulſion.

2. And this is more eſpecially cauſed by the effuſion of the Arterial Blood, in regard that with it there is very much of the heat flowing in, as alſo the vital Spirits that are moſt chiefly Neceſſary for the preſervation of the life, poured forth and diſſipated.

3. And moreover alſo, for this reaſon the Wounds of the Arteries are more dangerous then the Wounds of the Veins, becauſe that they are more difficultly Cured and Conſolidated, by reaſon of their hardneſs, their perpetual motion, and the violent ruſhing forth of the Arterial Blood.

4. And

4. And those Wounds of the Arteries are yet likewise far more dangerous (and bring along with them a greater Hæmorrhage, and such as is more difficult to Cure) that are inflicted according to the length of the Artery, or transversly, or obliquely, then those in which the whole Artery is cut assunder, as experience it self testifyeth; so that indeed, (and as the Physitians are wont to perswade) if the Hæmorrhage cannot otherwise be stopt and stanched, in regard that the whole Artery is not cut quite through, it is then wholly to be cut assunder in a transverse manner. For if that the Artery be thus transversly cut in twain, it will again be contracted, and its orifices will again close and shut; and thereupon they wil the more easily meet and grow together again, and the sooner be covered and shut up by the circumjacent flesh lying round about it; neither will the Wound so gape and stand so wide, while the Artery is dilated. But if that the Artery be Cut long waies, or obliquely, (or if it be wholly cut assunder any otherwise then transversly) since that it is moved with the continual motion of the Dilatation and Contraction, by this motion, and especially the distention, the Wound is more dilated, and in every Diastole it gapeth; whereupon the Blood is poured, and leapeth forth with violence and rushing.

The Cure.

As in every over great Hæmorrhage, so likewise in this that proceedeth from a wound, we meet with a twofold Indication; the one, that which the wounded Vessels themselves suggest unto us, which requireth a Union and Glutination. The other that which the Hæmorrhage suggesteth; which if it be excessive and overgreat (so that it dejecteth the strength and powers of the Body) requireth that it be stanched, even before ever that the Vessels be shut up, and united. For whereas unto the Union of the Vessels there is some space of times required (so that the Patient may in the mean while run a great hazard of his Life) the Blood is therefore immediately to be stanched.

That the Flux of the Blood therefore may be stopt (although that the Wound of the Vessel be not as yet grown close together) all those things are to be performed which may hinder and inhibite the motion thereof. Now the Flux of Blood it impeded, if with convenient Remedies, and the binding up, the orifice of the wound be closed and shut up. In which manner if the Blood cannot be restrained, and that it also break through the Wound closed and shut up in any manner whatsoever, and all by reason of the impetuous violence of the Blood, then all those things that do any waies help forward the violent motion of the Blood are to be removed, such as are, the overgreat abundance of the Blood stirring up and continually provoking the expulsive faculty; Anger, drinking of Wine, hot and thin Humors (as it were) continually boyling up, and over violent motions of the Body: as likewise of an Artery, if it be not wholly cut in sunder, the motion thereof, the declining and downward Scituation of the member, and the like; and hitherto also may be referred the pain and heat in the part, which attracteth the Blood; and in this case that that violently and impetuously rusheth unto the wounded part is to be turned another way.

And first of all therefore, that the orifice of the Wound may be closed and shut up, we ought to use the utmost of our endeavour that this may be done. Now this is to be effected two waies; either by the Joyning together of the Lips of the wounded Vessels; or by the stopping of the orifice of the Wound. The Lips of the Wound may be joyned together, either by pressing together with the Fingers the orifice of the Wound, so long until the Blood be clotted, so that the thick and clotted Blood may it self obstruct and stop the orifice of the Vessel, that so the Mouth and Lips of the Vessel may touch and close together; or else the orifices are to be drawn close together by Swathes. But now, it is very rare that we may keep our Finger upon the orifice of the Wound until the Blood be clotted, so as to stop and obstruct the said orifice: neither hath this any place in the wounded Arteries, since that the Arterial blood, by reason of its thinness and heat, and the motion of the Artery, doth not easily (if at al) Clod in the orifice of the wound. Neither also may the Veins (if they lie deep) be easily drawn and kept close together by Swathes, neither yet may their orifices be pressed together with the Fingers. And therefore the safest Course is, that we do the best we can that so the orifice of the Vessel pouring forth blood may be stopt. And this that it may be done artificially, let the orifice of the Wound be shut up and closed with the Finger, as much as possibly it may be done; but if it be so that the orifice it self of the Vessel cannot be reached unto by the Fingers, then that branch of the Vein that poureth forth the Blood there in that place whereby it tendeth to the Wound, is first of all (in the place neerest unto the Wound) to be pressed very hard together with the finger; and the Wound to be cleansed from al humidity; and then after this there is immediatly a Medicament that will stop and stanch the Blood to be imposed. Which that it may be

be rightly and duly performed, the wound is not only to be loaden and rashly oppressed (a thing wherein I have seen many Chirurgeons greatly to offend) with too many astringent Medicaments; but we ought to use the best of our endeavor, that the very orifice of the wound be instantly (and that very close and strictly) shut up. For unless this be done, albeit there be never so many of these kind of Medicaments imposed; yet nevertheless if the orifice of the vessel be not close shut up, and obstructed, the blood wil by it break forth, and so make void all the labor and pains the Chirurgeons have been at, and all the former provision (be it never so great) that they have made. Now for the stopping and stanching of the blood in this manner, there is hardly any thing to be named that wil more conveniently do it (as daily experience testifieth,) then that kind of Mushrom dryed (they commonly call it, *Crepitus Lupi*, or Woolfs fart) that usually groweth, and is to be found up and down in Vineyards. For it being of a nature most dry, as it will no way admit of the flowing forth of the blood (which those Medicaments do that are naturally moyst, and therefore they are but little or nothing useful for the stanching of the blood) so it will ikewise cause that it subsist and stick fast in the vessel. But now this is most especially useful and beneficial, if it be first with a thread tyed together, and a weight layed thereon, or else pressed down and kept close together with a press wrung down hard upon it. For so, when it comes afterward to be imposed upon the wound, it again dilateth it self, and so stoppeth up the orifice of the wound.

What Medicaments they are that stanch the Blood.

But if it be so that you are not minded to confide in this one only remedy, then those powders that are known to be Astringent ought first to be strewed and sprinkled upon the wound. *Galen* above all other Medicaments (for the stanching of the blood) commendeth this that followeth: and in the fifth book of his Method, and *Chapt.* 4. he writeth that it is absolutly the best of all that he knew, and that he should much wonder, if it should be any ones chance to find out a better. It is as followeth;

Take *Frankincense one part, Aloes one part and a half, Make a powder, and of this powder mingle a sufficient quantity with the white of an Egge, to the consistence of hony. Make up this mixture in those soft hayrs (or flix) of a hare; and so lay it upon the vessel, and the whol wound. And afterwards in a fit and convenient manner bind up the wound with a swath; and then at length open and unbind it again on the third day. While this Medicament yet sticketh unto the wound, put yet another upon it; but if the former liniment begin of its own accord to fall off; then with the finger gently pressing down the root of the vessel (to wit) that nothing may flow forth of it, take away that with a careful hand, and put on the other. For so long as the Medicament shall be softened by the blood, the fluxion cannot be said to be wel and sufficiently stopt.* See Galen *in the place before alleadged. There are nevertheless other pouders that are likewise very useful* As.

Take *Bolearmenick, Dragons blood, Frankincense, Aloes Succotrine, of each alike, equal parts, and make a powder.*

Guilhelm. Fabricius commendeth this following, as having often made use of it with very good success.

Take *of the finest wheaten meal three ounces; Dragons blood and Frankincense, of each half an ounce; Oriental Bole, and sealed earth of each two drams; Parget six drams; water frogs prepared one ounce; Moss of a mans skul half an ounce; the soft flix of the hare cut very smal, one dram; the powder of the whites of Eggs carefully dryed in the Sun; the froth of the Sea dried likewise in the Sun, a new sponge tosted and torrefyed at the fire, of each half an ounce; Mingle them, and make a very smal and fine powder.* or,

Take *Moss of the wild sloe tree, the root of the nettle, and of the herb Dragon, of each half an ounce; Make a powder, and strew it upon the wound,* or,

Take *Vitriol powdered, as much as wil suffice; put it into a little linen cloth, and lay it upon the wound.* or,

Take *Aloes, Frankincense, the finest wheat flower, Spiders cobwebs, Bolearmenick, the soft flix of a hare, of each one dram, make a powder.* Or,

Take *A dead Nettle, and having beaten it into a very fine powder strew it upon the wound.*

Neither are we to desist from the use of those Medicaments, until the flesh that is bred is so produced about the vessel, that it shut up the orifice thereof. For unless this be done, there wil yet be alwaies great cause to fear an hæmorrhage.

Magatus his water against the hemorrhage.

Cæsar Magatus (in his first Book and 61. *Chapt*) writeth that this water following, (being wel mingled together with the whites of Eggs throughly beaten) doth perform wonderful effects.

Take *Juice of Plantane, of the sour unripe Grape, of Quinces, of sharp and tart Pomgranates, vinegar made of black wine, of each one pound; the Juice that is newly pressed forth of*

Asses dung one pound; the whites of thirty Eggs wel beaten together. The herb Horstail, Strawberry leaves, Mousear, Adders tongue, the herb Trinity, winter green, the herb Perewinkle, Wild Tansey, Bears ear, the leaves of al these new and fresh gathered, one handful; the new and fresh Roots of the greater consound one pound; the greater Centaury half a pound; Pomgranate Rinds and flowers, unripe Galls of the Oak, Gum Arabick, Tragacanth, Sarcocol, White Frankincense, of each half an ounce: Roots of Tormentil, Bistort, Bolearmenick, Sealed earth, Dragons blood, Earth of Samus, of each of these three drams; bruise what is to be bruised, and powder those things that are to be powdered, and so mingle them: and after a three days maceration, in a double vessel let there be a water drawn forth according to Art. But I doubt much whether or no this destilled water wil have in it any considerable Astringent virtue; in regard that that part of simple Medicaments in which the astringent power doth chiefly lie can hardly ascend thorow the Alembick.

More efficacious is that water that is destilled from Alum, after the manner following.

The Alum water.

Take *of the best Alume as much as you please; powder it and put it into a Buls or Oxe bladder and so put it into a kettle of hot water, that the Alume may be dissolved. Destil this water by an Alembick; and continue the work so long, even until the feces reside in the bottom. And these are again a new to be dssolved in the Oxe bladder, until the whol substance of the Alume shal by destillation be converted into water.*

Whether in case of an Hemorrhage we may use Caustick.

But if the blood shal not be stanched by these Remedies; there are some that use Causticks, that bring a crustines over the Wound, and so by the benefit of it shut the Orifice of the vessel. But the truth is, this way is not safe enough, but ful of peril. For seeing that so much of the Particle as is burnt into a crust, so much there falleth away of the Natural flesh from the part; when the crust falleth off the orifice of the vessel is again left naked, and bare of flesh; so that there is oftentimes a new hæmorrhage excited, and not easily stanched. Of these we may most safely make use of such of them as being burnt retain stil a caustick virtue, and being not burnt have in them a notable astringent power, but very little of the Caustick faculty, whereby they burn: and such a like medicament is crude *vitriol*; which therefore some (crude as it is) do beat into a powder, and so sprinkle it upon Wounds, for the stopping of the hæmorrhage. But others there are that dissolve it in water, and then they moysten linen clothes, & lay them upon the wound. And moreover *Calcanth* (which some call shoomakers black) either pulverized, or else dissolved in a convenient liquor is of singular use in wounds, where the orifice of the vessel cannot be closed either by compression, or by that mushrom before mentioned (which they commonly call *Crepitus Lupi*) or even by burning, be there never so great need thereof. But this Calcanth (especially if dissolved in liquor) penetrateth even thorow the very vessel that is hurt. But here notwithstanding we are to beware that the nerves (if any be neer) be not hurt. And therefore into such like deep Wounds (if there be any Nerves in the wounded part) other Medicaments that have a power to stanch blood are rather to be cast in by clysters that have little ears affixed to them, or some other fit and convenient instruments.

The virtue of vitriol in an Hæmorrhage.

In the interim notwithstanding, it will be likewise very requisite to administer certain general or (as they cal them) universal, remedies that make for the stopping and stanching of the blood, to wit, drawers back, intercepters; and certain internal Medicaments that stay the blood.

Venesection.

Those things that draw back, are first, venesection, appointed in the contrary place; which may then only be put in practise when the hemorrhage is not great, and the strength of the Patient but little impayred. But yet nevertheless, that so the Patients strength may be the better preserved, and the revulsion performed with the more expedition, the blood is not at once to be evacuated, but at several times.

But if the Patients str ength wil not bear venesection in this case, Cupping-glasses both dry, and scarifyed (as need shal require) are to be applyed in the remote and opposite places.

Intercepters.

But now Intercepters are administred, to the end they may drive back and incrassate the blood while it is in flowing unto the part; & that they may make more narrow those waies and passages by the which it floweth. But now such intercepting Medicaments are to be applyed unto the vessels by which the blood tendeth unto the wounded part; and so above upon the part, toward the root of the vessel; and more especially (where it possibly

bly may be done) in the exterior parts where only the veins lie hid under the skin, and are not covered with much flesh: touching which *Hippocrates* (in his fifth *Section, Aphoris.* 23) giveth us this advice. *We ought* (*saith he*) *to make use of some cold medicament, in those persons that have at present any blood flowing from them, or that are likely to be troubled therewith; and this medicament is not indeed to be applyed unto the same place, but unto those places from whence it floweth. & if there be any inflammations or burnings of the parts that tend unto a red or bloody colour* (*by reason of the fresh and flourishing blood that now appeareth therein*) *unto these very parts let it be administred.* Now these intercepters are made of Medicaments that are cold and Astringent, as *Posca* (*a compound of vinegar and water*) *harsh wine, the water of Roses of Plantane, of the Oak, and of night shade; Barly meal, the powder of Myrtles, Bolearmenick, Dragons blood, Mastick; the flowers of red Roses, Pomgranate flowers, and the whites of Eggs,* of which there are divers Medicaments to be made: the forms whereof are above propounded and set down (in the first part, *Chap.* 5.) among the defensives, in an inflammation. The Medicament being layd on, the part is to be bound up with a swath, that may bind close the vein toward the root thereof; and the ligature is not to be loosned before the third or fourth day; or indeed, it is not to be untyed until the blood be throughly stanched. *Avicen* (*in his Quart. Quarti, tr.* 2. *Chapt.* 18.) tells us of this following medicament, that hath in it not only a power of burning, but likewise an astringent faculty; and a virtue also to generate and breed flesh: As,

Take *Chalcanthum, Parget made into a very fine powder, and sifted thorow a hayr sieve, of each twenty drams; Frankincense powdered six drams; Aloes, dry Glue, of each eight drams; Arsenick four drams;* (*I had rather here take Mercury sublimate, in regard that many who are ignorant of things Chymical and Metallick, of tentimes when sublimate in general is mentioned,* (*and Mercury sublimate is evermore to be understood*) *there instead thereof these do substitute and appoint Arsenick:*) *let them be al beaten into a very fine and smal powder, made up in a liniment, and imposed upon the orifice of the vessel. Some there are that unto this Medicament do add Dragons blood, and the excrescence Hypocistis.*

But those internal medicaments that stanch blood, are either such as cool and thicken the blood, or else they are those we cal Narcoticks. The coolers and thickners are prepared of *Myrtle, Roses, Purslane, Lettice. Berberries, Ribes, Succory, Quinces, Pomgranates, Tormentil, Corals, Bolearmenick, Sealed Earth.* Out of which may be made Powders, Waters, Syrups, (and from these potions) and Electuaries.

There are likewise some certain things that are sayd to stay the blood by an occult and secret property: and thus *Strawberry Water* is much Commended in al hæmorrhages. And the *Root of Corn-rose* (or Cockle) held under the tongue stoppeth the hemorrhage. And some there be that for this purpose commend unto us the roots of that Cichory that hath a white flower. And some there are that order the Patient to hold in his hand the *Jasper Stone*, or the *Blood Stone.*

Stupefactives are not over commonly to be administred; neither indeed at all, unless the strength remain firm and entire; for fear lest that the powers being already much weakned, and faylng by reason of the over great loss of blood, should by these stupefactives be farther dejected: but if the Patients strength wil admit of it, then we may administer one grain (or two at the most) of *Opiat Laudanum.* But now that the blood when it is stanched may so remain, for this the situation of the wounded part maketh very much; which ought to be such, that the Member may look upward, and be free from all pain. For pain doth very easily attract the blood, and cause it to break forth again; and the blood doth more easily flow unto a declining and downward place.

If yet the blood by this means be not stanched; they tell us that we are then to cast upon the vessel pouring forth the blood somthing to tye it withal; and especially toward the root thereof, by which the branch looks toward the Liver, or the Heart; and that the veins or Arteryes are to be made naked and bare, to be layd hold on with a hook, and then presently with a thread (of silk especially) to be tyed, and the thread to be drawn very hard and close upon them; and then they appoint that the wound be filled up with flesh, before the bond be quite taken off. For if the flesh shal not first of al have filled up the place that is about the vessel, and have shut the very orifice of the vessel it self, the bond falling off, the hæmorrhage wil again easily follow. But the truth is that these things are more easily required and commanded, then they are put in practice & performed. If a vein or an Artery wounded & pouring forth blood be wholly cut asunder, the blood is then the more easily stanched: for the vessel is drawn back, and on both sides contracted within it self; and so its orifice is covered and shut up by the bodies that lie round about it.

But the best, safest, and most easie way (if it be rightly ordered) of stanching the blood, is that which is wrought by Medicaments that stop and stay the Blood, and shut up the orifice thereof; as they were before propounded by us.

When the Blood shal be stopt, the Wound is scarcely to be opened before the third day. And if the Wound be unbound, yet notwithstanding if there be yet any further fear of the Bloods breaking forth again, the Medicament is not wholly to be taken away; if it be not as yet moystened and vitiated by the purulent and sanious matter. But if by these it be made so moist, that it is ready of it self to drop off, another is in this case to be laid on, if there be yet any further flux of blood feared. And yet notwithstanding we are herein to deal very Cautiously, and with all manner of Circumspection; and with the one hand that part of the Vessel toward the Root thereof is to be pressed down close together, that so the flux of blood may be restrained; and with the other hand the Medicament is to be taken off, the moist Wound to be clean. and dried, and a new Medicament laid on.

But now if the internal Vessels shall be so wounded that they can neither be tied together by any ligature; neither yet obstructed and shut up by any Medicaments laid thereon; then Medicaments out of those things that have in them a virtue to cool and thicken the Blood (and which were but even now mentioned by us) are to be provided; and a Dyet that is like and answerable thereunto (as we have said) is to be prescribed.

Now when the blood shal be fully stanched, and shall become clotted, then we must use the best of our endeavour to prevent the putrefying of it; but that it be rather dissolved: which in what manner it is to be performed, we have declared before, (in the 2. *Book*, *Part* 2. *Chap.* 6. and above in the *first Part*, and 16. *Chap.*) where what we have written may be seen at large: for in this Chapter it is our purpose only to treat of the stanching of the Hæmorrhages of Wounds.

The Dyet.

The Dyet is likewise so to be ordained, that it may stop and stanch the Blood; and to this end, Meats are to be provided, *of Rice, of Amylum or the fine flour of Wheat, Barley, Pears, Ribes, Quinces, Services, Medlars, Lettice, Endive.* The Patient ought to abstain from Wine. He must likewise keep himself from Rage and Anger, all Commotion of the Minde, and over vehement motion and Exercise of the Body; and therefore his Adversary that gave him the Wound is not to be admitted into the Room where the Patient is.

Chap. 15. *Of the Wounds of the Nerves, and Tendons, in general, and of the pricking of the Nerves.*

And moreover, the Wounds likewise of the Nerves, Tendons, and Ligaments, are for the most part of such a Nature that something in the Curing of them may fal out that is peculiar and proper to them alone. And first of all, as for what concerns the Nerves, as also the Tendons, (for what we shall speak touching the Nerves may likewise be applied unto the Tendons) they are of another Nature then the flesh; and therefore also (as we shall afterward shew you) they require other Medicaments then the wounded fleth doth; and furthermore they have a very quick and exquisite sense, as the Tendons likewise have; and thereupon if they be hurt they bring great Pains and Convulsions. Now the Wounds of the Nerves are twofold; to wit, Pricking and Incision; according as the wounding Instrument inflicteth the Wound, either by a Prick or a downright Cut.

Signs Diagnostick:

Now the Wound of the Nerve is known first of all, from the Consideration of the wounded place; and from Anatomy, which acquaints us with the Nerves that are in every Member, and how they enter and are Scituate in them. For which cause, it is likewise to be considered, whether the wound be in the Heads of the Muscles, or in the ends of them: and whether the wound be above upon the Joynts, or else in the very Joynts themselves: for if it be in the Heads of the Muscles, it betokeneth that a Nerve is wounded; but if it be in the ends, and neer the Joynts, it is a sign then that a Tendon is wounded. And moreover, from the vehement pain that immediatly after the receiving of the wound infesteth the wounded person, unless the whole Nerve be cut assunder transverswise or over thwart. For the Nerves have a very quick and exquisite sense; and therefore, when these are prickt, there instantly ariseth in the wounded part a vehement pain, and upon this an inflammation; and so the Brain being drawn into a Consent, oftentimes Convulsions and Deliries are excited. But now the Tendons, although they are not endued with a sense altogether so quick and exquisite; yet never-

nevertheleſs, even theſe (they being not wholly void of ſenſe and feeling) when they are pricked, there are alſo pains, and from thence Convulſions excited.

Prognoſticks.

1. All Wounds in the Nerves are dangerous, by reaſon of that exquiſite ſenſe they have, and their Conſent with the Brain. And yet notwithſtanding, a Wound by pricking is more dangerous then that that is made by cutting, as afterwards we ſhall ſhew you.

2. The Wounds of the Tendons are leſs dangerous then thoſe of the Nerves.

3. *That Convulſion that happeneth upon a Wound is Mortal*, as we find it, in the 5. *Sect. Aphor.* 2. Which is to be underſtood of the Wounds of the Nervous parts. And yet notwithſtanding, the Greek word *Thanaſimon*, and the Latine, *Lethale*, (as *Galen* explaineth it in his *Comment*) do not here ſignifie that which of neceſſity and evermore bringeth Death, but only that which is very dangerous and oftentimes cauſeth death.

4. *Thoſe that with their Wounds (as ſuppoſe, thoſe of the Nerves) have conſpicuous Tumors, theſe are not greatly troubled with Convulſions, neither with madneſs; but thoſe in whom the ſaid Tumors ſuddenly vaniſh (if this be done in the binder part) unto ſuch Convulſions and the* Tetanus *do uſually happen: but if it be on the forepart that theſe Tumors vaniſh, then there wil befal them madneſs; a ſharp pain in the ſide, an* Empyema *and Dyſentery, if the Tumors be of a Reddiſh colour.* Sect. 5. Aph. 65.

5. Yea, what we find in the 5. *Sect. Aphor.* 66. (and which we have above alleadged touching wounds in general) hath place here more eſpecially; to wit, *if the Wounds being great and dangerous there ſhall no Tumor be ſeen to appear, it is then a very ill ſign.* For in no kind of wounds are Inflammations more eaſily excited, then in the wounds of the Nerves. And therefore, if there be preſent any Cauſe and occaſion of a fluxion; and yet nevertheleſs a Tumor ſhall not happen thereupon; it is then a ſign that either the matter is driven to ſome other place, by repelling Medicaments, and ſo deteined in the more inward and deep places and parts of the Body, or elſe that they are by Nature her ſelf thruſt unto ſome other place.

6. And yet notwithſtanding there oftentimes appear no Tumors at all in ſuch kind of Wounds; to wit, if the Phyſitian take away all the Cauſes of fluxion, or if that Nature her ſelf ſhall allay and aſſwage the violence of the Humor. And there is alwaies ground of good Hopes, if even unto the ſeventh day there ſhall follow no evil thereupon: for it is a ſign, that Nature hath appeaſed the motion, and the impetuous violence of the Humors: touching which, *Galen* (in his *third B. of the Compoſit. of Medicam. according to their ſeveral kinds*, and 2. *Chap.*) thus writeth: *If unto the fifth, or even unto the ſeventh day of the Diſeaſe, there be neither Phlegmone ſo much as appearing, and that there be altogether a freedom from pain, and that the ſick perſon feel no extenſion and ſtretching in the part affected, he ſhall after this time be ſafe and ſecure.*

7. The wounded Nerves do very eaſily likewiſe conceive a putridneſs; ſince that they have in them but a weak heat, and are of a very dry Nature, and ſo may be eaſily hurt by thoſe things that are moiſt; whereupon it is that Water and Oyl are enemies unto the Nerves. Neither is that putridneſs and Corruption conteined in the wounded part alone, but it is likewiſe communicated unto the neer neighbouring parts, yea and oftentimes alſo unto thoſe parts that are more remote. Whereupon it is, that the hand being wounded, or but the Finger only, the pains are wont to appear in the Arm and Shoulder; and that the Leg being hurt, there are wont to be in the Thigh not only pains, but alſo Impoſtumations; and that the Malady is imparted not unto one of the ſides alone, but even unto that alſo that is oppoſite. Yea and in the whole Body likewiſe the Humors are corrupted; whereupon feavers, pains in the ſides, and Dyſenteries are wont to be excited. And (that which we are here to give you notice of, and not to paſs it over in ſilence) there are not evermore preſent ſigns that betoken an Inflammation or putridneſs; yea and oftentimes there are likewiſe preſent no vehement pains; but that very often ſecretly and ſuddenly the Convulſion invadeth the wounded perſons. For the vitious matter being thin and depraved is hiddenly carried by the Nerves unto the Brain, (as we ſee that this is done in the Epilepſie or Falling-ſickneſs) a poyſonous Air aſcending unto the brain from the extream parts, without any notable pain in thoſe parts by and through which it paſſeth. Of which thing we meet with many examples, and how that the wounded perſons, without any pain and Inflammation, have been ſuddenly ſurpriſed with a Convulſion, and have inſtantly died thereupon. And therefore in the Wounds of the Nerves, although that there ſhall be no pain felt, neither any Inflammation appearing; yet notwithſtanding, we are not to truſt to this; but for all this the Cure is carefully to be heeded and attended.

The Cure.

Touching the Curing of the Wounded Nerves, *Galen* (in his sixth Book of his Method of healing, *Chap.* 2.) taketh a great deal of pains in treating thereof. But seeing that in all Wounds of the Nerves pains and inflammations easily make their approach, and threaten the patient, we must endeavor that the pain may be mitigated, and the inflammation prevented. And therefore if need require, both by letting forth of the blood, as also by a purging out of the sharp and thin humors, their afflux unto the affected part is to be restrained and prevented: but the wound it self is to be kept open, that so the excrements may the more freely flow forth. For the Chiefest cause of pain in Wounds of the nerves is the excrementitious matter shut up; which being overlong detayned getteth to it self a depraved quality, pulleth and twingeth the Nerves, and at length putrifieth. And therefore those Medicaments that are called *Enemata*(although they may be very fit and proper in bloody Wounds, and those of the fleshy parts, in regard that they speedily close & shut up the wound, yet) here in this case are no waies convenient. Neither is water fit & proper no r yet any thing that is cold; since that (as *Hippocrates* writeth in his fifth section, *Aphoris.* 18.) *every thing that is cold is an enemy to the bones, teeth, Nerves, Brain, spinal marrow; but that which is warm, a friend unto them.* Yea neither ought other Medicaments that are actually cold to be administred unto the wounded parts. For seeing that the Nerves are parts voyd of blood, and having in them but very little natural and innate heat, and endued with a most exquisite sense, they are soon and easily offended by any thing that is cold, (it being biting and causing pain) as *Hippocrates* writeth in the 20. *Aphor.* of his fifth *Section*, and as *Galen* likewise teacheth thus, in the sixth Book of his *Method* of *Curing*, *Chapt.* 3. But yet things that are blood-warm are not sufficiently commodious; touching which *Galen*(in his sixth Book of the *Composit:* of *Medicaments according to the kind*, *Chapt.* 2. thus writeth *Let the oyl* (*sayth he*) *with which we cherish the wound be sufficiently hot, lest that otherwise it offend such a wounded part. For like as that which is cold is most of all contrary unto these kind of Affects; so likewise that that is but blood warm is not very much a friend unto them.* And a little after: *and for this Reason* (*sayth he*)*I my self chuse rather to make use of a fomentation of oyl that is sufficiently hot, alwaies shunning that which is but luke-warm, but most of al refusing that which is quite cold.* And yet Nevertheless, if there be a nerve discovered and made bare, *Galen* then administreth rather such things as are but tepid or Luke-warm, then those things that are very hot; as we may find in the sixth Book of his *Method of Curing*, and *Chapt.* 3.

But although that for the asswaging of the pain, that which is hot and withal moyst is most useful and convenient: yet nevertheless, in regard that under those things that humectate and moysten the Nerves do easily putrefy, therefore for all Wounds of the Nerves those Medicaments are most accomodate and proper that in their activity are temperate, (or somwhat tending unt oheat) but that in passives do dry; and that are of thin parts, that may corroborate the weak heat of the Nerves, by consuming and drying up the excrements: touching which *Galen* (in his sixth Book of the *Method* of *Curing*, and 2 *Chapt.*) writeth in this manner: *The faculty of the Medicaments of the wounded Nerves ought to be both thin, and also moderatly heating, and such as may dry without any pain; in regard that this alone can draw the Sanies (or thin excrements) from the bottom of the Wound, without either contracting, or biting of the particle.* And then a little after, *the Wounded Nerves* (*sayth he*) *require such Medicaments that may excite a tepid or luke-warm heat, and may strongly dry; and which from the Nature of their own substance have both a power of drawing, and are of thin parts.* And the same he teacheth us in his third Book of the *Composition of Medicaments according to the kinds*, *Chapt.* 2. And such like Medicaments have in them this benefit likewise, that although they are endued with a faculty of drying, yet notwithstanding they do not conglutinate the orifice of the Wound seeing that they have both an attractive power, and yet nevertheless are free from and void of an Astringent faculty. And yet notwithstanding regard ought to be had unto the nature of the Wounded person; and unto the softer and more tender bodies the weaker Medicaments are to be administred; but unto hard and strong bodies those medicaments that we administer may be the stronger. And there is also regard to be had unto the matter that is to be dryed up; and according to the store of the humidity we are to make choice of Medicaments that are conveniently drying For as *Galen* (in the place last alleadged, to wit, the third Book of the *Composition of Medicam. according to the places*, and *Chapt.* 2.) sayth that in a very copious humidity the increase thereof requireth to be dryed up by a Medicament that is more then ordinary drying; if it be but little, then by a medicament that doth this moderately; and if it be much,

then

then by a Medicament that dryeth much; and yet nevertheleſs, not extremly, neither in the higheſt degree. For there ought to be a proportion anſwerable between the quantity of the humidity and the drying of the Medicament. And if there be alſo any of thoſe drying Medicaments, and of thin parts, (which are of fit uſe in all Wounds of the Nerves) that have adjoyned with them a Notable heat, and a biting Acrimony, and thereupon may eaſily excite both pain and fluxions, (ſuch as are deſtilled Balſams, ſpirits, and oyls) their heat and acrimony (unleſs of its own accord it ſoon vaniſheth, as it commonly happeneth in the ſpirit of Wine) is to be tempred and Mitigated by the mingling together of other things with them.

Such like Medicaments as theſe, that are uſeful in all Wounds of the Nerves, are propounded by *Galen* in his ſixth Book of the *Method of Curing*, *Chapt.* 2. and in his third Book of the *Compoſite of Medicam. according to the kinds*, *Chapt.* 3. 4. and 7. and they ſhal be likewiſe declared by us anon, when we come to ſpeak of the *pricking* of the *Nerves*.

But now that the pain may be aſſwaged, the temperament of the part preſerved, and the Afflux of humors, and the inflammation may be prevented, there are not only convenient Medicaments to be impoſed upon the part affected, (of which we ſhal ſpeak by and by) but even al the parts alſo that lie in the midſt from the wound to the beginning of the Nerves are to be anoynted and cheriſhed with hot oyls, to wit, the Oyl of Earth worms of White Lilyes, the Oyl of a Fox, the Oyl of Coſtus, the Oyl of Caſtor, and the like. And *Galen* commands us thus to do, in the ſixth Book of his *Method*, *and* 3 *Chapt.* And therefore, if the Nerve be of thoſe that appear in the Neck, then the Arm from the Wound even unto the Armpits and the Neck, is to be anoynted. But if the nerve be of thoſe that are found in the Legg, then the Groyns are to be anoyn ted; and we muſt aſcend in anoynting from the Groyns (by the Backbones) even unto the head and Neck.

But ſince that the Prognoſticks, as alſo the uſe of thoſe Medicaments doth ſomwhat vary (according as the Nerve is wounded either by pricking, or by a down-right cut) we ſhal therefore ſpeak of the Pricking and inciſion of the Nerves in ſpecial; out of which thoſe things that in the general ſeem neceſſary to be ſpoken of touching the cure of the wounds of the Nerves, wil the more cleerly appear.

Of the Pricking of the Nerves.

Signs Diagnoſtick.

Now it may be known whether the Nerves be wounded (yea or no) by pricking, from the kind of the weapon it ſelf, and the condition of the Wound; to wit, if it be narrow, and yet notwithſtanding a great and grievous pain followeth; and upon this a beating, an imflammation, a Fever, and a Convulſion: which ſymptomes do never happen, where the Nerve is wholly cut aſſunder. For when the Nerve is wholly and tranſverſly cut in two, it no longer continueth its commerce with the Brain; Neither can it draw the ſame into a Conſent with it; and ſo there can be no pain, neither convulſion excited.

Prognoſticks.

1. The Pricking of the Nerves is the moſt dangerous among al the wounds of the nerves: for as *Galen writes* (*Art. Med.* and *Chapt.* 92.) the *Pricking of a Nerve and a Tendon, by reaſon of the vehemency of the ſenſe, and becauſe that this part is continued with the principal part the head, it is thereupon very apt and ready to excite a Convulſion of the Nerves, and then more eſpecially when nothing at al breaketh forth, the wound in the ſkin being cloſed and ſhut up.* And in his ſixth Book of the *Method* of *Curing*, *Chapt.* 2. he ſaith thus; *Where a Nerve is prickt, there of Neceſſity a pain muſt invade the perſon greater then the pain that is in any other of the parts; and then of neceſſity a* Phlegmone *muſt ſoon follow thereupon.*

2. And yet nevertheleſs the pricking of the Nerve is ſo much the more dangerous, by how much the body that it lighteth upon is impure, and ill diſpoſed: touching which *Galen* (in his ſixth Book of the places affected, *Chapt.* 2.) thus writeth; *If any one whoſe Wounds do eaſily heal be pricked with a Needle, this man although without any Medicament, and the member altogether bare and naked, may betake himſelf unto his accuſtomed labors and buſineſs and yet find nor feel no hurt at al; but if any one whoſe Wounds are hard to cure, ſhal ſo do, (eſpecially if he be either Plethorical, or elſe oppreſſed and ful of bad humors that is to ſay, Cacochymical) this party will indeed at the firſt feel much pain; and afterward likewiſe the part affected wil be infeſted, not only with a Pulſe and beating, but alſo with a Phlegmone.*

3. If in the prickings of the Nerves there appeareth a Tumor, and that it afterward

ſuddenly

suddenly disappear and vanish, then a Convulsion and a Deliry arise, as before (out of the 5. *Sect.* and 65. *Aphorism,*) we acquainted you.

The Cure.

That Indication that is common in all the wounds of the other parts (to wit, that what is dissolved must be again united) this hath likewise its place in the prickings of the Nerves. And yet notwithstanding, in regard that when a Nerve is prickt, (by reason of the Acrimony of the sense which it hath) there followeth a greater pain then in the other parts; and upon this an Inflammation: in the pricking of the Nerves therefore this ought to be the main care and endeavour of the Physitian, that the said pain may (if possibly) be prevented or at least mitigated and moderated, and however that the Inflammation be by all means prevented. Now this is prevented, if there be not heaped up in the wound those excrements that may bring pain Now these may be kept from heaping up, if from all parts of the Body the vitious Humors be not permitted to flow unto the part affected, to wit, the wounded place; and if that those which are gotten together in the wound be not suffered thereto continue, but be forthwith evacuated: Which may be performed if the Skin, as likewise the wound of the flesh that lieth upon the Nerve, be kept open; or if the wound shall not be open enough, that it be made yet wider, and the Skin cut wider by two incisions made at the right Angles, that so by it there may be opened a more free passage forth for those Excrements that are heaped up in the Wound.

And therefore in the pricking of the Nerves there are three things principally to be done; first the Body is to be purged from vitious Humors, the pain to be mitigated, and a passage made for the Excrements, that so they may be emptied forth and taken away.

But now afterwhat manner the whol body is to be purged, we have often told you before. But upon the wounded part there are Medicaments to be imposed, which both mitigate the pain, and open a passage forth for the *Sanies* or thin Excrements, and that draw forth the Excrements that lie hid very deep, even at the bottom of the Wound. And if the wound be over narrow, it is then to be made wider either by a Section made across (in the form of the Letter X) so that the prick be the Center of the Sections, or else by Tents that may dilate the Skin, but yet not touch the Nerve.

And yet nevertheless, for the moderating of the pain, neither is warm water, or that that is hot and moist, thought to be convenient; (since that Water and all cold things are enemies unto the Nerves; and those things that are hot and moist may eallily excite a putridness in the Nerves:) but we ought rather to use Oyl of a thin substance, as that of *Earth-Worms*, or such like. And it will be likewise to very good purpose, to anoynt the part about the wound with Oyl somwhat warm, of most thin parts, and not altringent. Or, if you cannot get enough of such an Oyl, then use the Oyl of white Lillies, of Earthworms, or Camomile, of Dil, or of Melilote. But if the pain shall not yet cease, and that an Inflammation be nigh at hand, it will then be very requisite to impose some Cataplasm to qualifie and mitigate the pain; and this may be made of *Barley Meal, Bean Meal, the Meal of the Vetch Ervum, and that of Lupines, Betony, Camomile flowers, and Oyl fully ripe.* For such like Cataplasms do asswage pain, throughly dry, and discuss, resist putridness, Cherish and strengthen the Native heat; and therefore in the wounds of the Nerves and Tendons they are very fitly administred: and especially, such are then to be made use of, when the Nerves begin to be enflamed, and to putrifie; and then those Cataplasms are to be made with Oxymel or else with a Ley; and the same Cure (almost) is to be instituted, and in the same manner to be ordered, as it is wont to be in a Gangrene but now beginning.

And therefore in this all Authors agree, and Practise it self and experience teach us this, that in all prickings of the Nerves we ought to abstain from all things cold, Astringent, and moist; and that we are to use those things that are hot, dry, and having a thin substance: or (as *Galen* saith) all our Care and Counsel must be directed and tend unto this, that the faculty of the Medicaments be both thin, as also meanly and indifferently heating, and such as may dry without any pain. For these alone can draw from the bottom of the wound the *Sanies* or thin Excrement, without either contracting or biting any the least part thereof.

But although that this indeed be out of doubt, that the Medicaments that are administred unto the prickings of the Nerves have such a like faculty (as ere while we told you of) to wit, to dry up and discuss the thin Excrements, and to draw from the bottom of the wounds; but then whether they yet do nothing else but this, and whether their being administred be to no other end, of this I much doubt. And that which causeth me so to doubt, is that which hath been spoken above in the *eight Chapter*, touching Sarcoticks.

Sarcoticks. For whereas in that place I have shewn, that it is not at all absurd to determine that the chief and principal end of all Sarcotick Medicaments is this, that they may Corroborate the heat of any part whatsoever, that so Nature in the generating of flesh may so much the more rightly discharge its office; this is especially requisite in the wounded Nerves, Tendons, and Ligaments. For since their heat is far more weak then that of the fleshy parts, this heat is yet further debilitated in those that are wounded; and therefore they are not able rightly to Concoct and Assimilate the Aliment that floweth unto them; and from hence it is, that this Aliment is converted into *Sanies*; and by how much the greater the weakness is, by so much the greater is the store of such *Sanies* that floweth out. And moreover in regard that the Nervous parts are endued with a most exquisite sense, they are easily affected with a pain likewise, upon occasion of which the vicious Humors flow unto them from al other parts of the Body. And from hence it very often happeneth, that from the wounded Joynts, (and especially in the Arm, or Knee; and yet more especially, if there be present an Inflammation) there is never any laudable *Pus* generated, but there floweth forth great store of this *Sanies*, which our Chirurgeons cal *das Glied VVassel*, or the *Joynt Water*; and some of the more ignorant of these Chirurgeons think it to be the genuine Humor of the Joynt it self; and thereupon they endeavour to obstruct and stop the afflux thereof, by I know not what kind of Medicaments; when as notwithstanding there cannot be conteined so much Humor in all the Joynts of the whole Body, as we shall sometimes have flowing forth of such a wound in one day: and the said Flux can no way be stanched, unless unto the wounded part there be restored its own Natural Temper: of which likewise *Johannes Langius* gives us notice, in his *Preface to his Medicinal Epistles*; and in his *first B.* and *third Epistle*.

But now for those Medicaments which experience hath taught us to be very useful in al wounds of the Nerves and Tendons, and more especially in the Wounds that are caused by prickings, they are, *Oyl* fully ripe, such as is two yeers old, rather then new; the *Oyl* of *Earth worms*, of *Rue*, of *white Lillies*, of *Costus*, of *Castor*, of *Turpentine*, (this last may be used alone of it self in Children, Women, and such as are of a more moist and soft Constitution of Body; but in such as have drier Bodies, there may be some *Euphorbium* mingled therewith) *Ammoniacum*, *Galbanum*, *Root of round Aristolochy*, *Dittany*; and generally all Roots that are bitter without Astriction; Propolis of Beehives, in the same manner, either alone, or else with *Euphorbium*; instead of *Euphorbium Sagapenum* may likewise be therewith mingled; the *destilled Oyl of Turpentine*, *the Sweat or Tear of the Fir-Tree*, and other Artificial Balsams. *Galen* likewise commendeth an Emplaster that is made of *Wax*, *one part*; *Turpentine and Pitch*, *of each half parts*; *Euphorbium*, the twelfth part: touching which see further in *Galen* his *sixth B.* of the *Meth. of Curing*, *Chap.* 2. where he taketh great pains, and is very Exact and Large in treating of the use of *Euphorbium* in the wounds of the Nerves; the Sum and substance of al which is this. Whereas no one can possibly comprehend the use of *Euphorbium* by measure, both by reason of the different age of the *Euphorbium*, as also by reason of the various Natures of Bodies; we ought therefore to heed what this *Euphorbium* is, to wit, whether new or old, and in what proportion it is to be mingled. For the old (which is more yellow and more Pale then the New, but more hard and dry of Consistence) is less efficacious; and although that it keep some of its virtue unto the third yeer, yet in the fourth, fifth, or sixth yeer, it is then so decaied, that in the process of time it is altogether useless and good for nothing. And therefore the new is to be mingled with a triple quantity of *Wax*. As,

Take *Euphorbium*, *one ounce*; *Wax*, *three ounces*; *Oyl*, *ten or twelve ounces*.

But when it is become a little old, it ought then to be mingled in somwhat a greater proportion; and there must be added thereto one part and half (or two parts if it be three or four yeers old) more then formerly when it was new: that is to say, a double weight unto the former; or if you please it may in weight be equal unto the *Wax*, in which thing notwithstanding use is much to be heeded and attended. For if the wounded person shall complain of any biting that he feels from the said Medicament; and the parts lying about the Puncture shall appear to be hot, then the Puncture or Pricking it self is somwhat more swelling then is fit, and the Lips of the wound wil be some thing affected with an Inflammation; and we may conclude that the Medicament is stronger then it ought to be: and therefore either the strength of it is to be abated and qualified by the admixture of the greater store of Oyl, or else the older *Euphorbium* is to be taken. But if the Contrary shall happen, then the strength of the Medicament is to be augmented, either by mingling a greater quantity of the old, or else by the admixture of the newer *Euphorbium*: for that mixture that hath in it a triple proportion of *Wax*, is the strongest; that which

hath a five-fold quantity of the said *Wax*, the weakeſt; and the mixture having but a quadruple proportion of the Wax, is in a mean betwixt both.

Galen (as we may ſee in his *third B. of the Compoſit. of Medicaments according to their kinds*, and 2. *Chap.*) mentioneth likewiſe other things that are to be made uſe of, as *live Sulphur, unſlaked Lime waſhed; Arſenick, Sandarach, Pompholyx, the ſcourings of Braſs, Chalcitis (or red Vitriol) burnt.* But in all theſe he had only a regard unto their drying faculty; and he would only have the Medicaments to be ſo made and Compounded, that they might be able to cal forth and conſume the Excrements out of the Wounds of the Nerves. But unto me (as I told you before) it ſeemeth far more probable, that ſuch Medicaments are to be made choice of, that may withal Corroborate and Augment the Native heat of the Nerves, which of it ſelf (and eſpecially in the wounded Nerves) is very weak.

And therefore this latter Age hath found out Medicaments that are far more ſafe; both ſuch as are prepared by the Chymical Art, as alſo ſuch as are brought unto us out of other Countries; yea and ſuch as are very ordinary at home among our ſelves; and ſuch as do their office without cauſing any pain (that is eaſily brought upon the Patient by the uſe of thoſe ſtronger Medicaments that the Ancients made uſe of) and which may be ſafely applied, whether the Nerve be naked and bare, or whether it be covered (whereas in the Nerve that is bare all thoſe Medicaments of the Ancients cannot be made uſe of with any ſafety) ſuch as are theſe; *Balſam of Peru, the diſtilled Oyl of Roſin Turpentine, and the Roſin of the Fir-Tree, Wax, Oyl or Balſam of St. Johns wort, the ſpirit of Wine, Gum Elemi, Gum Tacamahaca, and Gum Caranna.* All which obtain that faculty which by *Galen* and the Ancients is propounded, and have in them no Corroding quality at all; and withal obtain a Balſamick virtue (as thoſe of our times term it) which thoſe other of the Ancients are void of; and they do not only conſume the Excrements, but they likewiſe greatly ſtrengthen the Native heat of the wounded part, and are all of them very agreeable and ſuitable unto the Nerves. *Cæſar Magatus*, in his *ſecond B. of Wounds, 5. Chapter*, mentioneth theſe ſeveral forms following.

Take *Ammoniacum, Opopanax, Sagapenum, diſſolved in hot water; Propolis, and Turpentine, of each half an ounce; Oyl of thin parts, two or three yeers old, in which Earthworms have been boyled, one ounce and half; Mingle them, and make an Unguent.* Or,

Take *Cleer Turpentine, the exſudation or tear of the fir tree, of each one ounce; Tacamahaca, half an ounce; Caranna two drams, Balſam of Peru, three drams; Propolis ſix drams; our oyl of St. Johns wort, one ounce; Mingle them, and make an Unguent;* Or,

Take *Sagapenum, Opopanax, Propolis, of each half an ounce; Tacamahaca three drams; the deſtilled oyl of Turpentine, or the ſweat of the fir tree, one ounce; Sulphur that hath not come neer the fire, one dram and half; Mingle them, and make an Unguent.* Or,

Take *Tacamahaca, Opopanax, Propolis, the ſweat of the Firtree, of each two drams; Artificial Balſam, ſix drams; Mingle them, and make an Unguent.* Or,

Take *Artificial Balſam, our oyl of St. Johns Wort, of each half an ounce; Burning water (which the Latines call Aqua ardens) or the water of Balſam, three drams, and mingle them.* Or,

Take *Diachylon with Gums, one ounce; Tacamahaca, Caranna, Sagapenum, Propolis, Roſin of the Pine, Ship-pitch, of each three drams; Artificial Balſam, half an ounce; Euphorbium two ſcruples; Mingle them and make a cerot.* Or,

Take *The oldeſt Leaven one ounce and half, Doves dung, or Brimſtone, one dram; Aqua Ardens, or Water of Balſam, as much as will ſuffice; that the Medicament may have the conſiſtence of Honey; and ſo mingle them.* Or,

Take *Oyl of Turpentine, or the ſweat of the Fir tree, one ounce; Sagapenum, Propolis, of each half an ounce; Euphorbium one dram; mingle them.*

And if the Medicament that is layd on be of a thin ſubſtance, or (as the Chymiſts ſpeak) volatile, which may eaſily be diſſipated; then we are to mingle therewith all Turpentine and Gum Elemi; or elſe we muſt impoſe an Emplaſter of Gum Caranna, Tacamahaca, diſſolved in the compound Oyl St. Johns wort.

The Diet.

There is likewiſe regard to be had unto the diet. The Air in which the Patient is moſt converſant ought to be ſomewhat more warm then ordinary, ſince that the Cold is an Enemy unto the Nerves; as in the fifth *Sect. Aphoriſ.* 18. And therefore likewiſe the Wounds of the Nerves are not over often and without very great cauſe to be uncovered; and when they are uncovered, a Candle muſt be lighted, and a pan ful of hot coals muſt be in a readineſs; and this new binding up muſt be haſtened, and performed with all poſſible ſpeed. Let the ſick perſon abſtain from wine. The affected part is ſoftly and gently to be placed, and kept in quietneſs. For (as *Celſus* ſaith, in his fifth

fifth Book, and *Chapt.* 26.) the best of all Medicaments is Rest and quietness: and to move and walk (unless for such as are found) is altogether unfit and improper. Yea moreover, we have two histories that tells us, that Laughter may bring very much danger and damage in the wounds of the Nervous parts. These Histories we find taken notice of by *Guilhelm. Fabricius*, in his *first Century*, *Observat.* 23. Let Anger likewise, and the passions of the mind be avoyded. And let the patient at this time abstain from Venery that which is of all other things most hurtful unto him; as we are sufficiently taught by the history of that young man in *Guilhelm. Fabricius* his *first Cent. Observat.* 22. who being now almost perfectly wel, and recovered, dyed upon this very cause and no other.

Chap. 16. *Of the downright Wounds of the Nerves, as also of the Ligaments, by Cutting.*

But now if the Nerve or Tendon be wounded not by pricking, but by a downright cut, we are then to look whether the wound be longwaies, or whether it be transverse, and overthwart: and then whether the Nerve be wholly cut assunder, or else be but only in part Wounded; and how much of the skin lying over it is divided.

Signs Diagnostick.

The pain, if the Nerve be Wounded by a Cut, but not wholly divided and cut assunder, is not so great as if it be Wounded by a prick: and yet nevertheless for the most part it is even great enough. But if the Nerve be wholly cut assunder, there is then no pain at all felt, but yet nevertheless the sense and feeling, or else the motion of the part into which the Nerve is inserted, is taken away. And so likewise if the Tendon be wholly dissected, the motion of the Member is taken away.

Prognosticks.

1. If the Nerve be Wounded in the length thereof, then there is no great fear of a Convulsion, seeing that the fibres are not so much affected: but if it be wounded transversly, and yet not wholly cut in two, it may indeed bring upon the person all those symptoms (to wit, pains, inflammations, a Convulsion, and Deliryes or Dotings) which the pricking of the Nerve doth: because that from the fibres that are cut assunder the pain and hurt is communicated unto those fibres that are not dissected and divided; and from hence proceed pains, fluxions, inflammations, and other evils; and at length the Malady is communicated unto the brain it self; from whence there arise Convulsion fits and Deliryes.

2. But if the Nerve be wholly dissected, it doth not indeed bring along with it so much danger, neither is there any fear of a Convulsion: but yet nevertheless there is another incurable Malady that followeth it, to wit, a debility both in sense and motion of that part into which the Nerve is inserted, whenas the animal spirit can no longer be carried by the Nerve into the said part.

3. If any Tendon shall be wounded, but not wholly dissected, it causeth a debility of motion in that part that it moveth: but if it be altogether cut assunder, then the motion of the said part is altogether abolished and taken away.

4. If there flow forth great store of *Sanies* or thin excrement, it is then a sign and token of that ill constitution of the part affected; and that it is inflamed, and altogether in great danger. Now this *Sanies* floweth forth according to the various disposition of the part affected, sometime resembling as it were water, and somtimes like whey of milk; and somtimes as it were white and milkie; but that which floweth forth of the Tendons is more glutinous, like unto the white of an Egge. And I wel remember that in a certain Student there issued forth of his knee that was much wounded (day by day) a certain matter like unto the white of an Egg, but that it was somwhat whiter, and a little thicker; (and yet nevertheless altogether such as *Celsus* describeth in his fifth Book, and *Chapt* 26. which he calleth *Meliceria*, because that it is like unto white honey;) which flowed forth in that abundance, that an Eggshel could scarcely contain it.

The Cure.

The way and Method of Curing these Wounds is in the most the very same indeed with that which we mentioned in the foregoing *Chapter*; yet notwithstanding there are some things that are peculiarly to be attended. As first of all, those Nerves that are wounded by a downright cut are most commonly left naked, and bare of any skin to cover them and therefore we are to use our best endeavor, that they may not be exposed unto the external Air, in regard that the external cold Air (as we have often told you) is an enemy unto the Nerves. And therfore we are to do the utmost of our indeavor, that (as much as possibly may be) they may be covered with their own proper covering, and the skin that lieth upon it; and therefore if the Nerve be wounded according unto

its length, then with a swath the lipps of the Wound are to be drawn together and conjoyned; but if the Wound be transverse, and that necessity so require, there is then a future or sewing of the lips to be attempted; and yet great care must be taken, and all diligence used, that (if the future or stiching be wrought with the needle, which yet notwithstanding may easily be avoyded, as we told you before) the Nerve it self be not touched with the Needle. For if in the sewing it should chance to be prickt, the very same symptoms may happen that are otherwise wont to arise in the pricking of the Nerves. And yet nevertheless the wound is so to be drawn together, that there may still stand open a free passage forth for the *Sanies*; which (if need so require) may be done with a Tent; lest that if the said *Sanies* be retained and kept in it should corrupt and putrify the nerve. The nerves also when they are wounded will not bear those stronger biting Medicaments, of *Euphorbium*, and the like. And therefore in such kind of Wounds as these *Galen* was wont to use a Medicament of quick or unslaked Lime often washed with much oyl of roses mingled therwith; as also that Medicament of Pompholyx, if it be mingled with good store of oyl of Roses. But those Medicaments that have been found out by those of latter times are safest of all other; of which we have already made mention in the *Chapter* immediatly foregoing. But then the Wound it self may be externally covered with the *Emplaster Diachalcites*, or *Diapalma*, or the *Nerve* Emplaster, or any other that shal be known to be fit and convenient. *Galen (in his third Book of the Composit. of Medicaments according to their kinds & the third Chapt.)* propoundeth and mentioneth these kind of Emplasters; and there are many likewise of them extant in the writings of the latter Physitians; of which we have also in the former *Chapt.* 8 (touching vulnerary Medicaments) made mention; and given you some of the Chief of them. And this Unguent is also very good and useful; which they usually term the Unguent for the Worms.

Take *Centaury the less, the lesser Plantain, Hounds tongue, Mouse-eare, the greater and lesser Consound, the herb horse-taile, and Milfoyl, of each of these one handful; of Earthworms half a pound, Common oyl one pound, Wine one pint and half, Vinegar four ounces. Let them be al wel mashed and throughly mingled together, and so let them stand fermenting for seven daies together. And then after this, adde thereto, of the sewet of a Ram taken clean from the skin one pound; Ship pitch and Rosin, of each one quart. Gum Ammoniacum, Galbanum, Opopanax, dissolved in Vinegar, of each half a dram: let them be all boyled together over a moderate and gentle fire, until the wine and the Vinegar be all consumed, and then let them be strayned. And so soon as they shal be cold, add of Turpentine one ounce and half; of Frankincense, Mastick, Sarcocol, of each three drams; Saffron two drams; let them be wel stirred about with a Spatula, or else with a Pestle in a Mortar: and if it seem good, to cause a Consistence, Wax may also be added.*

And whereas by reason of the Scarcity of natural heat in the Nerves, there can hardly be made a good suppuration, but rather a Putridness and Corruption of the humors; a Cataplasm that may inhibite and resist the said putridness is to be imposed: which wil likewise perform this good office, to wit, of defending the Nerve (unto which cold is an Enemy) from the Injuries of the External Air. This following is also very useful.

Bean Meal, Barley Meal, and the Meal of the Pulse Ervum, the pouder of Camomil flowers, and Red Roses, as much as you think fit; with Oxymel simple, and the Oyl of Roses and Earthworms Compounded together, make a Cataplasm.

And seeing that in the Nerves transversly wounded, and yet not altogether cut assunder, the Brain by the fibres that are whole and entire may easily be drawn into consent, so that a Convulsion may be excited; this Convulsion ought (as much as is possible) to be prevented, by those Medicaments that have hither unto been propounded; and if it shal happen, you must remove it by those Remedies that we shal set down below in the *Chap.* 23. or if this may not possibly be done and that the Medicaments are not sufficient to effect it, then the whole Nerve is to be cut in sunder, that so the Convulsion may be removed. For although that thereby the part be somwhat debilitated, and may come to suffer a stupidity and insensibleness or else some hurt of the motion; yet better it is to bear this inconvenience, then suffer death.

Of the Wounds of the Ligaments.

The Ligaments (in regard that they are voyd of sense) when they are Woeundd produce neither pain, nor Convulsion; neither do they of themselves communicate their Affects unto the Brain. And more especially, the wound of that Ligament which tendeth from one bone to another, is most of all free from danger. But that which is inserted into a Muscle, (in regard that it is able to draw the Nerves and Tendons into a consent with it) if it be not rightly cured may bring a great deal more danger along with it. For because that even the very Ligaments

gaments themselves have but a very weak heat, therefore they wil not easily bear Wounds; but they are very apt and ready to heap up many excrements, that may contract a Putridness, and excite other Maladies and mischiefs; and therefore of those Medicaments that are useful in the Wounds of the Nerves and Tendons, those of them that are most drying are to be administred: and indeed we may with safety enough make use of them, since that this part is destitute of sense, and therefore may not easily be offended with the Acrimony of the said drying Medicaments. But yet nevertheless, in regard that it seemeth to me, that (as we told you before in the foregoing *Chapter*) such like Medicaments are wont to be administred not only for drying, but to the end likewise that they may cherish and strengthen the weak heat of the part, therefore we conclude that such of these drying Medicaments are to be made use of that do no way debilitate & dissipate the weak heat of these parts; but rather such as do cherish and Corroborate it.

Chap. 17. *Of the Wounds of the the Joynts.*

THe Wounds of the Joynts are very neerly related and of kin unto the Wounds of the Nerves; to wit, those that happen in the Elbow of the Arm, the Knee, or the Joynts of the fingers: and these are either with a luxation or loosness of the Joynt, or else without it.

Prognosticks.

Now al such Wounds are dangerous; since that the Joynts are very apt and readily prepared to receive the fluxions, as being such parts that are voyd of flesh, hollow, and which are knit together by Membranes and Membranous Tendons, and are easily assaulted with pains; whereupon arise Inflammations, Watchings, Deliryes, and Convulsions: and such like Wounds as these do easily degenerate into Ulcers of an ill and dangerous nature and quality; as *Galen* writeth in his fourth Book of the *Method of Curing*, and sixth Chapter.

2. And they are yet more dangerous in an internal part; becaufe that in that place the greater vessels and the Nerves are conteyned; where upon there are also the more notable and considerable hæmorrhages and Convulsions easily excited.

3. Touching these same wounds *Hippocrates* likewise writeth after this manner: *Those Wounds (sayth he) that are inflicted in the Joynts, if the Nerves be altogether cut assunder, (that contained them) without doubt they will render them lame. But if there be any doubt, how and in what manner the Nerve may be affected, if indeed the Wound be straight from a sharp Weapon, that which is transverse is better then it. But if the Weapon that inflicted the Wound be heavy and blunt, there is then no danger. But we must here consider both the depth of the Wound, and other like signs of this nature. If any* pus *happen at the Joynt, there is then a necessity that the Joynt should be rendered the harder. And if likewise the tumors shal withal persevere, there is then a necessity that the joynt should be rendered the harder. And if likewise the tumors shal withall Persevere, there is then a Necessity, that this place must be hard for a long time, and that the Ulcer being whol, the tumor or swelling stil remain. But in those where nothing is to be expected but the cutting off of the Nerve, there we may with the more confidence foretell a lameness to follow, and this more especially, if any of the inferior Nerves shal be loosened. But now whether or no the Nerve be to be cut off, may be discovered by these signs; if there flow forth under it a white* pus *that is thick, and of a long continuance, and that there arise pains and inflammations at the Joynt, about the very beginning: which are likewise wont to happen when the bone is to be cut out.*

4. The same *Hippocrates* (in the place alleadged) saith thus: *Those things that are cut assunder in the Elbows, (especially with an inflammation) are at length brought unto a suppuration, and cutting, and burning.*

5. But these Wounds are made yet the more dangerous, if there happen withal a loosening of the Joynt: for then the Joynt cannot be set and put back again into its place without endangering the life of the Patient, by reason of those pains that do perpetually accompany these kind of wounds. And therfore the Physitian may do wel to save his credit by heeding the Prognostick, lest that otherwise he be il spoken of by the common sort of people. For otherwise, if he wil adventure to put back the Joynt into its former place, and that the Joynt when it is put back so continue, it bringeth death unto the sick person; and it hath been commonly seen, that upon a very smal Wound death hath followed. For when with such a Wound a luxation or looseness of the Joynt doth happen, the Nervous parts about the Joynts do suffer a distraction; upon which there are caused fierce and cruel pains, and fluxions: but if the Joynt be brought back unto its place, the same parts are again extended; and so of necessity there must happen inflammations and convulsions, which unavoydably are communicated unto the Brain: and withal

from

from the afflux of the matter proceeding from so many distractions and extensions the heat is suffocated, and so there followeth a Gangrene, and Sphacelus. Wherefore if any such Wound be brought unto the Physitian to Cure, let him acquaint the standers by with the danger of the Patients life, and let him likewise give them notice of the feaver that will follow, and that a Convulsion will likewise happen in a very short time, if this bringing back of the Joynt be attempted, and accordingly effected. Touching which *Hippocrates* (in his *B. of the Joynts*, Text 74.) speaking of the Ankle-bone, thus writeth: *But whosoever they be* (saith he) *that upon any Wound there inflicted have their Ankle-bones out of Joynt, and altogether sticking out from the Joynts of the Foot, they ought not to be returned and put back again into their places: but they are to be permitted so to continue: and if any Physitian wil adventure to put them back, let him know for a certain, that if they so continue when they are set, the Patients are not like to live, and that their life is like to be but for a very few daies; for there be but few of them that live beyond the seventh day: for that which destroies them is the Convulsion. Add this likewise, that it often happeneth, that both the Ankle and the Foot are taken with the Gangrene. And we may be most certainly assured, that these things will thus come to pass.* And of the Elbow, (Text 16.) he saith thus: *The very same happeneth in the bones of the Elbow: for if these bones also (upon any Wound of the Hand-Wrist) be made to stick forth either toward the interior or the exterior part of the Hand, we are to know for a truth, that the persons who have these bones brought back and set in their former places, (if they so abide) they shall within a few daies die the same Death that we told you of before:* And touching the Thigh-bone, (Text 77.) *And if* (saith he) *the Thigh-bone be fallen forth by reason of any Wound inflicted upon the Knee, if it be again replaced, and so continue, it speedily bringeth a more violent Death, then in the cases aforesaid.* And afterwards; *And the very same is likewise to be said as touching the Joynts of the Hand-Wrist, and of the Arm. For whatsoever they be of these that upon a Wound are dislocated and loosened, and hereupon stick out, if they shall again be put back into their places, they certainly cause Death.*

6. And yet notwithstanding the lesser Joynts if they be brought back, and replaced, they do not necessarily bring Death; but many of them are preserved: touching which *Hippocrates* (in his *B. of the Joynts*, Text. 78.) writeth thus: *But now* (saith he) *if any upon a Wound have the Joynts of their Fingers, or of the Foot, or of the Hand, loosened and sticking out, there being indeed no bone broken, but drawn away in the very Coherence, these if the Joynts be again replaced (and shal so continue) have indeed the danger of a Convulsion threatening them, and nigh at hand, unless they be rightly Cured.* And *Galen* (in his 3. *B. of Fractures*, Text 16.) saith: *If the smal Joynts, to wit, such as are found about the Fingers, chance to be wounded, and dislocated, neither then also is the Cure altogether free from danger; for if these persons do notwithstanding escape and recover, most of them obtain this their recovery through the great diligence and pains taken in the Cure.* And afterwards he addeth: *It is yet nevertheless to be expected, that the Joynts about the Fingers that are brought back to their former places will again fall forth; for so for the most part it happeneth, if there follow but any the least Inflammation thereupon. Wherefore if there were no fear that the Physitian would be accused and discredited by reason of the Ignorance and unskilfulness of the vulgar, there were not any one of these to be brought back unto their own former places.* And which that the Physitian may the better avoid, and may not hasten the Death of the Patient, he ought not so much as to undertake the replacing of the Joynt. But then if the Physitian shall not order the Joynt to be brought back and set in its former place, he shall by the vulgar be accused of ignorance and unskilfulness, and as one that hath made the Patient Lame or maimed. Wherefore the Physitian in this Case is to preserve his Credit and Reputation by the aforesaid Prognostick, and foretelling unto the standers by the danger of Death that may in thus doing accrue unto the sick party.

The Cure.

The Cure of these wounds, if they be without any Luxation or loosening, is almost the same as was that before of the Nerves. To wit, the lips of the wound are indeed again to be drawn together, but yet not wholly, if the Wound be deeper then ordinary, that so there may be an open passage forth for the Humors that are easily gathered together. And seeing that the Joynts especially have in them but little heat, they are therefore in the best manner that may be to defend them from the injuries of the external Air. Wherefore not only those Unguents and Emplasters that are used in other Wounds (especially those of the Nerves) are to be imposed; but likewise those Cataplasms, of which mention was made above in the *eighth Chapter*. As,

Take *Pouder of Marsh-mallow Root, half an ounce; Betony, flowers of Camomile, and Melilote, of each one ounce; the meal of Linseed,*

seed, and Fenugreek seed, of each one ounce and half; of Beans, one ounce; and make a Cataplasm.

The afflux of the Humors is likewise to be prevented; and therefore the whole body is to be evacuated with al diligence; and the Humors that flow are to be intercepted, and turned quite out of the Body.

It matters very much likewise, that the member be rightly Scituated and placed, that the pain and the afflux of Humors may be prevented, and the action of the member preserved.

If therefore the fore part of the Shoulder be wounded, then let a thick bolster be put underneath the wing thereof, and likewise wrapt up in something that may bear up the Arm, and drive up higher the top or head of the Shoulder. For the top or head of the Shoulder being drawn downward by its own proper weight causeth that the Wound is cured much the more slowly. If the Wound be inflicted upon the Joynt of the Elbow, the Arm is then neither altogether to be kept stretched forth straight, neither is it too much to be bended inward, but it is to be placed in a middle posture, resembling an obtuse Angle. Which Scituation of the part that it may be so preserved, and by the sick person whilest he sleepeth (or else through Incogitancy) not altered, it is to be kept in that posture either by fit and convenient bindings up, or else by wooden Instruments made fit for that purpose. The Hand-Wrist being wounded, or the Joynts of the Fingers, the Hand is to be kept half bended, and the Fingers not stretched forth, lest that a Cicatrice being brought over them the Hand should abide stiff, and be hurt by its contraction. If the joynt of the Thigh be wounded, let the sick person lie upon his back, and with fit little Pillows and bindings let the Huckle-bone in the head thereof be contained and kept in its proper place; and until the Cicatrice be brought over it, the sick person must be commanded that he sometimes move and stir his Thigh this way and that way; lest that the Cicatrice being brought over it, there should happen a hurt of the motion by means of the said Cicatrice. The Knee when it is wounded must be stretched forth, and placed in a right and straight Figure, that so Lameness may be prevented.

A Wound with Luxation.

But now if the Wound be with a Luxation or loosening of the Joynt, if the Joynt that is loosened be great, the putting of it back again into its place is to be omitted; and the sick person is to be told before hand of the Lameness and danger that would follow thereupon: and the fluxion is by all manner of means to be turned away; and the pain to be mitigated; and the Member to be placed in such a posture as may seem most grateful and convenient unto the Patient, and such as may bring the least pain unto him; provided stil, that the Member hang not down, lest that there should be an occasion for an afflux of the Humors. But the wound is to be Cured like as other Wounds; but yet nevertheless it is not to be bound up in the same manner as other wounds are. And great care must likewise be taken that it be not offended by the external cold of the Air. Cataplasms are likewise to be imposed, not upon the Wound it self, But upon the parts that lie neer unto it, lest that by any means the part should by the weight thereof be grieved and butthened. And in regard that fluxions are easily caused (in this case) unto these parts, and thereupon the Cure the longer ere it be perfected; therefore the Body is by often purgations, and likewise by sweats, to be purged and cleansed from all its vitious and superfluous Humors.

Chap. 18. *Of a Wound with a Contusion.*

AND seeing likewise that the quality and Condition of the instrument wherewith the Wound is inflicted may cause a difference of the Wound we are therefore here not to pass this over in silence, without speaking something unto it. For some wounds are inflicted by sharp Instruments or weapons, and others by those that are obtuse and blunt; which doth not a little vary the Cure. And indeed the Cure of Wounds made with sharp Instruments may sufficiently appear by what hath hitherunto been said: and as for what is peculiar unto Wounds that are inflicted by blunt Weapons, we will here in this Chapter declare it. Now that kind of Unity dissolved that obtuse and blunt Weapons cause in a soft part, is called a Contusion. And indeed it is properly termed a Contusion, when the superficies of the part (or the Skin) being whole and entire, those soft parts that lie under it are bruised, and as it were battered together; of which Contusion some mention hath likewise been made above, in the *first Part*, and *sixteenth Chapter*. And yet nevertheless, now and then, the part is not only bruised within, but it is also externally wounded in the superficies, where the Wound is joyned with a Contusion; and touching this Contusion it is that we intend here to treat; of which we shal notwithstanding so order our discourse,

A Wound with a Contusion.

that

that what is to be done in every Contusion may manifestly appear.

The Causes.

Now a Contusion is caused in Wounds, when the Weapon or Instrument wherewith the Wound is inflicted hath not only a power of cutting and making an incision, but likewise of bruising and battering the part upon which it lighteth; and this is done, when the Weapon or Instrument is blunt, or heavy; or when a man is thrown against somthing that is hard: in which manner also the soft part may be bruised without a Wound, or else with a Wound.

Signs Diagnostick.

Wounds with a Contusion are known by the instrument with the which the wound was made, to wit, if it be blunt and heavy; and then in the next place from the pain, and the black and blew color of the part.

Prognosticks.

1. A Wound with a Contusion is more dangerous, and more difficult to Cure, then that which is without a Contusion. For the bruised parts, and the blood that is poured forth, if they be not discussed, they must of necessity be turned into *Pus*, or otherwise before this is done the Wound cannot be Cured.

2. And if the bruised part, and the blood poured forth of the broken Vessels begin to putrefie, it may excite and cause a Gangrene.

The Cure.

In regard that no wound that hath any other affect that hindereth the Curing thereof Joyned with it can be cured until the said Affect be removed, and that the part it self be rightly disposed; it from hence easily appeareth, that our first care must be directed unto the cure of the Contusion. And when the Contusion or bruise is once taken away, the rest of the Cure is to be performed in the manner and form aforesaid.

But then, seeing that what is bruised cannot be restored again, and made entire as before, and that the Blood which is poured forth of the Vessels may stick in another place, (where it ought not to be) and so may be easily corrupted; therefore we ought first of all to endeavour, that both of them may be taken away: and that they may either be discussed, or else converted into *Pus*. And because that there is evermore caused an afflux of the Humors unto the bruised part, by reason of the pain that attendeth the said Contusion; therefore, first of all, Universal Revulsions (and chiefly Venesection or opening of a Vein, if need so require) are to be administred. And then in the next place, that there may flow no more of the Humor unto the part affected, Defensives and Repellers are to be administred; touching which we have spoken above, in the 1 *Part*, *Chap.* 16. which ought to be such that they will no way admit of the afflux of the Humor; and withal that they may consume and dry up some part thereof.

And when there shall be no further cause to fear an afflux of Humors; then we are to do our endeavour that that which is bruised, and the Blood which being forth of the Vessels sticketh in the bruised part may speedily be turned into *Pus*: as *Hippocrates* teacheth us, in his *B. of Ulcers*: *If* (saith he) *any of the flesh shall be battered and bruised by the Weapon, we are then to take care, that it be* (as soon as may be) *converted into Pus, for as it is less dangerous then an Inflammation; so there is also a necessity, that the flesh being battered and bruised by the Weapon should being converted into* Pus *waste and consume away, and then a new Flesh be bred instead thereof.* Now what those Medicaments are that move and forward the *Pus*, we have elsewhere told you. But in the use of them, in regard that they are hot and moist, we ought to have a special care that we apply not those things that are over moist; since that by the use of such Medicaments, putridness and the corruption of the part may easily be excited: and therefore certain Discussives are to be added. *As*,

Take *of Marsh-Mallow Root, one ounce; wild Cucumber, half an ounce; Organy, and tops of Dill, of each half a handful; Fat dry Figs, six in number*; boyl them all to a softness, and then pass them through a hair sieve: then add *the pouder of the flowers of Camomile, the meal of Lin-seed, and Fenugreek seed, of each half an ounce; Dragons Blood, three drams; Styrax liquid, Galbanum, and Mirrh, of each two drams; Saffron, one scruple; Oyl of St. Johns-wort, and Hoggs Fat, of each a sufficient quantity*; Mingle them, and make a Cataplasm. But now these Cataplasms are not to be imposed upon the Wound it self, but they are to be laid on round about, where the part is bruised. And this very thing *Hippocrates* teacheth us in his *B. of Ulcers*, where he thus writes; *When it seemeth requisite that the Wound should be fortified and fenced with a Cataplasm, it ought to be brought back from the Wound, and laid upon the parts next unto it, that so the* Pus *may pass forth, and those things that are hard may be softened*

But

But upon the very Wound it self there is to be anoynted a Digestive made of *Rosin Turpentine, and the yelks of Eggs, or Triapharmacum, or the Unguent Basilicon*, or the like, out of those things that we mentioned before; and then upon this Liniments dipt in the same Digestive are to be imposed.

The *Pus* being bred, the Wound is then to be cleansed with convenient Medicaments; and then to be filled up with flesh, and Consolidated.

But if that which is bruised be not changed into *Pus*, but that on the third, fourth, or fifth day a Tumor arise with a pain, and so increase from day to day, & that a beating pain be excited, so that the sick person cannot wel bear the touch of that place, and that at length the fresh and flourishing colour in the part be extinguished, and the part tend unto a yellowishness, and that the pain and beating remit, and that there be present other signs and tokens of a Gangrene neer at hand; then the part is to be scarified, and the *Egpptiack Unguent* laid thereon; and the Cure is so to be instituted and ordered as we told you in the *place alleadged* (to wit, *Chapt.* 16. of the *first part*) and as is wont to be done in case of a neer approaching Gangrene; touching which we have already spoken in the 2. *Part*, *Chap.* 19.

But if not the flesh alone, but likewise the Nerves, Tendons, and Ligaments be bruised: the Nerves indeed and the Tendons if they be bruised without any Contusion of the Skin, they are to be cherished with warm Oyl that hath in it a Discussive virtue, as for instance, *the Oyl of Rue, Orrace, Dill, and sweet Marjoram*. But if withal the Skin be bruised, first of all, *the white of an Egg* mingled with the *Oyl of Roses* is to be laid on, to mitigate the pain. And then the pain being somwhat moderated, the part is to be cherished and fomented with Astringent Wine; and afterwards (according as *Galen* writeth that it was in frequent in use with Wrastlers, who have oftentimes such bruises befalling them) a Cataplasm of *Bean-meal* and *Oxymel* is to be imposed. There is here likewise much commended the *Leaves* of the *Elm* boyled in Oyl, and applied; as likewise the *Ashes* of the *smal shoots* of the *Vine* mingled with the *Fat* of a *Hen*, and *Vinegar*. And if some extraordinary Vehement pain be joyned together with the affect, then *Liquid Pitch*, with *Oxymel* and *Bean-meal* may be mingled, boyled, and laid on as hot as the Patient can well endure it. But if we see that there is cause of more drying, then we may mingle with the former the *meal* of the Pulse *Ervum*, or the *Pouder of the Orrace Root of Illyrium*; and the place ought to be anoynted with the *Oyl of Camomile, of Dill, of Orrace; and of Rue*, with any one of them.

Or else let an Unguent be made of Galbanum and Myrrh. But all things whatsoever that are moist, and that easily bring in a Putridness, they are all of them to be avoided, and no use made of them. And there are also certain internal Medicaments to be administred; as the Root of Birthwort, Gentian, Ellecampane, Centaury the less, Ammoniacum with Honey.

But if after Contusion or Contorsion (by reason of the conflux of the thick Humors) there remain a hardness in the Nerve or Tendon, and that thereupon a Numness and stupidity be excited in the part, then Emollients and Digestives are to be laid on; such as are, the Root of Marsh-mallows, of white Lillies, Bdellium, Ammoniacum, Galbanum, and the great Diachylon.

And Lastly, If the Ligaments be bruised, and writhed out of their places, then there are to be laid on those Medicaments that have in them a virtue and faculty of heating, discussing, and strengthing the heat of the part; and such are the Oyl of Mastick, Spikenard, Orrace, Spike, the Emplastrum Barbarum, and the black Emplaster. *Or,*

Take *Oyl of Mastick, Spicknard, Spike, of each one ounce; Bdellium, two drams; Saffron, one scruple; Wax as much as will suffice, and make an Unguent.*

Chap. 19. *Of Wounds caused by the biting of Living Creatures.*

UNto Wounds with a Contusion there belong likewise even those that are caused by the biting of Living Creatures, and Bullets shot from Guns; touching which our purpose is therefore to treat in special, and particularly. And in the first place, as concerning Wounds that are made by the biting of Living Creatures, we intend to treat of them here in this Chapt. as they are void of Poyson: and of the biting of Poysonous Creatures our purpose is to speak afterward, in the 21. Chapter. For it somtimes so happeneth that a man may be bitten by a Dog, Ape, Horse, Ass, or other Creatures that are not poysonous or mad; or else one man may be bitten by another. But *Cornelius Celsus* (in his 5. *B.* and 27. *Chap.*) writeth, that all bitings whatsoever of wilde Beasts have in them a certain kinde of Poyson: which indeed cannot well be denyed of wilde Creatures. For since that the very spittle of living Creatures hath in it a great power and virtue, (in so much that if there be any thing vitious in the Body it easily drinketh it up)

this spittle may together with the biting easily be conveyed into the Wound. And this must likewise be remembred, that these Animalls when they bite, they are for the most part enraged. And then it being true, (as it is generally wel known) that wrath and rage have in them a great power both of causing a commotion in the humors, as also of corrupting them; that vitiousnes of the humors is very eatily communicated unto the spittle, and by it may as easily be imparted unto the Wound: and this happeneth much the rather, if so be the Man be Frantick. And if there were altogether nothing of virulency in the Wound that is inflicted by the biting of one of these living creatures; yet notwithstanding the very contusion itself (which rendereth all wounds whatsoever the more dangerous, and the more difficult to be cured maketh those wounds the more grievous. For since that the teeth of the said Animals are not so sharp as a sword, or some other kind of Weapon; while they wound, they do withal likewise bruise, and cause a Contusion in the part they fasten upon.

Prognosticks.

But now how dangerous these wounds also may be that are caused by one mans biting of another, *Guibelm. Fabricius* teacheth us by three Examples, and instances, that he giveth thus in his 2 *Century, Observat.* 84. and 85. The first whereof is of a certain Merchant who a midst his Cups by anothers biting was wounded in the very tip of the right forefinger; whose whole right hand upon the same biting became inflamed, and a *Gangrene* soon after began to follow, with Convulsions, an extreme burning feaver, a Syncope, and continual restlesnes.

The second instance is of a Physitian, who rashly and inconsideratly putting his finger into the mouth of a Phrantick woman, to the end he might feel her tongue, had it bitten by t his mad woman; and upon this biting he became extremly afflicted with a vehement pain, not only in the said finger, but in the whol Arm also. The last example is of a man that being by another furious and enraged person sorely bitten even unto the first Articulation of his Thumb, he likewise was instantly taken with a vehement pain al that Arm throughout, and soon after there followed a feaver, and a Syncope.

Matthias Glandorpius (in *Specul. Observat. Chirurgic. Observ.* 49.) relateth the like History of a certain person, who by another mans teeth (the man being much enraged) was wounded in his thumb, about the first Joynt; from whence there arose a most extreme pain, an Inflammation of the whol hand, a Continual fever, a restlesnes of the body, frequent faintings and swoundings, and a very intense pain of the head.

And evermore the wounds are dangerous, both in themselves, (by reason of the contusion) as also becaus that the spittle of the furious and enraged Animals hath somwhat of malignity Joyned with it; and they are so much the more dangerous, if any of the Nervous parts (such as are the fingers) shal chance to be bitten.

The Cure.

In regard that (as we have said) in every wound that is inflicted by the biting of any living Creature there is present a Contusion, and this somtimes greater, and somtimes less according as the teeth of those Creatures are more sharp (such as are the teeth of a Dog, Ape, and Squirrel) or else less sharp, (as those of a Man, Horse, Ass &c.) and that from this Contusion the pain is caused; therefore there ought a regard to be had both unto the Contusion and the pain.

And therefore in the first place, the blood is carefully to be pressed and squeezed forth of the wound; and opening of a vein, or purgation (according as need shal require) is to be instituted: and to prevent the greater afflux of the humors, and the Malady from being communicated unto the superiour parts some Defensive of Oxycrate, or some other the like, is to be imposed upon the superior part; but unto the Wound it self (for the asswaging of its pain, the promoting of the suppuration, and the keeping of the Wound open,) such a like Medicament as this that followeth is to be applyed.

Take *One Egge, butter half an ounce, Saffron one scruple, Oyl of Violets, and Roses of each two drams; and mingle them.* or,

Take *Marshmallow Roots, one ounce and half; the leaves of Mallows, flowers of Camomile, and Melilote, of each half a handful; Wormwood two pugils; boyl them to a softnes and let them be wel bruised and mashed together: when they are wel bruised add unto them the yelk of one Egge, oyl of Roses, and Camomil, of each as much wil suffice, and make a Cataplasm.*

If there be any fear that there is some kind of virulency in the Wound, then we may ad *Scordium*, as also *Treacle*; and therefore such an unguent is to be provided.

Take *The Basilick Unguent, and fresh butter, of each half an ounce, Treacle one dram; oyl of Roses one ounce, the yelk of one Egg, and mingle them.*

And moreover, that what is bruised may be wholly converted into *Pus* we are to use *Honey of Roses, Rosin Turpentine, with the yelk of an*

an Egge, or the Basilick Unguent, or if any Malignity be feared, this that followeth.

Take *Pouder of Myrrh, Root of Round Aristolochy, Orrace of Florence, and Aloes, of each one dram; Angelica, half a dram; Treacle dissolved in the spirit of Wine, two drams, with hony of Roses make a Liniment.*

And at length, the Wound being wel wiped and cleansed, it is to be filled up with flesh, and so shut up with a cicatrice, as in other cases is wont to be done.

If a *Gangrene* be feared, as nigh at hand, then the Cure is so to be ordered, as we sayd before, touching the *Gangrene*.

Glandorpius his father (in the case before alleadged) besides general and internal remedies, was wont to administer these Topicks.

First of all, with this Unguent he anoynted the filaments; and then he imposed them hot upon the Wound, with the *Citrine Emplaster*. As,

Take *Venice Turpentine often washed one ounce, the powder of Earthworms two scruples: Frankincense half a dram; the yelk of one Egge, and mingle them.*

The hand even unto the wrist was anoynted with the *Oyl of Roses*.

The pain increasing, he applyed warm this following Cataplasm.

Take *Scordium or Water Germander, the herb Sauce alone or Jack by the hedg, of each four pugills or smal handfuls; Wormwood, the tops of St. Johns wort, Sage, Marjoram, of each two pugills, Red Roses three pugils, flowers of Camomil and Melilote, of each one pugil; the pith of Rie bread three ounces: bran, one ounce; the meal of Lupines one ounce and half with a sufficient quantity of Wine make a Cataplasm; adding in the conclusion, oyl of Rue six drams; oyl of Roses with Earthworms, an ounce and half; the yelk of one Egge, Saffron one scruple; and mingle them.*

The pain yet for all this little or nothing remitting, about the hand wrist, and the Elbow, he applyed this Defensive.

Take *The Unguent of Roses Camphorated (or with Camphyre and the Santaline Oyl, or the oyl of Saunders, of each half an ounce; oyl of Roses with the Juice of Night-shade, three drams; Bole Armenick two drams, powder of red Roses one dram; Rose vinegar as much as wil suffice, and mingle them.*

The pain somwhat abating, there was then discovered a Nerve, or rather a black Tendon; and upon this he strewed the following powder.

Take *Roots of round Aristolochy, Sow fennel, Orrace of each one scruple; Harts horn burnt, prepared powder of Earthworms, and Frankincense, of each half a scruple, mingle them and make a very fine powder.*

Upon which he laid on the filaments after he had dipt them in the *Diapompholyx Emplaster*; and covered them with the *Emplaster Diapalma*: & so the fear that was conceived of the necessity of the cutting off of the Thumb, was taken away: and a great part of the Tendon cut forth; and the first little bone, being become altogether rotten was drawn forth with the Nayl. But because that the fingers (by reason of their being continually bound up,) as also the thumb, were benummed and wanted their motion, by fomentations, Bathes, and Liniments, the fingers recovered their motion again; and the thumb albeit that it remayned immoveable, yet nevertheless it had a new Nayl instead of the former.

Chap. 20. *Of the Wounds by Gun-shot.*

UNto Wounds with contusions we may likewise add those that are inflicted by Gunshot. Where at the very first, and before we proceed any further, this question cometh to be discussed; to wit,

Whether wounds that are inflicted by Gunshot have any Malignity in them; and whether they receive any burning heat, (causing an Inflammation, and putrefaction of the humors) from the powder, or the Bullet?

Three opinions touching wounds by Gun-shot.

And here in this Controversy, we find that Authors are altogether divided into three Ranks, and opinions. The first determine, that the Wounds inflicted by bullets from Guns are poysonous. Others deny indeed that they have any thing of poyson in them; yet they have nevertheless (as they say) an *Empyreuma*, and burning. But thirdly, and lastly, others there are that wil not admit of either of these; but they assert, that al that wherein these Wounds differ from those that are inflicted by a sharp weapon, is from the contusion and tearing of those parts the bullet passeth thorow. All which opinions we wil now examine in order.

The first opinion.

And first of al, the opinion of them that assert these wounds to be poysonous is indeed very Ancient; and therefore soon after the invention of Guns, according to this opinion, there was likewise a Method

propounded and practised, for the curing of Wounds inflicted by Gunshot. For *John de vigo* (in the second part of his *Pract. Chirurg.* Book 1. and the *Chapter of a poysonous wound*) writeth in this manner: If the Wound shal be caused by the Instrument now much used, and called *la Bombarda*, or (as we term it) the Gun; then there ought to be made a cauterization, with the oyl of *Elder*, or the oyl of *Linseed* only. And *Paræus* writeth (in his tenth Book of *Chirurgery*, *Apologism* 1.) that it was a thing much in use even in his time, to burn into such wounds with the oyl of Elder applyed very hot, and that had mingled with it a little Treacle; and that he himself also at the first followed this way and method of curing; until accidentally (by a certain chance) there was another way taught; touching which, see the place alleadged.

The reasons by which the first opinion is proved.

But those that follow this opinion prove this poysonousness (in the general) from the diseases and symptoms that usually happen there upon; such as are, the corruption of the parts, and the Gangrene, those ulcers resembling the Nature of the Tumor *Herpes*, the trembling of the Heart, Malignant fevers, the lips of the Wound leaden coloured, or black; and then next of al they prove it from the course that is taken in the Cure; because that it is found by experience, that *Alexipharmaca* (or Counterpoysons) have brought much benefit and help unto the Patient; and because that these Wounds are to be kept open a long time, after the manner of other poysoned Wounds. And lastly, some there are that pretend this likewise, that it hath been found, that all those have perished that in some certain battles have been wounded by such bullets; or if any have escaped, that it was very hardly; and that they were preserved by some extraordinary pains and labour; although that the Wounds did not seem so great and dangerous, whatever were the diligence and care of the Chirurgeons, and though it were never so little.

But others of this opinion wil have this poysonousness to proceed from the Gunpouder, by the force and violence whereof the bullets are driven forth; others from the matter and metal of which the bullets are made; others from the poyson wherewith these bullets are poysoned. For this powder consisteth of Brimstone, Nitre, and Coals: of which (they say) the two former are hot in themselves; and when they are fired, they then become extremely hot; and if they take flame, then do they at length acquire a poysonous quality, as these would perswade us. And this they think to be sufficiently manifest even by this also, because that those who make this powder shut both their mouth and their Nosethrills, that so they may not be hurt by the poysonous exhalations of this powder. But they who derive this poysonousness from the Metal, these tell us that al Metals in general are poysonous, and enemies unto our bodies: others although they say not that these bullets are in themselves poysonous; yet nevertheless they take upon them to prove that these bullets may be poysoned; and that this was much used by divers Nations, they abundantly prove out of several Authors; As, *Theophrastus*, in his *ninth Book of Plants*; *Chap.* 15. *Dioscorides* in his *sixth Book, and Chapt.* 20. *Pliny*, in his *twelfth Book, and Chapt.* 53. *Paulus Ægineta* in his *sixth Book and Chapt.* 88. and other modern Writers. And some there are who here (for to prove this their opinion) betake themselves to the likeness and resemblance of the lightening and blow of the Gun; and as it is most certain that oftentimes in Lightening there is a certain poysonous quality and power (as is sufficiently testifyed by the stench, and the wonderful power it hath of blasting and destroying both man and beast, and that in a moment; as also the other malignant Effects thereof sufficiently witness the truth hereof) so they conceive that there is something like unto it in the flash of the powder and the noyse or report of the Gun.

The Second opinion.

Secondly, Many there have been, and stil are, who affirm that an Empyreuma or Combustion of the parts is joyned with these Wounds. And hereupon it is, that Chirurgeons commonly carry about with them so many Medicaments, which our Chirurgeons term *Pulver le shung*, (that is, extinguishers of the Gunpouder, or the *Empyrema* when the parts are inflamed and burnt in these wounds by Gunshot) because, to wit, that they are perswaded, that in such wounds there is an *Empyreuma*, which is first of all to be extinguished. And this they endeavor to prove by these Reasons. First of al, because those bullets when they are cast forth may be inflamed by the Gunpouder, and so may contract an *Empyreuma*. Secondly, from the motion it self of the bullet, which in regard that it is most quick and swift, they conclude that the bullet is thereby made hot; the same that even *Aristotle* also hath taught us; who (in his second Book *de Cælo Chapt.* 7. *text* 42. and in his first Book of *Meteors*, *text*, 3.) writeth, that by a vehement motion the Iron is made hot,

The Reasons for proofe of the second opinion.

hot, and the Arrow heads melted, and wood and stones set on fire: which we are likewise taught by Experience it self, it being very wel known, that by the hard and vehement rubbing of wood one piece against another the Country people do sometimes raise a fire; and that the Axletrees of Mil-wheels, unless they be often moystened with fat, are very apt to be inflamed and set on fire. And thirdly also, the very same is by experience confirmed in these bullets; since that oftentimes it hath been found, that (in villages) the straw or thatched houses have by these bullets been set on fire; and that whole houses have been burnt down thereby. Fourthly, they say also that other things that are wont to happen in combustions or burnings, do appear likewise in those Wounds; to wit, that the wound it self becometh black, that there flow forth from thence sharp, stinking and black Ichores (or thin Excrements) and that the inflammation (as it is wont to be in all combustions or burnings) is augmented even untill the Ninth day, and then after this diminished.

The third Opinion.

Reasons for the defence thereof.

1. That there doth not proceed any poyson from the Gun-pouder.

And thirdly, those that deny that there is present in these Wounds any poyson or burning they urge these Reasons for their opinion. And indeed in the first place, they in this manner fight, and oppose themselves against this poysoning of the Wounds. First of al (say they) if there be any poyson in such Wounds as are inflicted by gun-shot, it is brought in and caused either from the Gun-pouder, or else from the bullet. That it proceedeth not from the Gun-powder, appeareth from hence, that those things of which it is compounded are not poysonous: for it is made of Brimstone, Nitre and Coals: of all which not one of them is poysonous. For both the Sulphur, and the Nitre, are made use of in the stead of internal Medicaments, both by the Ancient, and by the Modern Physitians also; and this is a thing so generally wel known, that it needeth not any proof at all. And much less have these Coals any thing of poyson in them. And although that this powder shal be kindled, yet notwithstanding it cannot from thence acquire any poysonousness, since that fire doth rather consume then produce venenosity or poysonousness. And that this powder is not poysonous, there are many Soldiers that have sufficiently proved; who have made great use of it (together with vinegar) for the Curing of the Plague: and they use to burn it in houses, in time of a great plague to drive it away, and to preserve themselves from the contagion thereof. Yea, the affect it self, and experience do sufficiently prove this, which testify, that very many who have been wounded by these bullets have yet notwithstanding suffered no symptom at all, that in the least might betoken any thing of poyson.

2. Not from the Bullet.

Neither also can this poyson come from the leaden bullet. For it is most manifest, that the bullet of lead (especially if it be whole) cannot possibly bring any poyson along with it; and it appeareth even from this, that many carry about in their bodies such bullets that have been shot into them, sometimes for the space of many years, and this without any hurt or damage at al. Yea some have swallowed bullets of lead, and cast them forth again by the belly, without any the least hurt. And it is a thing very wel known, that Lead, and such various Medicaments as have from it been made, have been by the Ancients and our selves very successfully administred unto the External parts, for the curing of old Ulcers. But now that such bullets may indeed be poysoned (as we shall afterwards shew you) this they deny not: but this happeneth not unto al such wounds; as we shall anon further shew you.

That there is present no burning, how proved.

And that there is also no burning present in the Wound they thus prove it. For first of all if these Wounds should bring in any burning at all, then the bullets themselves ought to be fired, and thereupon melted; whereas notwithstanding, we see that the bullets are taken whol out of Wounds, and appear to have suffered no such thing. Secondly, this burning should rather be perceived in those things that are more combustible; and this burning should first of all appear especially in the Clothes of those that are in this manner wounded: whereas notwithstanding, there is not the least appearance or shew of any burning in these Garments, whether Linen or Woollen: yea and those who endeavor to defend ships and houses from the violence and blows of these bullets, what do they? Do they not hang before them Sacks filled ful of Wooll or hurds? Which were yet never known to be set on fire by these bullets, no not by the greatest of them. Neither may any one here object, and say that there is great difference between the parts of mans body, and Garments, and such like things. For such things as these (by reason of the widness of their passages,) may be pierced thorow by this most thin Exhalation, without touching or hurting the substance: which yet may hurt

a mans

a mans Body, by reason of the closeness and compactedness thereof: and that the same happeneth here which is wont in the lightening that oftentimes melteth the Sword, without hurting the Scabbard.

But there is here a very vast difference between the Lightening and a Bullet. For the whole Action of the Lightening is by a most powerful Spirit; and by a most subtile substance that pierceth through all things whatsoever: but it is not yet proved, that there is Joyned with the Leaden Bullet any such spirit; but here the whole Action is of the Bullet it self, which neither burneth things that are thin and permeable, nor yet Wood, (and other things of a thick substance) upon which it not only glanceth, but directly striketh against. Thirdly, since that there is hardly any thing to be named that is more inflamable then the Gun-pouder; if these bullets should burn the Body of Man, it should much more kindle and set on Fire the Gun-pouder; which yet nevertheless it doth not do; experience it self testifying, and teaching us, that although a Vessel that is ful of such Gun-pouder shall be shot through by such a bullet, yet that the said Gun-pouder is not hereby kindled and set on Fire. But if at any time it so chance that by a Bullet sent out of a Gun the Gun-pouder be fired, this happeneth because that either the flame it self penetrateth unto the Pouder; or else that the Bullet striking against Iron, or some Stone, is kindled by the sparks of Fire, just as we see it to be in the striking together of the Steel and the Flint-stone. Fourthly, if instead of the Leaden bullet, either Papper pellets or pellets of Hurds be ram'd into the Gun, and then shot forth, there will not appear any the least tokens of any burning in them (caused either by the Gun-pouder, or else from the vehemency of motion;) but only, that sometimes they are sullied by the Gun-pouder, and made a little black; and they are oftentimes drawn forth of the very Wounds as whole and entire as they went in. Fifthly, Those who are thus wounded do not feel any heat or burning from these bullets, but only a pain from the bruising and tearing of the flesh. Sixthly, That those bullets are not made hot either by the flame of the Gun-pouder, or else by the swiftness of their motion, we are sufficiently assured of it even by this, that a bullet made of Wax, and shot forth of a Gun, doth not at all melt, but that it even pierceth through a two inch board, or any piece of Wood two Fingers thick. And from this alone it may appear very manifest that those bullets, whatsoever it be that they do, it is not by the power and virtue of any Fire that they have in them; but what they effect, is meerly by their force, and violence.

The Decision of all the opinions.

But now that I may a little open unto you my thoughts, and give my Judgment touching this Controversie; I conceive the third Opinion (well weighing the Reasons that are brought for it) to be the most agreeable to truth. But those Arguments that are brought for the two former Opinions may easily be answered. For the first of the three, who defend, that those Wounds are poysonous, they do not prove it by this, that first of all grievous and dangerous Symptoms do infest those that are wounded in this manner. For all those Symptoms may possibly proceed from a Contusion if it be not rightly Cured, or if it be overgreat, and that there be from hence a putridness excited. For when that bullet doth with the greatest violence that may be penetrate through those parts against which it hitteth, it dasheth together all whatsoever lieth in its way, bruiseth, and teareth it; by which said violence not only the Capillary Veins, and the Arteries and Nerves, (that be every where up and down dispersed throughout the flesh) are rent and torn; but the greater Vessels likewise are battered and broken; insomuch that the Natural flux of the Blood and the Spirits is hereby hindered; whereupon the bruised parts being deprived of their Natural and Vital heat are easily corrupted, and soon putrifie. Neither can it truly be said, that the trembling of the Heart, and the like Symptoms do happen unto all that are thus wounded. But as for what they say in the second place, that *Alexipharmaca* (or Counter-poysons) have been sometimes found very good and commodious for the person thus wounded; we answer, that this is not true of all Wounds made by Gun-shot; but of those only, when by the Contusion, and the great putridness following thereupon, and the neer approaching of a Gangrene, the Heart is hurt by the putrid Vapors, ascending from the Wound through the Arteries; and thereupon it is by Alexipharmick and Cordial Medicaments to be defended from them, and withal strengthened. But, that those Wounds are a long time to be kept open, this is not therefore to be done, that so the poyson may be evacuated; but that the *Pus* that is continually generated from the bruised parts may be emptied forth, which is done too slowly, in regard that in such Wounds as these there is very much of that that is bruised. And Lastly, for what they alleadg, that in many battles the most of those that have been wounded, either they have Died, or else they have been preserved with very great pains and much difficulty;

this;

this did not therefore happen, because that the Wounds inflicted by Gun-shot were poysonous; (since that in very many other battles no such thing hath been observed,) but it happened from hence, to wit, either by reason of the bad and unhealthful Constitution of the Air; or else from the vitious and unsound Constitution of the Body, and the great store of depraved Humors in these wounded persons; such as is most commonly wont to be in those that follow the Camp.

But now in special, and particularly, the poysonousness of those Wounds cannot be proved to arise either from the Gun-pouder, or from the bullet. For (as we also told you before) neither is the Sulphur, nor the Nitre, nor yet the Coals, all or any one of them poysonous; and therefore surely of these there can nothing be compounded that is poysonous. And that Sulphur and Nitre may be safely administred, appeareth out of *Dioscorides* his 5. *B.* and 83. *Ch.* and out of *Hippocrates*, in his *B. of the Nature of Women*; and others, both Ancient and Modern. Now the kindling and inflaming of these, and the Fire following thereupon, would rather dissipate this poyson (if any such were present) then any waies produce it. Neither do those that make this pouder stop their Mouths and Nosethrils, by reason of any poysonous quality that it hath, but to keep out the pouder, that is otherwise very troublesom when it gets into the Mouth or Nosethrils: neither yet do all that make pouder stop the aforesaid places, although some do for the reason I have given you.

And moreover, much less can this poysonousness be produced from the Lead. For although it being long deteined in the Body, and there resolved, like unto other Metals, (if it contract any rustiness) it may possibly do hurt: but yet nevertheless, that in this its moment any passage through the Body there should be any poyson imprinted by it upon the Body, this can no way be. And (as we told you above) these bullets have sometimes been known to lie in the Body for many yeers together, without any inconvenience or hurt: yea and moreover, from lead there are many very useful Medicaments to be made, for External Ulcers.

But this we easily (and of our own accord) yield unto, and readily grant them; that those Bullets, as also all other Weapons, may be infected with poyson. For although the Lead be thick enough, yet nevertheless, since that Iron that is yet far more solid may be infected with Poyson, why may not Lead also be poysoned? Now that Iron may be infected with poyson, there is no doubt at all to be made; the truth whereof is sufficiently testifyed by the Histories (both Ancient and Modern) of those Nations that as yet use Arrows. And this we are assured of by *Dioscorides* (in his *sixth Book*, and 21. *Chapt.*) and by *Paulus Ægineta*, (in his *sixth B.* and 88. *Chap.*) and by *Virgil*, (in the *tenth B.* of his *Æneids*, and elsewhere) as also by *Ovid* in his 3. *B. de Tristibus*. And of this there is no question at all to be made. But here lieth the question, whether or no every Wound inflicted by the bullet out of a Gun be poysoned; and this I deny. And therefore, like as we cannot truly conclude, that because that Wound which is inflicted by a poysoned Sword is poysoned, therefore that all Wounds inflicted by the Sword are mortal: so also we can no more rightly and truly conclude thus, if there be some certain Wounds made by Gun shot, that are poysoned, therefore they are all such. Neither is there any reason, why any one (with *Paræus* in his 10. *B. Apologism* 2.) should think, that there is in Fire power enough (and more then enough) to dissipate all the strength of the poyson, if any should chance to be poured upon the bullet. For (as we shall afterwards prove) and as even *Paræus* himself granteth, those bullets out of Guns can by no means get any such great heat, as that thereby (like as by Fire) the poyson (if any such there be present) may be dissipated and consumed.

But now, in what manner these bullets may be infected, whether only by being anoynted, (as *Paræus* is of opinion) or else by an infusion of the very poysoned substance it self (which he denieth) of this I dispute not. And yet nevertheless, I do not think it a thing altogether impossible, that some poysoned substance (if not vegetable, yet Mineral) may be given, which by infusion may be mingled together with the Lead, and there remain. But I shall not contend at all in the maintaining of this my Opinion, neither shall I take much pains to discover whether there be any such, yea, or no.

And whereas they would by the instance they give of the Lightening prove their opinion; we answer that there is not so great a resemblance between the Lightening and the Report or blow of a Gun, as they think. For indeed that there is oftentimes in Lightening a certain kinde of poysonousness, it cannot be denied. But in the blow or Noise of a Gun there is no sugh thing, as we have before already proved out of its Composition. Neither doth any flame from the kindled pouder penetrate unto the Wound it self; but whatsoever the bullet doth it performeth

by

by its violence and motion, after the manner of other things that are cast forth with violence, as Arrows, and Stones cast forth of slings. But now, for what reason things thus cast forth by a violent and vehement motion should work such effects, here is no fit place for me to dispute. And if there be any resemblance at all between the Lightening and Guns, this likeness is rather in the Fire from the Gun-pouder being kindled and cast forth, then in the Leaden bullets.

And Lastly, Their telling of us that in some certain battles such as have been wounded by these kind of Bullets they have most of them died of their Wounds, neither doth this prove the poysonousness of these Wounds. For neither doth this happen in all battles, (as we likewise told you before) but very many have been Cured and recovered of the most dangerous and desperate Wounds. And this if it shall somtimes happen, it is to be ascribed either unto the Malice of the enemy, infecting these bullets with poyson, or else to the ill disposition of the wounded bodies, or lastly, even unto the vitious Air it self. For it is a thing well known, that the Bodies of Souldiers (by reason of that ill course of Dyet they keep) are very much disposed unto the Plague, and other Diseases: in whom Wounds, if any happen unto them, may easily prove Mortal; like as the Wounds of Hydropick and other Cacochymical persons are wont to be very dangerous. And there is likewise no doubt to be made, but that the Air becoming impure and corrupt, both by the unseasonableness of the weather, the Crazy Constitution of the yeer, and the impurities, and nastiness that alwaies followeth the Camp, may cause the wounds to be the more dangerous. And evermore in such like Wounds the ill disposition of the Bodies, and the Vitious Constitution of the Air, bring more danger unto the party, then in other Wounds inflicted and made without any bullet. For in these latter there is no such great need of suppuration; but in those other Wounds that are not made without much bruising, there is altogether great need of Suppuration, and Suppurating Medicaments. Neither without these can such Wounds by bruising be any waies Cured; which said wounds in Bodies that are ill disposed do very easily get a putridness; which the feavers that follow, and the bad Symptoms are easily able to excite. Neither indeed is this any new kind of wound. For although that the invention of Guns, and this casting forth of the Leaden bullets be new; yet the manner of the wound is not at all new, (as being wel known both unto *Hippocrates* and *Galen*) to wit, Contusion, or bruising. And yet nevertheless our expert Chirurgeons do not rest themselves in the alone use of Suppuratives, but if there be any fear of a putridness nigh at hand, which may very easily produce a Gangrene, they then use the *Ægyptiack Unguent*, and other Medicaments that may prevent and keep off the Gangrene; as we shall anon have occasion to speak further hereof, when we come to shew you the Cure; which yet notwithstanding ought so to be ordered and contrived, that they may not altogether hinder the suppuration; since that no wound made with Contusion or bruising can possibly be healed, unless that which is bruised be converted into *Pus*.

Now as for that other Opinion of those who assert that there is a burning or *Empyreuma* conjoyned with these wounds, neither have these any firm Reasons to ground their opinion upon. For that our German Physitians and Chirurgeons call these their Medicaments that are in these wounds at the very first administred, *Pulver le schung*, that is, Extinguishers of the *Empyreuma* or burning that happeneth from the Gun-pouder; this is grounded upon a false supposition; for they who at first gave this appellation unto these Medicaments did falsely beleeve, that there was an *Empyreuma* joyned with these wounds, and that this *Empyreuma* or burning was first of all to be extinguished. But now all those Medicaments perform nothing else, but that they either turn into *Pus* all that in the wound that is bruised, and to hinder and prevent putridness; or else they keep off, and turn away the inflammation, if there be any nigh at hand. Now that these suppurating Medicaments differ somwhat from those suppurations that are wont to be administred in other Wounds and Ulcers, there is no wonder in this: For above, (in the *first Part*, and 16. *Chapt.* and likewise a little before, in the 18 *Chap.* of this *fourth Part*, *touching a Wound with Contusion*) we told you that in Contusions those hot and moist suppuratives have no place at all, but that from the use of them a putridness and oftentimes also a Gangrene is thereupon excited; and that therefore those Medicaments that were more drying, and such as resist putridness (provided, that in the mean time they likewise strengthen Nature in her generating of *Pus*) are necessarily required.

But now the Reasons they alleadg for this their Opinion have in them very little of solidity. For first, whereas they assert that those bullets are as it were fired by the Gun-pouder when it is kindled, this is false; and above by those Arguments we brought for the third Opinion, it was sufficiently proved, that

that those bullets are no waies heated and set on Fire by the said Gun-pouder. And then furthermore, whereas they think that those bullets are made hot by their violent and swift motion, (and to prove this, they Cite *Aristotle*, as a witness on their side; for *Aristotle* indeed, in the *place before alleadged*, writeth, that motion is wont to set on Fire both Wood and Stones, and even Iron it self; and this he confirmeth by experience;) unto this we thus reply; that this may be done, there is a necessity that there be two hard and solid bodies long rubbed hard one against the other. But that Lead, or any other Metal, should by their motion through the Air become very hot, and that it should hereby be set on Fire, this was never yet taught us by experience. For if this were done, then Arrows also (that oftentimes are pointed with Iron or Brass points, we call them Arrow Heads) being shot through the Air ought to become hot, and likewise to be fired. But now, as for what they say in the third place, to wit, that by these bullets thatched Cottages and other Houses have been set on Fire; this we grant to be true, if any flame (which together with the bullet is sent forth of the Gun) touch the House; or if there be any kinde of Fewel, or Combustible matter fit to feed the Fire, tied and fastened unto the bullet, as Incendiaries are wont to do. But if it be from that flame, or from fiery matter: and if the bullet only touch the straw, neither it, as neither Wooll, nor Hurds, nor Gun-pouder it self can be kindled; as before we told you in the Arguments that were brought for the third Opinion.

Neither is there any place here for that distinction of *Quercetan*, (which he hath in his *Sclopetarius* or Gunner) where he writeth that if that bullet be sent forth of the Gun at a distance, and a great way off, or else that it hit any part that is covered with Clothes, that then the Wound is without an Empyreuma or burning: but if the Wound be inflicted by such a bullet out of a Gun nigh at hand, or if it light upon a part of the Body that is naked and bare, that then the Wound may have Joyned with it a heat and burning. For although that the flame from the kindled Gun-pouder, breaking forth of the Gun, may neer at hand hurt the beard, and the Hairs of the Head, or likewise the Clothes; yet notwithstanding it is altogether a thing incredible, that the flame by that smal Wound of the Skin (through which the bullet penetrateth into the Body) should together with the bullet break in, and pierce so far into the Body. Neither doth there appear any difference between Wounds made by bullets, whether a far off, or night at hand, but only this, that the Contusion is greater and more grievous that is caused by a bullet shot forth nigh at hand (in regard that it strikes with a greater violence) then the Contusion or bruise that cometh from that bullet that is shot at a great distance, and striketh more weakly. But Fourthly, As for what concerneth the Symptoms that appear in these Wounds; we answer, that all these do not proceed from any *Empyreuma* or burning, but from the Contusion; and they appear also in those other Wounds in which there is present no *Empyreuma*, nor burning, at all. And that at length about the ninth day the wound appeareth to be in a better condition, and what is corrupted begins to be separated; this happeneth not only in Wounds with burnings, and where there is an Eschar; but also in Contusions; since that a certain space of time there ought to be, wherein that which is battered and bruised and corrupted be turned and converted into *Pus*. Neither is that to be accounted for any true Eschar, that these men take for an Eschar in these kinds of Wounds; being that it is no waies hard, as an Eschar is; but flesh greatly bruised, which forthwith dieth; whereupon it likewise becometh black; and yet nevertheless, it is somtimes likewise discoloured, and made black by the heat of that Gun-pouder with which the bullet it foul'd and sullied.

The Nature of Wounds inflicted by Gun-shot.

By al which it may sufficiently appear, what the Nature of these Wounds is; to wit, that it is only with some notable Contusion and tearing of those parts through which the bullet passeth. And although the part may close at Hand, and at a neer distance, be burnt by the flame of the inflamed Gun-pouder, yet this appertaineth not unto the Wound it self; neither is the part burnt within. And we likewise grant that these bullets may possibly be infected by poyson; but this is no way essential unto these wounds but a thing meerly accidental: like as, if any one shal be wounded by a poysoned Sword, this poysoning is no way of the essence of the Wound.

But that which hath deceived all those of this Opinion, is this, that other Symptoms happen unto these wounds, and that these wounds require another kind of Cure then those Wounds that are caused by Arrows. But these ought better to have considered, that there is a very great difference between those wounds. For Arrows are sharp, and they make a wound by Cutting; but those bullets are round and blunt, and therefore they hurt by breaking and bruising; upon which there easily follow a Corruption

of the bruised part, and very ill Symptoms.

The Differences.

The Differences of these Wounds are taken. 1. From the greatness of the Wound; to wit, that some are great, some but smal, some superficial, others more deep. 2. From the part affected; that somtimes only the Flesh and the Skin are wounded, but somtimes the Nerves and Tendons, Yea and the greater Vessels are broken, Yea and the very bones likewise are broken and shattered. 3. Another Difference is from the manner, that a Man is somtimes wounded only in one part; and somtimes the whole Body, or some one part thereof is wholly shot through: and somtimes also the bullet passeth quite through the part, and then at other times it sticketh yet stil in the part: and somtimes only the bullet penetrateth into the Body; but somtimes again it carrieth along with it into the Body some of the weapon, or some thing else through which it passeth.

Signs Diagnostick.

There is no need that I declare unto you those signs by which these wounds in general are known; seeing it will be sufficient to know that the party was wounded with a bullet shot forth of a Gun. But now what parts they are that are Wounded, this is to be discovered either by putting in the Probe; or else it may be known from the very Scituation of the parts, with the which Anatomy will acquaint us. If the Nervous parts chance to be hurt, this the pain will manifest. But whether or no the wound be poysoned, this is known by the Symptoms following thereupon; to wit, if the colour of the flesh be more Wan and Leaden-coloured then it was wont to be; if there likewise happen an extraordinary heavines and sluggishnes of the whole Body; if there be a trembling and palpitation of the heart, Faintings and Swoundings, and other such like Symptoms as these, and that there be no other Cause appearing from which such Symptoms might proceed. Which notwithstanding even the very consideration of the bullet (if it be there present) wil sufficiently teach us. For if the bullet differ from all the other things in colour, or in any thing else, there is then great cause to suspect its being infected with poyson: and this is confirmed, if the bullet being put into a hot fire, we take good notice whether or no there exhale from it any thing that is black and stinking, or else whether the bullet it self being again cooled, there stick any thing unto the outside of it, and change its colour

It is known that such a Wound as this will degenerate and turn into a Gangrene, by the slow Maturation and generating of the *Pus*; by the extinguishment of the fresh and flourishing colour of the part, and its inclining unto a yellow, and Leaden colour; by the remitting of the pain without any apparent cause, and by the ceasing of the beating, and by the stupidity of the part, and by other like signs of the Gangrene, such as we have above shewn unto you, in the *second Part*, and 19. *Chapter*.

Prognosticks.

But now, that we may not here again repeat those Prognosticks which they have in common with other Wounds, and which we have declared unto you above, in the *third Chapter*.

1. All those Wounds, since that they have Joyned with them an extraordinary and notable Contusion, they are therefore far more dangerous then those Wounds that are inflicted with a Sword or Darr. And therefore (as we may observe) of these Wounds made with the Sword, (as to instance, the Wounds inflicted on the Belly, Guts, and Bladder) many have been recovered; but it is a very rare thing for any to be cured of those Wounds that are inflicted by Gun-shot.

2. But although that those Wounds be far more dangerous then the wounds that are inflicted by the Sword; yet notwithstanding we must not rashly forsake the Patient, and give the Cure over; seeing that even here Nature is likewise wont oftentimes to work miracles as it were; and it hath been observed that very many of those that seemd to have been neer unto the Grave, have yet nevertheless recovered, and done well: and Histories to this purpose we very frequently meet withal, and they are well known: and *Guilhelmus Fabricius* giveth us likewise a very notable Observation, and a singular way of Curing these kinde of Wounds; as we may finde it in the *third B.* of his *Observations*.

3. If there be many (and those the more noble parts) that are wounded, bruised, and torn; and especially if withal the Bones be any of them broken and impaired, the Wound is then so much the more dangerous, and the more difficult to Cure.

4. And hitherto are to be referred those parts that can easily draw the principal parts into a consent with them; such as are the Joynts, as also the great Vessels wounded; from which there arise not only Vapors, but likewise vitious and corrupt Humors; which being received and communicated unto the Heart do easily excite both Feavers, and Faintings,

faintings; and the *Syncope*, yea and also the Fluxes *Diarrhæa*. And this *Ambrose Parry* observed in Count *Mansfield*, who (as this Author relateth in his *tenth B.* and 12. *Chap.* and in his 16. *B.* and 49. *Chap.*) having received a Wound in his left Arm, out of it Nature sent forth by the Belly a Purulent and stinking *Sanies* or thin Excrement. Yea and in other Wounds also it sometimes happeneth, that both Blood and *Sanies* is emptied forth by siege, (that is, by the Belly,) and likewise by the Bladder; like as *Ambrose Parry* hath an instance and example of this thing, in the *alleadged* 16. *B.* and 49. *Chapter*. As I have also given you the like example in the *second B.* of our *Practise*, *Part* 2. *Chap.* 16. *Quest.* 5. where I likewise treated of the way by which this may be done.

5. If such Wounds befal a Cacochymical Body, they are much more dangerous then if they happen unto a sound Body: from whence it is, that in Armies (in which Epidemical Diseases are wont to reign and rage) most of those that are thus wounded die of their Wounds. Yea and otherwise also in Camps those Wounds are dangerous, and become more difficult to Cure; in regard that the Air is for the most part infected with the Nastiness and Defilements of the Camp; and that Souldiers (for want of better food, and fit wholesom drink) for the most part use a very bad and corrupt Course of Diet; eating any meats whatsoever that come next to hand, and drinking filthy and corrupt waters.

6. Those wounds wherein the bones are broken are far more dangerous, and difficult to Cure, then those without this Fracture of the bones.

7. These kind of wounds if they be inflicted by a poysoned bullet, they are indeed then greatly dangerous, and for the most part Mortal, and more especially if they penetrate unto the interior parts. And yet oftentimes notwithstanding those wounds that are but smal to see to do yet kill and destroy the Patient.

The Cure.

These kind of Wounds have especially three indications. The First is this, the drawing forth of the bullet, if it as yet stick in the part; The Second is, the converting of the battered and bruised flesh into *Pus*; and the Third is that in common with al other Wounds, to wit, that the Wound be filled up with flesh, and then at length shut up with a Cicatrice.

Of the drawing forth of the Bullets.

And First of all therefore the Bullets are to be drawn forth of the Wound; and this is to be done either at the very first dressing; or if it be not then fit to be done, or that it cannot then be done; we are then to do it at some other time during the Cure. Now the bullets are wont to be drawn forth the same way they went in, and likewise that way whither they tend: for if the bullet shall penetrate very deep, so that it be found to be neerer unto the opposite part, and that through the Skin and the Flesh lying underneath it may be felt; then the part being opened by an incision, the bullet is by it to be drawn forth. But if the bullet shall not pierce so deep that it may conveniently be drawn forth on the opposite part; then the searching Instrument being put into the Wound that way the bullet went in, the bullet is to be sought for, and it being found, we must then attempt to draw it forth by a fit Instrument; which are various, and very different in their length and breadth.

Now there are these three things required in this extraction or drawing forth of the bullet. The First is, that the way be sufficiently opened by the Instrument. And then Secondly, that the bullet be laid hold on. Now the Instrument taketh hold of the bullet, either as a pair of Cizers, or else as it fasteneth it self (in its extream part, or point) into the bullet; either when it comprehendeth it within its Cavity; or else when it layeth hold thereon by its extream part, made like unto a Saw. And from hence there springs a great variety of Instruments; of the which some lay hold on the bullet, and draw it forth as they are fastened into the bullet: and others of them Comprehend the bullets, as they are broader and hollow at the end; and others, as they are in their extream parts notcht and made like unto Saws; of which some are straight, and others somwhat Crooked, according as the Wound is in its progress either straight or oblique. And Thirdly, the Bullet being laid hold on by the Instrument it is by the Chirurgeons hand together with the Instrument to be drawn forth. The Instruments that are fit for this purpose we may find extant in *Paræus* his *tenth B.* and 14. *Chapt.* in *John Andræas a Cruce*, and *Guilhelm. Fabricius*, in his 1. *Cent. Observat.* 88. where he sheweth us a very easie way of drawing out these bullets with Instruments there described and delineated; and by a new invention of his own he maketh that known common Instrument in the form of a Wimblet, more apt and fit (then it was before) for the drawing forth of these Leaden bullets. For whereas if the Common Wimble be fastened in the Bullet, the said bullet may easily be stirred

and turn'd about together with the Wimble: which to prevent, he first of all puts down (very gently) a pipe of Silver, or Iron, or Brass, polished and made as smooth as possibly may be, and then anoynted with the Oyl of Roses; and this he thrusteth down even as far as the bullet. And then after this he conveyeth in another pipe or little Cane, at the one end toothed, or like unto a Saw; and so indeed, that the teeth thereof pass from the left unto the right, and that they may hinder the bullets being turned about when the Wimble is fastened in it. And then at length by this Second pipe the Wimble is let down; and when it shall be found to be sufficiently fixed in the bullet, then the Wimble with the Bullet (and both the pipes) is to be drawn forth. But if the bullet cannot be found out by the probe or searching instrument (as it happeneth now and then in wounds when they are very deep) then the Wound is a long time to be kept open, and suppurating Medicaments to be made use of; and the Member is so to be placed, that the bullet may fall forth of it by its own weight. And so sometimes we have known it, that Weapons or bullets that have layn hid for a while in the body, they have at length (in the progress of time) either been drawn forth by the help of Art, or else they have been expelled by Nature. Unto Nature therefore (if the bullet cannot be found out) the whol business is to be committed; and the same is likewise to be done, if there be any danger at all in the drawing of it forth; and the rather, in regard that leaden bullets may lie long, and be carried about in the body, without any hurt or detriment at all unto the Wounded party; which cannot be said touching Iron or Brass bullets, which because that they contract a Rustiness, they will not suffer the Wound to be healed.

But yet nevertheless, if the bullet stick fast in any Noble parts or that part that may easily draw the Noble part into a Consent with it, and that by reason of the Wound in it self the Patients life seem to be much endangered; the Chirurgeon ought not in this Case so much as to attempt the drawing forth of the bullet, since that by this means he cannot bring any help at al unto the wounded person, but may very easily hasten on that death, which the wound of it self would have brought upon the Party.

But then it is not the Bullets alone that are to be taken forth; but because that by means of these oftentimes the spills or splinters of Wood, Paper, fragments and pieces of Arms, and Garments, and other things of this nature, are violently carried into the wounds; al these therefore are in the first place to be drawn forth, & indeed this extraction is most fitly put in practise in the very beginning, and so soon as ever the Wound is made, in regard that the pain is as yet but little, & so likewise the inflammation is not so great as afterwards. But yet nevertheless, if such things as these cannot be drawn forth at the first dressing of the Wound; this is then to be done in the following dressings.

Of those Medicaments that are necessary for the Wounds inflicted by Gunshot.

And indeed, it may likewise verry wel be, that in these wounds there may be need both of venesection and purgation. But since that neither of these is proper unto the Wounds we are now treating of, but common unto them with other wounds, those things that we spake before on this subject touching wounds in general, may likewise here take place.

And therefore our first and main care must be, that what is bruised may be turned into *Pus*, and that it may be separated from the found flesh and the found parts. But in regard that the bruised parts may easily receive and gain a putridness, and that there may be great danger of a Gangrene nigh at hand, those ordinary and common digestive and suppurating Medicaments that are made use of in other tumors and wounds, here simply have no place; especially if any of the Nervous parts chance to be bruised; which cannot wel bear nor admit of such kind of moyst and simply Oyly and fat Medicaments, and require those that are dryer; but such are to be made use of that do in very deed make for the turning of the bruised flesh into *Pus*, and yet not produce any putridness. Which Medicaments have withall a virtue likewise to mitigate and moderate the pain. *Quercetan* (in his *Sclopetarius*) that he might the better prevent al those inconveniences that are wont to proceed from the use of common suppuratives, unto every ounce of these Suppuratives or Digestives he addeth one dram of precipitate Mercury. But I conceive that great caution is to be had in thus doing; and that nothing is to be done rashly. For though where there is present a putridness, and fear of a Gangrene nigh at hand, I do not at al dissuade the admixture of the said precipitate Mercury; yet nevertheless I say, that in all wounds whatsoever inflicted by Gunshot this is not either Necessary, or alwaies safe, since that experience testifieth, that many such wounds have been cured without the admix-

ture

ture of Mercury; and there are many other Medicaments more safe, that may prevent and keep off this putridness. And if the Nervous places chance to be wounded, this *Precipitate Mercury* may very easily occasion an extraordinary great pain.

Ambrose Parry received (as a great secret) this following Liniment, or Ballam, from a certain Chirurgeon, Famous by reason of that happy and succesful way he had of Curing these Wounds by Gun-shot.

Take *Oyl of white Lillies, or violets, four ounces; in these Oyls let two young Whelps (as young as you can get them) be boyled, until their very bones be dissolved: after this add of earth-worms washed in Wine, one pound; Boyl them together, and let them be strained without any strong expression; and unto the straining add of Venice Turpentine three ounces; Spirit of Wine, one ounce; mingle them and make a Liniment; which hath in it a wonderful virtue in mitigating of the pain, and ripening the* Pus.

This is likewise singularly useful,

Take *Oyl of Lin-seed, and Oyl of white Lillies, of each three ounces; Unguent Basilick, one ounce, and mingle them.*

And very useful likewise is the Oyl that is pressed forth of Hemp-seed. *Or,*

Take *Oyl of Hemp, and of Lin-seed, of each four parts; Honey, one part, Allum half a part; mingle them over the Fire.* Or,

Take *Oyl of Hemp, one pound; of Lin-seed, three ounces; Juyce of Plantane and Night-shade, of each a sufficient quantity; and boyl them, until the Juyces be confumed.* Or,

Take *Oyl of Hemp, and Flax, of each three ounces; Oyl of Roses, one ounce; Oyl of Mastick six drams; Oyl of Camphire half a dram; boyl them together, and let them be wel mingled, and used warm.* Or,

Take *Oyl of Flax, and of Hemp, of each four ounces; of white Lillies, Camomile, and Roses, of each three ounces; Oyl of Turpentine, one ounce; mingle them, and let them melt together.* Or,

Take *Turpentine four ounces, Frankincense and Mastick, of each three drams; Myrrh, one dram; Oyl of St. Johns-wort two ounces, the Yelks of two Eggs, Saffron a little, and mingle them.* Or,

Take *Honey and Turpentine, of each four ounces; Allum and Crocus Martis, of each two drams; Roots of round Aristolochy, poudered, and Aloes, of each half an ounce; and mingle them.* Or,

Take *Turpentine and Honey, of each three ounces; the Yelks of six Eggs; and boyl them to the Consistence of a Liniment.*

If there be any fear of putridness, (as nigh at hand) then these things following are to be made use of.

Take *Oyl of Hemp, Liquid pitch, and Turpentine, of each two ounces; Oyl of Roses, Mastick, Frankincense, of each one ounce; Allum half a dram; Galbanum, Nitre, Sal Armoniack, of each one ounce; Verdigrease, Oyl of Earth-worms, Pouder of Earth-worms, Oyl of Turpentine, white Vitriol, and Camphire, of each one dram; Oyl of Lin-seed, two ounces; mingle them, and let them melt over the Fire.* Or,

Take *Oyl of Hemp, and of Flax, of each one pound; Salt Armoniack, and white Vitriol, of each half an ounce; Verniss, three ounces; mingle them over the Fire.* Or,

Take *Oyl of Flax, and Oyl of Hemp, of each six drams; Salt Armoniack, and white Vitriol of each half an ounce; Treacle and Mithridate, of each two drams; let them melt together over the Fire.* If there be yet a greater fear of putridness, and a Grangrene, then there may be some Mercury Precipitate added unto the former Ingredients. As,

Take *the greater Basilick Unguent of* Mesues, *two ounces; fresh Butter one ounce; Mercury Precipitate two drams; and mingle them.*

But then that the afflux of the Humors may the better be prevented, Defensives are to be applied unto the more remote parts; from which this afflux may happen. As,

Take *Bole-Armenick, and Dragons blood, of each one ounce; Frankincense and Rose flowers, of each half an ounce; the whites of three Eggs; mingle them with as much Oxyrrhodium as wil suffice; and let them be put upon the part in a remote place.*

Or else let those parts be anoynted with the following Unguent.

Take *Oyl of Roses, Oyl of the rinde of Elder, and of Mastick, of each two ounces; Bole-Armenick half an ounce; the Santaline Unguent one ounce; Vinegar of Roses as much as wil suffice, and mingle them.*

Neither will it be amiss, to lay on some Cataplasm upon the wounded part it self, that may cherish the heat of the part, help forward the suppuration, and prevent putridness. As,

Take *Marsh-Mallow Roots one ounce; the greater Consound six drams; flowers of Camomile, Melilote, and St. Johns-wort, of each half a handful; Wormwood three pugils; boyl them to a softness, and then mash them together; after this, add of Barley Meal, and Bean Meal, of each one ounce and half; Wine as much as will suffice; boyl them again, and make a Cataplasm.*

whether the Seto may in this case be administred.

But now touching the Application of these Medicaments we are likewise to give you notice of this that it hath been in use with some, that if the bullet have wholly penetrated through any member of the Body, in so much that the wound appeared on both sides, they then administer their Medicaments by the *Seto* or *Setaceum*, made of Hemp, Flax, or Silk, which the Germans cal *Durchzug*; and as often as they open and uncover the Wound, drawing about the *Seto* this way and that way, they remove it, and anoint it with a new and fresh Medicament. But in regard that in this manner and by this means the passage forth of the *Pus* is stopt up, and a pain excited, it is apparent, that the use of these *Seto's* is not safe enough; since that the same may likewise be performed by Tents put in on both sides; and that Wounds which appear on one side only may be cured without any use of these. But yet nevertheless, the *Penecilli* or Tents themselves ought not to be over thick, lest that they hinder the issuing forth of the *Pus*, and cause a pain.

How often these Wounds are to be opened.

And indeed, it will be sufficient at the beginning that the Wound be dressed, and bound up once a day only, in regard that then at the First there is scarcely any thing in the Wound that will require Evacuation. But so soon as ever the *Pus* beginneth to flow, it is then to be opened and dressed twice a day; and when it floweth in that abundance, that unless it be often evacuated it may cause great grief and pain to the wounded person, then it will be requisite likewise to open and cleanse the Wound from the *Pus* or corrupt purulent matter, three times a day. But when the *Pus* begins again to be diminished in its abundance, it will suffice then twice a day to open and cleanse the Wound. And at length, when there floweth forth very little of the said *Pus*, and that the Wound beginneth to be filled up with flesh, it will then be sufficient to open, cleanse, and binde up the Wound once a day, as at the first. But First of all, we must endeavour that (here) there may be a passage opened for the *Sanies*, or thin Excrement, to flow forth, which in these Wounds is in great abundance heaped up, and gathered together, by reason of the Contusion of the parts, as also because of the fragments of the bones that Nature endeavoureth to expel: and this may be performed by Tents, that (if need require) may be hollow. And if *Splenia* (as they term them) or Linen thicker then ordinary, three or four times doubled, be imposed upon the bottom of the sinus; and that afterward the *Pus* and *Sanies* be pressed forth by a harder and closer binding, this will very much advance and help forward the flowing forth of the said *Pus* and *Sanies*.

But there is somtimes so great an abundance of the *Sanies* gotten together in the Wound, and the *Sinu's* are so deep and winding, that the *Sanies* cannot all of it either flow forth, or be pressed forth of the wound: and therefore then the *Sinus* is to be cut, that so the *Sanies* may flow forth, and the *Sinus* may be cleansed.

Neither are the vulnerary potions here in this case altogether useless and to no purpose; for in regard that they cleanse the Ulcers, and free them from the filth of the Excrementious Humors, and cause that all things in the Wounds that are from without (and Heterogeneous) may by Nature the more easily and sooner be thrust forth of the said wounds; if there be need of these potions in any other kind of Wounds, then certainly they are here most of all necessary. But touching these vulnerary potions we have spoken before, in the *eleventh Chapter*.

After that Concoction beginneth now to appear in the wound, (which seldom happeneth before the third or fourth day (in regard that by reason of the vehement Contusion of the part its heat was greatly weakned, and the spirits exhausted) and when there is now appearing neither any notable pain and Inflammation; and that which is bruised is for the greatest part turned into *Pus*, then the Wound is to be cleansed, filled with flesh, and at length shut up with a Cicatrice. And the truth is, when the wound is once become pure and clean, then it is very necessary that flesh be generated, because that the bruised flesh is all of it converted into *Pus*, and so the wound must necessarily become hollow.

Cleansers.

And indeed as touching Cleansers these ought to be either weaker or stronger, according as there floweth forth a greater or less abundance of the *Pus*, and according as the Wound is either more pure and clear, or else more foul and pollured. As,

Take *the Decoction of Barley, the Juyce of Plantane, Smallage, Agrimony, and the lesser Centaury, of each one ounce; boyl them, and in the end add, of Turpentine, three ounces; Honey of Roses, two ounces; Frankincense and Mastick, of each one dram; Saffron, one scruple; and mingle them.* Or,

Take *Meal of the bitter Vetch Orobus, one ounce and half; Frankincense, and Orrace Root, of each six drams; Juyce of Smallage, four ounces; Honey as much as will suffice;*

mingle

Mingle them over the fire, or,

Take *The Meal of Barly, and of Lupines, of each one ounce: Frankincense, Myrrh, Aloes, of each half an ounce; the pouder of Orrace Root two drams; Juice of Smallage and Wormwood, of each three ounces; Turpentine two ounces; Hony one ounce: let them be boyled unto the consumption of the Juices. If the Wound be fouler then ordinary, you may then add some of the Ægyptiack Unguent.* As,

Take *The Meal of the Vetch Orobus one ounce; Myrrh, and Frankincense, of each half an ounce; Turpentine and the Juice of Smallage, of each two ounces; Unguent Ægyptiack half an ounce; Mingle them.*

If the *Sinus* be very deep, it will be good then to wash it with the Decoction of the lesser Centaury, *Horse-tayle*, the greater Consound, *Birthwort*, *Orrace*, *Frankincense*; this Decoction must be made with Wine, adding thereto a sufficient quantity of Hony.

Medicaments that breed flesh.

But then for the breeding of flesh, let the Medicaments that were before propounded be made use of. And this following is likewise very useful in these Wounds.

Take *Oyl of Mastick one ounce and half; Rosin of the fir tree, one ounce; Manna Thuris (or the fine flower of Frankincense) half an ounce; the herb Horstayl, Tormentil, the greater Consound, St. Johns wort, Plantane, and Betony, of each half a handful; Earthworms washed in Wine two ounces; Wine as much as will suffice. Boyl them until the Wine be consumed: and afterwards strain them, with a strong expression and squeezing of them; and then add of Wax and of Goats sewet, of each four ounces; Frankincense, Myrrh, Mastick, and Aloes, of each half an Ounce; Mingle and make an unguent, which may be layd upon the Wound; and this Unguent may be covered with the Emplaster Diapalma. If the Wound be infected with poyson, then the Wound caused therby is to be referred unto the poysoned wounds; touching which we shal speak further in the following Chapter.*

But if the wounded part begin once to be taken with a Gangrene, then the cure is so to be ordered as we told you before, in the last *Chapter* of the second part, touching a Gangrene.

Wounds with a fracture of the Bones.

But now this is one thing that especially renders wounds inflicted by Guns difficult to be cured, when in the Arms, the thighes, and the Ankles, bones are broken; yea and many times shattered into divers fragments; in which, since that for the most part the Nervous parts are hurt, when these come to be purged from these fragments of the bones, there wil from thence arise most sharp and acute pains, convulsions, yea and the Gangrene it self, after all. Which if it happen, the Common Chirurgeons frequently hasten all they can to the amputation and cutting off of the whole Member. But although notwithstanding, that this may sometimes be done; yet nevertheless this is not to be put in practise so long as there is any the least hope left of a Cure; seeing that Nature is wont even in these wounds also to work miracles as it were.

The way of Curing is the same as of fractures with a wound; of which we shal treat further in the next part, to wit, the fifth, and the Second Chapter. The first and main care therefore must be, that the great fragments of the bones be restored again unto their places, and that they may be there joyned together: But yet nevertheless in administring of the splinters (which are otherwise wont to be applyed in the fractures of the bones) there ought great caution to be had; since that by the use of them there may easily be excited a pain, Convulsion, Inflammation, & at length the Gangrene it self; unto which Maladies these Wounds are otherwise obnoxious; like as also those Glutinating Cataplasms, (which stick so close and fast unto the part, and bind it so streightly together) have here no place; neither are they rashly and inconsiderately to be made use of, because that they bind together and streighten the part, and thereby cause pain. It is therefore most convenient, that after the bones are again composed and conjoyned, the Member be placed and fastened in a thin plate of Lead, or in a skin moystened, or with those slivers or chips that wheel-wrights (while they hollow the holes of their Carts and Wains) cut forth with the hollow Auger or Wimble, after they have been first moystened with water. For all these things as they hold the broken part together, so they do it in such a manner, that they may notwithstanding be bent as much as you please; that so they may not cause any pain.

But now in the stead of those Cataplasms there may be layd on some Emplaster or Cerote. As,

Take *Rosin and Wax, of each half a pound; the pouder of the barque of the teyl tree, one ounce and half; Turpentine two ounces; Bole armenick one ounce; the Juice of the herb Storks bill, or Cranes bill two ounces; boyl them to the Consistence of a Cerote.* or,

Take *Mucilage of the Root of the greater consound, the Gum or Juice that sweats out of the Apple tree, of each three ounces; the Juice of the greater Comfrey, and Bole Armenick, of each an ounce and half; the Juice of Cranes bill, six ounces; the powder of the rind of the*

Linden

Linden or Teyl tree two ounces; the yelks of twenty Eggs, Turpentine half a pound; the oyl of Earthworms three ounces, mingle them.

You shall have more of these prescribed, blow, in the fifth part, touching *Fractures.*

The Dyet.

Let the Air be dry; and in other Respects temperate; and rather inclining to heat, then cold. Let the Patients food be sparing; and yet nevertheless, there is here also a regard to be had unto the Patients strength, and his accustomed Dyet: and as in all other, so especially in this kind of Wounds, his Meats must be of a good Juice: but he ought carefully to abstain from all those meats that yield a naughty and corrupt Juice. Let the Patient altogether forbear the drinking of wine, unless he hath been much accustomed thereto: for whosoever he be that hath wholly accustomed himself to the drinking of wine he wil hardly away with the drinking of Water, in case Beer should be hard to come by. Let the Wounded person likewise carefully shun all occasions of Anger, abstain from all over swift and violent motion of the body; in regard that rest (*as Hippocrates* in his Book of Ulcers teacheth us) is the most fit and requisite for all that are wounded, and on the contrary, all labor hurtful. He must likewise avoid Venery, by keeping himself from womens company. And in a word, if ever there be need of an exact and accurate Dyet in other wounds; then certainly the most exact Dyet that may be is much more especially required in this kind of Wounds.

Chap. 21. *Of Poysoned Wounds.*

TOuching those poysoned Wounds, you are to understand that these poysoned Wounds require a peculiar kind of Cure by themselves; whether it be by poyson put upon the bullets, Arrows, Darts, or whatsoever other kind of poysoned Weapons; or else by the biting of any living Creature, as a Dog, or a fierce and raging Wolf, or some other poysonous Creature; or else by the blow of a Scorpion, Aspe, or any other venemous Creature whatsoever. And the very truth is that those wounds that are thus inflicted by the biting or strokes of poysonous Creatures (whether wild beasts or any other) they do more hurt by their venemous quality then by the Wound it self; which for the most part is but sleight; and of no great moment; whereas those Wounds that are inflicted by poysoned weapons do not only hurt by their poysonous quality, and by virtue of the poyson wherewith they are infected, but they are likewise oftentimes very dangerous simply as they are Wounds.

The Moravian Disease.

We must not here pass over in silence that Disease which is contracted from Scarifications; some have called it the new disease of Moravia, and the sickness of *Brunna*; because that it first of all began to shew it self at *Brunna* a town in *Moravia*, in the year 1577. touching which *Thomas Jordan* hath published a special Treatise, which *Johan. Schenckius* hath inserted in the sixth Book of his observations. And touching this same disease or plague, *Johan. Sporischius* hath written a Tract, and inscribed it, of the Symptoms of Scarification. And *Joh. Crato* likewise maketh mention of this same Disease, in his *Epist. collected by Scholtzius, Epist.* 139. The Sum of the whole business is this in brief. *All whosoever they were that in the year* 1577. *on St. Lucies day* (from what followeth notwithstanding I Collect this, that not only those that were thus scarifyed on the first day of Winter were taken with this Malady; but that all likewise that made use of these Scarifications from that first day of Winter, even unto the vernal or spring Solstice) *went into their publique Bath at Brunna, and had these scarifications administred to them, they instantly seemed to be taken and surprised with this Malady. Neither did they yet presently perceive the hurt and mischief thereof, although that forthwith there appeared some certain signs of the disease, now gotten into them. There were some that had the disease lying hid, and not discovering it self for the space of Eight days; in others the Malady lay concealed a fortnight, and in others during the whol time of their courses; to wit, according to the strength both of the Malady, as also of the party now affected therewith: But at length it manifested it self publiquely. In the mean time those that were taken with the disease were observed to be affected with an universal kind of sloath and dull sluggishness; and being thus taken with sloathfulness they became lazy, and altogether unfit and indisposed for the discharge of their Callings and wonted business; and they were likewise Melancholly, and of a sad countenance. The Native fresh colour of their face was suddenly turned into a paleness, the Vigor and quickness of their eyes into wilde and fierce lookes, there appearing in them a deformity with a dun and duskie Circle as it useth to be in women that have their Courses upon them. And then it soon discovered it self by manifest and apparent signs. After the application of Cuppingglasses, they were immediatly invaded by an extreme great and incurable heat; and after this there followed filthy impostumations, and*

putrid

putrid rotten Ulcers, flowing with Sanies *and foul black gore-Blood: and round about there appeared also certain pushes as broad as the Palm of the Hand, together with other running sores; out of which when they gaped, and were opened either with the Needle, or Medicaments, there issued forth a thin pituitous or Flegmatick matter, wheyish, and rotten, as also a snotty Sanies; and in others this thin pituitous matter was likewise sharp and corroding: then the Flesh al of it that was comprehended within the Circumference of the Cupping-Glass being corroded and putrifying sent forth a stinking savour, such as is wont to arise from the Telephian Phagedænical Ulcers. Where it was worth observation, and to be wondred at in the very beginning, that of so many Cupping-Glasses as were affixed (some having had ten or there about, and others also not above three of these Cupping-Glasses fastened and affixed unto their Flesh,) only one of them, or two at the most, of all these, brought forth any of the said filth and Corruption; the Mother in Law of one* Laurentius *a Taylor only excepted, who of fifteen that were applied, had three that produced of the aforesaid impostumated matter. You might have seen some of them with their whole bodies all overspread with Pustules or Pushes (as we cal them) their Face deformed, their Countenance sad and dejected, their looks terrible and frightful, their Back, Breast, Belly, Feet, even all places from the Head to the Foot of them, polluted and defiled with a scurfie scabbiness, and with Crusty Ulcers lifted up a little above the Skin, as broad as the Nail of ones Thumb, with a red Circle, and a white superficies and outside. And out of these Ulcers also did continually run a kinde of Fat liquor, and other Excrementitious filth and corruption, that did more resemble the thin and cleer Sanies, then the thicker Excrement that we cal* Pus. *Yea and moreover, the scabbiness being removed and cured, there stil remayned certain black spots, somewhat differing from those that appear in the* Impetigo *and the* Vitiligo, *which are of a dark, Leaden, and Duskie colour. In the progress of the Disease there grew together in the Head certain Callous or hard Crusts, which being with the greatest pain broken or dissected did sweat forth a kinde of matter not unlike unto Honey, and very tenacious (such a kinde of Juyce as we may see to destil from those Trees that bear a fruit like unto the Pine Apple) a certain substance (I say) thick and clammy, and therefore an Argument of the ripening and withering away of the flegm. These sordid and filthy impostumes (they being indeed of the worst sort of all others) were no sooner throughly cleansed and purged with a great deal of trouble, and much difficulty; and no sooner were those parts grown together with a little flesh brought over them, but out there breaks a new Symptom. The Limbs of the whole Body, the Arms, Shoulders, Shoulder-Blades, Elbows, Calves of the Legs, Ankles, and bottom of the Feet, they were all extreamly twinged and pulled with a certain kind of pricking, like unto stings; and as if they had been sawn assunder with some Iron Instrument. The members were all of them so heavy by reason of their weight, that they needed somthing to underprop them, and bear them up: yea and many of them also that had a palsie threatened unto them were fain of necessity to be born up, and carried upon mens Shoulders: And yet for all this they had no rest day nor night, being wracked with continual and incessant pains. And these tormenting pains were not for a day or two, but they lasted commonly for the space of a whole moneth. And the Head likewise that was not free. For besides the Achores above mentioned, together with the Gummy and Callous risings therein, (not unlike unto great warts) it was grievously infested with vehement pains (and especially about the hinder Region thereof) which by reason of the weakness and decay of the Parties strength, as also through the want of due rest and sleep, caused many of them to be Mad; which said Madness of theirs left them not until for a long while together very much of the aforesaid purulent snot and filth (of a most offensive and stinking Savour) had run forth from the Head by the Nosethrils. And all the whol time that the Disease had its course they took no pleasure at all in the gifts and comforts of* Ceres *or* Bacchus, *that is say, they were not at all delighted with their Food, whether Meat or Drink. They abhorred likewise and shun'd all manner of converse with others, either out of shame, or else for Anger and Indignation, when they beheld themselves (without any desert on their part, as they thought) quite over spread with a horrible and Contagious Disease, and of which they had smal hope to be recovered. This Disease continued the whole Winter long, even until the spring Equinoctial, that is, the Suns Entrance into the sign of Aries; about which time it manifestly declined, and was Judged to be quite ceased about Easter; because that after that time there was none found to be wholly overspread with this strange and (until then) unheard of Disease.*

As touching the rise and original of this Disease, there were two Opinions especially. For some there were that thought it to be a new kind of the French Disease, by Contagion or infection propagated in the hot House or Stove of the Bath: but others conceived that this poyson was communicated by the Scarification. The Chief Magistrate of the Town made a very diligent and strict

enquiry as touching the Cause of this Disease; but he could finde very little or nothing of a certainty. *Johan. Sporischius* (in his *Tract before alleadged*) admits of neither of these Causes before mentioned: but he conceiveth that this Malady had its original from a Pituitous and Flegmatick Cacochymy, heaped up in the Body by the unhealthy Constitution of that year; and withal that overmuch and Unseasonable Scarification drew these vitious Humors unto the Scarified places. And that he may the better prove this, he writeth many things touching the Scituation of this Town, and concerning the Dyet, and the Diseases of the inhabitants: and from all these put together he proveth that there was collected great store of this Flegmatick Humor.

And the truth is, that it is not altogether so plain and evident, from whence that Disease was at first contracted. For if it had its original from Scarification, then the Cause is not evident, wherefore this infection continued only from the Winter until the vernal or Spring Æquinoctial, and no longer (unless haply any one wil render this for a cause, that after this time none durst by reason of the fear they apprehended of a danger, make use of these Baths, or else because that this Bath was almost destroyed, and then again renewed) and why all the parts unto which the Scarified Cupping-Glasses were affixed were not exulcerated. For (in the Histories of the infected) *Thomas Jordanus* taketh notice, that a certain person who had five of these Cupping-Glasses affixed unto several places of his Body, yet that only two of all those places, (to wit, the hinder part of the Neck, and the Region of the left Loyn) were exulcerated; and he telleth us likewise of a certain Maid-servant that had seven of these Cupping-Glasses applied unto several parts; of all which, the Skin was exulcerated only under one of them, to wit, that which was affixed unto the right Shoulder-Blade: and there he assureth us that the very same happened also unto many others. But now, this seemeth to make very much against those who will have this Malady to proceed from the vitious conflux and storing up of the Humors, to wit, that there being at that same time three publique Baths at *Brunna*, they only were infected who made use of Scarification in that *Adams* Bath, which ought likewise to have happened altogether alike in them all, if the Disease had its original from the vitious Humors gotten together in the Body. But the opinion of *Sporischius* (as he determineth that this affect proceeded from the pituitous or Flegmatick Humor) doth no way deserve that any assent should be given unto it. For it easily appeareth unto any one that well weigheth the History, and considereth the Symptoms of this Disease, that the Cause of this Disease was from somwhat that was poysonous.

And yet nevertheless the Second opinion seemeth to me the more probable. For (like as *Crato* taketh notice, and giveth us to understand) since that there was not any one infected besides those that used Scarification, (and that also in this Bath only, and not in any other) it is therefore very likely and most agreeable to the truth, that by cuts and wounds inflicted by Scarification there was some kinde of poyson derived unto the Body; whether this poyson were imparted to the Body by the edg of the Penknife infected, or else by the Cupping-Glass, or by some poysonous Vapour of the Bath, or from the Water, or by whatsoever other means it were. For it is a thing generally wel known that Arrows are by many Nations infected with Poyson: which might likewise as well be done in the Penknife wherewith the Scarification was made, whether this came to pass by the Malice and wickedness of the keeper of the Bath, or else by his carelesness and want of Circumspection; whiles that with the very same Knife with which he Scarified some impure person, he likewise Scarified others, who were thereby infected; seeing that it is a truth very well known, that the opening of a Vein hath oftentimes fallen out very much amiss, that hath been performed by the same Penknife wherwith another mans Ulcer hath been opened. This poyson might likewise be communicated unto the Scarifying Knife from the Hone or Wherstone, (upon which these Instruments are wont to be rubbed hard, thereby to have an edg set upon them) if from the Vapor of the Bath any filth and Malignity should chance to stick unto them. There might likewise some contagion cleave fast unto the Cupping-Glasses, that are not alwaies wiped and made clean with that care and diligence as they ought to be. And Lastly, it is not altogether impossible that the Vapour of the Bath might insinuate it self into the Skin newly Scarified; or else into the water with the which the Scarified places are washed: which said Vapor is not evermore pure, but is somtimes defiled and infected by the sweatings, and filth, that come from divers persons. And that which also maketh much hereunto, may be this, that from those very Stones upon which the water is poured forth for the heating of the Stove or hot House there is lifted up great store of Vapors, which are not alwaies pure, but oftentimes very ill disposed, by reason of the

the filth and pollutions of the Bath, and the perpetual moystness of the place.

Another History of the like affect.

And in this opinion I am confirmed by a History of the like Scarification, that not many yeers since happened in *Franconia*; the History we have extant in the 2. B. of the *Medicinal Epist. Sect.* 6. of that Eminent and Famous Physitian, Dr. *Gregorius Horstius*; by which it appeareth that persons infected were al overspread with pustules or pushes, and as it were Cancerous Ulcers, not only in the Scarified places, but almost all the Body over; they suffered also very extream pains of the Limbs, (pains as if they would have even broken the bones,) whereby the Diseased persons were so greatly weakened that they were not able to raise them out of their Bed without the help of others, and by leaning upon them. But to conclude: this Malady altogether proceeded from the Malice and evil practise of the wicked Bath-keeper, who (as there we may finde it extant in his own confession) three or four times a week was wont to rub the Herb *Aconitum* upon the whetting block of Wood (being covered over with Leather or a Skin,) with which he was accustomed to sharpen the edges of his Penknifes; as also the pouder of the Metalick *Cadmia*, such as is digged out of the Earth; or the pouder of the stone *Cobaltum*, and Rats-bane; he confessed likewise that he rubbed upon his scarifying Knives the pouder of Locusts; and that he also dried Toads, and afterwards macerated the pouder of them in Water; which said water, together with the pouder, he poured out upon those Stones upon which (in the time of bathing,) the Water was wont to be poured forth; for the heating of the Stove or hot House, into which they entered when they went out of the Bath.

Signs Diagnostick.

Poysoned Wounds if they be inflicted by poysonons Creatures, this will appear by the relation of the sick person; and even by this it wil be known, that these Wounds proceeded from such kind of Creatures, because that they are envenomed. But if the Patient be wounded with a Dart, or any other kinde of Weapon, or a Leaden bullet, this is known by the extream great sense of pain and pricking that is felt in the wounded place; and by this also, that the Natural colour of the wounded part is quite altered and changed, degenerating into a Wanness and Leaden colour, or blackness; and that instantly upon it grievous Symptoms (for which no Reason can possibly be given) do follow upon the Wound; and that in the whole Body there is perceived and felt, sometimes an extraordinary heat and burning, and sometimes a kinde of stupidity and great streightning of the Heart, and sometimes the trembling of the Heart, together with dangerous fainting and swooning Fits.

For so soon as ever the poyson is received in by the Veins and Arteries, it immediatly diffuseth it self throughout the whole Body, and oppugneth the most principal members, and especially the Heart, (as it is the Nature of all poysons so to do) from whence divers Symptoms are excited. And these indeed are the more general Signs of a Poysoned Wound; unto which afterwards (according to the Nature of each Poyson) very many other Symptoms do adjoyn themselves.

Prognosticks.

1. Every Wound that is inflicted by any poysoned kinde of Weapon, or by the biting, sting, or stroke of any venemous wilde Beast, is far more grievous and dangerous then that Wound which is free from Poyson. And a smal Wound likewise when it is thus Poysoned may (and often doth) bring Death: whereas otherwise great Wounds may be healed.

2. And indeed by how much the more for number, and greater for danger, and contumacious the Symptoms are, and unyielding unto the remedies administred (though never so fit and proper) by so much the more dangerous they are, and for the most part deadly. But if the Symptoms be but few, and those not very grievous, and such as are mitigated by the Remedies administred, there is then so much the greater hope of Recovery and safety.

3. By how much the Poysoned Wound is nigher unto the Heart, by so much the more dangerous is it; and so likewise for that wound that is neer unto the Brain.

The Cure.

It sufficiently appeareth what Indications a wound, considered as a wound, pointeth out unto us, and supplyeth thus withal; and it is likewise sufficiently manifest (by what hath hitherunto been said) how it is to be cured. But now if we look upon it as poysoned, then we are to endeavour in the first place, that this poyson may not penetrate unto the more interior parts, especially the Heart; and then in the next place, that its power and strength may be broken and weakned by Alexipharmick Medicaments, which we commonly term Counter-Poysons. And therefore first of all, we ought carefully to heed whether any part of the poysoned

Weapon yet stick fast within the Wound. For indeed all our attempts of curing the Wound wil be frustrated, unless the weapon be drawn forth; and therefore we must labor that with all possible speed it may be taken forth by the operation of the hand: but if it cannot thus be taken forth, then together with the emplasters which have a power in them of calling forth the poyson, we are to mingle with them those things that are able to draw forth the Weapons and all other extraneous bodyes out of the Wounds; touching which we have spoken above in the eighth Chapter. And then moreover, that so the poyson may not penetrate unto the more inward parts, especially the heart, first of all (as *Celsus* in his fifth Book, *Chapt.* 27. teacheth us) *that member is to be bound up upon the wound, but yet notwithstanding this binding must not be overhard and streight, lest that the member should hereby be benummed, and lose all its sense and feeling*; or that (which somtimes through the unskilfulness of the Chirurgeons cometh to pass) it should be taken with a Gangrene. Then the poyson it self is to be drawn forth, and called out unto the more external parts. The Ancients to extract and call forth the poyson, were wont to appoint the sucking of the wound; and they who performed this office they termed *Psylly*; and they thought that these had a kind of propriety of attracting and drawing forth the poyson by sucking, and also of resisting the sayd poyson; whereas the truth is that it was only to shew their boldness and adventurousness in thus doing; touching which *Celsus* in his fifth Book, *Chapt* 27. thus writeth: *but if this indeed* (sayth he) *be not done* (*that is, if there be want of a Cupping-glass, or the like*) *then a Man is to be provided, who may suck the poyson out of the wound. Neither indeed have these men* (*whom they call Psylly*) *any more special and peculiar knowledg then others; but only a boldness and confidence confirmed by much use and practise. For the Poyson of a serpent* (*as likewise some certain poysons that Huntsmen use*) *hurt not by their tast, but only they impoyson a Wound. And presently he adds; and therefore* (sayth he) *whosoever he be that following the example of those Psylly, shall suck the Wound,* (*and yet would both himself be safe, and so also preserve him for whom he doth this office*) *let him carefully attend this advice* (*that so he perish not*) *that he admit not of any part of the Ulcer into his Gums, or his Palate, or any other part of his mouth.* Now the truth is that the poyson is most safely drawn forth by Cuppingglasses especially in the bittings and strokes of venemous Creatures; which said Cuppingglasses wil draw forth the poyson the more powerfully, if unto them there be added and administered Scarifications; and especially if they be made deeper then otherwise upon sleight occasions. After the removal of the Cuppingglasses, then the Gutts of Hens or other birds, or (if you please) the bodies of them being cut in the midst, the parts whiles they are yet hot may be layd upon the Wound. And if the place (be not nervous, (in the bitings of these poysonous Creatures) the flesh round about it is to be pared away, yea and quite cut off: And *Galen* relateth of a certain vine-dresser, that being bitten by a viper he presently with the pruning hook cut off the finger that was bitten; and so by thus doing escaped and avoyded all the danger. It will likewise prove to very good purpose, if the wound be washed with Vinegar or Wine in which Treacle hath been dissolved; or with the Decoction of Camomil-flowers or the root of the sowr or sharp dock Yea and in the bitings of poysonous Creatures (if the place that is wounded be not Nervous) a most effectual remedy is the Actual cautery, that by the force and power of the fire doth both consume the poyson, as also prevent and hinder the penetrating unto the more internal parts. But if the sick person wil not admit of an Actual Cautery, then the potentiall Cautery, or caustick Medicaments are to be administred. And care is likewise to be taken that the Eschar may fall off as soon as may be; and if it fall not off soon enough of it self, the wound is to be freed therefrom with the penknife; neither is the ulcer immediatly to be glutinated; and therfore an Onyon with Salt, or Wild Garlick, or Rue, are to be imposed upon the wound.

And these very things notwithstanding (although that Caustick Medicaments have not been premised) are to be imposed upon the Wounded or bitten place, for the drawing forth of the poyson; As for instance, the *Onyon, Wilde Garlick, Rue, Doves dunge, Wallnuts, with Garlick, Salt and Hony,* (as the Author of the Book of Remedies against poyson, telleth us in his fourth Chapter) which whether they be taken inwardly, or only outwardly imposed, are able to free from poysons (whether inwardly drunk, or else caused and brought upon the body by the bitings and strokes of venemous Creatures) *St. Johns wort, Swallow-wort, Elecampane, Raddish, Dittany, long and round Aristolochy.* Very useful also are *Carduus Benedictus, Scabious, Rue, Gentian, Vipers grass* and indeed all kinde of simples whatsoever that attract and draw poyson, either by a manifest quality, as heat; or else by an occult quality, and peculiar likeness. Touching the former this is to be noted, that in those

those parts that are Nervous we are not to make use of Medicaments that are over sharp, lest so while we seek to avoid one danger we fall into another as great, in exciting both a pain and a Convulsion. And therefore in such parts the safest way wil be to apply those Medicaments only that draw forth the poyson by the property of their substance. Neither likewise ought the use of sharp Medicaments alone to be long continued; but after they have been continued for a day or two, then after others more mild are to be imposed.

The Compositions are very many and various. Treacle is of singular use, if mingled with other Medicaments: which that some should therefore have in suspition in regard that by reason of the coldness of the Opium it may possibly drive the poyson inwardly, this is indeed a most ridiculous conceit, in a time of so much light from the truth. Or else drop in *Matthiolus* his oyl (which he describeth in his Comment upon the preface of the sixth Book of *Dioscorides*) or that of the great Duke of *Hetruria*; or the Juice of Vipers Grass.

Guido in poysoned Wounds commendeth this Emplaster.

Take *Galbanum, Sagapenum, Opopanax, Asafœtida, Myrrh, Pepper, Sulphur, of each one ounce and half; Doves dung, and Ducks dung, of each two ounces; Calamint and wild Mint of each one ounce; Let the Gums be dissolved in Wine; and mingling them all with honey and old oyl, make an Emplaster.* or,

Take *Turpentine, the Water or Juice of Swallow-wort washed, two ounces; the propolis of Beehives two ounces, Matthiolus his Oyl half an ounce; Oyl of Turpentine two drams, Precipitate a dram and half; Water Germander, and the Root of Vipers grass, of each four scruples; mingle them and make an unguent.* or,

Take *Ammoniacum, Galbanum, Bdellium of each half an ounce, Styrax Liquid three drams; Myrrh and Sulphur that hath not felt the fire, of each two drams; Euphorbium and Precipitate, of each one ounce; Matthiolus his oyl, and oyl of Turpentine, of each two drams; let the Gums be dissolved in scillitick vinegar, and then mingled with the rest; and then with as much Propolis and Ship pitch as will suffice, make a Cerote.* or,

Take *Root of Dragon wort, and Round Aristolochy, of each one ounce; Tabaco, and Water Germander, of each one handful; Frankincense, Myrrh, Brimstone that hath not been neer the fire, of each half an ounce; Dittany of Crete, Angelica Root, and white Dittany, of each three ounces; Oyl of Turpentine two ounces; Wax and Ship pitch, of each as much as will serve the turn; Mingle them, and make an Emplaster.* or,

Take *Tops of St. Johns wort two handfuls; Carduus Benedictus, Water Germander, Tobaco, Swallow wort, of each one handful; Rue one pugil, Root of Dragon wort two ounces; Sour or Sharp dock, an ounce and half; let them be well bruised together, and then applyed in the form of an Emplaster.* or,

Take *Oyl of Olives, and Honey, of each two ounces; Quick lime two drams, Roots of round Aristolochy one dram: make a Cataplasm.* or,

Take *Onyons, Garlick, Leeks, of each three ounces; boyl and bruise them, and then add the root of Dragon wort, and Asphodill, of each two drams; Treacle half an ounce; Oyl of Scorpions one ounce, and mingle them.* Or,

Take *Ashes of the herb Trinity or Hearts ease, and Quick lime, of each two ounces; Wormwood, Round Aristolochy, Rue, Garlick and Onyons, of each one ounce; Figgs twenty in Number; Goats dung, Oyl of Euphorbium, and Oyl of Scorpions, of each three ounces; Honey one pound and half; Wine Vinegar one pint; Mingle them, and make an Emplaster.*

More of these you shal have in the following sixth Book, touching the bitings of venemous Creatures.

And withall, (even instantly upon the receiving of the wound) there ought to be administred *Alexipharmaca* (or counterpoysons as we properly call them) that may Guard and fortify the heart from the poyson, and may expel it unto the outward parts. And indeed if the kind of poyson be known, we are then to oppose and counterworkit by its own proper and peculiar *Alexipharmaca*, touching which more in the following Book. But if the *species* or kind of the poyson be hid and unknown to us, then these universal or general *Alexipharmaca* (to wit) the *Bezoar* stone, Treacle, Mithridate, Treacle Waters, and others of this kind, (every where commonly known) are to be administred.

And with the very same the Heart is likewise outwardly to be fenced and guarded; and therefore not *Treacle* and *Mithridate* alone, but chiefly the Oyl of *Matthiolus*, is to be anoynted upon the Region of the Heart, and the Arteries; as also the Oyl of the *Great Duke* of *Hetruria*.

The poyson being drawn forth, we are then to hasten unto the Curing of the wound; for which purpose this Unguent is very usefull.

Take *Wax, black pitch, Rosin, the soft fat of a Ram, and old oyl, of each three ounces; Galbanum, six ounces; Make an Unguent.*

And afterwards, the Cure is to be performed as in all other Wounds.

But if we come to understand from the dangerous

gerous symptoms, (as cold sweats, faintings, swoundings, and the Syncope) that the poyson hath now already penetrated unto the more inward parts of the body, and especially the Heart, then the wounded part is not much to be troubled and tampered withall, but in this case we ought rather to take care for the preservation of the whole body, but more especially the Heart.

Chap. 22. *Of Particular Wounds.*

And hitherto we have been treating touching Wounds in General, as also touching the general Cure of them. But now in regard that the Cure of wounds is very different and various, according to the variety of the parts that are wounded; we should now therefore come to speak of them more particularly, (and in speciall;) to wit, of the wounds of each single part; But since that we have already handled them in our former Books, therefore here again to treat of them wil be a thing altogether needless and superfluous. For in Book 1. *Part.* 1. *Chapt.* 21. 22. 23. 24. *and* 25. We treated of the Wounds of the Head and Brain. Ibid. *P.* 3. *Sect.* 2. *Chapt.* 9. Of the Wounds of the Eyelids: *Chap.* 10. Of the Wounds of the Eyes. Ibid. *Sect.* 3. *Chapt.* 5. Of the Wounds of the Nosethrills. Ibid. *Sect.* 5. *Chapt.* 3. Of the Wounds of the Tongue.

Lib. 2. *Part.* 1. *Chapt.* 4. Of the Wounds of the Lipps. Ibid. *Part.* 2. *Chap.* 4. Of the opening of the vessels of the Lungs. Ibid. *Chap.* 11. Of the Wounds of the Lungs. Ibid *Chap.* 15. Of the Wounds of the Diaphragm. Ibid. *Chapt.* 17. Of the Wounds of the Chest. Ibid. *Chap.* 22. Of the Wounds of the spinal Marrow. Ibid. *P.* 4. *Chap.* 3. Of the Wounds of the Heart.

Book. 3. *P.* 1. *Sect.* 1. Of the Wounds of the *Oesophagus*. *Ibid. Chapt.* 16. Of the wounds of the Stomack. *Ibid, P.* 2. *Sect.* 1. *Chapt.* 8. Of the Wounds of the Intestines. *Ibid. P.* 4. *Chapt.* 7. Of the Wounds of the Spleen, *Ibid. P.* 6. *Sect.* 1. *Chapt.* 7. Of the Wounds of the Liver. *Ibid. P.* 7. *Sect.* 1. *Chapt.* 11. Of the Wounds of the Reins. *Ibid. P.* 8. *Sect.* 1. *Chapt.* 5. Of the Wounds of the Bladder. *Ibid. P.* 9. *Sect.* 1. *Chapt.* 5. Of the Wounds of the Testicles. *Ibid. Chap.* 11. Of the Wounds of the Yard. *Ibid. P.* 10. *Chap.* 15. Of the Wounds of the Abdomen.

Book. 4. *P.* 1. *Sect.* 2. *Chapt.* 1. We treated of the Wounds of the Womb.

Chap. 23. *Of the Diseases, and Symptoms that happen unto Wounds.*

And now, since that it often happeneth that other Diseases, as likewise divers symptoms do happen unto Wounds, and follow upon them; (al which yield forth peculiar Indications, and so draw the cure to themselves; deject and weaken the strength of the Patient, and render the Wounds very difficult to be cured, and dangerous) we ought therefore to treat of those also; and to shew you how and by what means they are to be removed and taken way; until which be done, no Cure of the wound is to be expected.

Of Feavers.

And indeed in the first place, it happeneth very often that Fevers follow upon Wounds And therefore although I have already treated of Feavers in a peculiar Tract by its self; yet nevertheless, in regard that it much concerneth us to know, and rightly to understand the differences of Feavers that follow upon Wounds, (that so we may the better remove them) we wil therefore herein this place speak somthing of them inspeciall, and particularly.

And therefore, first of al, we are diligently to inquire what the nature of this Feaver is that followeth upon the Wound, and what the Cause of it. For these kind of Feavers are very various; some of them being every day Feavers, having their Original from the great disturbance of the spirits, and the boyling heat of the blood; by reason of anger, Fear, and upon all occasions of the humors being disturbed by the motion of the body, or the commotion of the Mind. And moreover also, Secondly, these feavers happen while the *Pus* (and especially if there be great store of it) is in breeding, according to that of the 47. *Aphor.* of the *second Sect.* Thirdly, from an Inflammation; Fourthly, and somtimes these putrid Feavers are likewise generated from the putridness that is in the wounded part. And fifthly, from the store of the vitious humors.

The first kind of feaver from the disturbance of the humors.

The first kind of Feavers invadeth the Patient at the first in the very beginning; and (as I told you before) it proceedeth from the passion of the mind, and the motion of the body, and the disturbance of the blood and spirits following thereupon. And hitherto also belongeth most vehement pain, which by disturbing the humors, and causing restlesness, may both set on fire those humors, and the spirits, and likewise excite a Feaver. Their

Their Signs.

Now these Feavers are known by this, that they invade the wounded person instantly upon the inflicting of the Wound, and together with it. But yet notwithstanding because that the putrid Feavers may likewise somtimes invade the person immediatly, and even from the very first beginning, therefore by what Signs these *Ephemeræ* or every day Feavers may be discerned from the putrid, we have told you before; and the difference will sufficiently appear from what we have written hereof, in our *first Book of Feavers*, and *sixth Chapter*.

Prognosticks.

And the truth is, these Feavers of themselves bring with them no danger at all unto the sick person; and yet Nevertheless, neither can they at all promise any safety unto him, seeing that then the time of the fluxion and Inflammation, that are wont to follow upon the Wound, is not as yet overpassed and gone.

The Cure.

But now this Feaver requireth not any peculiar Cure; but (if the Patient will but only submit himself unto the strict Rules of Dyet) soon vanisheth of its own accord. But yet nevertheless all the Causes thereof (if they be yet present, or that there be any fear of their returning) are to be removed: for otherwise they may easily draw upon the person some kinde of danger. And in regard that otherwise (about the fourth day) Inflammations and fluxions are wont to happen; these Feavers, if they continue so long, (as until the said fourth day) may possibly attract and augment those Evils.

A Feaver from the generating of Pus:

And then again, while the *Pus* is in breeding, (and especially, if there be a great abundance thereof generated) Feavers are caused; as *Hippocrates* telleth us, in the 2 *Aphorism. Sect.* 27. For then, whatsoever over aboundeth in the wounded part, and cannot be changed into the substance of the part, beginneth to putrefie, and there is caused (as it were) a certain kinde of boyling forth of putrefied mattier. And yet notwithstanding Nature doth what lieth in her power, and what she is not able to turn into the substance of the part, she doth what she can so to work and frame it, that it may not be altogether corrupted, but most of it turned into *Pus*. And therefore from this Ebullition or boyling there is indeed a heat of the blood in the Veins and Arteries communicated unto the Heart, which when it is thither come it kindleth a Feaver, that is like unto an *Ephemera* (of many daies) rather then to putrid Feavers properly so called.

Signs.

And therefore the Signs of Putridness are absent, and appear not, (and so likewise for the Signs of an Inflammation) and these Feavers invade the wounded person at that time wherein the *Pus* is wont to be generated; and especially about the fourth day. The heat is much, but withall sweet; the pulse great, swift, and frequent. The Urine differeth and recedeth but little from its Natural state; and there is no ill and dangerous Symptom Joyned together with it, to accompany it.

Prognostick.

This Feaver of it self hath no danger at all in it, but soon after ceaseth.

Cure.

And this that it may so much the sooner be done, there is a passage forth to be made for the *Pus*; and this so much the more speedily, if the *Pus* be conteined in a more noble part, or in a part that hath consent with some one of the more principal and noble parts: and withal we are to endeavour that al the afflux of the Humors may be hindered and prevented.

Feavers from an Inflammation.

And Thirdly, Feavers are somtimes kindled from the Inflammation that followeth and happeneth unto the wounded part; somtimes Quotidians or every day Feavers; and somtimes putrid Feavers; even according as the Spirits Wax hot, and this heat is communicated unto the Heart; and also according as the putrid Vapours transfused into the Veins and Arteries do penetate unto the Heart, and heat it.

Signs.

Now these like Feavers are known from the Signs of an Inflammation; touching which we have spoken in the *first Part*, and 5. *Chapter*. But whether the Feaver be a Quotidian, or a right putrid Feaver, this may be known by the Signs of them both; of which we have likewise already spoken in our *first B. of Feavers*; and especially, that in the Quotidian the Signs of putridness disappear in the Urine, whereas in putrid Feavers they appear therin. And so the heat in putrid Feavers is far greater and sharper, then in Quotidians; and so are also the Symptoms more grievous; and withal there is a greater dejection of the strength and powers of the Body.

Prognostick.

Now these Feavers in regard that they wholly depend upon the Inflammation, they are therefore greater or less, according to the greatness of the inflammation; and so likewise more or less dangerous.

Cure.

These Feavers are taken away and Cured, upon

on the removal of the Inflammation, like as al other Symptomatick Feavers; touching which we have already spoken in their proper place. And therefore we ought in the first place to do our endeavour, that by coolers and other convenient altering Medicaments this Feaver may be Cured; lest that otherwise a putridness be excited in the Humors; or if there be now already present any putridness, that it may be restrained and kept under.

Feavers from the putridness of the Humors:

And Fourthly, There happen likewise feavers unto Wounds, kindled even by the putridness of the Humors that are in the Wound it self; as being neerly related and allied unto those things that are raised and have their rise from the *Pus* or thick purulent matter.

Signs.

Such Feavers as these are known from the Quantity & quality of the Excrements of the wound. For there floweth forth great store of *Sanies*, and this resembleth somthing that is putrid, rather than good & laudable *Pus*; and it is of a various and evil colour, and of a very unsavoury and offensive smel. And although there should not flow forth any great store of *Pus* or *Sanies*; yet nevertheless if the matter that floweth forth be naught and corrupt, if the colour of the part be changed, and if there be present any pain and heavinesss in the part, it is then indeed a sign and token that there is present a vitious matter, and that it hath not been sufficiently purged forth. But in the mean time there will be present, and appear, the signs of a Feaver, which will shew unto us in the Urine the Notes and Marks of putridness; or it may be they shew us none; according as the matter is more or less communicated unto the Veins, and Arteries.

Prognostick.

And as for these kinde of Feavers, they are more or less dangerous, according as the putridness is greater or less; and likewise as it is in a part more or less noble, and accompanied with more milde and gentle or else more sad and grievous Symptoms; and according as there may be made a passage for the more easie or more difficult flowing forth of the vitious matter.

Cure.

The Cure consisteth in this especially, that the putridness in the part affected be with all speed, and as much as may be, restrained and kept under, and that by all means possible there be a way and passage made for the vitious matter to flow forth. For the putridness being taken away and removed, the Feaver soon after easily vanisheth of its own accord.

A Feaver from the vitious preparation of the Humors.

And Lastly, There is also a kinde of Feaver, which ariseth (in wounded persons) from the storing up and the great provision that hath been made of vitious and naughty Humors, and the ill preparation of them. For if the wounded Body be impure, it may then easily be, that a Feaver may be kindled in it upon the occasion of the Wound. Now this is done in a twofold manner, and upon a double account. First of all, from the commotion and disturbance of the Spirits and Humors, after the receiving of the Wound. For as in Bodies otherwise impure there are Feavers oftentimes kindled from the passions of the minde, and Commotion of the Body; (even as we see it to befal Women that have hard labour in Child-bed) so the very same may likewise happen in those that are wounded. And furthermore a Feaver is also kindled from a putridness in the wounded part. For as in Child-bearing Women there are Feavers oftentimes kindled from the retention of the Secundine, and the blood that usually floweth from them after the Childe is born; (and this so much the more easily, if their Bodies be impure) even so if any putridness be kindled in the wounded part, and that the depraved Vapors communicated unto the Veins do finde any vitious Humors in these Veins, then a Feaver ariseth thereupon. Now these Feavers are various, (according to the different preparation of the vitious Humors;) somtimes intermitting, and somtimes continual; according as this treasury of the vitious Humors is laid up either without the *Vena Cava* (viz. the great hollow Vein) or else sticketh fast in the same; and indeed for the most part they are Tertians either continued or intermitting, (single, or double) and very rarely Quotidians; and most seldom, Quartans.

Signs.

These Feavers are known, in that both the heat, and the Urine, and the pulse, do all of them discover sure signs and tokens of a putridness. But now whether these Feavers are kindled only by the commotion and disturbance of the Humors, or else from the putridness in the wounded part, it is known by this, to wit, that if the Feaver proceed meerly and only from the Commotion of the Humors, then such a Feaver invadeth the person immediatly and in the very beginning; and there is no vitiousness or fault at all to be found in the Wound. But if it proceed from any putridness in the Wound, then the Feaver appeareth not instantly, and at the very first, but after a short time; and then there are Signs and tokens of Putridness in the Wound

Wound it ſelf. But then for the Nature and Quality of the Feaver, it is to be known from the proper Signs of Feavers.

Prognoſtick.

Of theſe Feavers, ſome of them are more dangerons then other ſome, as we have already told you before, in its proper place, touching Feavers: and intermitting Feavers they are of themſelves altogether void of danger; but the Continual are ſomwhat more dangerous; and that likewiſe more or leſs, according to the quality and condition of the putridneſs. But yet becauſe that theſe Feavers happen and follow upon Wounds, they al of them therefore bring ſome danger along with them, more or leſs. For whereas the wounded part was weak before, now the Feaver happening thereupon increaſeth the debility, and ſo augmenteth the danger thereupon depending; and thus it may very eaſily come to paſs, that at the part affected there may be a fluxion excited; or elſe by reaſon of the heat weakned upon the aforeſaid Cauſe very many Excrements may be generated in the part, and from hence other evils may be excited.

Their Cure.

Now as for the Cure of theſe Feavers; albeit that they are occaſioned by the Wound; yet nevertheleſs becauſe that the vitious proviſion of Humors is the principal cauſe of them, therefore theſe Feavers are to be cured in that manner we told you of in its own proper place.

Touching the Inflammation.

Now very often there happeneth unto Wounds an Inflammation; and ſomtimes likewiſe an *Eryſipelas*. And indeed an Inflammation doth moſt commonly (if not evermore) follow upon the inflicting of a Wound; and more eſpecially in the Nervous parts; in regard that the afflux of Blood unto the part affected ſtirreth up and cauſeth a pain therein; and moreover, becauſe that the Blood when it cannot ſufficiently flow forth from thence it putrifieth, and very eaſily exciteth an Inflammation, which is prevented by a due and ſufficient efflux of the Blood; touching which *Hippocrates* thus writeth, in his *B. of Ulcers*.

If there flow forth of the Wound Blood more or leſs, according to the ſtrength of the wounded perſon, then both the Wound it ſelf, and thoſe parts that are neer about it are the leſs troubled and affected with any Inflammation that ſhall follow upon the Wound.

And therefore if there be any cauſe to fear an Inflammation; and if the blood hath not ſufficiently flown forth, then forthwith a Vein is to be opened in the oppoſite place; and the Blood is to be evacuated according to the ſtrength of the ſick perſon, and as he is well able to bear it. Yea and moreover, if there be already preſent an Inflammation, and that the Patients ſtrength will bear it (and neceſſity ſo require) Veneſection and Purgation are both of them to be adminiſtred, according as there ſhall be need.

If the Inflammation be excited from pain, then we are to endeavour that the ſaid pain be taken away, and withal that the afflux of Humors be repreſſed. *Avicen* for this uſe highly commendeth the Cataplaſm that is made of the *Pomegranate* boyled in aſtringent Wine, then bruiſed in a Mortar, and ſo made up into the form of a Cataplaſm. There may likewiſe a Cataplaſm be made of the *meal of Barley, of Sea-lentiles, Mouſe Ear, and Oyl of Roſes*. But if the Inflammation be not removed by theſe, the reſt of the Cure is then to be performed, as we ſhewed you before in the *firſt Part, Chap.* 5. *Touching an Inflammation.*

Of the Eryſipelas.

If an *Eryſipelas* follow upon the Wound, this will ſoon appear from thoſe Signs that we gave you in the *firſt Part*, and 7. *Chapter*, touching an *Eryſipelas*. And in what manner it is to be cured, is manifeſtly declared by thoſe things that are there ſpoken of. And the truth is, *Hippocrates* (in his B. of Ulcers) teacheth us, that whenſoever an *Eryſipelas* ſhall follow upon an Ulcer, that then the Body is to be purged. And indeed, if it be ſo that Choler abound, (leſt that there ſhould be an afflux thereof unto the Wound) it will be very expedient wholly to evacuate the ſame. And yet notwithſtanding, becauſe that the *Eryſipelas* (which we cal *Roſa*) hath its original rather from the thinneſt of the Blood, and that part of it that is peculiarly corrupted; Sudorificks are therefore moſt eſpecially uſeful, as there we told you. *Hippocrates* was wont to impoſe upon the part affected the Leaves of Woad, or the Juyce thereof with Clay. We may likewiſe apply unto the place affected Cataplaſms of *Barley meal*, and *Eldern Water*, and other the like, ſuch as we have there mentioned, to wit, in the *place before alleadged.*

Of the Super-excreſcent Fleſh.

And ſomtimes likewiſe it ſo happeneth, that the Fleſh becometh Luxuriant and proud (as we term it) and groweth forth beyond all Reaſon and meaſure; which hindereth the production of the Cicatrice, and its covering over of the Wound; or at leaſt it cauſeth the ſame to be unſightly and deformed. But this happeneth through the unskilfulneſs

or want of care in the Physitian, who administred Medicaments that were not sufficiently drying. And therefore what Flesh we finde to be superfluous we must take it away, that so the Wound may be shut up with a Cicatrice.

But now this is the work of the Physitian, who is to consume the superfluous Flesh with Medicaments that are sufficiently strong in their drying, cleansing, and (if need so require) somwhat Corroding likewise.

But now what those Medicaments are with which this may be done, we have told you before, in the 2. *Part*, and 7. *Chapt.* whither we refer you. Of all which Medicaments there mentioned the most useful and principal is the Green Water there spoken of; which both consumeth the superfluous flesh, and likewise bringeth the Cicatrice over the Wound when it is cured.

Of the Hæmorrhage.

There happen also many Symptoms unto Wounds; which partly deject the strength of the Patient, and partly render the Curing of the Wound more difficult then otherwise it would have been. And first of all, there oftentimes happeneth indeed an extraordinary great Hæmorrhage and profusion of the Blood; which doth not only deject the strength and Spirits, (depriving the Patient oftentimes of his Life) but it likewise very much hindereth the Cure. For so long as the Flux of Blood lasteth, there can nothing at all be done in the Cure. Now that said Hæmorrhage happeneth upon the wounding of the greater Veins, as also the Arteries, not only the greater of them, but the mean and middle sort of these Arteries. But touching this Symptom we have already spoken above in the 14. *Chapter.* where you may see further.

Of pain with the Wound.

And oftentimes likewise there is an extraordinary vehement pain following and accompanying the Wound. For although there be indeed hardly any Wound without pain; yet nevertheless very usually this pain is tollerable, and such as the Patient can wel bear. But somtimes it is vehement and altogether intollerable: which happeneth more especially, when the Nerves and the Nervous parts are hurt and Wounded: and an extream vehement pain arising immediatly upon the inflicting of the Wound is a sure and certain Sign and token that either a Nerve or a Nervous part is wounded.

The Cause.

Now this pain is excited in Wounds, somtimes by reason of Errors committed by the Patient in the Course of his Dyet whiles he eateth all manner of bad and corrupt food; as Cabbage and Cole-worts, salt Fish, Swines flesh, or the like; whiles he exposeth the wounded part unto the cold Air, and moveth it overmuch by exercise. And somtimes also this pain happeneth by the Carelesness of the Chirurgeon, who administreth Medicaments that are overhot, and too sharp; bindeth the part too hard and streight, placeth it not aright, thrusteth into the Wound Tents over long, or thick; leaveth the *Pus* over long in the Wound, and suffereth some piece of bone to prick and molest the part that lieth next unto it. And somtimes also, without any of these Causes, a pain may be excited by an internal afflux of the Humors; and this pain oftentimes invadeth the wounded person suddenly, and with a certain unwonted coldness and Chilness; and this is oftentimes a very shrewd sign of some great Inflammation instantly to follow, or even of a Gangrene very nigh at hand; and this especially, if together with the pricking pain there be perceived a certain heat in the Wound.

Prognosticks.

Now these extraordinary and over vehement pains in Wounds are wont to be the Causes of grievous Evils. For besides that they cause a restlesness and want of sleep, and deject the stength of the sick person, they are likewise the Causes of the afflux of Humors unto the wounded part; whereupon Inflammations, a Feaver, somtimes also the Gangrene, are excited and brought upon the party. Touching which *Galen* also very frequently giveth us notice. *There is nothing* (saith he) *that more increaseth the Phlegmone then pain*; as he writeth in his 5. *B. of the Meth. of Curing*, and 4. *Chapt.* and in the 3. *B. of his Method, Chapt.* 2. and 6. *By reason of pains* (saith he) *the parts are troubled with and lie under fluxions.* And in the 13. *of his Method, Chapt.* 5. *Pain, and the heat of the member in which the Erysipelas resideth, (although the whole Body be pure and free from Excrements) become the Causes of a Fluxion.*

That therefore the pain may be taken away, we are to make diligent enquiry, and finde out, whether this pain proceed from any Errour and fault in the sick person, or else from the Carelesness of the Chirurgeon: and if any such Cause shall be discovered, it is to be removed before any thing else be done. But if no such Cause shall appear, but only that somthing extraneous sticketh in the Wound, this is without any delay to be drawn forth. If the pain proceed from the abundant

abundant store of the *Pus* retained and kept in; then a free and open passage is to be made for it that so it may freely flow forth But if it proceed from the overgreat Afflux of the humors (like as it is wont to be in an Inflammation) then we are to make use of those Medicaments that restrain the immoderate & excessive afflux of the humors; as also we are to administer Medicaments both rarifying and Anodyne. And very useful here is the *Oyl of Roses* with the *white* of an *Egge*, and the *yelk* of an *Egge* (according as the Case shal require) and in which *Earth worms* have been boyled: as likewise the Oyl of *Camomile*, of *Linseed*, of *sweet Almonds*, of *Earth worms*, and of Elder. A Cataplasm of the *Leaves of Mallows*, the *Roots of Marshmallows*, *Barly meal*, *Bean Meal*, and *bran*. But if the pain be greater then ordinary, we may then make use of the Oyl of *Poppy*, and of *Water-Lilye*; as likewise of the Cataplasm that is made of the *Leaves or Root of Nightshade*, and *Hoggs grease*. As for Example;

Take *Oyl of sweet Almonds*, *Oyl of Roses*, *and of Camomil*, *of each one ounce*; *the yelk of one Egg*, *and Saffron half a scruple*, *Mingle them &c.* or,

Take *Root of Marshmallows half an ounce*; *Mallow Leaves one handful*; *Elder flowers two pugills*; *boyl them all unto a softness*, *and then passt them thorow a hayre sieve*, *adding unto them the powder of Camomile flowers half an ounce*; *Barley Meal one ounce*; *Bean Meal and the Meal of Linseed*, *of each half an ounce*; *Make a Cataplasm hereof. Unto which (if you please) there may be added the Oyl of Roses*, *of Camomile*, *of white Lilyes*, *of Mastick*, *and the Unguent Dialthæa.*

If the pain be not asswaged by all these Medicaments, it is a sign that some Nerve is greatly hurt. And so then the cure ought in all respects to be carryed on, as that we mentioned above in the 15. Chapter touching the wounds of the Nerves.

Of Convulsions, and Convulsion Fits.

There happeneth likewise now and then a very grievous and dangerous symptom unto Wounds; to wit, a Convulsion, or Convulsion Fits, (the *Latines* term them Convulsive motions) touching which symptom many are wont to treat at large, touching Wounds. But in regard that we have already (in the first Book of our *Practise*, *Part.* 2. *Chapt.* 20.) spoken enough of a Convulsion in general; we shall here only set before you those things that are proper unto that Convulsion which is wont to follow upon Wounds.

Causes.

As for the Causes of the Convulsion; Convulsions are caused in Wounds, either from a pricking of the Nerves, and their extreme vehement pain, or else from some sharp and Malignant, either humor or vapour, pulling and twinging some Nervous part, or the Membranes of the Brain: for the expulsion of which when Nature beginneth to bestir her self, she then exciteth this Contraction, and Convulsive Motions. Touching which *Hippocrates* (in his 65 *Aphorism* of the fifth *Sect.*) thus writeth: *Those* (saith he) *that together with their Wounds have conspicuous Tumors*, *these are not greatly troubled with Convulsion fits*, *but they are taken with a kind of Madness. But these tumors suddenly vanishing* (*if this indeed happen on the hinder part*) *then Convulsions and Cramps follow thereupon.* And *Galen* (*in Art. Medica*, *Chap.* 92.) *saith*, *that the pricking of a Nerve and Tendon*, (*by reason of the vehemency of the sense*, *and because this part is knit together with the principium*, (*that is*, *the Brain*) *it is therefore very apt to excite and cause a Convulsion of the nerves*; *and then especially when nothing breatheth forth outwardly*, *the wound of the skin being closed and shut up.*

And indeed the matter exciting a Convulsion doth it sometimes only by its Acrimony, and somtimes also by its malignity; like as we see the very same to happen in Wounds and strokes, and bitings of venemous Creatures.

Prognostick.

Now these Convulsions or Convulsive Motions are very dangerous in wounds: touching which *Hippocrates* (*Sect.* 5. *Aphor.* 2.) sayth thus; *The Convulsion that followeth upon a Wound is Mortal.* and in the 5. *Sect. Aphor.* 3. *The Convulsion that followeth upon an extraordinary Flux of the blood*, (*or a sighing and sobbing upon the same occasion*) *is very evil and dangerous.*

Cure.

But now, as for the manner and method of Curing these Convulsions, we have shewed it unto you, in our 1 *B. Part.* 2. *Chapt.* 28 and there you may see enough hereof. And therefore here in this place we shall only give you notice of these things following. First of al, that in Convulsions and Convulsive Motions that happen unto Wounds (whether it be of themselves, or by Consent with some other part, how and in what manner soever it be) we ought to have a special regard unto the Brain, spinal Marrow, and the Nerves that proceed from these; and thereupon we are to anoynt the Neck (both

before and behind) and the whole ſpinal Marrow, with Convenient Medicaments; ſuch as we have already mentioned in the place alleadged. *Cæſar Magatus* (in his firſt *B. Chap.* 77.) Commendeth this following.

Take *Oyl of Bays, of Juniper Wood, of Juniper Berryes, Mans Fat, and Oyl of Earth Worms, of each four ounces; Oyl of Roſemary flowers, Lavender flowers, and Sage flowers, of each two ounces; Oyl of Peter, and of Turpentine, of each half a pound; Oyl of Tile, and the oyl of Been, of each three ounces and an half; Myrrh, Frankincenſe, Ladanum, Benzoin, and Gum Juniper, of each three ounces; Oyl of Cinamom, of Cloves, Mace, Nutmeg, of each one ounce and half; Bdellium two ounces: Ammoniacum, Opopanax, Galbanum; of each one ounce; Indian Tacamahaca, and Caranna, of each four ounces; Caſtoreum, and Saffron, of each ſix drams; the Root of the herb Maſterwort. Angelica, Valerian, Acorus, Coſtus, of each half an ounce; Fat ſtyrax Calamite one ounce and half; the fat of a Lion, and Bulls fat, of each two ounces; the beſt burning Water one quart; and mingle them wel together.*

And Laſtly, if the Convulſion happen from the Retention of the *Pus* or other excrements; then we are to endeavor that by all waies and means a paſſage forth may be made for both the thin and thick excrements and that there may be ſome liquor dropt into the Wound that hath in it a power and virtue to cleanſe and conſume. And outwardly alſo there ought ſomewhat to be impoſed that hath a power of drawing from the depth and bottom of the Wound; which kind of Medicaments may ſufficiently be known from what we have written before, and more eſpecially, touching the Wound of the Nerves.

Chap. 24. *Whether it be lawfull for a Chriſtian by Amulets, (the Greeks call them* Periapta, *we Preſervatives) or elſe by hanging of Seals about their bodyes, or by the like means, to defend and preſerve themſelves from all danger by Weapons?*

SInce that there is nothing now adays more frequently practiſed by Soldiers, then by certain Amulets (or Periapta) as alſo by Seals and Characters, to fence and Guard themſelves againſt all thruſts and Strokes of Weapons, and Gunſhot, (and ſo to render themſelves altogether inviolable;) before we end this diſcourſe touching Wounds, we think it not amiſs (for a Concluſion) to add and diſcuſs this queſtion; whether it be lawfull for a Chriſtian, and whether he may with a ſafe Conſcience, (and without breach of Piety) in any ſuch manner as aforeſaid make his body weapon-proof, and impenetrable by Gunſhot.

For although I neither deſire to make any inquiry into the ſecret and private practiſes of theſe kind of Perſons, nor think it worth the while ſo to do; yet notwithſtanding this is a thing very well and commonly known, that theſe men cannot Guard and fortify themſelves from all kind of violence whatſoever; but only againſt the thruſts and ſtrokes of Swords, and other the like Weapons, as alſo from Musket and Piſtol bullets, ſo that ſuch like Weapons, and ſmaller Gunſhot ſhall not by any means be able to penetrate their skin. But yet theſe perſons may by Clubs be dry-beaten, and by bullets ſhot forth of the greater Guns (as Ordnance, and the like) be hurt and violated; yea they may hereby likewiſe be deſtroyed, although it be true, that their skin cannot eaſily be wounded. Yea moreover (even as themſelves confeſs) there are ſome certain parts that cannot thus be ſafe-guarded and preſerved impenetrable and inviolable; and more eſpecially their Eyes. And moreover this is likewiſe commonly reported, that ſome of them can make not only themſelves, but that they can render even the bodies of others ſo impenetrable and inviolable, that they ſhall not be hurt by any kind of Weapons; yea that ſome of them are able to cauſe, that butter ſhall not be cut, either by knife, Sword, or by hatcher. And thirdly they report this alſo that ſuch as are altogether ignorant and unwitting unto any ſuch practiſe, may likewiſe by others be made inviolable, and proof againſt all kind of Weapons and Darts.

The various wayes and manner by which ſom make themſelves impenetrable by weapons.

But now they have divers waies & means of making themſelves thus impenetrable and weapon proof, which I neither know nor deſire to know. In the general, I ſhall only acquaint you with one or two of thoſe things that are commonly carryed about by them; that ſo by them you may likewiſe know how the better to Judge of all the reſt. And firſt of all, it is ſcarcely unknown to any, that there are certain Seals or *Pentacula* (as they call them) that are graven with figures and Characters, and ignorantly lettered (as *Apuleius* ſpeaketh) and theſe are carried up and down, and by the Souldiers hung

hung about their Necks; and they are wont also to be bound unto their Body; that so by them they may render themselves inviolable, and not to be hurt by any Weapons. And some there be, that only inscribe these kind of Characters upon a piece of paper, and so hang them unto their Bodies. And I my self knew a man, who reported that he hung one of these sheets of Paper about the Neck of a Dog; and then he shot him close at hand with a bullet out of a hand-Gun, and yet the Dog was not at all any whit hurt thereby. And there are some likewise, who swallow down these sheets or pieces of paper thus Figured and Charactered. And there is extant in a certain publique writing an instance of the like Artifice (if we may so call these delusions and impostures of the Devil) by which a certain Gentleman fenced and guarded his Body against all kinde of Weapons. Which practise of that renowned Commander (that so valiantly and successfully fought many battles against the Turks, in the behalf of the Christians in *Hungary*) whether it make more for his praise or dishonor, I leave it free unto any one to Judg thereof. I shall only say this, that oftentimes even great persons (Princes and worthies) have been deceived in this kinde, and have too incautelously given Credit unto these Cheaters and deceivers (who go up and down selling these things, and oftentimes putting them off at very dear rates) and have not sufficiently weighed and considered the dangerous consequence of what they go about. And therefore, as for the Course that these men take (seeing that it is altogether superstitious & impious) I do not think it any waies fit for me by my writings to propagate it unto Posterity: and yet notwithstanding, that the superstition and wickedness of this practise may appear, I will in the general speak somwhat thereof, and delineate it in some particulars. At the sacred time of our Saviours Nativity (or as we call it, Christmas) about midnight in a sheet of Vellom or Parchment there are these letters inscribed. I. N. R. I. and this same sheet of Parchment is closed up in certain bals or Lumps of Wheaten dough, which are privily put upon the high Altar, that so at certain and divers times three Masses may be celebrated over them. And then one of these little balls (with certain superstitious prayers they have for that purpose) must be eaten in the morning; and this wil for that day preserve the man safe and sound from all kinde of Wounds whatsoever.

In the same little Book, (the writing before mentioned) we are taught, in what manner on the day any wound is inflicted, before Sunrising, the Moss is to be taken and shaved from the Skul of one that was hanged or broken upon the wheel, (and this with certain prayers) which if sewed into the Garment under the left Arm-pit, and worn, will in like manner preserve the man inviolable, and not to be hurt by any Wound.

And there are some also who Wound their Skin; and then they put upon the Wound these kinde of Parchments, or some other things Charactered (as before) and so they Conglutinate the said wound, and close it up. And there are likewise (without doubt) many other such like waies and means well known to Souldiers; in the discovery of which I intend not at all to be Curious, or in the least to trouble my self.

The Authors of this practise.

If enquiry be made after the Authors of these Diabolical Practises, the prime and chief of them are for the most part unknown; and these things are by the incautious Souldiers derived from one to another, and from hand to hand. And if we should trace the Authors out even unto the very first of them, we shall finde the first Author hereof was (doubtless) some Devil and wicked Spirit, as we shall anon shew you. They do acknowledg that oftentimes hang-men or the common Executioners are the Authors of this wicked Artifice, as being a generation of Men for the most part much addicted unto Magick. And so the *Passavian* Art (as they cal it because that it first came to be known in that Army which being raised about *Passavium* afterwards in the yeer 1611. brake into *Bohemia*, & took *Prague*, and was every where divulged up and down the Country, and throughout *Germany*) at the first was communicated and made known unto the Souldiers by the common Executioner of that place.

If you enquire into the reason hereof; they first of all pretend experience, and they alleadg likewise great persons Princes and worthyes, who have by their Experiments found the truth hereof, and so have left it unto us as a *Probatum*, that any one may in this manner and by this means render himself inviolable and so as not to be hurt by any kinde of Weapons. And moreover, some there are that derive the virtue and Cause of this effect from the Constellations; and therefore it is that they teach us to make those Seals (which they cal *Periapta* and *Pentacula*) under certain Constellations.

But in very truth, we deny not this indeed, that such things as this may thus be done, and that they have been made use of by great persons, (Princes and others:) but the Question is now touching this, whether such like practises as these may be wrought by any Natural means; and whether a Christian Man

Man or Woman may lawfully and without Impiety in this manner render himself inviolable and impenetrable; or else whether or no whatsoever shall be done in this kinde be not done by Magick and the Diabolical Art, and by a compact with the Devil; and so therfore that it is altogether unlawful, impious, and wicked, for any one in this manner to make his Body impenetrable.

Thus to do simply unlawful:

In which Question we indeed defend the latter opinion; and we positively assert, that all the power, virtue and efficacy of the Means aforesaid proceed from a compact and agreement with the Devil, and so consequently from the Devil himself; and thereupon that he (whosoever he be) that shal by this kinde of Means endeavour to fence and guard his Body against the violence of Weapons, shall by thus doing attempt a thing altogether impious and unbefitting a Christian. For First of al, most certain it is, that there is no such virtue either in Metals, or in sheets of Paper or Parchment, of themselves and in their own Nature; but that they perform whatsoever is done, as they are marked with the aforesaid Characters. But now there can be no such virtue or efficacy in Figures and Characters: and therefore it will necessarily follow, that it proceedeth from some higher power; and this must be either from God, and the good Angels; or else from the Devil, that wicked Spirit. But it is no where extant in Holy Writ, that ever God did (either by himself, or the Ministery of the good Angels) work any such thing; or that he ever promised so to do. And who is there that can beleeve, that such an abuse of sacred Words, and other such like superstitious practises as have been before related, should be approved of by those good Angels: and therefore we must beleeve that they proceed from the Devil. And thus the Devil that he may seduce and withdraw men from the Worship and Service of Almighty God, and devote them unto himself, he maketh an Agreement and compact with any one that will hearken unto him, that if he wil forsake God, and become his, he will then make him free and inviolable from the violence of all Weapons whatsoever, so long as he shall carry about him such like Seals (or *Periapta* as they are commonly called) or shall devour the aforesaid Characters inscribed upon Paper. Unto which Compact they render themselves Obnoxious, and give their Consents, who ever they be that make use of the above mentioned Characters. For those Characters are the Devils Alphabet (if I may so term it) and as it were the Military pawn and Engagement by which he knows and acknowledgeth them, when they implore his help and assistance. For albeit there are some who here conceive themselves to be altogether free from all Idolatry, superstition, and impiety, and that they have herein no compact nor commerce with the Devil; yet nevertheless they are herein greatly deceived, so long as they make use of Means that were never ordained by God, but such as are of the Devils Institution.

Reasons proving the unlawfulness of this Practise:

A Compact with the Devil twofold:

For there is a twofold compact with the Devil, to wit, Mediate, and immediate; or explicite, and implicite. The immediate and explicite is, when any one shall make use of means immediatly delivered into his Hands by the Devil himself. But the Mediate or Implicite Compact is then, when any person shall make use of such means as were at first prescribed by the Devil, but yet such as he hath not received immediatly from the Devil himself, but hath had them by others and from Hand to Hand delivered unto him. Both which we finde forbidden, and contrary to the Law of God, which forbiddeth us to have any other Gods. Neither is it any whit to the purpose, that which many object, when they say, that it is no way probable, that compacts which others have entered into with the Devil, the guilt thereof should become theirs, and bring them under the like impiety; seeing (saith they) that it is the consent of the Covenanters that makes the compact: for in that Compact implicite or Mediate (as I have said) the consent is not altogether wanting. For whereas every one that hath but so much soundness of minde yet left him (*that he knows how to shun Rocks and avoid the pit that stands wide open, and ready to devour him*) will easily acknowledg, that those Characters or Words have no such virtue in themselves; and therefore before ever he make use of them he ought to inquire, by what power and virtue it is that they perform what they do. Which if he neglect to do, he then implicitely enters into a compact with the Devil, who hath made that promise that he will perform this for such as shal make use of those Characters and form of Words according to his prescription; and so consequently such a one cannot at al be free from impiety. And that this is a truth those two Histories following will sufficiently make good. *Martinus del Rio* in the 2. B. of his *Magic. Disquisition. Quæst.* 27. *Sect.* 1.) relateth of *Henricus Cornelius Agrippa*, who having at *Lovain* a youth boarding in his House that was over curious and prying, it so came to pass, that during this

this youths abode with him, *Agrippa* having at length occasion to ride a Journey far from his home, he delivered the keyes of his Study unto his Wife (whom he afterward put away by divorce) with this prohibition and charge that she should not suffer any to enter thereinto in his absence. But this youth having by his importunity and earnest intreaty gotten leave to go into the study, and lighting upon a little Conjuring book, while he was reading therein, lo a knocking at the Study door; but he persisting stil in his reading there is another knocking heard at the Study door, which the youth still reading on and not answering, the Divel entereth in, and asketh wherefore he was called; at which the youth being astonished and so far affrighted that he could not make any ready answer, the Divel immediately choaked and strangled him For as he that readeth any thing in an unknown Language, he himself haply may not understand what he reads which yet one that standeth by may understand; so it was here; although this youth knew not that he called for the Devil; yet notwithstanding the Devil wel knowing his own watch-word, and the engagement or Compact he had entered into, soon came upon calling.

The other History we have related by *Henricus Brucæus* (in the *Miscellanies* of *Smetius*, *B.* 5. *Epist.* 17.) which he tells us that he received from *Doct. Nævius*; and that the truth of this History was there confirmed by many of the Citizens. At *Leipswich* a little Girl not understanding what she did by reason of her Childishness and want of Age, whilst she was imitating all the Actions carriage and behavior of her Nurse (which she had seen her oftentimes use in the raising of storms and tempests) causeth thunder and Lightening, by which a village not far distant from this City was set on fire. The little young Girl being brought before the Senate, it was there with much deliberation debated whether they might legally proceed against her. But it was decided by the opinions of all the Counsellors there present, that they could no way proceed against her, neither punish her, by reason of her nonage, and ignorance of what she did. Which History doth sufficiently teach us that any one may even unwittingly, incautelously, and almost without his consent, cast himself into such a like compact with the Devil. For when as the aforesayd Girl (although by reason of her tender Age she understood not what she did) made use of those Ceremonies that were delivered and prescribed by the Devil unto the Witch her Nurse; the Devil was presently ready at hand, according to the Compact betwixt them) and raysed the aforesaid Tempest. Which if any one of a riper age (which might easily understand, that in these kind of Ceremonies themselves there can be no such power and virtue) had done, such a one (without doubt) had not been acquitted by the Counsellours, nor gone unpunished by the Senate. And therefore we conclude that there is none (unless he be out of his wits) that wil make use of the means aforesaid; seeing that he may easily understand that such like Ceremonies, Words, and Characters, do not perform those things they are sayd to do, either by any Natural power and virtue of their own, or else by any power given them from God, or the good Angells, but that they have this their power from that wicked spirit. And he whosoever he be that shal make use of them cannot be acquitted and freed from gross impiety, Magick, and Idolatry.

Whether there be any virtue in the seals.

But whereas there are some that endeavor to derive these virtues from the Constellations; (and therefore teach how to make divers of these Seals under some certain position of the Stars; we are therefore in the next place to examine that opinion also.

And the very truth is that among all the Seals of *Arnoldus de villa Nova*, and of *Paracelsus* (in his *B. Archidox Magic.*) there is none at all to be found that wil render a man inviolable, and so as not to be hurt by any kind of Weapons; and therefore this invention of the Devil seemeth to be newer and since their times. But now in regard that there is one and the same reason for all those aforesaid effects (that are promised from these kind of Seals) we conceive it therefore very fit to speak something, in the General, touching the aforementioned Seals. For if we shall (in the general) demonstrate unto you, that these Seales have in themselves no such natural virtue or efficacy, we shall thereby withall shew unto you, that these Seals likewise (that are made use of against Wounds) have not their virtue and power from the Constellations.

Magick.

That under the name of Astrology such like Magical Trumpery should be exposed to sale, is no new thing; for it was of old thus wont to be done in the Eastern Countryes. Touching which *Pliny* (*in the* 30. *B. of his Natural History, and Chapt.* 1.) *sayth thus. Magick that most fraudulent of all the Arts hath very much prevayled all the world over, and that now of a long time, & for these many Ages.*

But

But indeed there is no cause why any should admire at this the so great authority of Magick: in regard that she alone of all the Arts, adding unto her self and comprehending within her self three other of the most famous and sovereign of them (and such as have the greatest command upon the mind of Man) hath reduced them into one only, to wit, her self alone. For first of all there is none that doubteth and that wil not readily grant, that she hath her birth and original from Physick, and that she so crept in under a fair and specious pretence of safety and health, as a higher and more sacred Art then Physick it self. And so hath she likewise by her blandishments and large admirable promises added unto her self the strength and power of religion; with which now a days mankind is so strangely blinded. And that she might the more easily suggest these her promises, she intermingleth the Mathematicall Arts; there being none that is not very greedily desirous to know things future as concerning himself; verily believing that these things are fetcht and brought unto him from heaven it self. And thus the senses of Men being possessed, and lying under a threefold Obligation hath increased and grown up unto so great a heighth, that even at this day it is very prevalent in most Nations; and in the East especially it hath a commanding power over such Kings as have Kings for their subjects.

And I could heartily wish that the said superstition had there only had its residence and abode in the Easterly Countryes; and that Monarchy there perishing, she had likewise perished together with it. But afterwards this superstition became propagated likewise into other Regions. For even *Galen* also (in his 9. *B.* of the *facult. of simple Medicam. in his Chapt. of Stones, & the Jasp.* telleth us that it was a very usual custome even in his days to ingrave a Dragon upon the Jasper stone, and to set and wear it in rings for the comforting of the Stomack. And *Alexander Trallianus* (in his tenth *B.* about the end) writeth, that they were wont to carve upon the *Jasper* stone the effigies of *Hercules* standing upright, and killing the Lion; and this they set in a Gold ring, and wore it for the Curing of the Collick. And in the same place, he commendeth as a thing sacred and not to be communicated but unto sacred Persons, this Ring, against the Colick. On the seventeenth or the one and twentieth day of the Moon, he appoints us to take a Ring of Iron, and to make the Circle thereof eight-angled; and upon the Eight Angles to inscribe these words, *fuge, fuge, heu bilis: a'auda quærebat.* And this Sign or Mark following, he commandeth us to write upon the head of the Ring. And in his tenth *Book*, and *Chapt.* 1. against the Gout in the feet and toes, he commendeth a thin plate of Gold, in which (the Moon then being in *Libra* or *Leo*) is to be inscribed that verse of *Homer*: πτερὸν χεὶ δ' ἀγορὰ ὑπὸ δ' ἐσονάχιζετο γαῖα. And many more besides of this nature we likewise meet with very frequently in *Trallianus*. And *Paracelsus* hath also propounded very many of these like Characters, (in his Book *Archidox. Magic.*) And yet nevertheless he himself (in his *B.* of *occult Philosoph.* in the *Chapt. of Characters*) before all other Characters, Signs, *Pentacula*, and Seals, he preferreth two of them: one, that wherein (in a certain figure there is inscribed the name *Adonai*. The other is that in which likewise (in a peculiar figure) there is inscribed the Tetragrammick name of God, consisting of five syllables. And he writeth that these seals are very useful and avaylable against al Devills and also against all Charms and inchantments, and that they perform things wonderful and admirable. And therefore again I wish heartily, and I would to God that the sayd superstition which hath had a commanding power over great kings in the East who have had even Kings for their Subjects, had not likewise born too great a sway over Christian Princes, Nobles, and great persons; or that there were not found to be such as sold unto these Princes & Nobles those Magical Charms and spels under the name & pretence of Astrologicall Rarities: and likewise that these great persons would more diligently inquire into those preservatives when they are profered unto them: for they might easily find and discover that those things had not so much as any probability of Reason to ground upon. For although some have endeavoured to derive the cause of these effects from the Heavens; yet notwithstanding as for the manner how this is done, therein they agree not; neither do they bring any thing of probability to prove the same.

The Reconciler (*Difference* 101) from that of *Ptolomy*, (in his *Centiloquy*, *that the faces of sublunaries are subject unto the Celestial Aspects*, that is to say, the species of the Living Creatures of this inferior world are subject to the Cælestial images,) concludeth and positively determineth, that the Cælestial sign *Scorpio* hath the predominance over al inferior Scorpions, and the Serpent over all Serpents here upon Earth.

But grant indeed that it be so, (which yet Nevertheless they have no way proved) that these inferior Earthly Scorpions are subject unto the sign of the Scorpion in the Heavens; yet what is all this to the Scorpion carved and engraven upon the precious Stone? Certainly a Dog, or Scorpion, engraven or pictured, is not of the same kind, nor under the same *Genus*, with the living Creature,

Dog,

Dog, or Scorpion. There are others that say that this virtue is instilled into these Seals from Heaven and the Stars; and that the Astral Spirit that hath its influence and is sent upon them, doth not only accommodate it self unto those Metals, precious Stones, and those plants; but that it doth likewise secretly intermingle it self even with their very substance; and that in the very first Creation it obtained a Mutual and Sympathetical consent with them, then a Familiarity, and Lastly, soon after a Continuation also with them.

But let it indeed be granted, that the Heavens and the Stars do not only (as *Erastus* will have it in this Quest. *Part* 1. *Disputat. against Paracelsus, Page* 151.) warm these inferior Bodies, and enlighten them, and that in this manner they do (as a Common and general cause) at all times produce one and the same effect in all things here below: but let it likewise be determined, that there are some certain peculiar Stars that work upon these inferior Bodies by their secrets and occult influences, and that they do peculiarly affect those things with which they have the aforesaid familiarity; and that one Star hath a familiarity with the Adamant, another with the Rose, and a third with some other Plant: But I pray, what maketh all this for the engraving and inscribing of Figures and Characters, seeing that the Stars communicate their virtues unto things here below in a meer Natural way, without any prescript or Artifice of ours? And wherefore do not the Stars and Constellations infuse those their virtues equally and indifferently into Metals or precious Stones, whilest they are whole and entire, and before they are engraven and inscribed with any Characters, as they do afterwards (if these men speak truth) into those that have such like Characters Carved and Engraven upon them? And certain it is, that *Pæony* gathered at such a fit season of the year, as also other Plants, and all things else whatsoever that are made use of instead of Natural Amulets, do put forth their virtues; (and so likewise the Loadstone draweth the Iron, and is moved unto the Pole) without any kinde of Figure, or Character engraven thereon. And hereupon *Galen* rightly determineth, that the *Jasper* stone hath the very same virtues, whether the sign of the Scorpion be carved upon it, yea or no.

And *Henricus Cornelius Agrippa* seemeth to differ but very little from this opinion, who in his 1 *B. of occult Philosoph.* and 33. *Chap.* thus writeth touching the thing in Controversie: *All the Stars* (saith he) *have their own proper Natures, Proprieties, and Conditions; the Signs and Characters whereof they do by their Raies and Beams produce likewise even in these inferior Bodies, to wit, in the Elements, in pretious Stones, in Plants, in Animals, and their Members. Whereupon it is, that every thing whatsoever from its Harmonical disposition, and from its own Star Iradiating and Darting its Beams upon it, obtaineth some special Sign and Character imprinted upon it, that is significative of that Star or Harmony; and containing some special virtue in it self, differing from others, either in general, or in special, or in the number of the matter præexistent. Every thing therefore hath its own Character imprinted upon it (for the working of some peculiar effect by its own Star, and especially by that which above all other things hath the sovereign power and predominance over it: and these Characters contein within themselves, and so also they likewise retein these proper Natures of their own Stars, as also their virtues and Roots; and they produce the like operations with them on other things upon which they are reflected: and they also draw forth and help forward the influences of their own Stars (whether Planets, or even fixed Stars also, and Celestial signs, and Images) to wit, as often as they are wrought and fashioned in a due and fit matter, in their own due and proper time, and with due and fitting Solemnities.* And there he also delineateth very strange and admirable letters and Characters, proper and peculiar unto each of the Planets. And therefore if any one desire and seek after the virtues of any Star, the thing that is subject unto that Star is to be engraven upon somwhat that he wears about him. As for instance, if any one desire to have the virtue and influence of the Sun, let him then take Gold and engrave upon it the Character of that Planet, at that very time when the virtues of the said Planet are most strong and vigorous. But these are all meerly grounded upon a false supposition; whereas they take that for granted which indeed was never yet by us, neither will it ever be granted unto them. For first of al, *Agrippa* and others do attribute unto these Seals many such like virtues (as we may see frequently in divers places of their Descriptions) which in very truth cannot be the Natural virtues of any Star. And *Paracelsus* (in the fourth *B.* of his *Archidox. Magic.*) teacheth us how we may make a Bodkin, and paint and inscribe upon it certain Characters; and then he affirmeth that if any one shal with Chalk make a circle against a wal, and in the very Centre thereof fix the sayd Bodkin, all the flies neer that place wil come and sit upon the sayd Circle, and there remain until such

time as the Bodkin shall be again pulled out of the Wall. But let *Apella* the Jew believe this, for indeed I shal not.

And yet notwithstanding there are at this day those that do not only believe this, but endeavour likewise by their publique writings to perswade others hereunto; and these conceive that this virtue is by those Characters derived from the Constellations. But let them shew us what Star it is that hath this commanding power over these Flies. *Beelzebub* is indeed called the god of Flies. And without all doubt these poor Flies are more likely to obey his Commands then the Stars. There is Another who tels us how we may make a Seal with the Figure of old Father *Saturn* digging up the Earth with a Spade (which, say they, ought to represent unto us the Planet *Saturn*;) and this Seal if any one shall carry about him in his left Boot, (and why not. I pray, as well in his right Boot, or on his Arm?) he writeth that it will then so preserue a man, that he shall suffer no hurt at all from his Horse; and moreover that it wil speed and hasten the hard labor in Childbearing Women.

And moreover how and from whence will they be able to prove that these strange and uncouth Characters (that are to be seen in *Corn. Agrippa, Paracelsus*, and others) are the Characters of certain Stars? And not Characters only, but even other Figures also. They paint *Saturn* in the likeness of an old man, with a Pruning Hook, Sythe, Spade, or Plow-share. They paint or Picture *Jupiter* like a King with a Scepter in his Hand. Now what agreement is there between these Figures and those Planets which they Represent? And what, I pray, may the Reason be, that the Planets communicate their virtues and influences unto Metals, only if they be engraven and inscribed with these Figures, and not with others? And who was the first that taught us, that this Star taketh a delight in this kind of Character, and that Star in another kind of Character different from the former? And the Reason is the same for al other Figures; touching all which they ought to prove unto us, that these are the Figures of certain Stars. And moreover, besides these Characters, what mean they by so many Words, which they not only pronounce in the framing and fashioning of these Seals, but they are likewise engraven and imprinted upon these Seals; as we may see in *Paracels.* his *B. Archidox. Magic.* and in the Seals of *Arnold. de villa Nova.*

But others there are that endeavour to free themselves, and clear the controversie, by saying, that individuals when they begin to be under some determinate Constellation, they then receive a certain admirable faculty (of operating, or of suffering) over and beside that they have in special, or from the species. But let this be granted; yet notwithstanding it cannot be said, that the precious stone, or Metal, do then begin to have their being when they have these Characters engraven upon them; for they were, and had their being before; and indeed their substance was likewise individual; and according also to their own opinion, the Attral Spirit & virtue insinuateth it self into that substance wherewith it hath a Sympathy. For there is, to wit, between natural substances themselves a cerrain occult and secret familiarity and Sympathy; but yet no such thing between Natural Substances and Artificial Figures.

But others are of this opinion, that the Figure is not indeed the principle of operation, but yet notwithstanding that it conduceth very much unto the said operation. For the conception of a deformed Figure in the minde of Man or Woman, we see what sadness it produceth unto them; and on the contrary what Joy and cheerfulness the conception of a fair and delightful Figure and representation causeth in their Minds and Countenances. And by the Instruments of Artificers, according to the variety of the Figures, so are the operations various; some of them by the Saw, and some others of them by the Hatchet or Axe.
